 - 14 Anthers 1-3.6 (-4) mm long; stigmas 1.5-4.7 (-6) mm long.....*Thalictrum dasycarpum*
 - 14 Anthers 0.5-2.8 mm long; stigmas 0.6-3.5 mm long.*Thalictrum amphibolum*

Thalictrum amphibolum Greene. SKUNK MEADOWRUE, WAXY MEADOWRUE. **Hab:** Mesic to dry forests, woodlands, barrens, and prairies, over hornblende, greenstone, dolostone, and serpentized olivine. **Dist:** QC and ON south to n. FL, LA, and TX, and scattered southwest to CO, NV, and AZ. **Phen:** May-Aug. **Tax:** The name *T. revolutum* is illegitimate, as de Candolle cited *T. pubescens* Pursh in synonymy when he named it; it must be replaced by *T. amphibolum* Greene. **Comm:** The species is normally stipitate-glandular or papillose, but can be glabrous, as accounted for in the key. **Syn:** = K4; = *Thalictrum revolutum* A.P. de Candolle – Ar, C, F, G, GW2, Il, K1, K3, Mi, NE, NY, RAB, S, Va, W, WH3, WV; < *Thalictrum revolutum* A.P. de Candolle – FNA3, Pa.

Thalictrum macrostylum Small & A. Heller. SMALL-LEAVED MEADOWRUE. **Hab:** Moist places, perhaps associated with circumneutral soils, moist to dry ultramafic outcrop barrens (over serpentinized olivine), tidal freshwater marshes, rarely pineland seepages with calcareous substrate. **Dist:** Se. VA south and west through NC, SC, sc. GA, FL, and AL to MS. **Phen:** May-Aug. **Tax:** Under taxonomic study by D.B. Poindexter and A.S. Weakley. **Syn:** = C, F, FNA3, G, GW2, K1, K3, K4, S, Va, WH3, Park (1992); > *Thalictrum macrostylum* Small & A. Heller – RAB; > *Thalictrum subrotundum* B. Boivin – RAB.

111b. RANUNCULACEAE

Identification Notes: An unmistakable plant, the woody stems usually about knee-high and unbranched, bearing a cluster of pinnate leaves near the tip, and the rhizomes with a bright yellow, staining, bitter-tasting alkaloid.

Xanthorhiza simplicissima Marshall. YELLOWROOT, BROOK-FEATHER. **Hab:** Streambanks and riverbanks, less typically in moist rocky forests. **Dist:** Se. VA, w. VA, WV, and s. OH south to FL Panhandle and s. MS; disjunct west of the Mississippi in w. LA and e. TX; also scattered northward as naturalized populations from cultivation in PA, MD, NY, MA, CT, and ME. **Phen:** (Late Jan-) Mar-May; May-Jun. **ID Notes:** See Colenbaugh & Hagan (2021) for a detailed discussion of *X. simplicissima*. **Syn:** = C, F, FNA3, G, GW2, K1, K3, K4, NY, Pa, RAB, Tn, Tx, Va, W, WH3, WV; = *Xanthorhiza apiifolia* L'Héritier; = *Xanthorrhiza simplicissima* – S, orthographic variant. **NatureServe G5** (Secure).

113. NELUMBONACEAE A. Richard 1827 (LOTUS-LILY FAMILY) [in PROTEALES]

A family of 1 genus and 2 species, aquatic herbs, of temperate and subtropical e. North America and e. Asia. References: Wiersema (1997a) in FNA3 (1997); Williamson & Schneider in Kubitzki, Rohwer, & Bittrich (1993).

Nelumbo Adanson 1763 (LOTUS-LILY, LOTUS, SACRED-LOTUS, SACRED-BEAN)

A genus of 2 species, aquatic herbs, of temperate and subtropical e. North America and e. Asia. References: Wiersema (1997a) in FNA3 (1997); Williamson & Schneider in Kubitzki, Rohwer, & Bittrich (1993).

Identification Notes: *Nelumbo* can be immediately distinguished in vegetative condition from the other 'pads' (*Nymphaea*, *Nuphar*, and *Nymphoides*) by its peltate leaves, and from the peltate *Brasenia* by the much larger size and round (rather than elliptic) leaves.

- 1 Petals yellow; flower stalks and petioles smooth; mature fruits ('nuts') usually < 1.25× as long as wide *Nelumbo lutea*
 1 Petals pink or white; flower stalks and petioles roughened; mature fruits ('nuts') usually > 1.5× as long as wide *Nelumbo nucifera*

Nelumbo lutea Willdenow. YONKAPIN, AMERICAN LOTUS-LILY, YELLOW LOTUS, YOCKERNUT, WATER-CHINQUAPIN, POND-NUTS. **Hab:** Ponds, natural lakes, sluggish streams, freshwater tidal marshes. **Dist:** NY and s. ON west to MN and IA, south to s. FL and e. TX, and south into the West Indies and Mexico. **Phen:** Jun-Sep. **Syn:** = Ar, C, F, FNA3, G, GrPl, GW2, Il, K1, K3, K4, Mi, NcTx, NE, NY, Pa, RAB, S, Tn, Tx, Va, W, WH3, WV; = *Nelumbo nucifera* ssp. *lutea* (Willdenow) Borsch & Barthlott; = *Nelumbo pentapetala* (Walter) Fernald. **NatureServe G4** (Apparently Secure).

* ***Nelumbo nucifera*** Gaertner. SACRED-LOTUS, ORIENTAL LOTUS-LILY, PINK LOTUS. **Hab:** Ponds, lakes, canals. **Dist:** Native of Asia. **Phen:** Jun-Sep. **Syn:** = Ar, C, F, FNA3, G, GW2, Il, K1, K3, K4, RAB, WH3. **NatureServe G5** (Secure).

114. PLATANACEAE T. Lestiboudois 1826 (PLANE-TREE FAMILY) [in PROTEALES]

A family of a single genus and about 7 species (and several additional infrataxa), trees, of North America south to Central America and w. Asia to se. Asia. Probably with a close relationship to the Proteaceae (Angiosperm Phylogeny Group 2009), and sometimes included there (Angiosperm Phylogeny Group 1998, 2003). References: Kaul (1997) in FNA3 (1997); Kubitzki, Rohwer, & Bittrich (1993).

Platanus Linnaeus 1753 (PLANE-TREE, SYCAMORE)

A genus of about 7 species (and several additional infrataxa), trees, of North America south to Central America and w. Asia to se. Asia. References: Grimm & Denk (2010); Kaul (1997) in FNA3 (1997); Kubitzki, Rohwer, & Bittrich (1993); Nixon & Poole (2003).

Identification Notes: The exposed white inner bark on the middle and upper trunks make *Platanus occidentalis* recognizable at long distances, especially in winter.

Platanus occidentalis* var. *occidentalis. SYCAMORE, PLANE-TREE. **Hab:** Riverbanks and alluvial forests, streambanks, sometimes weedy on rocky roadcuts. **Dist:** S. ME west to s. ON, MI, and MN, south to Panhandle FL and TX. **Phen:** Apr-Jun; Sep-Nov. **Tax:** *P. palmeri* Kuntze, sometimes treated as *P. occidentalis* var. *palmeri* (Kuntze) Nixon & Poole ex Geerinck, but better interpreted as a species (Grimm & Denk 2010), occurs from central TX south into Coahuila. **Comm:** One of the largest trees in e. North America, and probably the largest that is widespread in the Piedmont of our area. **Syn:** = Nixon & Poole (2003); = *Platanus occidentalis* Linnaeus – Ar, K4, Mi, NcTx, NY, Tx, Va, Grimm & Denk (2010); < *Platanus*

114. PLATANACEAE

occidentalis Linnaeus – C, FNA3, G, GrPl, GW2, IL, K1, Pa, RAB, S, Tn, W, WH3, WV; >> *Platanus occidentalis* var. *glabrata* (Fernald) Sargent – F; > *Platanus occidentalis* var. *occidentalis* – F.

117. BUXACEAE Dumortier 1822 (BOXWOOD FAMILY) [in BUXALES]

A family of 517 genera and about 120 species, mainly shrubs, mainly of the Northern Hemisphere. References: Boufford (2021a) in FNA10 (2021); Channell & Wood (1987); Köhler in Kubitzki, Bayer, & Stevens (2007); von Balthazar, Endress, & Qiu (2000).

***Pachysandra* Michaux 1803 (PACHYSANDRA)**

A genus of 3–4 species, 1 of e. North America, the others of e. Asia, suffruticose herbs and shrubs. References: Boufford (2021a) in FNA10 (2021); Köhler in Kubitzki, Bayer, & Stevens (2007); Robbins (1968).

- 1 Leaves subcoriaceous, semi-evergreen, pubescent, mottled with several shades of green (more apparently so at some seasons than others); inflorescences lateral from near the base of the plant; [native plant of rich forests] ***Pachysandra procumbens***
 1 Leaves coriaceous, evergreen, glabrous, dark green; inflorescences terminal; [cultivated alien plant, rarely persistent] ***Pachysandra terminalis***

Pachysandra procumbens Michaux. MOUNTAIN PACHYSANDRA, ALLEGHENY-SPURGE. **Hab:** Moist rich forests, mainly over calcareous or mafic rocks. **Dist:** C. KY south to w. NC, nw. SC, w. GA, Panhandle FL (Jackson County only), AL, MS, and e. LA (on loess in the Tunica Hills). **Phen:** Feb-May; Jul-Aug. **Comm:** Its distribution (and, for that matter, that of the genus as a whole) appears to be relictual and to reflect a poor ability to disperse itself and colonize new territory. Channell & Wood (1987) refer to *P. procumbens* as a "nonaggressive if not 'senile' species with a very low evolutionary potential". The only locations for this species in NC are in Polk County, NC, which has other notable disjunctions of species which normally occur west of the Blue Ridge (*Veratrum woodii*, *Smilax lasioneura*). **Syn:** = C, F, FNA10, G, K1, K3, K4, Pa, RAB, S, Tn, W, WH3, Robbins (1968). **NatureServe G4G5** (Apparently Secure).

* ***Pachysandra terminalis*** Siebold & Zuccarini. PACHYSANDRA, JAPANESE-SPURGE. **Hab:** Persistent after cultivation, and spreading vegetatively to adjacent forests; commonly cultivated, rarely persistent to naturalized. **Dist:** Native of China and Japan. **Phen:** Jun-Oct. **Comm:** This species is a popular ground-cover, difficult to eradicate once established. **Syn:** = C, F, FNA10, G, IL, K1, K3, K4, Mi, NE, NY, Pa, RAB, Robbins (1968). **NatureServe GNR** (Not Yet Ranked).

**123. ALTINGIACEAE** Horaninow 1846 (SWEET-GUM FAMILY) [in SAXIFRAGALES]

A monogeneric family of 1 genus and about 15 species, trees, of e. Asia, Indomalaysia, e. North America, Central America, and e. Mediterranean. References: Endress in Kubitzki, Rohwer, & Bittrich (1993); Hoot, Magallón, & Crane (1999); Ickert-Bond & Wen (2013).

***Liquidambar* Linnaeus 1753 (SWEET GUM)**

A genus of about 15 species, trees, north temperate, of e. North America, Central America (Mexico to Nicaragua), e. Asia (s. China, Taiwan, Vietnam, Cambodia), and e. Mediterranean (Turkey, Rhodos, Cyprus). The circumscription of *Liquidambar* here follows Ickert-Bond & Wen (2013) in including *Altingia* and *Semiliquidambar*. References: Endress in Kubitzki, Rohwer, & Bittrich (1993); Ickert-Bond & Wen (2013); Li & Donoghue (1999); Meyer (1997b) in FNA3 (1997); Morris et al (2008).

- 1 Leaves palmately 3-lobed and 3-veined (juvenile leaves sometimes with minor sublobes); [alien, sparingly planted and naturalizing] ***Liquidambar formosana***
 1 Leaves palmately 5-lobed and 5-veined (small leaves may be merely 3-lobed, and very robust leaves, such as on fire or stump sprouts may be 7-lobed); [widespread native] ***Liquidambar styraciflua***

* ***Liquidambar formosana*** Hance. CHINESE SWEETGUM. **Hab:** Suburban woodlands, escaping from horticultural use. **Dist:** Native of China, Taiwan, s. Korea, Laos, and n. Vietnam. Naturalizing in our region at least in NC (Orange County) and MS (Harrison County; H. Horne, pers.comm. 2020). **Syn:** = Ickert-Bond & Wen (2013); = n/a – RAB.

Liquidambar styraciflua Linnaeus. SWEET GUM, RED GUM. **Hab:** Swamp forests, floodplains, moist forests, depressional wetlands, pond and lake margins, old fields, disturbed areas, nearly ubiquitous in the modern southeastern United States landscape. **Dist:** CT west to s. OH, s. IL and OK, south to s. FL and TX; Mexico; Guatemala. **Phen:** (Mar-) Apr-May; Aug-Sep. **Tax:** Morris et al. (2008) report on the genetic diversity within *L. styraciflua* as it relates to post-Pleistocene plant migrations. A form with rounded leaf lobes ('*Rotundiloba*') is sometimes grown horticulturally. **Comm:** One of the most spectacular of our trees in the fall; a single tree often has a mixture of green, yellow, orange, dark red, bronze, and purple leaves. The sap was previously gathered as a source of chewing gum. The bark is one of the favorite foods of beavers. Although sometimes thought of as a small and weedy tree, *Liquidambar* reaches its greatest abundance and size in Coastal Plain swamp forests, where it can reach 2 meters in

diameter. Along with such species as *Pinus taeda*, *Quercus phellos*, and others, *Liquidambar* is a good example of a primarily bottomland tree which has proven to be an excellent colonizer of disturbed uplands. The twigs sometimes have irregular corky growths. **Syn:** = Ar, C, F, FNA3, G, GW2, Il, K1, K3, K4, Mo1, NcTx, NE, NY, Pa, RAB, S, Tn, Tx, Va, W, WH3, WV, Ickert-Bond & Wen (2013). NatureServe G5 (Secure).

124. HAMAMELIDACEAE R. Brown 1818 (WITCH-HAZEL FAMILY) [in SAXIFRAGALES]

A family of ca. 27 genera and ca. 87 species, trees and shrubs, tropical to temperate, and especially e. Asian. References: Endress in Kubitzki, Rohwer, & Bittrich (1993); Meyer (1997b) in FNA3 (1997).

- 1 Leaves 5-7-palmately lobed and palmately veined, glabrous.....*Altingiaceae*
- 1 Leaves unlobed, pinnately veined, stellate-pubescent beneath (at least when young).
 - 2 Leaves entire or with very obscure teeth (visible at 10×); petals 4-5 (-6), white, cream, or pink.....*Loropetalum*
 - 2 Leaves coarsely crenate, at least towards the apex; petals 0 or 4, if present, greenish, yellow, or reddish.....*Hamamelis*

Hamamelis Linnaeus 1753 (WITCH-HAZEL)

A genus of 5-6 species, shrubs and small trees, of e. North America and e. Asia (China and Japan). References: Endress in Kubitzki, Rohwer, & Bittrich (1993); Jenne (1966); Lane (2005); Leonard (2006); Meyer (1997b) in FNA3 (1997); Wen & Shi (1999).

- 1 Outer surface of calyx yellow; petals 7-20 mm long, yellow, flowering Oct-Jan; leaves 3.7-16.7 cm long, 2.5-13 cm wide; leaf lateral veins 9 or 10 (5 on one side of the leaf, 4-5 on the other); [plants collectively widespread in our area].
 - 2 Stellate trichomes of the leaves moderately dense to dense, averaging 0.09 mm across, with 7-11 rays; leaves (3.6-) avg. 6.4 (-10.3) cm long, (1.8-) avg. 4.1 (-6.2) cm wide; petals 7-15 mm long, 0.5-0.8 mm wide; [e. SC south to Panhandle FL, west to se. LA in the Coastal Plain].....*Hamamelis virginiana* var. *henryae*
 - 2 Stellate trichomes of the leaves sparse to moderately dense, averaging 0.16-0.40 mm across, with 3-6 (-8) rays; leaves (4.7-) avg. 9.9 (-14.0) cm long, (3.9-) avg. 6.6 (-9.2) cm wide; petals 15-20 mm long, 1 mm wide; [widespread in our area].....*Hamamelis virginiana* var. *virginiana*
- 1 Outer surface of calyx scarlet; petals red or reddish (often yellow-tipped, or rarely completely yellow), flowering late Dec to Apr; leaves 7-24 cm long, 4-17 cm wide; leaf lateral veins 9, 10, or 11 (5 on one side of the leaf, 4, 5, or 6 on the other); [Gulf Coast of GA to TX, Interior Highlands of MO, AR, and OK].
 -*Hamamelis ovalis*

Hamamelis ovalis S.W. Leonard. RUNNING WITCH-HAZEL, SOUTHERN RED WITCH-HAZEL, BIGLEAF WITCH-HAZEL. **Hab:** Dry-mesic pineland ravines. **Dist:** Originally believed to be possibly endemic to sc. MS (Perry County) (Leonard 2006), but now found as well in five counties in s. AL (Butler, Clarke, Covington, Crenshaw, and Monroe Counties.) (Keener 2010, Diamond 2013), in e. GA (T. Patrick, pers. comm., 2015), e. TX (Lewandowski, pers. comm., 2016), and w. Panhandle FL (Loran Anderson and Steve Leonard, pers. comm. 2018). **Phen:** Late Dec-early Feb. **Syn:** = K3, K4, Leonard (2006); < *Hamamelis vernalis* Sargent – Tx.

Hamamelis virginiana Linnaeus var. *henryae* Jenne ex C. Lane. SMALL-LEAVED WITCH-HAZEL. **Hab:** Sandhill margins, xeric hammocks, streamheads. **Dist:** E. SC (Horry and Hampton counties), s. GA, and Panhandle FL west to se. LA. **Phen:** Nov-Jan. **Tax:** Though cited in Lane (2005) as var. *henryi*, the honoree is collector Mary G. Henry; thus the honorific epithet is corrected to the feminine. Additional study is needed of these small-leaved Coastal Plain populations. **Syn:** = *Hamamelis virginiana* var. *henryi* Jenne ex C. Lane – Jenne (1966), Lane (2005), orthographic error; < *Hamamelis virginiana* – FNA3, GW2, K1, K3, K4, S, WH3.

Hamamelis virginiana Linnaeus var. *virginiana*. NORTHERN WITCH-HAZEL. **Hab:** Moist to dryish forests. **Dist:** QC and NS west to n. MI and MN, south to FL and TX. **Phen:** Sep-Dec; Oct-Nov (of the following year). **Comm:** The bark is still gathered in large quantities in the Southern Appalachians, as the source for witch hazel liniment. The name ‘witch-hazel’ alludes to its superficial resemblance to *Corylus*, the true hazel, and to the ‘perversity’ of its flowering in the fall as it drops its leaves. **Syn:** = Va, Jenne (1966), Lane (2005); < *Hamamelis virginiana* – Ar, C, FNA3, G, GW2, Il, K1, K3, K4, Mi, NE, NY, Pa, RAB, S, Tn, Tx, W, WH3, WV; > *Hamamelis virginiana* var. *parvifolia* Nuttall – F; > *Hamamelis virginiana* Linnaeus var. *virginiana* – F.

Loropetalum R. Brown 1828 (LOROPETALUM)

A genus of 3 species, shrubs and small trees, native of China, n. and e. India, and Japan. References: Endress in Kubitzki, Rohwer, & Bittrich (1993); Zhang, Zhang, & Endress (2003).

Identification Notes: *Loropetalum* has leaves that are reminiscent of *Hamamelis* in their oblique base and distichous array on the twigs, but the leaves are much smaller and only obscurely toothed.

* ***Loropetalum chinense*** (R. Brown) Oliver. LOROPETALUM. **Hab:** Disturbed urban and suburban areas, spreading at least locally around plantings in suburban and urban areas, both by seed and by root sprouts. **Dist:** Native of e. Asia. **Comm:** Var. *rubrum* seems to be merely a form; root sprouts revert from pink to white petal color and coppery to green leaf color. **Syn:** = K4; > *Loropetalum chinense* var. *rubrum* Yieh – Zhang, Zhang, & Endress (2003).

127. ITEACEAE J. Agardh 1858 (SWEETSPIRE FAMILY) [in SAXIFRAGALES]

A family of 1 genus and about 27 species, shrubs, of e. and se. Asia (about 25 species), e. North America (1 species), and sub-Saharan Africa (1 species). References: Kubitzki, Bayer, & Stevens (2007); Morin (2009a) in FNA8 (2009).

Itea Linnaeus 1753 (VIRGINIA-WILLOW, SWEETSPIRE, TASSEL-WHITE)

A genus of about 27 species, shrubs and trees, all but 2 (ours and 1 in sub-Saharan Africa) are in e. and se. Asia. The closest relative of our species is *I. japonica* Oliver, of Japan. Various treatments in a very broadly-conceived Saxifragaceae (RAB, F, G, GW, W), a less comprehensive Grossulariaceae (C, K), a narrow Escalloniaceae, or a very narrow (single genus) Iteaceae (S), the relationships of *Itea* remain problematic. Recent molecular data suggest that the relationship between *Itea* and other woody “saxifragaceous” genera (including *Escallonia*) is only distant (Morgan & Soltis 1993). *Itea* is here conservatively treated in a narrow Iteaceae. References: Bohm et al (1999); Kubitzki, Bayer, & Stevens (2007); Morgan & Soltis (1993); Morin (2009a) in FNA8 (2009); Spongberg (1972).

Identification Notes: Sometimes confused needlessly with *Clethra*, whose much more coarsely serrate, obovate leaves contrast with the serrulate, elliptic leaves of *Itea*. Also often confused with *Eubotrys racemosus* in vegetative condition.

Itea virginica Linnaeus. VIRGINIA-WILLOW, SWEETSPIRE, TASSEL-WHITE. **Hab:** Moist forests and thickets, especially along the banks of streams. **Dist:** S. NJ south to s. FL and west to e. TX and OK, north in the interior (especially in the Mississippi Embayment) to s. IL and se. MO. **Phen:** Apr-Jun. **Syn:** = Ar, C, F, FNA8, G, GW2, Il, K1, K3, K4, Pa, RAB, S, Tn, Tx, Va, W, WH3. NatureServe G4 (Apparently Secure).

129. SAXIFRAGACEAE A.L. de Jussieu 1789 (SAXIFRAGE FAMILY) [in SAXIFRAGALES]

If narrowly circumscribed (as here), a family of about 35 genera and 500-650 species, herbs (mainly perennial), nearly cosmopolitan, but especially diverse in warm temperate and cold temperate regions of North America and Eurasia. The circumscription of a much narrower Saxifragaceae is clearly warranted, based on a wide variety of data, and strongly corroborated by molecular data (Morgan & Soltis 1993 and many later references). References: Morgan & Soltis (1993); Soltis in Kubitzki, Bayer, & Stevens (2007); Spongberg (1972); Wells & Elvander (2009) in FNA8 (2009).

- 3 Basal leaves short-petioled or sessile, the petioles 0-1× as long as the blade; basal leaves cuneate or rounded at the base; leaf venation predominately pinnate.
 - 4 Leaves entire, serrate, or coarsely dentate. *Micranthes*
 - 4 Leaves deeply trilobed. *Saxifraga tridactylites*
- 3 Basal leaves long-petioled, the petioles (1-) 2-5× as long as the blade; basal leaves cordate at the base; leaf venation predominantly palmate. {add to key *Saxifraga (stolonifera)*}
 - 5 Petals fimbriate; inflorescence a raceme; flowers on pedicels 1-2 (-5) mm long. *Mitella*
 - 5 Petals not fimbriate; inflorescence a panicle or raceme; flowers mostly on pedicels > 3 mm long.
 - 6 Inflorescence racemose; stamens 10 *Tiarella*
 - 6 Inflorescence paniculate; stamens 5. *Heuchera*

Heuchera Linnaeus 1753 (ALUMROOT)

Contributed by R.A. Folk and A.S. Weakley

A genus of about 37 (or more) species, perennial herbs, of North America. Sections and subsections recognized follow Folk & Freudenstein (2014). References: Folk & Freudenstein (2014); Folk & Freudenstein (2015); Folk et al (2018); Rosendahl, Butters, & Lakela (1936); Schuette et al (2018); Soltis in Kubitzki, Bayer, & Stevens (2007); Wells & Shipes (2009) in FNA8 (2009); Wells (1979); Wells (1984).

Identification Notes: Vegetatively, *Heuchera* resembles *Tiarella* and *Mitella*. *Heuchera* usually has leaves as wide as long and with prominent variegation, while *Tiarella* and *Mitella* usually have leaves longer than wide and lacking variegation (except in cultivated forms of *Tiarella*).

129. SAXIFRAGACEAE

- 1 Calyx glandular-villous, white or pink, often with green-tipped lobes, 1.3-3.3 mm long, 1.1-2.9 mm in diameter; free hypanthium 0.1-0.4 mm long; petals linear or oblanceolate, 2-3× as long as the calyx lobes, glabrous; plants flowering (Jun-) Jul-Oct; [section *Holochloa*, subsection *Villosae*].
- 2 Leaves with widely to narrowly triangular lobes and triangular teeth; petals linear, often coiled; seeds echinate; internodes of floral branches 0.3-2.9 mm long. *Heuchera macrorrhiza*
- 2 Leaves with rounded lobes and rounded teeth; petals oblanceolate, reflexed; seeds smooth; internodes of floral branches 2.5-11.2 mm long. *Heuchera missouriensis*
- 1 Calyx glandular-puberulent, greenish, 2.9-13.2 mm long, 2.4-7.5 mm in diameter; free hypanthium 0.6-7.0 mm long; petals rhombic-spatulate, slightly shorter to slightly longer than the calyx lobes, glandular-puberulent on the lower surface; plants flowering Apr-Jun; [section *Heuchera*, subsection *Heuchera*].
- 10 Petioles densely hirsute; free hypanthium (1.1-) avg. 1.5 (-1.9) mm long *Heuchera hirsuticaulis*
- 10 Petioles glabrous, short-pubescent, or scantily hirsute; free hypanthium either (0.6-) avg. 1.1 (-1.5) mm long or (1.5-) avg. 1.7 (-1.9) mm long. *Heuchera americana*

Heuchera americana Linnaeus. AMERICAN ALUMROOT. **Hab:** Rocky forests, rock outcrops, particularly where soils are subacidic to circumneutral. **Dist:** CT and NY west to s. ON, n. IN, s. IL, and sc. MO south to c. GA, c. AL, n. MS, n. LA, and ne. TX. **Phen:** Apr-Aug. **Tax:** *Heuchera americana* var. *heteradenia* may warrant recognition, and is likely the basis of some eastern records considered to be *H. hirsuticaulis*; further study is needed. **Comm:** *H. americana* is the most widespread species of *Heuchera* in e. North America. Within the range of *H. caroliniana*, *H. americana* is nearly absent. **Syn:** = C, Pa, Va; = *Heuchera americana* var. *americana* – Ar, FNA8, K1, K3, K4, NE, NY, Tn, Schuette et al (2018), Wells (1984); < *Heuchera americana* Linnaeus – RAB, W; > *Heuchera americana* var. *americana* – F, G, WV; > *Heuchera americana* var. *brevipetala* Rosendahl, Butters, & Lakela – G, NcTx, Tx, Rosendahl, Butters, & Lakela (1936); > *Heuchera americana* var. *calycosa* (Small) Rosendahl, Butters, & Lakela – Rosendahl, Butters, & Lakela (1936); > *Heuchera americana* var. *heteradenia* Fernald – F; > *Heuchera americana* var. *subtruncata* Fernald – F; > *Heuchera americana* var. *typica* – Rosendahl, Butters, & Lakela (1936); > *Heuchera calycosa* Small – S; > *Heuchera curtisii* – S; > *Heuchera lancipetala* Rydberg – S. **NatureServe G5T5** (Secure).

Heuchera hirsuticaulis (Wheelock) Rydberg. **Hab:** Bluffs and outcrops. **Dist:** S. MI west to n. IL and sw. MO, south to c. TN, nw. AR, and ne. OK. In Union Parish, LA (Michael 2021c). Allegedly ranging east to w. KY (Medley 1993), w. and c. TN (D. Estes, pers. comm. 2008), and e. GA (Screven County specimens at NCU, but perhaps better considered *H. americana* [var. *heteradenia*]). **Phen:** May-Jul. **Tax:** Considered by Wells (1984) to represent fertile hybrids between *H. americana* var. *americana* and *H. richardsonii*; here regarded as a stabilized taxon, with numerous occurrences beyond the distribution of one or the other alleged parent. **Comm:** {add to synonymy G, S}. **Syn:** = GrPl; = *Heuchera* × *hirsuticaulis* (Wheelock) Rydberg, pro – C; = *Heuchera americana* Linnaeus var. *hirsuticaulis* (Wheelock) Rosendahl, Butters, & Lakela – Ar, FNA8, K1, K3, K4, Mi, Tn, Wells (1984); > *Heuchera americana* Linnaeus var. *hirsuticaulis* (Wheelock) Rosendahl, Butters, & Lakela – F, Il, Rosendahl, Butters, & Lakela (1936); > *Heuchera americana* var. *interior* Rosendahl, Butters, & Lakela – F, Il, Rosendahl, Butters, & Lakela (1936). **NatureServe G5T5** (Secure).

Heuchera macrorrhiza Small. GIANT ALUMROOT. **Hab:** Cliffs, riverbanks, especially in calcareous or subcalcareous substrates. **Dist:** S. WV, s. OH, and s. IN south through c. KY and c. TN to n. AL and ne. MS. **Phen:** (Late Apr) May-Jul (and sometimes reblooming Sep-Oct). **Tax:** This taxon has usually been disregarded in recent years, but is recognized by Chester et al. (1997). This plant is generally sharply distinct from typical *H. villosa*, and actually may be more closely related to *H. arkansana*. A few intermediates and intergrades with *H. villosa* may be encountered; they have been called *H. villosa* var. *intermedia*. In the Ozarks of AR, *H. macrorrhiza* is replaced by the related *H. arkansana* Rydberg [*H. villosa* var. *arkansana* (Rydberg) E.B. Smith] with shorter and narrower inflorescence, shorter pedicels, and larger flowers. "*Heuchera macrorrhiza* differs from typical *villosa* (Small 1898, F, W) in its relatively short, broad bractlets, which are densely long-ciliate (versus narrowly lanceolate to subulate, glabrous to thinly ciliate); bracts are oblong to spatulate, and at least the lower ones toothed (versus linear, mostly entire); its stems are "shaggily" villous (versus loosely); leaves are hirsute below, with long soft hairs along veins (versus glabrous to thinly hairy, with appressed stiff hairs along veins); leaf lobes are all shallow, much broader than long (versus deep and sharp, especially the terminal); rhizomes are ca. 1-2 cm thick (versus 5-9 mm)" (Campbell 2012). **Comm:** *Heuchera macrorrhiza* is popular horticulturally as a native wildflower, almost invariably labeled as "*Heuchera villosa*". **Syn:** = S, S; = *Heuchera villosa* Michaux var. *macrorrhiza* (Small) Rosendahl, Butters, & Lakela – G, Tn; > *Heuchera villosa* var. *intermedia* Rosendahl, Butters, & Lakela – F, WV, Rosendahl, Butters, & Lakela (1936); > *Heuchera villosa* Michaux var. *macrorrhiza* (Small) Rosendahl, Butters, & Lakela – F, WV, Rosendahl, Butters, & Lakela (1936); < *Heuchera villosa* Michaux var. *villosa* – C, FNA8, K1, K3, K4, Wells (1984).

Heuchera missouriensis Rosendahl. INTERIOR LOW PLATEAU GROTTO ALUMROOT. **Hab:** Shaded cliff bases, usually under overhangs, on grotto floors, nearly always in deeply shaded situations where little or no direct sunlight falls. **Dist:** S. IN and s. IL south through Cumberland TN to n. AL and ne. MS (Tishomingo County). **Phen:** Jul-Sep. **Tax:** See Folk & Freudenstein (2014, 2015) for discussion of this species. **Syn:** = K4, Folk & Freudenstein (2015); < *Heuchera parviflora* – S, Tn; < *Heuchera parviflora* Bartling var. *parviflora* – C, FNA8, K1, K3, Wells (1984); < *Heuchera parviflora* var. *rugelii* (Shuttleworth) Rosendahl, Butters, & Lakela – F, G, Il, Rosendahl, Butters, & Lakela (1936).

Micranthes Haworth 1812 (SAXIFRAGE)

A genus of about 85 species, perennials, mostly of north temperate, boreal, and arctic regions of North America, South America, and Eurasia. As shown by molecular data, *Saxifraga*, as often broadly defined, is polyphyletic, and all of our native species belong in *Micranthes* (Soltis 1995, Soltis et al. 1996, Mort & Soltis 1999, Tkach et al. 2015). Soltis et al. (1996) demonstrate that *Micranthes* is closely allied with *Heuchera*, *Mitella*, and *Tiarella*, less closely related to *Astilbe*, *Boykinia*, *Sullivantia*, and *Chrysosplenium*, and least closely related to the bulk of *Saxifraga*. Sectional classification follows Tkach et al. (2015). References: Brouillet & Elvander (2009a) in FNA8 (2009); Brouillet & Gornall (2007); Cushman, Richards, & McMillan (2020); Lanning & Mathews (2019); Lanning (2009); Soltis in Kubitzki, Bayer, & Stevens (2007); Tkach, Röser, & Hoffmann (2015).

Micranthes virginensis (Michaux) Small. EARLY SAXIFRAGE. **Hab:** Rock outcrops, moist alluvial and slope forests, streambanks, riverbanks. **Dist:** NB west to MB, south to c. GA, LA, and AR. **Phen:** Feb-Jun. **Syn:** = Ar, FNA8, Il, K3, K4, Mi, NE, NY, S, Tn, Va, Brouillet & Gornall (2007), Tkach, Röser, & Hoffmann (2015); = *Saxifraga virginensis* Michaux – C, F, G, GW2, Pa, RAB, W, WV; > *Saxifraga virginensis* var. *virginensis* – K1.

Mitella Linnaeus 1753 (MITERWORT)

As traditionally circumscribed, a genus of about 20 species, herbs, of cold temperate e. North America, w. North America, and e. Asia. Soltis (2007), Okuyama, Pellmyr, & Kato (2008), and Folk & Freudenstein (2014) indicate that *Mitella* as currently circumscribed is polyphyletic and is likely to be divided; our species will remain in a narrowly circumscribed *Mitella* of 2-3 species. References: Soltis in Kubitzki, Bayer, & Stevens (2007); Soltis & Freeman (2009) in FNA8 (2009).

Mitella diphylla Linnaeus. TWO-LEAVED MITERWORT. **Hab:** Mesic, rocky forests, rocky seeps, and seepage swamps, especially over mafic or calcareous rocks. **Dist:** QC west to MN, south to e. VA, w. NC, nw. SC, ne. GA, nw. GA, MO, and n. AR. **Phen:** Apr-Jun. **Comm:** The fringed petals will reward a close look. **Syn:** = Ar, C, F, FNA8, G, GW2, Il, K1, K3, K4, Mi, NE, NY, Pa, RAB, S, Tn, Va, W, WV. [NatureServe G5](#) (Secure).

*Saxifraga* Linnaeus 1753 (SAXIFRAGE)

A genus of ca. 390 species, herbs (mainly perennial), of mainly north temperate regions. Sectional classification follows Tkach et al. (2015). References: Alley et al (2020); Brouillet & Elvander (2009b) in FNA8 (2009); Ladd (2019); Tkach, Röser, & Hoffmann (2015).

* ***Saxifraga tridactylites*** Linnaeus. RUE-LEAVED SAXIFRAGE. **Hab:** Gravel and thin soils along roads and highways and in parking lots, especially in calcareous areas. **Dist:** Native of Mediterranean Europe, n. Africa, and w. Asia. Reported for MO by Ladd (2019). See Alley et al. (2020) for detailed information on the naturalization of this species in our region. **Syn:** = FNA8, K3, K4, Alley et al (2020), Ladd (2019). [NatureServe GNR](#) (Not Yet Ranked).

*Tiarella* Linnaeus 1787 (FOAMFLOWER)

A genus of 3-6 species, perennial herbs, of temperate North America and e. Asia. References: Fernald (1943); Jog (2009) in FNA8 (2009); Lakela (1937); Nesom (2021a); Soltis in Kubitzki, Bayer, & Stevens (2007); Spongberg (1972); Wherry (1940); Wherry (1949).

Tiarella wherryi Lakela. **Hab:** Moist forests, cove forests, rock outcrops, well-drained bottomland forests. **Dist:** KY south through TN to GA, AL, and MS. **Syn:** = Nesom (2021a).

130. CRASSULACEAE J. Saint-Hilaire 1805 (STONECROP FAMILY) [in SAXIFRAGALES]

A family of about 34-35 genera and 1100-1410 species, succulent shrubs and herbs, nearly cosmopolitan, but with centers of diversity in s. Africa and Mexico. References: Gontcharova, Artyukova, & Gontcharov (2006); Messerschmid et al (2020); Moran (2009a) in FNA8 (2009); Nikulin et al (2016); Thiede & Egli (2007) in Kubitzki, Bayer, & Stevens (2007).

- 1 Leaves connate at the base, opposite; flowers solitary in the axils of leaves; flowers 3-4-merous; [subfamily *Crassuloideae*]..... *Crassula*
 1 Leaves distinct, whorled or alternate; flowers in terminal cymose inflorescences; flowers 4-5 (-8)-merous.
 *Sedum*

 ? : questionable

Crassula Linnaeus 1753

A genus of 195-250 species, nearly cosmopolitan (centered in s. Africa). Mort et al. (2009) provide strong evidence supporting the inclusion of *Tillaea* in *Crassula*. References: Bywater & Wickens (1984); Moran (2009b) in FNA8 (2009); Mort et al (2009); Thiede & Eggli (2007) in Kubitzki, Bayer, & Stevens (2007).

Crassula longipes (Rose) Bywater & Wickens. LOUISIANA PYGMYWEED. **Hab:** Aquatic or stranded on sand or mud. **Dist:** MS and AR south to LA, TX, and Mexico; also s. South America. **Phen:** Apr-May. **Syn:** = FNA8, K1, K3, K4, Bywater & Wickens (1984). NatureServe GNR (Not Yet Ranked).

Sedum Linnaeus 1753 (STONECROP, ORPINE, SEDUM)

A genus of perhaps 200 species, depending on circumscription. There is considerable controversy about the circumscription of the genus *Sedum*. *Diamorpha* is usually separated, but Thiede & Eggli (2007) include it in *Sedum*. The removal from *Sedum* of the plants treated here in genera *Aizopsis*, *Hylotelephium*, *Petrosedum*, *Phedimus*, and *Rhodiola* is uncontroversial. Other segregates from *Sedum* which would affect the species treated below have been proposed, such as *Chetyson*, *Clausenellia*, and *Oreosedum* (see synonymy); these remain controversial, with some advocating for them and others for a broad (remnant of) *Sedum*. The circumscription of a broad remnant of *Sedum* would likely also include *Diamorpha* and *Lenophyllum*. References: Calie (1981); Clausen (1975); Messerschmid et al (2020); Nikulin et al (2016); Ohba (2009) in FNA8 (2009); Thiede & Eggli (2007) in Kubitzki, Bayer, & Stevens (2007).

Identification Notes: Other species of *Sedum* are grown as ornamentals, especially in rock gardens; some are aggressive and rather weedy and can be expected eventually to become a naturalized part of our flora.

- 1 Leaves primarily whorled in 3's or 4's (to 5's).
 - 2 Largest leaves distinctly spatulate, much wider than thick, 8-20 mm wide; flowers and fruits 4-merous; petals white; [native, of moist forest and rock outcrops]; [section *Ternata*] ***Sedum ternatum***
 - 2 Largest leaves linear-lanceolate, oblanceolate, or elliptic, almost as thick as wide, < 7 mm wide; flowers and fruits 5-merous; petals yellow; [alien]. ***Sedum sarmentosum***
- 1 Leaves primarily alternate. ***Sedum pulchellum***

Sedum pulchellum Michaux. WIDOW'S-CROSS, BLUFF MOSS. **Hab:** Calcareous rock outcrops. **Dist:** E. TN (Monroe, Knox, and Bradley counties) (Chester, Wofford, & Kral 1997) and nw. GA (Jones & Coile 1988) west to KS, OK, and TX. **Phen:** Mar-Jun. **ID Notes:** This species is easily distinguished from other *Sedum* by its clasping stem leaves with auricles. **Syn:** = Ar, C, F, FNA8, G, GrPl, Il, K1, K3, K4, Mo2, NcTx, Tn, Tx, W, Calie (1981), Clausen (1975); > *Chetyson pulchella* (Michaux) A. & D. Löve; > *Chetyson vigilimontis* (Small) A. & D. Löve; > *Sedum pulchellum* Michaux - S; > *Sedum vigilimontis* Small - S. NatureServe G5 (Secure).

* ***Sedum sarmentosum*** Bunge. **Hab:** Xeric rock outcrops, stone walls, disturbed areas. **Dist:** Native of China. **Phen:** May-Jun; Jun-Jul. **Syn:** = Ar, C, F, FNA8, G, Il, K1, K3, K4, Mi, Mo2, NE, NY, Pa, RAB, Tn, Va, W, WH3, WV, Clausen (1975). NatureServe GNR (Not Yet Ranked).

Sedum ternatum Michaux. MOUNTAIN STONECROP, WHORLED STONECROP. **Hab:** Moist forests, coves, bottomlands, shaded rock outcrops. **Dist:** NJ west to MI and IA, south to nw. GA, c. AL, and sw. AR. **Phen:** Apr-Jun; May-Jul. **Syn:** = Ar, C, F, FNA8, G, Il, K1, K3, K4, Mi, Mo2, NE, NY, Pa, RAB, S, Tn, Va, W, WV, Calie (1981), Clausen (1975); = *Clausenellia ternata* (Linnaeus) A. & D. Löve. NatureServe G5 (Secure).

133. PENTHORACEAE Rydberg ex Britton 1901 (PENTHORUM FAMILY) [in SAXIFRAGALES]

A family of one genus and 2 species, herbs, of e. North America and e. Asia. *Penthorum* has been variously placed in the Crassulaceae, Saxifragaceae, or in the Penthoraceae. Haskins & Hayden (1987) concluded that *Penthorum* was best treated in a monogeneric Penthoraceae, a conclusion based on extensive anatomical evidence. Among those who do not favor a monotypic family, there is nearly evenly divided opinion between the Crassulaceae and Saxifragaceae; this in itself perhaps supports segregation in the Penthoraceae. Molecular evidence supports the recognition of the Penthoraceae, and suggests closer affinities with the Haloragaceae than with either the Crassulaceae or the Saxifragaceae (Morgan & Soltis 1993). References: Freeman (2009a) in FNA8 (2009); Thiede in Kubitzki, Bayer, & Stevens (2007).

Penthorum Linnaeus 1753 (PENTHORUM, DITCH-STONECROP)

A genus of 2 species, herbs, of e. North America and e. and se. Asia. The only other species in the genus is *P. chinense* Pursh, of e. Russia, China, Korea, and Japan. References: Freeman (2009a) in FNA8 (2009); Haskins & Hayden (1987); Thiede in Kubitzki, Bayer, & Stevens (2007).

Penthorum sedoides Linnaeus. AMERICAN PENTHORUM, MARSH-STONECROP, DITCH-STONECROP. **Hab:** Shores, drawdown areas, moist forests, floodplain forests, moist disturbed areas, ditches. **Dist:** NB west to MB, south to Panhandle FL and TX; introduced from BC south to OR. **Phen:** Jun-Oct. **Syn:** = Ar, C, F, FNA8, G, GrPl, GW2, II, K1, K3, K4, Mi, NcTx, NE, NY, Pa, RAB, S, Tn, Tx, Va, W, WH3, WV, Haskins & Hayden (1987). [NatureServe G5](#) (Secure).

134. HALORAGACEAE R. Brown 1814 (WATER-MILFOIL FAMILY) [in SAXIFRAGALES]

A family of 8-10 genera and about 120-150 species, mainly aquatic and wetland herbs (including all our taxa), also with some shrubs and trees, cosmopolitan but centered in the Southern Hemisphere (especially Australia). The family has sometimes been spelled 'Haloragidaceae'. References: Kubitzki, Bayer, & Stevens (2007); Scribailo & Alix (2021) in FNA10 (2021).

- 1 Leaves whorled or alternate; stamens 4 or 8; carpels 4; emerged leaves bract-like and much-reduced (except in *M. aquaticum*) *Myriophyllum*
 1 Leaves alternate; stamens 3; carpels 3; emerged leaves foliaceous, little if at all reduced..... *Proserpinaca*

Myriophyllum Linnaeus 1753 (WATER-MILFOIL)

Contributed by B.A. Sorrie and A.S. Weakley

A genus of about 68 species, aquatic and wetland herbs, cosmopolitan, with a primary center of diversity in Australia and secondary centers in North America and Asia. The species taxonomy and infrageneric classification used here follow Moody & Les (2010). References: Aiken (1981); Crow & Hellquist (2000a); Moody & Les (2010); Scribailo & Alix (2021) in FNA10 (2021).

Identification Notes: Stranded plants of *M. heterophyllum* and *M. humile* (and perhaps others) produce leaves that are reduced in size. Leaves and bracts become pectinate or pinnate, so that plants resemble *M. pinnatum*. Such plants are the source of nearly all inland records of *M. pinnatum* in the VA-NC-SC-GA area. *M. heterophyllum* usually flowers and fruits when stranded and may be distinguished from *M. pinnatum* by its much denser disposition of leaves and bracts, and by its dull red fruits obscurely tuberculate (vs. tan or pale brown fruits strongly tuberculate). From stranded *M. humile*, *M. heterophyllum* may be distinguished by leaves and bracts which are clearly whorled and much more densely disposed. *M. humile* differs from *M. pinnatum* by its wholly alternate leaves and bracts, and by its smooth fruits.

- 2 Flowers/fruits absent and emerged shoots with leaves closely similar in size and shape to submersed ones; widespread alien; [subgenus *Myriophyllum*; section *Pectinatum*] *Myriophyllum aquaticum*
 2 Flowers/fruits present; emerged shoots present or not.
 3 Flowers/fruits in axils of leaves. *Myriophyllum aquaticum*
 3 Flowers/fruits in erect spikes emerged from water, flowers/fruits subtended by bracts much smaller than the normally submersed leaves.
 6 Uppermost flowers/fruits alternate; leaves alternate or whorled or both; [subgenus *Brachythea*; section *Tessaronia*; subsection *Spondylastrum*].
 7 Bracts much shorter than floral internodes, varying from pectinate to entire; fruit surface smooth or papillose *Myriophyllum laxum*
 7 Bracts usually longer than floral internode, pinnatifid to pectinate; fruit surface strongly tuberculate *Myriophyllum pinnatum*
 6 Uppermost flowers/fruits opposite; leaves whorled (technically pseudo-whorled in many *M. heterophyllum*) (note that early season plants of *M. pinnatum* may have flowers opposite, but at least some leaves will be alternate).
 8 Bracts usually > 2× as long as pistillate flowers; stems drying brown, pale brown, or reddish. *Myriophyllum heterophyllum*
 8 Bracts usually < 2× as long as pistillate flowers; stems drying pale tan or whitish; [subgenus *Myriophyllum*; section *Myriophyllum*; subsection *Myriophyllum*].
 *Myriophyllum spicatum*

Alternate key

- 4 Emerged shoots with feathery leaves about same size and shape as submersed leaves; flowers/fruits rarely produced; [widespread alien] [subgenus *Myriophyllum*; section *Pectinatum*] *Myriophyllum aquaticum*
 4 Emerged shoots with bracts subtending flowers/fruits; these bracts much different in shape than submersed leaves. [stranded plants may produce bracts and leaves of similar size and shape, but these not feathery].
 6 Bracts usually longer than the internodes; [subgenus *Brachythea*; section *Tessaronia*; subsection *Spondylastrum*].
 7 Leaves whorled or pseudo-whorled; fruits with low bumps *Myriophyllum heterophyllum*
 7 Leaves strictly alternate; fruits strongly tuberculate *Myriophyllum pinnatum*
 6 Bracts usually shorter than the internodes.
 9 Leaves alternate, pseudo-whorled, or both; plain green; [of se. VA and southward] ; [subgenus *Brachythea*; section *Tessaronia*; subsection *Spondylastrum*]...
 *Myriophyllum laxum*
 9 All leaves whorled, grayish green; [collectively widespread]; [subgenus *Myriophyllum*; section *Myriophyllum*; subsection *Myriophyllum*].
 *Myriophyllum spicatum*

134. HALORAGACEAE

* **Myriophyllum aquaticum** (Vellozo) Verdcourt. PARROT-FEATHER. **Hab:** Ditches, slow-moving rivers, pools, ponds. **Dist:** Native of South America. An introduced species now widespread in se. United States, north to NY, WV, and MO. **Phen:** Apr-Sep. **Syn:** = Ar, C, FNA10, GW2, K1, K3, K4, Meso4.1, NcTx, NE, NY, Pa, Tn, Va, W, WH3, Aiken (1981), Crow & Hellquist (2000a), Moody & Les (2010); = *Myriophyllum brasiliense* Cambessedes – F, G, GrPl, RAB, Tx, WV; = *Myriophyllum proserpinacoides* Gillies ex Hooker & Arnott – S. **NatureServe GNR** (Not Yet Ranked).

Myriophyllum heterophyllum Michaux. SOUTHERN WATER-MILFOIL. **Hab:** Ditches, slow-moving waters of rivers and streams, pools, ponds, springs. **Dist:** NY west to ON and MN, south to FL, TX, and Mexico (VER). **Phen:** Apr-Oct. **Syn:** = Ar, C, F, FNA10, G, GrPl, GW2, Il, K1, K3, K4, Meso4.1, Mi, NcTx, NE, NY, Pa, RAB, S, Tn, Tx, Va, WH3, WV, Aiken (1981), Crow & Hellquist (2000a), Moody & Les (2010). **NatureServe G5** (Secure).

Myriophyllum laxum Shuttleworth ex Chapman. LOOSE WATER-MILFOIL. **Hab:** Limesink depression ponds (dolines), spring-runs, rarely also in lakes. **Dist:** Se. VA south to n. FL, s. AL, s. MS (Sorrie & Leonard 1999), and e. LA (Reid et al. 2021). Documented for VA by a 1922 specimen from Princess Anne County at GH (Sorrie, pers. comm.). **Phen:** Jun-Oct. **ID Notes:** *M. laxum* and *M. heterophyllum* both have reddish submersed stems and present difficulties in identification when in sterile condition. *M. laxum* has a total of 7-15 (-17) segments per leaf, vs. (15-) 17-31 (-37) segments in *M. heterophyllum*. **Syn:** = FNA10, GW2, K1, K3, K4, RAB, S, Va, WH3, Aiken (1981), Moody & Les (2010); = *Myriophyllum x laxum* Shuttleworth ex Chapman (pro species) – NE. **NatureServe G3** (Vulnerable).

Myriophyllum pinnatum (Walter) Britton, Sterns, & Poggenburg. ALTERNATE-LEAVED WATER-MILFOIL, CUTLEAF WATER-MILFOIL, GREEN PARROT'S-FEATHER. **Hab:** Pools, ditches, ponds. **Dist:** NB, VT, and MA west to IA and SD, south to GA and TX. **Phen:** Mar-Oct. **Syn:** = Ar, C, F, FNA10, G, GrPl, GW2, Il, K1, K3, K4, NcTx, NE, NY, RAB, S, Tn, Tx, Va, W, WH3, WV, Aiken (1981), Crow & Hellquist (2000a), Moody & Les (2010). **NatureServe G5** (Secure).

* **Myriophyllum spicatum** Linnaeus. EURASIAN WATER-MILFOIL. **Hab:** Ponds and impoundments. **Dist:** Native of Eurasia. Easily confused with *M. sibiricum*. *M. spicatum* is an introduced species, now widespread in e. United States. Reported for SC by Hill & Horn (1997). **Phen:** Apr-Oct. **Syn:** = Ar, C, FNA10, GW2, Il, K1, K3, K4, Mi, NcTx, NE, NY, Pa, Tn, Va, W, WH3, Aiken (1981), Crow & Hellquist (2000a), Moody & Les (2010); < *Myriophyllum spicatum* var. *exalbescent* – Tx, misapplied. **NatureServe GNR** (Not Yet Ranked).

Proserpinaca Linnaeus 1753 (MERMAID-WEED)

A genus of 2 species, aquatic and wetland herbs, of e. North America, the West Indies, Central America, and South America. References: Alix & Scribailo (2021) in FNA10 (2021); Catling (1998); Crow & Hellquist (2000a).

- 1 Bracteal (emersed) leaves serrate; submersed pectinate leaves with 8-14 pairs of divisions 5-30 mm long; fruits 2.3-6.0 mm wide **Proserpinaca palustris**
 1 Bracteal (emersed) leaves pinnatifid to pectinate; submersed pectinate leaves with 4-12 pairs of divisions 2-7.5 mm long; fruits 2.0-3.6 mm wide **Proserpinaca pectinata**

Proserpinaca palustris Linnaeus. COMMON MERMAID-WEED. **Hab:** Wet places, swamp forests. **Dist:** Throughout e. North America and south to the Caribbean and Central and South America. **Phen:** Jun-Oct. **Tax:** Various varieties and an additional species have sometimes been recognized in this variable species (see synonymy). **Syn:** = Ar, Bah, FNA10, GW2, Meso4.1, Mi, NE, NY, Va, Crow & Hellquist (2000a); > *Proserpinaca x intermedia* – NE; > *Proserpinaca intermedia* – C, F, G, K1, K3, K4, RAB, Tn, Catling (1998); > *Proserpinaca palustris* Linnaeus – K4, RAB, S, Tn; > *Proserpinaca palustris* var. *amblyogona* – C, F, G, K1, NcTx, Tx, Catling (1998); > *Proserpinaca palustris* var. *crebra* – C, F, G, Il, K1, Pa, WV, Catling (1998); > *Proserpinaca palustris* var. *palustris* – C, F, G, Il, K1, Pa, Catling (1998); > *Proserpinaca platycarpa* Small – S.

Proserpinaca pectinata Lamarck. FEATHERY MERMAID-WEED. **Hab:** Bogs, savannas, ditches, other wet places. **Dist:** NS south to s. FL and west to w. LA, mostly on the Coastal Plain, but scattered inland as well, as in c. TN; Cuba; Central America. **Phen:** Jun-Oct. **Syn:** = C, F, FNA10, G, GW2, K1, K3, K4, Meso4.1, Mi, NE, NY, Pa, RAB, S, Tn, Tx, Va, WH3, Catling (1998). **NatureServe G5** (Secure).

136. VITACEAE A.L. de Jussieu 1789 (GRAPE FAMILY) [in VITALES]

A family of about 14-16 genera and 900 species, vines (rarely small trees or herbs), of tropical, subtropical, and temperate regions of the Old and New Worlds. Tribes and genera follow Ma et al. (2020), with the exception of separating *Muscadinia* (and extraregional *Ampelocissus*) from *Vitis*, as is suggested as equally parsimonious by their findings. References: Chen, Ren, & Wen (2007); Ma et al (2020); Moore & Wen (2016) in FNA12 (2016); Pérois et al (2011); Ren et al (2011); Soejima & Wen (2006); Tröndle et al (2010); Wen in Kubitzki, Bayer, & Stevens (2007); Wen et al (2018).

136. VITACEAE

- 1 Leaves simple, sometimes shallowly or deeply 3-5 (-7)-lobed.
- 3 Petals separate at their tips, falling individually; pith white, continuous through the node; bark adherent; tendrils bifid or trifid *Ampelopsis*
- 3 Petals connate at their tips, falling together; pith tan to brown, interrupted by a diaphragm at each node (*Vitis*) or continuous through the node (*Muscadinia*); bark adherent (*Muscadinia*) or exfoliating (*Vitis*); tendrils bifid or trifid (*Vitis*) or simple (*Muscadinia*); [tribe Viteae].
- 5 Tendrils simple; bark adherent (on all but the largest stems), with prominent lenticels; pith continuous through nodes; leaves relatively small (< 10 cm long and wide) and coarsely toothed, pentagonal in outline, but never deeply lobed *Muscadinia*
- 5 Tendrils bifid to trifid; bark shedding, the lenticels inconspicuous; pith interrupted by diaphragms at nodes; leaves relatively large (well-developed leaves usually > 10 cm wide and long) and finely toothed, often deeply lobed *Vitis*
- 1 Leaves compound with either 3-5 (-7) or numerous leaflets.
- 6 Leaves bipinnate to tripinnate, the leaflets on at least the better-developed leaves > 7; inflorescences axillary; [tribe Ampelopsidae] *Nekemias arborea*
- 6 Leaves 3-7-foliolate; inflorescences axillary, leaf-opposed, or terminal.
- 8 Leaves pedately 5-foliolate (the lateral 2 leaflets on either side borne on a common stalk, attached to one another above the summit of the petiole); [tribe Cayratieae] *Causonis japonica*
- 8 Leaves palmately 3-7-foliolate (the petiolules of all leaflets joined at the summit of the petiole).
- 9 Inflorescences leaf-opposed or apparently terminal; leaves 3-7-foliolate; [tribe Parthenocisseeae] *Parthenocissus*
- 9 Inflorescences axillary or leaf-opposed; leaves 3-foliolate (even the largest and best-developed) *Cissus trifoliata*

Ampelopsis Michaux 1803 (PEPPERVINE)

A genus of about 25 species, woody vines, of temperate and subtropical America and Asia. See Wen, Boggan, & Nie (2014) and Soejima & Wen (2006) for the reasons for separating *Ampelopsis* sect. *Leeaceifoliae* as genus *Nekemias*. References: Chen, Ren, & Wen (2007); Moore & Wen (2016) in FNA12 (2016); Soejima & Wen (2006); Wen in Kubitzki, Bayer, & Stevens (2007); Wen, Boggan, & Nie (2014).

- 1 Leaves bipinnate to tripinnate, with > 11 leaflets; [native and alien species] *Nekemias*
- 1 Leaves simple and palmately veined (grape-like), or palmately 5-foliolate (the leaflets additionally pinnately lobed); [alien species].
- 3 Leaves not lobed (to shallowly 3-lobed); young twigs green, glabrous *Ampelopsis cordata*
- 3 Leaves 3-5 lobed; young twigs purplish, sparsely puberulent (sometimes becoming glabrate) *Ampelopsis glandulosa*

Ampelopsis cordata Michaux. HEARTLEAF PEPPERVINE, RACCOON-GRAPE, FALSE-GRAPE. **Hab:** Moist forests, bottomlands, and thickets, particularly where disturbed. **Dist:** E. VA south to Panhandle FL, west to TX, north in the interior to s. OH, s. IN, s. IL, MO, and NE; also introduced at scattered sites inland. **Phen:** Apr-Jun; Jul-Sep. **Syn:** = Ar, C, F, FI3, FNA12, G, GrPI, GW2, II, K1, K3, K4, NcTx, NE, NY, RAB, S, Tn, Tx, Va, W, WH3. NatureServe G5 (Secure).

* ***Ampelopsis glandulosa*** (Wallroth) Momiyama. PORCELAIN-BERRY, AMUR PEPPERVINE. **Hab:** Riverbanks, thickets and disturbed areas. **Dist:** Native of ne. Asia. **Phen:** May-Aug; Sep-Oct. **Syn:** = FNA12, NY; > *Ampelopsis brevipedunculata* (Maximowicz) Trautvetter – Ar, C, F, II, K1, Pa, RAB, Tn, Va; > *Ampelopsis glandulosa* (Wallroth) Momiyama var. *brevipedunculata* (Maximowicz) Momiyama – K3, K4, Chen, Ren, & Wen (2007); < *Ampelopsis heterophylla* (Thunberg) Siebold & Zuccarini – S; > *Ampelopsis heterophylla* (Thunberg) Siebold & Zuccarini var. *brevipedunculata* (Maximowicz) C.L. Li – NE. NatureServe G5 (Secure).

*Causonis* Rafinesque 1830 (BUSHKILLER)

A genus of 25 species, lianas and herbaceous vines, of the Old World tropics and subtropics. Our single introduced species has been traditionally placed in *Cayratia* subgenus *Discypharia*, but this has been shown to be more closely allied to *Tetrastigma* than to *Cayratia* s.s., and so has been separated as *Causonis* (Lu et al. 2013). References: Chen, Ren, & Wen (2007); Krings & Richardson (2006); Lu et al (2013); Moore & Wen (2016) in FNA12 (2016); Wen in Kubitzki, Bayer, & Stevens (2007).

* ***Causonis japonica*** (Thunberg) Rafinesque. BUSHKILLER, SORREL VINE. **Hab:** Disturbed areas, suburban woodlands. **Dist:** Native of temperate and subtropical se. Asia. Reported for NC from several suburban areas, as in Forsyth County (Krings & Richardson 2006) and Mecklenburg, Davidson, and Franklin counties (Soule et al. 2008). Reported as naturalized in AL (Hansen & Goertzen 2006), MS, LA, and TX. Reports of *Nekemias megalophylla* (Diels & Gilg) J. Wen & Z.L. Nie as naturalized in MS are misidentifications based on *Causonis japonica* (S.W. Leonard, pers. comm., 2006). **Phen:** May-Jun; Aug-Sep. **Syn:** = FNA12; = *Cayratia japonica* (Thunberg) Gagnepain – K1, K3, K4; > *Cayratia japonica* var. *japonica* – Chen, Ren, & Wen (2007). NatureServe GNR (Not Yet Ranked).

Cissus Linnaeus 1753

A genus of about 350 species, woody vines, herbaceous vines, and rarely shrubs, of tropical and rarely warm temperate areas. References: Moore & Wen (2016) in FNA12 (2016); Wen in Kubitzki, Bayer, & Stevens (2007).

Cissus trifoliata (Linnaeus) Linnaeus. MARINE-IVY, SORREL-VINE. **Hab:** Coastal hammocks, dunes, disturbed coastal areas, inland in exposed bluffs, glades, and rocky, open woodlands, disturbed thickets, agricultural field edges. **Dist:** Se. SC (Jasper County) south through GA, FL, and west along the Gulf Coast to TX, AR, and Mexico, thence south through Central America to South America; West Indies. **Phen:** Apr-Jun; Aug-Sep. **ID Notes:** The leaves have a strong fragrance reminiscent of stale chocolate, or also described as "a disagreeable, pungent, nitrogenous odor similar to that of jimson-weed" (Great Plains Flora Association 1986). **Syn:** = Ar, Bah, Fl3, FNA12, K1, K3, K4, WH3; > *Cissus incisa* (Nuttall) Des Moulins – GrPl, GW2, NcTx, S, Tx; > *Cissus trifoliata* (Linnaeus) Linnaeus – S.

***Muscadinia*** (Planchon) Small 1903 (MUSCADINE, SCUPPERNONG)

A genus of 2 species and 4 taxa, woody vines, of se. North America (including Mexico) and the West Indies. In the past decade, a number of molecular phylogenetic studies of the Vitaceae have been undertaken, using different genes and different sampling within the family; overall, they all corroborate the clear distinction of the muscadines from the true grapes. Some studies suggest that muscadines are sister to *Vitis* s.s., while others show equivocal results as to whether *Muscadinia* + *Vitis* is a monophyletic group. Overall, and even if *Muscadinia* is basal to but forms a monophyletic clade with *Vitis* s.s., recognition of *Muscadinia* at generic rank is warranted, based on the long-recognized morphological distinctiveness of *Muscadinia* vs. *Vitis* s.s. (see key), the genetic distance of it from *Vitis* s.s., the different chromosome numbers (40 in *Muscadinia*, 38 in *Vitis* s.s.), the frequent past and current recognition of *Muscadinia*, and the standards of morphological distinctiveness of genera in the Vitaceae (Nie et al. 2012; Ren et al. 2011; Péros et al. 2011; Tröndle et al. 2010; Rossetto et al. 2002; Soejima & Wen 2006; Weakley et al. 2011). References: Comeaux, Nesbitt, & Fantz (1987); Moore & Wen (2016) in FNA12 (2016); Moore (1991); Ward (2006b); Weakley et al. (2011); Wen in Kubitzki, Bayer, & Stevens (2007); Wen et al. (2018).

Muscadinia rotundifolia (Michaux) Small var. *rotundifolia*. MUSCADINE, SCUPPERNONG. **Hab:** Dry upland forests (especially sandy or rocky), other forests, swamps, dunes, roadsides, thickets. **Dist:** DE west to s. WV, KY, and MO, south to FL and TX. **Phen:** May-Jun; Aug-Oct. **Comm:** Cultivars of this species are popular in the Southeastern United States as table grapes and the source of a distinctive wine. **Syn:** = Weakley et al. (2011); = *Muscadinia rotundifolia* (Michaux) Small – K4, S; = *Vitis rotundifolia* Michaux – C, F, GW2, RAB, Tn, W, WV, Comeaux, Nesbitt, & Fantz (1987); = *Vitis rotundifolia* Michaux var. *rotundifolia* – FNA12, K1, K3, Moore (1991), Ward (2006b); < *Vitis rotundifolia* Michaux – Ar, Fl3, NcTx, Tx, WH3. **NatureServe G5T5** (Secure).

Nekemias Rafinesque 1833 (PEPPERVINE)

A genus of ca. 9 species, lianas, of e. Asia and e. North America. See Wen, Boggan & Nie (2014) for a discussion of the issues of generic circumscription. References: Chen, Ren, & Wen (2007); Moore & Wen (2016) in FNA12 (2016); Soejima & Wen (2006); Wen in Kubitzki, Bayer, & Stevens (2007); Wen, Boggan, & Nie (2014).

Nekemias arborea (Linnaeus) J. Wen & Boggan. PEPPERVINE. **Hab:** Swamp forests, marshes, wet thickets, moist to wet maritime forests. **Dist:** Se. VA (and MD?) south to s. FL, west to TX and n. Mexico, north in the interior to s. IL and sw. WV. **Phen:** Jun-Oct; Sep-Oct. **Syn:** = FNA12, K4, Wen, Boggan, & Nie (2014); = *Ampelopsis arborea* (Linnaeus) Koehne – Ar, C, F, Fl3, G, GW2, IL, K1, K2, NcTx, RAB, S, Tn, Tx, Va, W, WH3, WV. **NatureServe G5** (Secure).

Parthenocissus Planchon 1887 (VIRGINIA-CREEPER, WOODBINE)

A genus of about 15 species, woody vines, of temperate Asia and North America. References: Chen, Ren, & Wen (2007); Moore & Wen (2016) in FNA12 (2016); Wen in Kubitzki, Bayer, & Stevens (2007).

Parthenocissus quinquefolia (Linnaeus) Planchon. VIRGINIA-CREEPER. **Hab:** Swamp forests, bottomlands, maritime forests and thickets, rock outcrops, mesic forests. **Dist:** ME west to IA and NE, south to s. FL and TX; West Indies (Bahamas, Cuba); Central America (El Salvador, Guatemala). **Phen:** May-Jul; Jul-Aug. **Syn:** = Ar, Bah, C, F, Fl3, FNA12, G, GrPl, IL, K1, K3, K4, NcTx, NE, NY, Pa, RAB, Tn, Tx, Va, W, WH3, WV, Chen, Ren, & Wen (2007); > *Parthenocissus hirsuta* (Pursh) Graebner – S; > *Parthenocissus quinquefolia* (Linnaeus) Planchon – S. **NatureServe G5** (Secure).

Vitis Linnaeus 1753 (GRAPE)

A genus of about 60-65 species, vines, of temperate regions of Eurasia and North America. References: Comeaux, Nesbitt, & Fantz (1987); Mabberley (1999); Moore & Wen (2016) in FNA12 (2016); Moore (1991); Ward (2006b); Wen in Kubitzki, Bayer, & Stevens (2007); Wen et al. (2018); Wen et al. (2020). [also see *Muscadinia*]

- 1 Tendrils simple; bark adherent (on all but the largest stems), with prominent lenticels; pith continuous through nodes; leaves relatively small (< 10 cm long and wide) and coarsely toothed, pentagonal in outline but never deeply lobed *Muscadinia*
- 1 Tendrils bifid to trifid; bark shedding, the lenticels inconspicuous; pith interrupted by diaphragms at nodes; leaves relatively large (well-developed leaves usually > 10 cm wide and long) and finely toothed, often deeply lobed.
- 3 Mature leaves glaucous beneath (the glaucescence sometimes rather obscured by pubescence); nodes often glaucous; inflorescence rachis (flowering and young-fruitlet) orange-red arachnoid-pubescent; [series *Aestivalis*]. *Vitis aestivalis* var. *aestivalis*
- 3 Mature leaves not glaucous beneath; nodes not glaucous; inflorescence rachis (flowering and young-fruitlet) glabrous, hispid, or white-floccose.
- 7 Leaves densely pubescent beneath, so as to obscure the surface; [series *Labruscae* or hybrid involving that series].
- 8 Tendrils or inflorescences present at 3 or more consecutive nodes. *Vitis labrusca*
- 8 Tendrils or inflorescences present at only 2 consecutive nodes. *Vitis mustangensis*
- 7 Leaves glabrous or somewhat pubescent beneath (but not so densely as to completely obscure the leaf surface).
- 13 Nodal diaphragms < 1 mm wide, usually < 0.5 mm wide; growing shoot tips enveloped by enlarging, unfolded leaves; inflorescence rachis (flowering or early-fruitlet) glabrous or glabrescent; [section *Ripariae*] *Vitis riparia*
- 13 Nodal diaphragms > 1 mm wide; growing shoot tips not enveloped by enlarging, unfolded leaves; inflorescence axis (flowering or early-fruitlet) hispid and/or white-floccose.
- 14 Branchlets of the season more or less terete, glabrous or arachnoid-pubescent; mature 3-4 seeded berries usually > 8 mm in diameter; nodes usually not banded with red pigmentation; inflorescence rachis (flowering or early-fruitlet) densely hispid (never floccose); [series *Cordifoliae*].
- 15 Nodal diaphragms > 2.5 mm wide; leaves strongly 3-lobed, the tips usually long-acuminate; branchlets of the season with a red or purplish cast *Vitis palmata*
- 15 Nodal diaphragms < 2.5 mm wide; leaves unlobed or shallowly lobed, the tips acute to short-acuminate; branchlets of the season gray, green, or brown (sometimes purple only on one side) *Vitis vulpina*
- 14 Branchlets of the season angled, arachnoid-pubescent and/or hirtellous-pubescent (or nearly glabrous); mature 3-4 seeded berries < 8 mm in diameter; nodes frequently banded with red pigmentation; inflorescence rachis (flowering or early-fruitlet) white-floccose (and sometimes also hispid); [series *Cinereae*].
- 16 Branchlets of the season sparsely to densely hirtellous pubescent, often with arachnoid pubescence as well; leaf undersurfaces usually more-or-less uniformly hirtellous on the veins; [western, east to w. KY, w. TN, sc. AL, and Panhandle FL] *Vitis cinerea*
- 16 Branchlets of the season lacking evident hirtellous trichomes (if present, obscured by the arachnoid pubescence; leaf undersurfaces lacking hirtellous pubescence, or only very sparsely so; [collectively widespread in our area].
- 17 Branchlets glabrate to only slightly arachnoid-pubescent; nodes usually banded with red pigmentation; leaves glabrous to very slightly arachnoid-pubescent beneath; [mostly of the Piedmont and Mountains] *Vitis baileyana*
- 17 Branchlets slightly to densely arachnoid-pubescent; nodes usually not banded with red pigmentation; leaves slightly to densely arachnoid-pubescent beneath; [mostly of the Coastal Plain] *Vitis simpsonii*

Vitis aestivalis Michaux var. *aestivalis*. SUMMER GRAPE. **Hab:** Forests and woodlands, mostly upland. **Dist:** MA west to MO and IA, south to s. FL and e. TX. **Phen:** May-Jun; Sep-Oct. **Syn:** = C, F, G, IL, K1, K3, NcTx, NE, RAB, Tn, Va, WH3, WV, Moore (1991); = *Vitis aestivalis* - S; < *Vitis aestivalis* - Ar, F13, FNA12, GrPl, GW2, K4, NY, Pa, Tx, W; < *Vitis aestivalis* Michaux var. *aestivalis* - Comeaux, Nesbitt, & Fantz (1987), Ward (2006b).

Vitis baileyana Munson. POSSUM GRAPE. **Hab:** Forests and woodlands, mostly bottomlands. **Dist:** Sw. PA, s. OH, and se. IN south to c. SC, c. GA, and AL. **Phen:** Late May-Jun; Sep-Oct. **Syn:** = C, F, G, RAB, S, Wen et al (2018); = *Vitis cinerea* (Engelmann in A. Gray) Engelmann ex Millardet var. *baileyana* (Munson) Comeaux - FNA12, K1, K3, K4, Pa, Va, Comeaux, Nesbitt, & Fantz (1987), Moore (1991); < *Vitis cinerea* (Engelmann) Engelmann ex Millardet - IL, W, WV; < *Vitis vulpina* Linnaeus - GW2.

Vitis cinerea (Engelmann) Engelmann ex Millardet. GRAYBARK GRAPE, PIGEON GRAPE. **Hab:** Hammocks, most forests. **Dist:** VA (?) , w. KY, wc. TN, IN, and WI, south to Panhandle FL (Okaloosa County), sc. AL and TX. **Phen:** May-Jul; Sep-Nov. **Syn:** = Wen et al (2018); = *Vitis cinerea* (Engelmann) Engelmann ex Millardet var. *cinerea* - C, F, FNA12, G, K1, K3, K4, NcTx, RAB, Tn, Moore (1991); < *Vitis cinerea* (Engelmann) Engelmann ex Millardet - Ar, GrPl, GW2, IL, W; > *Vitis cinerea* (Engelmann) Engelmann ex Millardet var. *canescens* (Engelmann) Bailey - Tx; > *Vitis cinerea* (Engelmann) Engelmann ex Millardet var. *cinerea* - Tx. NatureServe G4G5TNR (Not Yet Ranked).

Vitis labrusca Linnaeus. FOX GRAPE. **Hab:** Forests and woodlands, mainly in wet to moist situations. **Dist:** ME west to s. MI, south to n. GA, n. AL, and n. MS. **Phen:** May-Jun; Sep-Oct. **Syn:** = C, FNA12, GW2, IL, K1, K3, K4, NE, NY, Pa, RAB, S, Tn, Va, W, Comeaux, Nesbitt, & Fantz (1987), Moore (1991); < *Vitis labrusca* Linnaeus; > *Vitis labrusca* var. *labrusca* - F, G; > *Vitis labrusca* var. *subedentata* Fernald - F, G.

Vitis mustangensis Buckley. MUSTANG GRAPE. **Hab:** Woodland edges, fencerows, thickets, lowland woods, disturbed areas. **Dist:** AR and s. OK south to s. LA and s. TX; disjunct east of the Mississippi River in MS and AL. **Phen:** May-early Jun; Aug-Sep. **Syn:** = FNA12, K1, K3, NcTx; > *Vitis mustangensis* Buckley var. *diversa* (Bailey) Shinnars - Tx; > *Vitis mustangensis* var. *mustangensis* - Tx. NatureServe G4G5 (Apparently Secure).

Vitis palmata Vahl. RED GRAPE, CAT GRAPE, CATBIRD GRAPE. **Hab:** Floodplain forests, riverbanks. **Dist:** IN, sw. VA (Townsend, pers. comm. 2009), c. TN (Chester, Wofford, & Kral 1997), sc. GA (Jones & Coile 1988), and FL Panhandle west to MO, OK, and TX. **Phen:** Mid Jun-late Jun; late Jul-Oct. **Syn:** = Ar, C, F, F13, FNA12, G, GW2, IL, K1, K3, K4, NcTx, NE, S, Tn, Tx, Va, WH3, Moore (1991), Ward (2006b). - 5 Leaves 0-3-foliolate; [subfamily *Faboideae*]. **Key G**
- 9 Leaves 2-foliolate **Key G**
- 9 Leaves 0, 1, or 3-foliolate. **Key I**
- 10 Leaves unifoliolate, or with leaf or leaflet blades absent, replaced by a tendril (and with foliaceous stipules) **Key I**
- 10 Leaves trifoliolate (plants with some upper stem or lower stem leaves unifoliolate but with other trifoliolate leaves should be keyed here). **Key J**
- 11 Leaves palmately 3-foliolate (the petiolules of the 3 leaflets usually of similar length (if the apparent petiolule of the terminal leaflet is slightly longer, it does not have a joint between a rachis and the petiolule of the terminal leaflet) **Key J**
- 11 Leaves pinnately 3-foliolate **Key K**

Key A - woody legumes with all leaves 1-, 2-, or 3-foliolate, or reduced to flattened phyllodia or phyllodial spines

- 2 Leaves 1- or 2-foliolate and > 2 cm wide; trees, shrubs, or lianas. **Cercis**
- 2 Leaves 3-foliolate, or reduced to phyllodial spines, or 1-foliolate (but then < 2 cm wide); shrubs or woody vines (rarely trees in *Erythrina*); [subfamily *Faboideae*]. **Lackeya multiflora**
- 6 Woody vine (*Pueraria*, a robust herbaceous vine, is also keyed here as a failsafe). **Pueraria montana var. lobata**
- 8 Calyx 4.5-6 mm long; leaflets unlobed; [tribe Phaseoleae] **Lackeya multiflora**
- 8 Calyx 10-12 mm long; leaflets generally lobed; [tribe Phaseoleae] **Pueraria montana var. lobata**
- 6 Shrub or tree. **Genista tinctoria**
- 9 Shrub with angled or flanged green twigs; leaves palmately trifoliolate, unifoliolate, or reduced to spine-tipped phyllodes; [introduced]; [tribe Genisteae]. **Genista tinctoria**
- 9 Shrub or tree with twigs various, but not conspicuously green or flanged; leaves pinnately trifoliolate or unifoliolate. **Lupinus**
- 15 Leaves unifoliolate; [tribe Genisteae] **Lupinus**
- 15 Leaves trifoliolate. **Erythrina**
- 16 Corolla 30-50 mm long, scarlet; legume with several seeds; leaflets lobed or not; [tribe Phaseoleae] **Erythrina**
- 16 Corolla 8-15 mm long, purplish, pink, or white; legume 1-seeded; leaflets not lobed. **Lespedeza**

Key B - woody legumes (trees, shrubs, or woody vines) with bipinnately compound leaves

- 1 Leaves variously modified from strict 2-even-pinnateness, either with 1) a mixture (on a tree) of 1-even-pinnate and 2-even-pinnate leaves, and/or 2) the pinnae or leaflets often subopposite or fully alternate, and/or 3) with an odd number of pinnae per leaf (the tip of the rachis with a pair of lateral pinnae and a terminal pinna, but the leaflets of the pinnae still in opposite pairs), and/or 4) the basal pair of pinnae evolutionarily replaced by a single pair of leaflets larger than the other leaflets. **Gleditsia**
- 3 Leaves characteristically a mixture (on a tree) of 1-even-pinnate (mainly on spurs) and 2-even-pinnate (mainly on new growth), the pinnae and the leaflets strictly opposite or subopposite; leaflets 1.5-4 cm long, acute to rounded at the apex; trunks with simple, trident, or multiply branched thorns to 20 cm long (or unarmed) **Gymnocladus dioica**
- 3 Leaves all 2-even-pinnate, the basalmost "pinna pair" usually replaced by a pair of leaflets larger than the others, the pinnae and the leaflets often 'straying' to subopposite or fully alternate arrangement (some pinnae appearing odd-pinnate); leaflets 3-6 cm long, acuminate at the apex; trunks unarmed **Gymnocladus dioica**
- 1 Leaves strictly 2-even-pinnate (with pinna pairs borne opposite one another and no pinna terminal on the rachis, and with leaflets also borne in opposite pairs). **Parkinsonia**
- 6 Pinna pairs 1-6 (-7) per leaf; leaflets 4-ca. 250 per leaf. **Vachellia**
- 7 Leaflets 1.5-14 mm long. **Albizia**
- 8 Glands absent on petioles and rachises. **Mimosa**
- 8 Glands (stalked, columnar, or domed) 1 or more on petioles or rachises, on the petiole or at rachis nodes. **Mimosa**
- 7 Leaflets 10-60 mm long (at least the larger leaflets on a plant > 14 mm long). **Mimosa**
- 6 Pinna pairs 4-25 per leaf (at least the larger leaves on a plant with > 6 pinna pairs); leaflets 150-3000 per leaf. **Mimosa**
- 29 Glands absent on petioles and rachises. **Mimosa**

(see introduction for more)

* : waif
EN : endemic
H : historic

N : no X : extirpated
P : planted
? : questionable

29 Glands (stalked, columnar, or domed) or nonglandular spheroid projections 1 or more on petioles or rachises, on the petiole or at rachis nodes.

31 Branches unarmed.

..... *Albizia julibrissin*

31 Branches variously armed, with nodal spines, thorn spurs, or catclaw prickles scattered along internodes.

..... *Vachellia*

Key C - woody legumes with evenly 1-pinnately compound leaves with 2 or more leaflets
[subfamilies *Faboideae* and *Caesalpinioideae*]

1 Flowers with 5 petals, 2 fused to form the keel (papilionaceous); corolla rose, yellow, orange, red, pink, or white; [subfamily *Faboideae*].

..... *Sesbania*

1 Flowers with 5 or 3 petals, all distinct (caesalpinaceous); corolla yellow, orange, red, or pink; [subfamily *Detarioideae* or *Caesalpinioideae*].

..... *Senna*

Key D - woody legumes with oddly 1-pinnately compound leaves with 5 or more leaflets
[subfamilies]

1 Liana, climbing by twining; [tribe *Millettieae*]

..... *Wisteria*

1 Shrubs and trees, lacking climbing adaptations.

3 Leaflets glandular-punctate (not requiring magnification).

5 Corolla reduced to a single petal (the standard); flowers whitish, sky blue, dark blue, purple, or violet; [collectively widespread] *Amorpha*

5 Corolla of 5 petals; flowers white to cream, sometimes 'fading' to dark purple; [s. FL, TX].

..... *Dalea*

3 Leaflets lacking punctate glands.

7 Leaflets 3-9 per leaf; leaflets 2-15 (-20) cm long; small or large tree (to shrub in *Dermatophyllum secundiflorum*).

..... *Cladrastis kentukea*

7 Leaflets (5-) 7-31 per leaf, at least the larger and better developed leaves on a plant with 11 or more leaflets; leaflets 0.4-12 cm long; shrub, small tree, or large tree.

13 Corollas 5-6 mm long, pink or purplish; fruits 15-35 mm long, 1-3 mm wide *Indigofera tinctoria*

13 Corollas 9-30 mm long, yellow, white, pink, or purplish; fruits 25-150 (-200) mm long, 5-35 mm wide.

..... *Robinia*

Key E - herbaceous legumes with palmate leaves with 4 or more leaflets [subfamily *Faboideae*]

1 Leaflets 4; corolla yellow; [tribe *Dalbergieae*] *Zornia bracteata*

1 Leaflets 5 or more (at least on the largest and best developed leaves); corolla blue, pink, or violet (except yellow in *Lupinus luteus*).

2 Leaflets and fruits not glandular-punctate; stamens monadelphous; [tribe *Genisteae*] *Lupinus*

2 Leaflets and fruits glandular-punctate; stamens diadelphous; [tribe *Psoraleae*].

..... *Pedimelum*

Key F - herbaceous legumes with bipinnate leaves [subfamily *Mimosoideae*]

6 Petiole with 1-several glands; stems ascending to erect; flowers greenish-white *Desmanthus*

6 Petiole without glands; stems prostrate to weakly arching; flowers pink-purple, yellow, or greenish-yellow.

7 Flowers pink-purple; legume ribbed, the ribs with prickles *Mimosa*

7 Flowers yellow to greenish-yellow; legume not ribbed or prickly *Neptunia*

Key G - herbaceous legumes with once-pinnately, even-pinnately compound (or 'palmately' 2-foliate) leaves with 2 or more leaflets
[subfamilies *Faboideae* and *Caesalpinioideae*]

1 Flowers nearly regular; stamens 5-10, separate; [subfamily *Caesalpinioideae*, tribe *Cassieae*].

2 Leaflets 5-25 pairs, each leaflet 0.5-1.5 cm long; stipules persistent, striate *Chamaecrista*

2 Leaflets (2-) 3-12 pairs, each leaflet 1.5-12 cm long; stipules caduceous, small, not striate *Senna*

1 Flowers papilionoid; stamens diadelphous or monadelphous; [subfamily *Faboideae*].

3 Tendrils lacking on all leaves; stamens monadelphous or diadelphous.

4 Leaflets 2 per leaf; [tribe *Aeschynomeneae*] *Zornia*

4 Leaflets 4-60 per leaf.

6 Leaflets 20-60 per leaf; strong herbs (or woody) 1-4 m tall, simultaneously erect, > 1 m tall, and with stems usually > 5 mm in diameter

7 Fruit a loment, with single-seeded segments separated by sutures; stamens monadelphous or diadelphous in 2 phalanges of 5; [tribe *Aeschynomeneae*] .

..... *Aeschynomene*

7 Fruit a legume; stamens diadelphous; [tribe *Sesbanieae*] *Sesbania*

6 Leaflets 4-18 per leaf; weak or sprawling herbs to 1.5 m long, with weak stems usually < 5 mm in diameter (or if thicker, then < 1 m long; stamens monadelphous or diadelphous).

8 Leaflets 4 per leaf; stamens monadelphous; [tribe *Dalbergieae*] *Arachis*

8 Leaflets 4-16 per leaf; stamens monadelphous, diadelphous (9 and 1, or 5 and 5)

..... *Vicia*

3 Tendrils present in the terminal position on some or all leaves; stamens diadelphous; [tribe *Fabeae*].

(see introduction for more)

* : waif
EN : endemic
H : historic

N : no X : extirpated
P : planted
? : questionable

- 10 Stipules foliaceous, typically larger than the leaflets.....*Pisum*
 10 Stipules smaller, typically much smaller than the leaflets.
 12 Style stout, flattened or folded, with a dense longitudinal band of hairs longitudinally arrayed along the inner side; stems ridged, angled, or longitudinally winged; leaflets 2-6 (-8) cm long; calyx 5-12 mm long.....*Lathyrus*
 12 Style slender and hair-like, terete (round in \times -section), glabrous except for a ring of short hairs just below the stigma; stems ridged or angled, but not longitudinally winged; leaflets 0.5-4.5 cm long (except larger in a few waifs); calyx 2-8 mm long (except larger in a few waifs).....*Vicia*

Key H - herbaceous legumes with once-pinnately, odd-pinnately compound leaves with 5 or more leaflets
[subfamilies *Faboideae* and *Caesalpinioideae*]

- 1 Lateral veins of each leaflet neatly straight and parallel to one another; [tribe Millettiae].....*Tephrosia*
 1 Lateral veins of each leaflet complicatedly and less regularly arrayed.
 2 Leaves (at least the largest and those with the most leaflets) with ≥ 13 leaflets.
 5 Hairs dolabriform (with 2 branches parallel to the surface and pointing at 180° from each other).....*Indigofera*
 5 Hairs basifixed.
 7 Fruit a loment (jointed between each seed and splitting into single-seeded segments).
 8 Loments cylindrical, jointed but not noticeably constricted between the seeds; Inflorescence an umbel of (7-) 10-15 flowers; corolla white and pink (or yellow in the rare waif *S. securidaca*); [tribe Loteae].....*Securigera*
 8 Loments flattened, prominently constricted between the seeds; inflorescence a raceme of 2-6 flowers; corolla primarily yellow (sometimes also marked with pink or orange); [tribe Dalbergiae].....*Aeschynomene*
 7 Fruit a legume (lacking joints between each seed, though sometimes the pod constricted).
 9 Inflorescences pedunculate, axillary racemes; leaflets eglandular; fruits dehiscent; [tribe Galegeae].....*Astragalus*
 9 Inflorescences terminal racemes, spikes, or heads; leaflets glandular-punctate or not; fruits indehiscent.....*Dalea*
 2 Leaves (the largest and those with the most leaflets) with < 11 leaflets.
 11 Fruit a loment (constricted between each seed and splitting into single-seeded segments); petals primarily yellow (sometimes also marked with pink or orange); [of the se. Coastal Plain, from e. GA southwards and westwards]; [tribe Dalbergiae].....*Ctenodon viscidulus*
 11 Fruit a legume (lacking constrictions between the seeds); petals variously colored; [collectively widespread].
 15 Plants erect or ascending herbs.
 16 Leaves with 5 leaflets, the 2 basal leaflets positioned like stipules at the base of the leaf (the leaf thus sessile); [tribe Loteae].....*Lotus*
 16 Leaves with 5-9 (or fewer or more and then keyed elsewhere), the lower leaflets positioned above a definite petiole.
 17 Hairs dolabriform (with 2 branches parallel to the surface and pointing at 180° from each other; petals reddish orange and/or with some pink or salmon; flowers papilionaceous; stamens 10, diadelphous (9+1); leaflets often > 5 mm wide; legume 3+-seeded; flowers 5-12 mm long, in racemes; [tribe Indigoferae].....*Indigofera*
 17 Hairs basifixed; petals of various colors; flowers not papilionaceous, barely bilaterally symmetrical; stamens 5, monadelphous; leaflets 0.5-5 mm wide; legume 1-seeded; flowers very small, < 5.5 mm long, aggregated into tight spike; [tribe Amorpheae].....*Dalea*
 15 Plants prostrate or twining herbaceous vines.
 18 Hairs dolabriform (with 2 branches parallel to the surface and pointing at 180° from each other; petals reddish orange and/or with some pink or salmon; [tribe Indigoferae].....*Indigofera*
 18 Hairs basifixed; petals of various colors; [tribe Phaseoleae].
 20 Corolla purplish, maroon, brownish, or yellowish green; leaflets 4-9 cm long, on petioles 3-5 mm long; keel coiled.....*Apios*
 20 Corolla either white with red striations or lavender; leaflets 2-5 cm long, on petioles 1-2 mm long; keel carinate, not coiled.....*Galactia*

Key I - herbaceous legumes with all leaves unifoliolate or leaflets absent [subfamily *Faboideae*]

- 1 Tendrils present on plant; leaves modified into tendrils (leaflike structures present clearly interpretable as stipules); [tribe *Fabeae*].
 2 Legume 4-7 mm wide; corolla 10-13 mm long.....*Lathyrus aphaca*
 2 Legume 12-20 mm wide; corolla 18-25 mm long.....*Pisum*
 1 Tendrils absent; leaves or stipules present on plant and interpretable as leaves with 1 leaflet.
 3 Leaflet blades roundish, 0.6-1.5 \times as long as wide.
 4 Leaves with a well-developed petiole, > 0.5 cm long.....*Rhynchosia*
 4 Leaves sessile, subsessile, or perfoliate.....*Baptisia*
 3 Leaflet blades elongate, 1.5-15 \times as long as wide.
 7 Leaves basally disposed.....*Lupinus*
 7 Leaves all or primarily cauline.
 11 Stamens monadelphous; corolla yellow, 8-30 mm long; [tribe *Crotalariae*].....*Crotalaria*
 11 Stamens diadelphous; corolla purple, lavender, or cream, 5-15 mm long.....*Alysicarpus*

Key J - herbaceous legumes with palmately trifoliolate leaves [subfamily *Faboideae*]

- 1 Stamens separate, unfused; stipules (at least the lower on the stem) often persistent, foliaceous, not striate; corollas yellow, white, or purple-blue.....*Baptisia*
 1 Stamens monadelphous or diadelphous; stipules either caducous or well-developed and persistent, and then separate or adnate to the petiole; corollas pink, blue, violet, yellow, or white.

- 3 Stamens monadelphous; corollas 7-20 mm long. *Crotalaria*
- 3 Stamens diadelphous (9 and 1); corollas 3-16 mm long.
- 7 Foliage punctate-glandular; corollas blue, violet, or white. *Pedimelum*
- 7 Foliage eglandular; corollas purple, pink, red, or white.
- 9 Lateral veins of each leaflet lateral veins neatly straight and parallel to one another; leaflets entire; [tribe *Desmodieae*] *Kummerowia*
- 9 Lateral veins of each leaflet complicatedly and irregularly arrayed; leaflets denticulate; [tribe *Trifolieae*] *Trifolium*

Key K - herbaceous legumes with pinnately trifoliolate leaves [subfamily *Faboideae*]

- 1 Leaflets denticulate (sometimes inconspicuously so); [tribe *Trifolieae*].
- 2 Inflorescences elongate racemes with an axis 5-15 cm long, the flowers well-spaced along the axis, the overall inflorescence much longer than its diameter. *Melilotus*
- 2 Inflorescences umbellate or headlike clusters or short racemes with an axis < 2 cm long, the flowers closely clustered, the overall inflorescence little (if at all) longer than its diameter.
- 3 Legumes spirally coiled or curved, often tuberculate or prickly; stems 4-angled towards the tip. *Medicago*
- 3 Legumes straight or nearly so, never tuberculate or prickly; stems terete or flattened (2-angled) towards the tip. *Trifolium*
- 1 Leaflets entire (and sometimes also with 1 or 2 broad lobes), or with scattered, irregular large teeth (*Pachyrhizus erosus*).
- 4 Main stems erect or ascending, not trailing, twining, or otherwise vine-like.
- 5 Flowers not papilionaceous (the wings and keel epistemonous, arising terminally or laterally from the stamen tube), barely bilaterally symmetrical; stamens 5, monadelphous; [tribe *Amorpheae*] *Dalea pinnata* var. *trifoliata*
- 5 Flowers papilionaceous; stamens 10, diadelphous or monadelphous.
- 6 Plants with separate leafy and flowering stems (the flowering stems naked or nearly so of leaves).
- 7 Standard bright red, remaining folded, 30-50 mm long; leaves hastately lobed; fruit a torulose legume, 6-20 cm long, the seeds red; [tribe *Phaseoleae*] ... *Erythrina herbacea*
- 7 Standard white or pink, expanded, 4-8 mm long; leaves not hastate; fruit a flattened loment, < 5 cm long, the seeds drab; [tribe *Desmodieae*] *Hylodesmum nudiflorum*
- 6 Plants bearing leaves and flowers on the same stems.
- 8 Leaves, stems, and/or calyces glandular-punctate.
- 9 Corollas pink or lavender/purplish; leaflets estipellate; fruit 1-seeded, indehiscent; [tribe *Psoraleae*] *Orbexilum*
- 9 Corollas yellow; leaflets stipellate; fruit 2-many-seeded, dehiscent; [tribe *Phaseoleae*, subtribe *Cajaninae*] *Rhynchosia*
- 8 Leaves, stems, and calyces lacking punctate glands.
- 11 Leaflet blades large, at least the largest terminal leaflets on a plant > 5 cm long.
- 12 Stipels absent on the petiolules of mature leaflets; stamens monadelphous.
- 13 Fruit a legume (not segmented into 1-seed dispersal units), hairy but the hairs not hooked; [plants cultivated as garden plants, rare as waifs] ... *Canavalia ensiformis*
- 13 Fruit a loment (separating into single-seeded segments), uncinulate (with hooked hairs, the fruits attaching to hairs or clothes as 'stick-tights'); [plants widespread, common] *Hylodesmum*
- 12 Stipels present, persistent; stamens diadelphous (9 and 1).
- 14 Fruit a loment (separating into single-seeded segments), uncinulate (with hooked hairs, the fruits attaching to hairs or clothes as 'stick-tights'); [plants widespread, common] *Desmodium*
- 14 Fruit a legume (not segmented into 1-seed dispersal units), hairy but the hairs not hooked; [plants cultivated as crops or garden plants, rare as waifs]
- 15 Keel of corolla coiled 1-3 turns; stipules inconspicuous; [soy beans] *Glycine max*
- 15 Keel of corolla not coiled; stipules conspicuous, persistent, striate; [bush green beans or lima beans] *Phaseolus*
- 11 Leaflet blades smaller, all on a plant < 5 cm long.
- 16 Stipels present, persistent.
- 17 Fruit a loment (separating into single-seeded segments), uncinulate (with hooked hairs, the fruits attaching to hairs or clothes as 'stick-tights') *Desmodium*
- 17 Fruit a several- to many-seeded legume, glabrous to hairy (but not uncinulate) *Galactia*
- 16 Stipels absent on the petiolules of mature leaflets.
- 20 Petioles fused most of length with amplexicaul stipules, the leaves thus appearing sessile or nearly so; corollas lemon to orange yellow; flowers subsessile; fruit a loment of 2 segments, the terminal segment fertile, the lower segment either sterile or fertile *Stylosanthes*
- 20 Petioles free from stipules, leaves evidently petiolate; corollas white to pink; flowers pedicellate; fruit either 1-seeded, or a loment normally with 3+ segments
- 21 Fruit a loment, with 1-3 segments; terminal leaflets 3-10 cm long, 1-1.5× as long as wide; stamens monadelphous *Hylodesmum*
- 21 Fruit 1-seeded; terminal leaflets 1-5 cm long, 1.2-8× as long as wide; stamens diadelphous (9 and 1) *Lespedeza*
- 4 Main stems trailing, twining, creeping, or climbing or sprawling over other vegetation.
- 22 Leaves, stems, and/or calyces glandular-punctate; corollas yellow. *Rhynchosia*
- 22 Leaves, stems, and calyces lacking punctate glands; corollas yellow, pink, purplish, white, red, blue.
- 23 Leaflet blades smaller, all on a plant < 5 cm long.
- 24 Stipels absent on the petiolules of mature leaflets.
- 25 Fruit a loment of 2 segments, the terminal segment fertile, the lower segment either sterile or fertile; corollas lemon to orange yellow *Stylosanthes*
- 25 Fruit 1-seeded; corollas pink-purplish to white, or bronze to brick-red. *Lespedeza*
- 24 Stipels present, persistent (minute in *Amphicarpaea*).
- 27 Fruit a loment (separating into single-seeded segments), uncinulate (with hooked hairs, the fruits attaching to hairs or clothes as 'stick-tights'). *Desmodium*

Key to Map
Symbology:

- 27 Fruit a legume, dehiscent (at least tardily), unsegmented, and with 2+ seeds.
- 29 Flowers resupinate (the pedicel twisted 180 degrees), the banner 2.5-5.5 cm long and positioned lowermost.
- 30 Calyx lobes equal to or longer than the calyx tube; fruits 3-5 mm wide *Centrosema*
- 30 Calyx lobes shorter than the calyx tube; fruits 5-8 mm wide *Clitoria*
- 29 Flowers not resupinate, the banner 0.7-2.5 cm long and positioned uppermost.
- 31 Stipules caducous *Galactia*
- 31 Stipules persistent, sometimes conspicuous, sometimes striate.
- 32 Keel petal and the included style straight to gently upcurved; stems very slender, < 0.75 mm in diameter *Amphicarpaea*
- 32 Keel petal and the included style either strongly curved upwards 90-180 degrees, or even more extensively coiled (asymmetrically and spirally) in towards the flower center; stems slender to thicker, > 0.75 mm in diameter.
- 33 Keel petal and the included style strongly curved upwards 90-180 degrees; corollas yellow or pink to lavender (or whitish).
- 34 Corollas pink to lavender (or whitish); corolla keel usually somewhat twisted, asymmetrical; [widespread in our region] *Strophostyles*
- 34 Corollas yellow; corolla keel symmetrical; [mainly outer Coastal Plain] *Vigna*
- 33 Keel petal and the included style extensively coiled > 180 degrees (asymmetrically and spirally) in towards the flower center; corollas pink, purple, maroon, purple-black (or whitish).
- 35 Peduncles long, the flowers borne in clusters on a raceme axis shorter than the peduncle; plants glabrate to villous, the hairs not hooked *Macroptilium*
- 35 Peduncles short, the flowers scattered along a (sometimes branched) raceme axis, the raceme axis about as long as or longer than the peduncle; plants uncinulate pubescent (use 20× magnification, or touch the plant for the 'tacky' feel) *Phaseolus*
- 23 Leaflet blades large, at least the largest terminal leaflets on a plant > 5 cm long.
- 36 Stipels absent on the petiolules of mature leaflets; stamens monadelphous *Canavalia*
- 36 Stipels present, persistent (minute in *Amphicarpaea*); stamens diadelphous (9 and 1) or monadelphous (*Pueraria*).
- 37 Stamens monadelphous; robust herbaceous vine with stems to 30 m long; flowers purple, when fresh smelling like artificial grape flavoring. *Pueraria montana var. lobata*
- 37 Stamens diadelphous (9 and 1); herbaceous vines with stems usually < 5 m long; flowers various in color, not 'grapy' in odor.
- 38 Flowers resupinate (the pedicel twisted 180 degrees), the banner (standard) petal lowermost; banner (standard) 25-50 mm long, much larger than the other petals.
- 39 Calyx lobes equal to or longer than the calyx tube; fruits 3-5 mm wide *Centrosema*
- 39 Calyx lobes shorter than the calyx tube; fruits 5-8 mm wide *Clitoria*
- 38 Flowers not resupinate, the banner (standard) uppermost; banner (standard) < 25 mm long, or if up to 30 mm then not much longer than the other petals.
- 40 Fruit a loment (separating into single-seeded segments), uncinulate (with hooked hairs, the fruits attaching to hairs or clothes as 'stick-tights') *Desmodium*
- 40 Fruit a several- to many-seeded legume, glabrous to hairy (but not uncinulate).
- 41 Keel incurved < 90 (-120) degrees; style glabrous or pubescent.
- 42 Stipules inconspicuous or obsolescent. *Lackeya multiflora*
- 42 Stipules persistent and conspicuous.
- 49 Keel petal and the included style straight to gently upcurved; stems very slender, < 0.75 mm in diameter *Amphicarpaea*
- 49 Keel petal and the included style strongly curved upwards 90-180 degrees; stems slender to thicker, > 0.75 mm in diameter *Strophostyles*
- 41 Keel petal and the included style either strongly curved upwards 90-180 degrees, or even more extensively coiled (asymmetrically and spirally) in towards the flower center; style or stigma pubescent.
- 50 Plants uncinulate pubescent (use 20× magnification, or touch the plant for the 'tacky' feel) *Phaseolus*
- 50 Plants glabrate to villous, the hairs not hooked.
- 51 Keel petal and the included style strongly curved upwards 90-180 degrees *Strophostyles*
- 51 Keel petal and the included style even more extensively coiled (asymmetrically and spirally) in towards the flower center. *Macroptilium*

Aeschynomene Linnaeus 1753 (JOINTVETCH)

A genus of about 115 species, herbs and shrubs, pantropical and warm temperate. The genus as currently circumscribed includes at least three disparate clades (Cardoso et al. 2019), one of which has been removed (Cardoso et al. 2020) as *Ctenodon*. References: Arrighi et al (2013); Cardoso et al (2019); Cardoso et al (2020); Carulli, Tucker, & Dill (1988); Isely (1998); Rudd (1955); Vanni (2016).

- 2 Prostrate perennial; leaves with 3-19 leaflets; stipules basifixid; loment articles separated by a joint and also an isthmus; calyx campanulate; [of dry, sandy or of disturbed areas] *Ctenodon*
- 2 Erect or ascending annual; leaves with 21-51 or more leaflets; stipules peltate or medifixed; loment articles separated by only a joint; calyx bilabiate; [of moist to wet habitats]. *Aeschynomene indica*

Key to Map Symbology:

? : questionable

Aeschynomene indica Linnaeus. SOUTHERN JOINTVETCH. **Hab:** Marshes, ditches, disturbed wetlands. **Dist:** Apparently native to se. North America, from NC west to AR, south to s. FL and TX, now widespread in the tropics and subtropics of the Old World and New World. **Phen:** Jul-Oct. **Tax:** A member of the American sect. *Aeschynomene* clade (Oliveira Silva Cardoso et al. 2019). At least some s. TX material may represent *Aeschynomene evenia* C. Wright (see Correll & Johnston (1970)). **Comm:** Perry, Ware, & McKenney-Mueller (1998) discuss the occurrence of this species in VA. Apparently a tetraploid derivative of *A. evenia* and *A. scabra* (Arrighi et al. 2013). **Syn:** = Ar, Fl3, GW2, K1, K3, K4, Mo2, SE3, Va, WH3, Carulli, Tucker, & Dill (1988), Isely (1998), Rudd (1955); < *Aeschynomene virginica* (Linnaeus) Britton, Sterns, & Poggenburg – S.

Albizia Durazzini 1772 (SILKTREE)

A genus of about 100-120 species, trees, shrubs, and vines, of tropical, subtropical, and warm temperate Asia, Africa, and America. References: Barneby & Grimes (1996); Isely (1973); Isely (1998).

* **Albizia julibrissin** Durazzini. MIMOSA, SILKTREE. **Hab:** Disturbed areas, suburban woodlots, escaped and persistent in forests and woodlands. **Dist:** Native of warm-temperate and subtropical Asia. A serious weed tree; "literally almost everywhere in the 'Dixie' south" (Isely 1973). **Phen:** May-Aug; Jul-Nov. **Syn:** = Ar, C, Fl3, GrPl, Il, K1, K3, K4, NcTx, NE, NY, Pa, RAB, SE3, Tn, Tx, Va, W, WH3, Barneby & Grimes (1996), Isely (1973), Isely (1998); = *Albizzia julibrissin* – F, G, S, orthographic variant. NatureServe GNR (Not Yet Ranked).

Alysicarpus Necker ex Desvaux 1813 (ALYCE CLOVER)

A genus of about 25-30 species, herbs, native of the Old World tropics. References: Isely (1998); Woods & Diamond (2016).

* **Alysicarpus ovalifolius** (Schumacher) J. Léonard. ALYCE CLOVER. **Hab:** Disturbed areas. **Dist:** Native of the Old World Tropics, planted as a forage crop (at least formerly), and rarely naturalized. The VA occurrence is from chrome ore piles in Newport News and presumably a waif. Present in the SC Coastal Plain (Bradley et al. [in prep.]). **Syn:** = Fl3, K3, K4, WH3, Woods & Diamond (2016); < *Alysicarpus vaginalis* (Linnaeus) A.P. de Candolle – Ar, K1, SE3, Isely (1998).

Amorpha Linnaeus 1753 (INDIGO-BUSH, LEADPLANT)

A genus of about 15 species, shrubs, of temperate North America. References: Isely (1998); Straub, Sorrie, & Weakley (2009); Wilbur (1954); Wilbur (1964); Wilbur (1975).

10 Foliage blackening when dried; leaflets (7-) 9-15 (-19) per leaf, usually shiny above when fresh; [of s. SC and southward] **Amorpha nitens**
10 Foliage remaining green when dried; leaflets (7-) 9-23 (-31) per leaf, dull to somewhat shiny above when fresh; [widespread in our area].

..... **Amorpha fruticosa**

Amorpha fruticosa Linnaeus. TALL INDIGO-BUSH. **Hab:** Riverbanks, forests, woodlands, marsh edges, sometimes in disturbed sites. **Dist:** NB west to WA, south to s. FL, TX, s. CA, and Mexico (BCN, CHH, SON). **Phen:** Apr-Jun; Jun-Oct. **Syn:** = Ar, C, Fl3, G, GrPl, GW2, K1, K3, K4, Mi, NcTx, NE, NY, Pa, RAB, SE3, Tn, Va, W, WH3, Isely (1998), Wilbur (1975); > *Amorpha curtissii* Rydberg – S; > *Amorpha fruticosa* Linnaeus – S; > *Amorpha fruticosa* var. *angustifolia* Pursh – Il, Tx; > *Amorpha fruticosa* var. *croceolana* (P.W. Watson) Schneider – Il, Tx; > *Amorpha fruticosa* var. *fruticosa* – F, Il, Tx; > *Amorpha fruticosa* var. *occidentalis* (Abrams) Kearney & Peebles – Tx; > *Amorpha fruticosa* var. *tennesseensis* (Shuttleworth) E.J. Palmer – F; > *Amorpha montana* Boynton; > *Amorpha tennesseensis* Shuttleworth – S; > *Amorpha virgata* Small – S.

Amorpha nitens F.E. Boynton. DARK INDIGO-BUSH, SHINING INDIGO-BUSH. **Hab:** Dry to mesic upland and riparian forests, ravines, bluffs, stream banks, glade margins, sandy woodlands, rocky slopes, bottomland forests. **Dist:** S. SC south to GA, west to s. LA, north in the interior to w. KY, s. IL, AR, and e. OK. First reported for SC by Nelson & Kelly (1997) and for MS by John Kees (2021). **Phen:** Apr-Jun. **Syn:** = Ar, Il, K1, K3, K4, S, SE3, Tn, Isely (1998), Wilbur (1975); = n/a – RAB. NatureServe G3? (Vulnerable).

Amphicarpaea Elliott ex Nuttall 1818 (HOG-PEANUT)

A genus of 5-6 species, of e. and se. Asia, North America, and montane Africa. It now appears that 3 (or more?) semi-cryptic taxa should be recognized in what has traditionally been considered a single species of *Amphicarpaea* (Kartzinel et al. 2016; Callahan 1997; Parker 1996). The genus name has been corrected to *Amphicarpaea* from the frequently used *Amphicarpa*. References: Callahan (1997); Isely (1998); Kartzinel et al (2016); Parker (1996); Parker, Doyle, & Doyle (2004).

140. FABACEAE

Identification Notes: Producing inflorescences of two types, one with chasmogamous flowers and aerial legumes, the other with cleistogamous flowers and subterranean legumes.

- 1 Petiole 3.5-5.3 cm long; petiolule of the terminal leaflet (not including the rachis extending from the point of connection of the lateral leaflets to the joint marking the beginning of the petiolule of the terminal leaflet) 1.0-1.4 mm long; terminal leaflet 4.2-5.2 cm long *Amphicarpaea bracteata* var. *bracteata*
 1 Petiole 6.0-6.8 cm long; petiolule of the terminal leaflet 1.7-1.9 mm long; terminal leaflet 5.5-6.1 cm long *Amphicarpaea bracteata* var. *comosa*

Amphicarpaea bracteata (Linnaeus) Fernald var. *bracteata*. HOG-PEANUT. **Hab:** Dry to moist forests, thickets. **Dist:** Widely distributed in eastern North America but more common eastwards. **Phen:** Jul-Sep; Aug-Oct. **Comm:** {The distributions and habitats of the two varieties in our area require herbarium and field investigation}. **Syn:** = Il, K1, K3, K4, Mi, Callahan (1997), Parker (1996); = *Amphicarpa bracteata* var. *bracteata* – F, G, orthographic variant; < *Amphicarpa bracteata* – Pa, RAB, orthographic variant; < *Amphicarpaea bracteata* – Ar, C, GrPl, NcTx, NE, NY, SE3, Tn, Tx, Va, WH3, Isely (1998); < *Falcata comosa* (Linnaeus) Kuntze – S; ~ *Falcata pitcheri* (Torr. & A. Gray) Kuntze. NatureServe G5T5 (Secure).

Amphicarpaea bracteata (Linnaeus) Fernald var. *comosa* Fassett. HOG-PEANUT. **Hab:** Dry to moist forests, thickets. **Dist:** Widely distributed in eastern North America, but more common westwards. **Phen:** May-Sep; Aug-Oct. **Comm:** {The distributions and habitats of the two varieties in our area require herbarium and field investigation}. **Syn:** = Il, K1, K3, Mi, Callahan (1997), Parker (1996); = *Amphicarpa bracteata* var. *comosa* – F, G, orthographic variant; = *Amphicarpaea comosa* (Linnaeus) G. NatureServe G5T5? (Secure).

*Apios* Fabricius 1759 (GROUNDNUT)

A genus of about 6 species, perennial vines, of temperate e. Asia and e. North America. Our two species are sister to one another, and otherwise most closely related to *A. delavayi* Franchon (Himalayan) and *A. fortunei* Maximowicz (of Japan, China, and Taiwan) (Li et al. 2014). References: Isely (1998); Li et al (2014); Woods (2005).

- 1 Petiole 20-58 mm long; flower deep maroon to pale maroon and white; style glabrous; legume 6-10 (-12) cm long; seed 5-6 mm long; tubers several in a chain, each 2-10 cm in diameter. *Apios americana*
 1 Petiole 70-75 mm long; flower pale green and rose-purple; style bearded; legume 12-15 (-18) cm long; seed 7.2-11.0 mm long; tuber 1, 15-20 cm in diameter. *Apios priceana*

Apios americana Medikus. COMMON GROUNDNUT. **Hab:** Marshes (tidal and non-tidal), wet thickets, streambanks, bottomland forests. **Dist:** NS, NB, and QC west to MN and SD, south to s. FL and TX. **Phen:** Jun-Aug; Jul-Sep. **Syn:** = Ar, C, F13, GrPl, GW2, Il, K1, K3, K4, Mi, NcTx, NE, NY, Pa, RAB, SE3, Tn, Tx, Va, W, WH3, Isely (1998), Woods (2005); = *Apios apios* (Linnaeus) MacMillan, name invalid (a tautonym); = *Glycine apios* Linnaeus – S; > *Apios americana* var. *americana* – F, G; > *Apios americana* var. *turrigera* Fernald – F, G. NatureServe G5 (Secure).

Apios priceana B.L. Robinson. KENTUCKY GROUNDNUT, PRICE'S POTATO-BEAN. **Hab:** Mixed oak woods, especially over limestone. **Dist:** Sw. KY, c. TN, ne. MS, and n. and c. AL. **Phen:** Jul-Sep. **Syn:** = C, F, G, Il, K1, K3, K4, SE3, Tn, Isely (1998), Woods (2005); = *Glycine priceana* (B.L. Robinson) Britton – S. NatureServe G3 (Vulnerable); USESA T.

*Arachis* Linnaeus 1753 (PEANUT)

A genus of about 60 species, annual and perennial herbs, native of South America (especially Brazil). References: Isely (1998).

* *Arachis hypogaea* Linnaeus. PEANUT. **Hab:** Fields; commonly cultivated, rarely persistent. **Dist:** Native of South America. This remarkable plant bears normal aerial flowers, but following pollination the pedicels elongate and arch downward, the legume soon buried and developing underground. **Phen:** Jul-Oct. **Syn:** = C, F, F13, Il, K1, K2, K4, NcTx, NE, RAB, S, SE3, WH3, Isely (1998). NatureServe G5 (Secure).

Astragalus Linnaeus 1753 (MILKVETCH)

A genus of 2300-2500 species, herbs and shrubs, most diverse in arid regions of w. North America and w. and c. Asia. The habitats of the southeastern species may be characterized as rocky or sandy, "relictual islands" of aridity in the generally moist landscape of eastern North America. References: Barneby (1964); Isely (1998).

3 Plants erect, stems (3-) 4-15 dm long; legume straight to moderately curved.

-*Astragalus canadensis* var. *canadensis*
- 3 Plants decumbent or ascending, stems 1-5 dm long; legume either dry and strongly curved (about 90 degrees), or globose and initially fleshy.
- 8 Leaflets mostly 1-2× as long as wide, typically noticeably notched at the tip; mature legume reticulately textured; corolla (7-) 8-11 mm long; [of dry sandy sites in FL and possibly adjacent GA and s. MS]*Astragalus obcordatus*
- 8 Leaflets mostly 2-3.5× as long as wide, truncate or shallowly notched at the tip; mature legume lacking a reticulately textured surface; corolla 9-15 mm long; [either of shaley habitats from w. VA northward or of woodlands and prairies from MS westward]
- 9 Keel 7-9.5 mm long; legume usually 3-4× as long as wide, often curved 90°, grooved along sutures on both sides *Astragalus distortus* var. *distortus*
- 9 Keel 6-7 mm long; legume usually 2.5-3.5× as long as wide, nearly straight or curved < 90°, grooved only along one suture..... *Astragalus distortus* var. *engelmannii*

***Astragalus canadensis* Linnaeus var. *canadensis*.** CANADA MILKVETCH. **Hab:** Forests, woodlands, streambanks, rocky slopes and bluffs, prairies. **Dist:** Ranging through much of North America, from QC and Hudson Bay west to BC, south to GA, TX, NM, and CA; also apparently disjunct in Siberia. **Phen:** Jun-Aug; Jul-Oct. **Tax:** The other varieties occur farther west. See Barneby (1964) for a detailed discussion of taxonomic and nomenclatural problems involving *A. canadensis*. Barneby comments that "the eastern mountain race [in the Appalachians] is commonly distinguished from var. *canadensis* of the Mississippi Valley and northward by a narrower and more open flowering and fruiting raceme, and the flowers at the same time are relatively small. There is something to be said in favor of recognizing an eastern montane variety, so long as we confine its distinguishing characteristic to a loose raceme". The distribution, as mapped by Barneby, is suggestive of a composite map of two (or more) different taxa, one of them being centered in the Southern and Central Appalachians (extending out into nearby provinces). F and G separate var. *carolinianus*, basing the distinction, however, on a different set of characters, and considering var. *canadensis* to range south to VA (at least). Further study is needed; it seems we may have in our area two taxa worthy of distinction at the varietal level. **Syn:** = Ar, K1, K3, K4, NE, NY, SE3, Va, Barneby (1964), Isely (1998); < *Astragalus canadensis* – C, GrPl, Il, Mi, NcTx, Pa, RAB, Tn, Tx, W; > *Astragalus canadensis* Linnaeus var. *canadensis* – F, G; > *Astragalus canadensis* var. *carolinianus* (Linnaeus) M.E. Jones – F, G; > *Astragalus carolinianus* Linnaeus – S.

***Astragalus distortus* Torrey & A. Gray var. *distortus*.** OZARK MILKVETCH, BENT MILKVETCH. **Hab:** Shale barrens and other dry, shaley places, westwards in a variety of dry open and wooded habitats. **Dist:** *A. distortus* is interpreted by Barneby (1964) (and followed by Cronquist [1991] and Isely [1990]) to consist of 2 varieties: var. *distortus*, occurring in the s. Midwest from IL, MO, and OK south to MS, LA, and AR, and disjunct in n. and sc. VA, e. WV, and w. MD, and var. *engelmannii* (Sheldon) M.E. Jones, of TX and ne. LA. **Phen:** (Late Mar-) May-Jul. **Tax:** The two varieties seem fairly readily distinguishable morphologically in the Midwest. Appalachian var. *distortus* complicates the issue, since it approaches var. *engelmannii* in flower size and matches it in ovule number. The Appalachian plant, with a combination of morphologic characters not matching the two named varieties and far allopatric from them might better be considered a distinct variety. Further study is needed. **Syn:** = Ar, C, K1, K3, K4, NcTx, SE3, Tx, Va, Barneby (1964), Isely (1998); = *Holcophacos distortus* (Torrey & A. Gray) Rydberg – S; < *Astragalus distortus* – F, G, GrPl, Il. NatureServe G5T5? (Secure).

Astragalus distortus* Torrey & A. Gray var. *engelmannii (E. Sheldon) M.E. Jones. ENGELMANN'S MILKVETCH. **Hab:** Open pine or oak woodlands. **Dist:** AR, TX, and w. LA; disjunct eastward in MS (?) (NatureServe 2007). **Phen:** Feb-May. **Syn:** *Astragalus distortus* Torrey & A. Gray var. *engelmannii* (E. Sheldon) M.E. Jones; = Ar, K1, K3, K4, NcTx, SE3, Tx, Barneby (1964), Isely (1998). NatureServe G5T4 (Apparently Secure).

***Astragalus obcordatus* Elliott.** FLORIDA MILK-VETCH. **Hab:** Longleaf pine sandhills. **Dist:** S. MS south to c. peninsular FL. **Comm:** Reported for s. GA, but no specimen documentation is known (Barneby 1964). **Syn:** = Fl3, K1, K3, K4, SE3, WH3, Barneby (1964), Isely (1998); = *Phaca obcordata* (Elliott) Rydberg ex Small – S. NatureServe G3G4 (Vulnerable).

*Baptisia* Ventenat 1808 (WILD INDIGO)

A genus of about 20 species, perennial herbs, of temperate e. and c. North America. References: Isely (1981); Isely (1998); Larisey (1940a); Mendenhall (1994a); Mendenhall (1994b); Turner (2006a); Weakley (2018) in Weakley et al (2018a); Woods & Diamond (2014).

Identification Notes: Many of our species hybridize when they grow in proximity. They are generally recognizable (especially in context with their parents) by their intermediate morphology. Additional hybrids have been created by plant breeders and may be found in cultivation.

Canavalia Adanson 1763

A genus of about 50 species, perennial or annual herbs or vines, pantropical. References: Isely (1998); Sauer (1964).

- 1 Leaflets coriaceous, 1.0-1.4× as long as wide, rounded (or obtuse) at the apex; seeds 1.5-2.0 cm long, mottled lighter and darker brown; [native, of beaches and coastal strands] *Canavalia rosea*
- 1 Leaflets herbaceous, 1.5-2× as long as wide, acute to obtuse at the apex; seeds 1.5-3.0 cm long, not mottled, either white to off-white or brown to dark olive; [rare alien, of disturbed areas]. *Canavalia ensiformis*

* **Canavalia ensiformis** (Linnaeus) A.P. de Candolle. JACKBEAN, WONDERBEAN. **Hab:** Disturbed areas. **Dist:** Native of tropical America. **Phen:** Jun. **Tax:** Sauer (1964) describes this species as "a prehistoric American Indian domesticated, found archaeologically at various sites in the southwestern United States, most abundantly since 1300 A.D." and additionally states that "all available collections with habitat data are either from cultivation or apparently feral escapes in artificial habitats". This suggests the possibility that *C. ensiformis* is a cultigen selected for large seeds, presumably from stock of *C. brasiliensis*. **Syn:** = Fl3, Il, K3, K4, SE3, WH3, Isely (1998), Sauer (1964). NatureServe GNR (Not Yet Ranked).

Canavalia rosea (Swartz) A.P. de Candolle. BAYBEAN, SEASIDE JACKBEAN. **Hab:** Ocean beaches, coastal strands. **Dist:** Pantropical, north to Dixie County on the west coast and Volusia County on the east coast of FL. **Phen:** Jan-Dec. **Syn:** = Fl3, K1, K3, K4, SE3, WH3, Isely (1998); = *Canavalia maritima* – Tx, Sauer (1964); ? *Canavali lineata* (Thunberg) A.P. de Candolle – S, misapplied.

Centrosema (A.P. de Candolle) Benth 1837 (SPURRED BUTTERFLY PEA)

A genus of about 40 species, perennial vining herbs, of tropical and warm temperate regions of the Western Hemisphere. References: Fantz (2002a); Isely (1998).

Identification Notes: *Centrosema* and *Clitoria* are unique among our legumes in having resupinate flowers, the pedicel twisted 180 degrees so that the large "standard" is lowermost. They are often confused; the following key includes both genera for easier differentiation. The two widespread Southeastern United States species *Clitoria mariana* and *Centrosema virginianum* are especially often confused when vegetative (see key for easy distinctions when in flower or fruit). *Clitoria mariana* has the upper leaf surface glabrous (vs. uncinulate, and thus tacky to the touch, sticking lightly to skin or fabric, in *Centrosema virginianum*), the terminal leaflet broadest 0.3-0.5× of the distance from the leaflet base to leaflet apex (vs. *Centrosema virginianum* broadest at 0.1-0.4×), terminal leaflet with 4-5 or fewer main veins on each side of the midvein (vs. 5-7, or more in *Centrosema virginianum* var. *angustifolium*), the apex blunter (vs. more acute), the venation less raised and reticulated on the lower leaflet surface (vs. more obviously raised-reticulated), and the color of the leaf bluer (vs. greener).

- 3 Calyx tube (of chasmogamous flowers) 4-5 mm long, shorter than or about as long as the lobes; bracteoles 5-12 mm long, partly enclosing the calyx tube; legume 6-12.5 cm long, 3-6 mm broad; standard 2.5-3.5 cm long, spurred near the base. *Centrosema virginianum* var. *virginianum*
- 3 Calyx tube (of chasmogamous flowers) 7-13 mm long, much longer than the lobes; bracteoles 3-7 mm long, not enclosing the calyx tube; legume 3-5 cm long, 5-7 mm broad; standard 4-6 cm long, not spurred. *Clitoria mariana* var. *mariana*

Centrosema virginianum (Linnaeus) Benth var. *virginianum*. SPURRED BUTTERFLY PEA. **Hab:** Dry woodlands and openings. **Dist:** S. NJ south to s. FL, west to KY, sc. MO, AR, and TX; West Indies; Mexico, Central America, and South America. **Phen:** Jun-Aug; Jul-Oct. **Tax:** *Centrosema virginianum* s.l. is very variable in leaflet length:width ratio, with forms with very narrow leaflets prevalent southwards (10:1 or greater), especially in peninsular FL (and in the West Indies). These are here accorded taxonomic recognition as *C. virginianum* var. *angustifolium* (A.P. de Candolle) Grisebach. Further study is needed. **Syn:** =; = *Centrosema virginianum* (Linnaeus) Benth – Bah; < *Bradburya virginiana* (Linnaeus) Kuntze – S; < *Centrosema virginianum* (Linnaeus) Benth – Ar, C, Fl3, G, K1, K3, K4, NcTx, RAB, SE3, Tn, Tx, Va, W, WH3, WI, Isely (1998); > *Centrosema virginianum* var. *ellipticum* Fernald – F; > *Centrosema virginianum* (Linnaeus) Benth var. *virginianum* – F.

Cercis Linnaeus 1753 (REDBUD)

A genus of about 6-10 species, trees of north temperate areas. Apparently the basalmost (evolutionarily the earliest diverging) extant genus in the Fabaceae (Lewis et al. 2005). References: Greene (1912a); Isely (1975); SE3; Isely (1998); Robertson & Lee (1976).

Cercis canadensis Linnaeus. EASTERN REDBUD. **Hab:** Moist to dry forests and woodlands, especially over calcareous or mafic rocks, also commonly planted as an ornamental. **Dist:** MA, WI, and NE south to c. peninsular FL and e. TX. **Phen:** (Jan-) Late Feb-May; Jun-Nov (and persistent later). **Tax:** Other taxa (here treated at specific rank) occur in OK, TX, and Mexico. **Comm:** This spectacular small tree is showy in bud or flower. The smooth, medium gray bark is distinctive in winter. **Syn:** = *Cercis canadensis* Linnaeus var. *canadensis* – Ar, C, G, K1, K3, K4, NcTx, NE, SE3, Tx, Va, Isely (1975), Isely (1998), Robertson & Lee (1976); < *Cercis canadensis* Linnaeus – F, Fl3, GrPl, Il, Mi, Pa, RAB, S, Tn, W, WH3; > *Cercis canadensis* Linnaeus – Greene (1912a); > *Cercis dilatata* Greene – Greene (1912a); > *Cercis georgiana* Greene – Greene (1912a). NatureServe G5T5 (Secure).

Chamaecrista Moench 1794 (PARTRIDGE-PEA)

A genus of about 250-350 species, shrubs and herbs, of primarily tropical and subtropical areas, extending into temperate areas in North America, South America, and e. Asia. References: Franck (2021a) in Weakley et al (2021); Irwin & Barneby (1982); Isely (1975); SE3; Isely (1998); Robertson & Lee (1976).

- 7 Corolla 0.8-1.0 cm in diameter, the larger petals 4-7 (-8) mm long; functional stamens 4-8; fruits (15-) 18-32 (-36) mm long.
 8 Petiole pilose with yellowish hairs 1-2 (-3) mm long; petiolar gland cylindric or clavate; functional stamens 5-8; leaflets 5-6× as long as wide *Chamaecrista nictitans* var. *aspera*
 8 Petiole incurved-puberulent with hairs 0-0.8 mm long; petiolar gland stalked-cupuliform or stalked-discoid; functional stamens 4-5; leaflets 3-5× as long as wide. *Chamaecrista nictitans* var. *nictitans*
 7 Corolla 2.0-3.5 cm in diameter, the larger petals 12-20 mm long; functional stamens 10; fruits 25-75 (-85) mm long.
 9 Perennial from a horizontal woody root or crown; stems usually clustered, and variously prostrate, decumbent, ascending, or erect; peduncles axillary, or supra-axillary by adnation 0-10 (-15) mm above the node. *Chamaecrista horizontalis*
 9 Annual from a taproot; stems solitary (rarely several), ascending to erect; peduncles adnate to the stem 1-26 mm above the node (appearing to diverge from the stem in the internode); [series *Chamaecrista*].
 14 Surface of leaflets pubescent; [from w. Panhandle FL and s. AL westward] *Chamaecrista fasciculata* var. *1*
 14 Surface of leaflets glabrous; [collectively widespread in our area] *Chamaecrista fasciculata* var. *fasciculata*

Chamaecrista fasciculata (Michaux) Greene var. *1*. **Hab:** Dunes, sandy disturbed areas. **Dist:** Panhandle FL and s. AL west to e. and se. TX. **Comm:** {synonymy incomplete}. **Syn:** = *Cassia fasciculata* var. *puberula* (Greene) J.F. Macbride – Isely (1975); = *Chamaecrista puberula* Greene; < *Chamaecrista fasciculata* (Michaux) Greene – Fl3, SE3, WH3, Irwin & Barneby (1982); < *Chamaecrista fasciculata* (Michaux) Greene var. *fasciculata* – K1, K3, K4, Isely (1998); > *Chamaecrista littoralis* Pollard – S; > *Chamaecrista mississippiensis* (Pollard) Pollard ex Heller – S.

Chamaecrista fasciculata (Michaux) Greene var. *fasciculata*. COMMON PARTRIDGE-PEA. **Hab:** Fields, disturbed areas, fencerows, and a wide range of other habitats. **Dist:** MA west to MN, south to s. FL and Mexico. **Phen:** Jun-Sep; Jul-Nov. **Tax:** See discussion of the *Chamaecrista fasciculata* complex under var. *macrosperma*. **Syn:** = NY, Va; = *Chamaecrista fasciculata* var. *fasciculata* (variant 1, variant 2, and typical variant) – Isely (1975); > *Cassia chamaecrista* var. *robusta* Pollard – GrPl; > *Cassia chamaecrista* var. *rostrata* – GrPl, not published; < *Cassia fasciculata* Michaux – RAB, W; > *Cassia fasciculata* var. *fasciculata* – F, G, Tx, Robertson & Lee (1976); > *Cassia fasciculata* var. *ferrisiae* – Tx; > *Cassia fasciculata* var. *littoralis* (Pollard) J.F. MacBride – Robertson & Lee (1976); > *Cassia fasciculata* var. *puberula* (Greene) J.F. Macbride – Tx; > *Cassia fasciculata* var. *robusta* (Pollard) J.F. Macbride – F, G, Tx, Robertson & Lee (1976); > *Chamaecrista fasciculata* var. *fasciculata* – Il, misspelling; > *Chamaecrista fasciculata* var. *robusta* – Il, misspelling; < *Chamaecrista fasciculata* (Michaux) Greene – C, Fl3, Mi, NcTx, NE, Pa, Tn, WH3, Irwin & Barneby (1982); > *Chamaecrista fasciculata* (Michaux) Greene – S; < *Chamaecrista fasciculata* (Michaux) Greene var. *fasciculata* – Ar, K1, K3, K4, SE3, Isely (1998), (also see var. *macrosperma*); > *Chamaecrista robusta* Pollard – S.

Chamaecrista horizontalis A.R. Franck. **Hab:** Longleaf pine sandhills, other dry longleaf pine woodlands, disturbed sandy areas. **Dist:** Sw. and wc. GA (Jones & Coile 1988) south to s. peninsular FL, Panhandle FL, and west to s. MS (Sorrie & Leonard 1999). **Phen:** Late Mat-early Aug. **Tax:** See Franck in Weakley et al. (2021). **Syn:** = Franck (2021a) in Weakley et al (2021); < *Chamaecrista deeringiana* Small & Pennell – K1, K3, K4, SE3, Irwin & Barneby (1982), Isely (1975), Isely (1998); < *Chamaecrista fasciculata* (Michaux) Greene – Fl3, WH3.

Chamaecrista nictitans (Linnaeus) Moench var. *aspera* (Muhlenberg ex Elliott) Torrey & A. Gray ex H.S. Irwin & Barneby. SOUTHERN SENSITIVE-PLANT. **Hab:** Pine savannas, pinelands, disturbed sandy soils. **Dist:** Se. SC south to s. FL. **Phen:** Jun-Oct; Jul-Nov. **Syn:** = Bah, Fl3, WH3, Isely (1998); = *Cassia aspera* Muhlenberg ex Elliott – RAB, Isely (1975), Robertson & Lee (1976); = *Chamaecrista aspera* (Muhlenberg ex Elliott) Greene – S; = *Chamaecrista nictitans* ssp. *nictitans* var. *aspera* (Muhlenberg ex Elliott) Irwin & Barneby – K1, K3, K4, SE3, Irwin & Barneby (1982). NatureServe G5T5 (Secure).

Chamaecrista nictitans (Linnaeus) Moench var. *nictitans*. COMMON SENSITIVE-PLANT. **Hab:** Forests, woodlands, disturbed areas, pine savannas, and a wide variety of other habitats. **Dist:** *C. nictitans* is widely distributed in e. North America, and (depending on the scope of what is included in it) south into South America. Var. *nictitans* ranges throughout se. United States, north to MA, NY, OH, and KA. **Phen:** Jun-Oct; Jul-Nov. **Syn:** = Ar, Fl3, NY, Va, WH3, Isely (1998); = *Chamaecrista nictitans* ssp. *nictitans* var. *nictitans* – K1, K3, K4, NE, SE3, Irwin & Barneby (1982); < *Cassia nictitans* Linnaeus – GrPl, RAB, W, Isely (1975), Robertson & Lee (1976); > *Cassia nictitans* var. *hebecarpa* Fernald – F, G; > *Cassia nictitans* var. *nictitans* – F, G, Tx; < *Chamaecrista nictitans* – Il, misspelling; > *Chamaecrista multipinnata* Pollard – S; < *Chamaecrista nictitans* – C, Mi, NcTx, Pa, Tn; > *Chamaecrista procumbens* (Linnaeus) Greene – S. *Cladrastis* Rafinesque 1824 (YELLOW-WOOD)

A genus of about 6 species, trees, of the se. United States and montane regions of Japan and China. References: Duley & Vincent (2003); Isely (1981); Isely (1998); Rudd (1972).

Cladrastis kentukea (Dumont de Courset) Rudd. YELLOW-WOOD. **Hab:** Mountain forests, Piedmont bluffs, especially on calcareous or mafic rocks (introduced only in the Piedmont of NC). **Dist:** This small to large tree has a native range primarily in the Southern Appalachians (mostly on the west side), the Ozarks, and limestone regions in-between (such as c. TN), ranging from s. OH, s. IN, s. IL, and s. MO south to sw. NC, sc. SC, n. GA, AL, c. AR, and e. OK, but is cultivated and (at least sparsely) naturalized more widely. **Phen:** Apr-May; Jul-Aug. **Comm:** As discussed by Wyatt (1985), the SC occurrence on Fall Line bluffs of the Savannah River is an interesting disjunction, apparently relictual. Yellow-wood is a distinctive tree, distinguished by its smooth silvery-gray bark, peculiar leaves with alternate leaflets, and pendent panicles of white flowers. Increasingly planted as an ornamental, and likely to start escaping more widely, as reported for Fairfax County, VA (Steury 2011). **Syn:** = Ar, IL, K1, K3, K4, NE, NY, W, Duley & Vincent (2003), Rudd (1972); = *Cladrastis lutea* (Michaux f.) K. Koch – C, F, G, RAB, S, SE3, Isely (1981), Isely (1998). NatureServe G4 (Apparently Secure).

*Clitoria* Linnaeus 1753 (BUTTERFLY PEA, PIGEONWINGS)

A genus of about 60 species, of tropical and warm temperate regions of the New and Old World. References: Fantz (2000); Fantz (2002b); Isely (1998).

Identification Notes: *Centrosema* and *Clitoria* are unique among our legumes in having resupinate flowers, the pedicel twisted 180 degrees so that the large 'standard' is lowermost. They are often confused; see key and identification comments under *Centrosema*.

Clitoria mariana Linnaeus var. *mariana*. BUTTERFLY PEA, SHE-PEA. **Hab:** Dry woodlands and openings, roadsides. **Dist:** NY (Long Island), NJ west to s. OH, s. IL, MO, and OK, south to c. peninsular FL, TX, and South America; disjunct in s. AZ. **Phen:** Jun-Aug; Jul-Oct. **Tax:** Var. *pubescentia* Fantz is endemic in c. and s. peninsular FL (see below); a third variety, var. *orientalis* Fantz, is endemic in se. Asia. **Syn:** = K4, NY, Va, Fantz (2000), Fantz (2002b); < *Clitoria mariana* – Ar, C, F, G, GrPl, IL, K1, K3, NeTx, Pa, RAB, SE3, Tn, Tx, W, WH3, Isely (1998); < *Clitoria mariana* Linnaeus var. *mariana* – Fl3; < *Martiusia mariana* (Linnaeus) Small – S.

*Crotalaria* Linnaeus 1753 (RATTLEBOX)

A genus of about 600 species, annual and perennial herbs, nearly cosmopolitan in tropical and temperate regions (especially diverse in Africa). References: Isely (1986b); Isely (1998); Leverett & Woods (2012); Ward (2009a); Ward (2010b); Windler (1974).

- 1 Leaves trifoliate; either a decumbent or ascending perennial herb to 1 m tall, or an erect annual herb, typically 1-2 m tall.
 - 3 Leaflets lanceolate, often narrowly so, 3-15× as long as wide; legume straight or nearly so (or upcurved at the tip).
 - 4 Corolla 8-10 mm long; legume 4-6 mm in diameter, upcurved at tip..... *Crotalaria lanceolata*
 - 4 Corolla 18-20 mm long; legume 15 mm in diameter, not upcurved..... *Crotalaria ochroleuca*
 - 3 Leaflets obovate to elliptic-oblong, 1.5-3.5× as long as wide; legume either straight or conspicuously curved.
 - *Crotalaria pallida* var. *obovata*
- 1 Leaves unifoliate; plants of various habits, mostly either perennial, smaller, or both.
 - 7 Corolla 1.7-3.0 cm long; leaflets 4-15 cm long; stipules not decurrent on the stem and not conspicuously foliose; [exotic annual herbs, in disturbed habitats].
 - 9 Bracts of the inflorescence 2-3 mm long, caducous; leaflets 4-8 cm long..... *Crotalaria retusa*
 - 9 Bracts of the inflorescence 5-8 mm long, persistent; leaflets 5-15 cm long..... *Crotalaria spectabilis*
 - 7 Corolla 0.7-1.4 cm long; leaflets 1-8 cm long; stipules of at least the upper leaves conspicuously decurrent on the stem, giving the impression of a downward-pointing arrowhead (this feature sometimes inconspicuous or essentially absent in *C. maritima*, *C. rotundifolia*, and *C. avonensis*); [native perennial or annual herbs, in natural or disturbed habitats].
 - 10 Plant an erect annual; stems with spreading pubescence, the longer hairs 1-2 mm long; leaflets of the upper portion of the plant (4-) avg. 6 (-8)× as long as wide; [mostly of the Piedmont and Mountains (and Coastal Plain of VA)]..... *Crotalaria sagittalis*
 - 10 Plant a decumbent, sprawling, or erect perennial; stems with appressed or spreading pubescence, the longer hairs < 1.2 mm long; leaflets of the upper portion of the plant averaging either (1-) avg. 1-2 (-4)× or (5-) avg. 8-10 (-15)× as long as wide; [mostly of the Coastal Plain].
 - 11 Leaflets glabrous above; leaflets of the upper portion of the plant usually (5-) 10 (-15)× as long as wide; plant erect or ascending *Crotalaria purshii*
 - 11 Leaflets pubescent above with strigose hairs (the hairs sometimes sparse – check with hand lens); leaflets of the upper portion of the plant usually (1-) 2-10× as long as wide; plant erect, decumbent, or low-ascending.

Ctenodon Baillon 1870

A genus of 66 or perhaps 120 species, herbs, subshrubs, shrubs, treelets or small trees, of s. North America, Central America, South America, and the West Indies. The genus has often been treated as *Aeschynomene* sect. *Ochopodium*, but is more closely related to *Dalbergia* and *Machaerium* than to *Aeschynomene* sensu stricto. It may be expanded to include taxa in the Old World tropics (Cardoso et al. 2020). References: Cardoso et al (2019); Cardoso et al (2020).

Ctenodon viscidulus (Michaux) D.B.O.S. Cardoso & A. Delgado. STICKY JOINTVETCH. **Hab:** Dry sandy areas, such as longleaf pine sandhills, other dry pinelands, sandy coastal prairies, and barrier islands. **Dist:** From s. GA (Jones & Coile 1988; Carter, Baker, & Morris 2009; SE), panhandle FL, s. AL, s. MS, and s. TX south to s. FL; Mexico south through Central America to South America; West Indies. **Syn:** = Cardoso et al (2020); = *Aeschynomene viscidula* Michaux – K1, K3, K4, SE3, Tx, WH3, Isely (1998), Rudd (1955), Vanni (2016); = *Secula viscidula* (Michaux) Small – S. **NatureServe G5?** (Secure).

Cullen Medikus 1787

A genus of ca. 35 species, herbs and shrubs, of the Old World. References: Isely (1998).

* ***Cullen americanum*** (Linnaeus) Rydberg. SCURF-PEA. **Hab:** Waste areas around wool-combing mills and dumps, other disturbed areas, perhaps only a waif. **Dist:** Native of the w. Mediterranean region (a misnomer). There are other (older) reports from other southeastern states, including FL and MS. **Syn:** = K4, NY, S, Isely (1998); = *Cullen americana* – K1, K3, SE3, orthographic variant. **NatureServe GNR** (Not Yet Ranked).

*Dalea* Linnaeus 1758 (PRAIRIE-CLOVER)

A genus of about 165 species, herbs and shrubs, of temperate and tropical America, especially of dry habitats and most diverse in Mexico. References: Barneby (1977); Diggs & Weakley (2017) in Weakley et al (2017); Isely (1998); Turner (2006b); Turner (2010); Turner (2013); Ward (2004c); Woods (2013).

Identification Notes: In our region, *Dalea* may be recognized by its odd-pinnately compound leaves with 3-many leaflets, the aggregation of smallish flowers into spikes, racemes or heads, the modification of the flower to a lesser or greater degree from the standard papilionaceous "pea flower bauplan", and being mainly small to medium-sized herbs (except for three shrub species, restricted to s. FL, OK, and TX). Flowers of *Dalea* in our region are diverse. *Dalea* Type A has the corolla bilaterally symmetrical and papilionaceous, the 9-10 stamens enclosed in a keel, the wings and keel of standard papilionaceous conformation, arising laterally from the stamen column. *Dalea* Type B has the corolla nearly symmetrical, the petals arising laterally from the stamen column, the 9-10 stamens or staminodes exposed. *Dalea* Type C has the corolla nearly symmetrical, the epistemonous petals arising from the summit of the stamen column, the 5 stamens exposed.

16 Spikes arrayed in a compound corymb; spike capitate, surrounded by an involucre of 3-4 series of sterile bracts.

.....*Dalea pinnata* var. *trifoliata*

16 Spikes not corymbosely disposed, ovoid to cylindric; spikes not capitate, with or without a few subtending, sterile bracts.

25 Calyx glabrous (puberulent in *D. oligophylla*); bracteoles present, 0.5-1.5 mm long, bristle-like and tending to be persistent; stems glabrous.

28 Calyx tube split on the upper side; calyx tube ribs not prominent, the intervals eglandular or nearly so; leaflets 5; [GA, AL, FL].

.....*Dalea mountjoyae*

28 Calyx not split on the upper side; calyx tube ribs prominent (sometimes even flange-like), the intervals with 1 (-3) prominent gland(s); leaflets 5-11; [IN, c. KY, e. TN, c. AL westward].

.....*Dalea candida*

25 Calyx variously and obviously hairy; bracteoles absent; stems glabrate to variously hairy.

.....*Dalea purpurea*

Dalea candida Michaux ex Willdenow. WHITE PRAIRIE-CLOVER. **Hab:** Calcareous glades and barrens, prairies. **Dist:** WV, KY, IN, WI, MN, and SK south to nw. GA, e. TN, w. AL, sc. MS, s. LA, and ne. TX. **Phen:** Late May-Sep. **Syn:** = Il, NE, SE3, Tn, Isely (1998); = *Dalea candida* var. *candida* – Ar, C, GrPl, K1, K3, K4, NcTx, Barneby (1977); = *Petalostemon candidus* (Michaux ex Willdenow) Michaux – S; = *Petalostemon candidum* (Michaux ex Willdenow) Michaux – F, G; = *Petalostemon candidum* var. *candidum* – Tx. **NatureServe G5T5** (Secure).

Dalea mountjoyae M. Woods. SPRAWLING WHITE-TASSELS. **Hab:** Wet pine savannas. **Dist:** Sc. and sw. GA west to se. LA. **Phen:** Aug-Sep. **Comm:** The combination at the specific level in *Dalea* using the epithet '*gracilis*' is preoccupied; the replacement name is supplied by Woods (2013). **Syn:** = K3, K4, Woods (2013); = *Dalea carnea* (Michaux) Poir. var. *gracilis* (Nuttall) Barneby – Fl3, K1, SE3, WH3, Barneby (1977), Isely (1998); = *Dalea gracilis* (Nuttall) D.B. Ward – Ward (2004c), invalid name; = *Petalostemon gracilis* Nuttall – S. **NatureServe G5T3** (Vulnerable).

Dalea pinnata (J.F. Gmelin) Barneby var. *trifoliata* (Chapman) Barneby. **Hab:** Longleaf pine sandhills, dry to moist longleaf pine flatwoods. **Dist:** E. GA (near the Savannah River) south and west to w. Panhandle FL, s. AL, and s. MS. **Phen:** Sep-Nov. **Tax:** Under study by Diggs & Fuller. **Syn:** = Fl3, K1, K3, K4, SE3, WH3, Barneby (1977), Isely (1998); = *Dalea species 1*; = *Petalostemon pinnatus* (J.F. Gmelin) Blake ssp. *trifoliatus* (Chapman) Wemple; < *Kuhnistera pinnata* (J.F. Gmelin) Kuntze – S. **NatureServe G5T3T4** (Vulnerable).

Dalea purpurea Ventenat. PURPLE PRAIRIE-CLOVER. **Hab:** Prairies, glades, and open woodlands. **Dist:** ON west to BC, south to KY, TN, n. AL, c. MS, TX, and NM. **Phen:** Jun-Sep. **Syn:** = Il, K3, K4, Mi, NcTx, Tn; = *Dalea purpurea* var. *purpurea* – C, GrPl, K1, NY, SE3, Barneby (1977), Isely (1998); = *Petalostemon purpureus* (Ventenat) Rydberg – S; = *Petalostemon purpureum* (Ventenat) Rydberg – F, G, Tx. **NatureServe G5T5** (Secure).

140. FABACEAE

*Desmanthus* Willdenow 1806 (BUNDLEFLOWER)

A genus of about 25 species, herbs and shrubs, of warm temperate and subtropical America. References: Isely (1973); Isely (1998); Luckow (1993); MacRoberts & MacRoberts (2011b).

Desmanthus illinoensis (Michaux) MacMillan ex B.L. Robinson & Fernald. COMMON BUNDLEFLOWER, PRAIRIE MIMOSA. **Hab:** Prairies, open woodlands, barrens, marsh edges, disturbed areas. **Dist:** OH, MN, and ND south to Panhandle FL, TX, and NM; with scattered adventive occurrences east and west of the native distribution. **Phen:** Jun-Jul; Aug-Nov. **Syn:** = *Ar*, C, F, FI3, G, GrPl, IL, K1, K3, K4, Mi, NcTx, RAB, SE3, Tn, Tx, W, WH3, Isely (1973), Isely (1998), Luckow (1993); = *Acuan illinoense* (Michaux) Kuntze – S; = *Mimosa illinoensis* Michaux. NatureServe G5 (Secure).

*Desmodium* Desvaux 1813 (TICK-TREFOIL, TICK-CLOVER, BEGGAR'S-TICKS, STICK-TIGHTS)

A genus of about 275-300 species, annual herbs, perennial herbs, and shrubs, nearly cosmopolitan (but lacking from Europe). In our area, *Desmodium* is a complex genus. Some of the species in our area are confusing and can be identified only with difficulty. References: Isely (1998); Krings (2004); Ohashi & Ohashi (2018); Ohashi (2013); Ohashi et al (2018); Ohashi in FNA () (in prep); Raveill (2002); Thomas (2020).

Identification Notes: In fruit, *Desmodium* is easy to recognize, as one of only four genera of Fabaceae in our region with loments (legumes which separate into one-seeded segments along sutures). *Aeschynomene* has pinnately compound leaves with many leaflets, in contrast to the trifoliolate (exceptionally unifoliolate) leaves of *Desmodium*. The other two genera have both often been treated as components of *Desmodium*. *Grona* is represented in our flora by a single naturalized species, *Grona triflora*, in the Coastal Plain of FL, GA, AL, and e. LA (and to be expected in MS and perhaps other nearby areas); it has flowers in axillary clusters rather than axillary or terminal racemes or panicles. *Hylodesmum* consists of three species occurring in mainly shady, forested settings, separable from *Desmodium* by many characters (see key).

- 2 Longest calyx lobes shorter than the calyx tube; stipe of the loment 4-20 mm long, about 3× or more as long as the calyx; mature leaves without stipels at the base of the petiolules of the leaflets; leaves subverticillate at the top of the stem (alternate in *D. pauciflorum*); stamens monadelphous; lower margin of the loment incised to the upper suture **Key A**
- 2 Longest calyx lobes longer than the calyx tube; stipe of the loment absent or nearly so, included within the calyx; mature leaves retaining stipels at the base of the petiolules of the leaflets; leaves alternate; stamens diadelphous; lower margin of the loment not incised to the upper suture.
- 3 Leaflets narrow, the terminal leaflet < 14 mm wide, and also 4-12× as long as wide, typically thick and strongly reticulate; petioles of midstem leaves 1-10 (-15) mm long; [primarily of the Coastal Plain and lower Piedmont (rarely Mountains) in our area] **Key A**
- 3 Leaflets broader, the terminal leaflet > 15 mm wide, or < 4× as long as wide, typically thin and not reticulate; petioles of midstem leaves various, but > 15 mm long if leaflet proportions are narrow; [collectively widespread in our area].
- 4 Stems trailing vinelike along the ground, and/or the plants stoloniferous or rhizomatous **Key B**
- 4 Stems erect or ascending, not vinelike.
- 5 Stipules (5-) 7-20 mm long, > 1 mm wide at the base, clasping or truncate at the base, persistent (most or all of the stipules persisting through the year), 4-20 mm long; leaflets 1.5-3× as long as wide **Key C**
- 5 Stipules 2-6 (-9.5) mm long, < 1 mm wide at the base, narrowed or parallel-sided to the base, caducous (most or all of the stipules falling soon after expansion of the leaves); leaflets 1-8 (-10)× as long as wide **Key D**

Key A - : *Desmodium* with very narrow leaflets

- 1 Petioles (0-) 1-3 (-4) mm long, the leaves thus sessile; leaflets 5-10 mm wide, strongly pubescent on the lower surface *Desmodium sessilifolium*
- 1 Petioles 3-15 mm long, the leaves thus obviously petiolate; leaflets 2-5 (-8) mm wide, glabrate or inconspicuously puberulent on the lower surface.
- 2 Loment segments flat to distinctly concave along the upper (suture) margin; [of dry to mesic habitats] *Desmodium strictum*
- 2 Loment segments slightly convex along the upper (suture) margin; [of boggy, wet, or mesic habitats] *Desmodium tenuifolium*

Key B - : *Desmodium* with trailing stems or stoloniferous-rhizomatous habit

- 4 Stipules ovate, persistent, slightly to strongly clasping at the base, 6-12 mm long.
- 5 Leaflets ovate, 1.2-1.9× as long as wide; flowers white to yellowish; loment uncinately-puberulent only along the sutures *Desmodium ochroleucum*
- 5 Leaflets ovate, 0.8-1.1× as long as wide; flowers blue-purple; loment uncinately-puberulent over the surface *Desmodium rotundifolium*
- 4 Stipules lanceolate to linear (or deltate in *D. humifusum*), usually quickly deciduous, not clasping at the base, 2-8 mm long.
- 6 Terminal leaflet 1.4-2.0× as long as wide, 3.0-7.0 cm long; loment segments 6-8 mm long; stipules 4-8 mm long, ovate to lance-acuminate *Desmodium humifusum*
- 6 Terminal leaflet 0.9-1.2× as long as wide, 1.5-2.3 cm long; loment segments 4-5 mm long; stipules lanceolate, 1-5 mm long *Desmodium lineatum*

Key C

- 1 Loment segments 3-5.5 mm long, nearly symmetrical along the axis of the loment (the isthmi more or less equal above and below, thus each segment diamond-shaped, rounded-diamond-shaped, or essentially elliptical).....*Desmodium tortuosum*
- 1 Loment segments 5-11 mm long, asymmetrical along the axis of the loment (the isthmi deeper below than above, thus each segment triangular, rounded-triangular, or semi-circular).
- 5 Stem densely spreading pilose (at least the upper stem) and also uncinat-puberulent; loment segments 6.5-10 mm long.....*Desmodium canescens*
- 5 Stem glabrous or uncinat-puberulent; loment segments 9-11 mm long.....*Desmodium cuspidatum*

Key D

- 2 Loment with 1-3 segments, rounded below.
- 3 Leaflets cinereous on the lower surface; corolla 6-7 mm long; loment with 3 (-4) segments.....*Desmodium nuttallii*
- 3 Leaflets not cinereous on the lower surface; corolla 3.5-6 mm long; loment with 1-2 (-3) segments; ["*Desmodium ciliare* group"].
- 4 Leaflets 3-5.5× as long as wide.....*Desmodium ciliare*
- 4 Leaflets 1.2-3.5× as long as wide.
- 5 Terminal leaflet usually distinctly longer and narrower than the lateral leaflets; stem (near the middle) sparsely to densely uncinat-pubescent.....*Desmodium obtusum*
- 5 Terminal leaflet similar to the lateral leaflets; stem (near the middle) glabrous to pilose, or also with some uncinat-pubescent.
- 6 Petioles 1-3 (-5) mm long; pedicels 3-8 mm long; stem usually pilose; leaflets sub-appressed pubescent (to glabrate).....*Desmodium ciliare*
- 6 Petioles 10-25 mm long; pedicels 8-15 mm long; stem glabrous (to sparsely uncinat-puberulent); leaflets glabrous or with only a few scattered hairs....*Desmodium marilandicum*
- 2 Loment with 2-5 segments, mostly obtusely angled below.
- 7 Leaves densely villous on the lower surface; stem densely pubescent with uncinat or non-uncinat hairs.
- 8 Leaflets 1.5-2.0 (-2.2)× as long as wide; loment usually curved (the upper margin convex); loment with 2-4 segments; loment segments 4-7 mm long.....*Desmodium nuttallii*
- 8 Leaflets 1.0-1.5 (-1.9)× as long as wide; loment straight; loment with (3-) 4-5 (-6) segments; loment segments 5-8 (-9) mm long.....*Desmodium viridiflorum*
- 7 Leaves glabrous to moderately appressed-villous on the lower surface; stem glabrate, pilose or uncinat pubescent.
- 9 Bracts (subtending clusters of 2-3 flowers) usually villous; plants moderately to densely villous; loment usually incurved (the upper margin convex); loment with 2-4 segments, each segment 4-5 mm long.....*Desmodium nuttallii*
- 9 Bracts (subtending clusters of 2-3 flowers) not villous; plants glabrous or slightly to moderately villous or pilose; loment usually nearly straight; loment with 3-5 segments, each segment 4-8.5 mm long.
- 10 Corolla 8-10 mm long; pedicels usually 10-15 (-20) mm long; stems and leaves glabrous; leaflets distinctly pale on the lower surface.....*Desmodium laevigatum*
- 10 Corolla 6-8 (-9) mm long; pedicels 3-12 mm long; stems and leaves pubescent or glabrate (but pubescent at least on the leaves); leaflets green or slightly pale on the lower surface; ["*Desmodium paniculatum* group"].
- 11 Leaflet lower surface glabrous, except for the conspicuous uncinat puberulence on the veins; stems and petioles glabrous or uncinat-puberulent; [plant of the Coastal Plain and possibly lower Piedmont].....*Desmodium fernaldii*
- 11 Leaflet lower surface strigose to conspicuously sub-appressed-villous, and sometimes also uncinat-puberulent; stems and petioles glabrate to conspicuously pilose or uncinat-puberulent; [plants collectively widespread in our area].
- 12 Leaflets (2.5-) 3-8 (-10)× as long as wide; leaflet pubescence usually sparse, of straight, appressed hairs < 0.5 mm long (or sometimes of longer spreading hairs); leaflets usually lacking uncinat pubescence on either surface; mid-stems glabrous or glabrate, the pubescence usually uncinat puberulence.....*Desmodium paniculatum* var. *paniculatum*
- 12 Leaflets 1.5-3 (-4)× as long as wide; leaflet pubescence usually evident, of spreading hairs > 0.5 mm long; leaflets usually with uncinat pubescence on the veins of the upper surface; mid-stems pubescent, either pilose or with uncinat pubescence (if not, evidently pubescent on the petioles).
- 14 Each side (from the isthmus on one side of the article to the broadest point) of the ventral margin of most articles straight to slightly convex; leaves gradually but noticeably reduced in size and petiole length distally along the stem, often with small leaves extending well onto the flowering branches; terminal leaflets lanceolate to broadly ovate (most specimens, especially of full sun habitats, are on the narrow end of this range), broadest nearer the base than the middle.....*Desmodium glabellum*
- 14 Each side (from the isthmus on one side of the article to the broadest point) of the ventral margin of most articles concave; leaves mostly all the same size and not or little extending onto the flowering branches (the few leaves that do extend into the inflorescence branches will also be reduced in size but more abruptly so); terminal leaflets narrowly ovate to broadly elliptic-ovate (most specimens are on the wider end of this range), broadest nearer the middle than the base.....*Desmodium perplexum*

Desmodium canescens (Linnaeus) A.P. de Candolle. HOARY TICK-TREFOIL. **Hab:** Fields, woodland borders, disturbed areas. **Dist:** MA west to WI and NE, south to n. peninsular FL and TX. **Phen:** Jun-Oct; Aug-Nov. **Syn:** = Ar, C, F, FI3, FNA, G, GrPl, Il, K1, K3, K4, Mi, NcTx, NE, NY, Pa, RAB, SE3, Tn, Tx, Va, W, WH3, WV, Isely (1998); = *Meibomia canescens* (Linnaeus) Kuntze - S. **NatureServe G5** (Secure).

Desmodium ciliare (Muhlenberg ex Willdenow) A.P. de Candolle. **Hab:** Fields, woodland borders, disturbed areas. **Dist:** MA west to IN, MO, and se. KS, south to s. FL and TX; also in Cuba. **Phen:** Jun-Oct; Aug-Nov. **Syn:** = Ar, Bah, C, FI3, G, GrPl, Il, K3, Mi, NcTx, NE, NY, Pa, RAB, SE3, Tn, Tx, Va, W, WH3, WV, Isely (1998); = *Desmodium marilandicum* (Linnaeus) A.P. de Candolle var. *ciliare* (Muhlenberg ex Willdenow) H. Ohashi - FNA, K4, Ohashi (2013); = *Meibomia ciliaris* (Muhlenberg ex Willdenow) Blake - S; > *Desmodium ciliare* var. *ciliare* - F, K1; > *Desmodium ciliare* var. *lancifolium* Fernald - F, K1.

Desmodium cuspidatum (Muhlenberg ex Willdenow) A.P. de Candolle ex Loudon. LARGE-BRACTED TICK-TREFOIL. **Hab:** Fields, woodlands, woodland borders, disturbed areas. **Dist:** VT and MA west to MN, south to FL Panhandle and e. TX. **Phen:** Jun-Aug; Aug-Oct. **Syn:** = Ar, FI3, FNA, Mi, NE, Pa, RAB, Tn, Tx, W, WH3, WV, Isely (1998); > *Desmodium cuspidatum* (Muhlenberg ex Willdenow) A.P. de Candolle ex Loudon var. *cuspidatum* - C, F, G, GrPl, Il, K1, K3, SE3, Va; > *Desmodium cuspidatum* (Muhlenberg ex Willdenow) A.P. de Candolle ex Loudon var. *longifolium* (Torrey & A. Gray) Schubert - C, F, G, GrPl, Il, K1, K3, SE3; ? *Meibomia bracteosa* (Michaux) Kuntze.

Desmodium fernaldii B.G. Schubert. FERNALD'S TICK-TREFOIL. **Hab:** Longleaf pine sandhills and dry flatwoods, other dry sandy habitats, woodland borders. **Dist:** Se. VA south to s. SC (and maybe e. GA and n. FL); Isely (1998) states that reports from the Gulf Coast are based on "glabrate forms of *D. glabellum*", and also suggests that *D. fernaldii* is only weakly differentiated from *D. glabellum*. **Phen:** Jun-Sep; Aug-Oct. **Syn:** = C, F, FI3, G, II, K1, K3, RAB, SE3, Tx, Va, W, WH3, Isely (1998); = *Desmodium paniculatum* var. *fernaldii* – K4, Ohashi (2013); < *Meibomia rhombifolia* Vail – S. NatureServe G4 (Apparently Secure).

Desmodium glabellum (Michaux) A.P. de Candolle. TALL TICK-TREFOIL. **Hab:** Fields, woodland borders, disturbed areas. **Dist:** ME west to WI and NE, south to n. peninsular FL and TX. **Phen:** Jun-Sep; Aug-Oct. **Tax:** See Thomas (2020) for a detailed discussion and reinterpretation of the taxonomy of *Desmodium glabellum* and *D. perplexum*. **Syn:** = Ar, F, FI3, II, K1, K3, Mi, NE, Pa, RAB, SE3, Tn, Tx, Va, WH3, WV, Isely (1998), Thomas (2020); < *Desmodium glabellum* (Michaux) A.P. de Candolle – C; < *Desmodium paniculatum* var. *dillenii* (Darlington) Isely – W; < *Desmodium paniculatum* (Linnaeus) A.P. de Candolle var. *paniculatum* – K4; ? *Meibomia paniculata* (Linnaeus) Kuntze – S; ? *Meibomia pubens* (Torrey & A. Gray) Rydberg – S.

Desmodium ×humifusum (Muhlenberg ex Bigelow) L.C. Beck [paniculatum × rotundifolium]. GROUND-SPREADING TICK-TREFOIL. **Hab:** Dry, sandy soils. **Dist:** MA (NS?) south to MD and DC (and possibly VA). **Tax:** Raveill (2002) discusses the probably hybrid origin of *Desmodium humifusum* (paniculatum × rotundifolium). The exact nature of its origin and status as a hybrid versus a species of hybrid origin is unclear. **Syn:** = FNA, K3, K4, NE, Raveill (2002); = *Desmodium glabellum* (Michaux) A.P. de Candolle – G, misapplied; = *Desmodium humifusum* (Muhlenberg ex Bigelow) L.C. Beck – C, F, K1, Pa, SE3, Isely (1998); = *Desmodium paniculatum* × *rotundifolium* – NY; = *Meibomia glabella* – S, misapplied.

Desmodium laevigatum (Nuttall) A.P. de Candolle. SMOOTH TICK-TREFOIL. **Hab:** Dry oak and pine forests, fields, woodland borders, disturbed areas. **Dist:** S. NY west to IN and MO, south to n. FL, Panhandle FL, and TX. **Phen:** Jun-Sep; Aug-Oct. **Syn:** = Ar, C, F, FI3, FNA, G, II, K1, K3, K4, NY, Pa, RAB, SE3, Tn, Tx, Va, W, WH3, WV, Isely (1998); = *Meibomia laevigata* (Nuttall) Kuntze – S. NatureServe G5 (Secure).

Desmodium lineatum A.P. de Candolle. MATTED TICK-TREFOIL. **Hab:** Longleaf pine sandhills and other dry forests and woodlands. **Dist:** Se. MD south to n. peninsular FL, west to TX, rarely inland. **Phen:** Jun-Sep; Aug-Oct. **Syn:** = C, F, FI3, FNA, G, K1, K3, K4, RAB, SE3, Tx, Va, W, WH3, WV, Isely (1998); > *Meibomia arenicola* Vail – S; > *Meibomia polymorpha* (A. Gray) Small – S. NatureServe G5 (Secure).

Desmodium marilandicum (Linnaeus) A.P. de Candolle. MARYLAND TICK-TREFOIL. **Hab:** Fields, woodland borders, disturbed areas. **Dist:** MA west to MI and MO, south to n. peninsular FL and TX. **Phen:** Jun-Sep; Aug-Oct. **Syn:** = Ar, C, F, FI3, G, GrPl, II, K1, K3, Mi, NcTx, NE, NY, Pa, RAB, SE3, Tn, Tx, Va, W, WH3, WV, Isely (1998); = *Desmodium marilandicum* var. *marilandicum* – K4, Ohashi (2013), Zhang, Zhang, & Endress (2003); = *Meibomia marilandica* (Linnaeus) Kuntze – S.

Desmodium nuttallii (Schindler) B.G. Schubert. NUTTALL'S TICK-TREFOIL. **Hab:** Fields, woodland borders, disturbed areas. **Dist:** NY west to IN, south to n. peninsular FL, FL Panhandle, AL, and AR. **Phen:** Jul-Sep; Aug-Oct. **Syn:** = Ar, F, FI3, FNA, II, K1, K3, K4, NcTx, NY, Pa, RAB, SE3, Tn, Tx, Va, W, WH3, WV, Isely (1998); < *Desmodium viridiflorum* (Linnaeus) A.P. de Candolle – C, G; < *Meibomia viridiflora* (Linnaeus) Kuntze – S.

Desmodium obtusum (Muhlenberg ex Willdenow) A.P. de Candolle. STIFF TICK-TREFOIL. **Hab:** Longleaf pine sandhills and dry pine flatwoods, other dry pine woodlands, fields, woodland borders, disturbed areas. **Dist:** MA west to s. MI, south to Panhandle FL and TX. **Phen:** Jun-Sep; Aug-Oct. **Syn:** = Ar, FI3, GrPl, II, K1, K3, Mi, NcTx, NE, NY, Pa, RAB, SE3, Tn, Tx, Va, W, WH3, Isely (1998); = *Desmodium marilandicum* (Linnaeus) A.P. de Candolle var. *lancifolium* (Fernald & B.G. Schubert) H. Desmodium viridiflorum (Linnaeus) A.P. de Candolle. VELVETY TICK-TREFOIL. **Hab:** Fields, woodland borders, disturbed areas. **Dist:** NJ and DE south to c. peninsular FL, west to TX, and inland to w. VA, w. NC, n. TN, and AR. **Phen:** Jun-Sep; Aug-Oct. **ID Notes:** This robust species is strongly uncinately puberulent on the upper leaf surfaces, stems, and inflorescence axes. **Syn:** = Ar, F, FI3, FNA, Il, K1, K3, K4, NcTx, Pa, RAB, SE3, Tn, Tx, Va, W, WH3, Isely (1998); < *Desmodium viridiflorum* (Linnaeus) A.P. de Candolle – C, G; < *Meibomia viridiflora* (Linnaeus) Kuntze – S.

Erythrina Linnaeus 1753 (CORAL BEAN)

A genus of about 120 species, trees, shrubs, and perennial herbs, of tropical and subtropical regions of the Old and New World. References: Isely (1998); Nesom (2016e).

- 1 Leaflets not lobed; [cultivated tree, persistent] *Erythrina crista-galli*
 1 Leaflets hastately lobed; [native herb or shrub] *Erythrina herbacea*

* **Erythrina crista-galli** Linnaeus. CORALTREE. **Hab:** Cultivated, disturbed areas, roadside ditches. **Dist:** Native of South America. **Syn:** = K1, K3, K4, SE3, Isely (1998); = *Micropteryx crista-galli* (Linnaeus) Walpers – S. NatureServe G4 (Apparently Secure).

Erythrina herbacea Linnaeus. CORAL BEAN, CARDINAL-SPEAR, COLORIN. **Hab:** Maritime forests, dry sandy woodlands, hammocks, longleaf pine sandhills. **Dist:** Se. NC south to FL, west to se. TX. **Phen:** May-Jul; Jul-Sep. **Tax:** Populations in e. Mexico (Tamaulipas, San Luis Potosi) previously ascribed to this species have been separated as a species (Nesom 2016). **Syn:** = Nesom (2016e); > *Erythrina arborea* (Chapman) Small – S; < *Erythrina herbacea* Linnaeus – Ar, FI3, K1, K3, K4, NcTx, RAB, SE3, Tx, WH3, Isely (1998); >> *Erythrina herbacea* Linnaeus – S. NatureServe G5 (Secure).

Galactia P. Browne 1756 (MILKPEA)

A genus of about 111 species, perennial herbs, of tropical and warm temperate regions, primarily American. References: Duncan (1979); Franck (2017); Isely (1998); Nesom (2015a); Nesom in FNA () (in prep); Ward & Hall (2004).

- 4 Stems erect (not prostrate, trailing, or twining), with 4-6 (-8) leaves, usually alternately bent at nodes; inflorescence subsessile, 1-6-flowered *Galactia erecta*
- 4 Stems prostrate, trailing, or twining, with numerous leaves (except in depauperate plants), not bent at nodes; inflorescence pedunculate, 1-flowered if sessile or subsessile.
- 5 Stems climbing or sprawling, twining.
- 11 Leaflets mostly elliptic to broadly elliptic, (5-) 10-21 (-25) mm wide, usually widest at the midpoint; stems moderately to densely hirsute to hirsute-villous with spreading-deflexed hairs; corollas 7-10 mm; leaflets thick in texture, not glaucous below *Galactia regularis*
- 11 Leaflets mostly ovate to lanceolate, 5-15 (-17) mm wide, widest below the midpoint; stems moderately to sparsely strigose with tightly to loosely appressed, retrorse hairs, sometimes glabrate; corollas 9-14 mm; leaflets thin in texture, usually glaucous below *Galactia volubilis*
- 5 Stems procumbent at least proximally and variously twining, weakly twining, or not twining towards the tip.
- 14 Leaflets subcoriaceous to coriaceous, venation raised on both surfaces. *Galactia minor*
- 14 Leaflets herbaceous, venation not raised. *Galactia floridana*

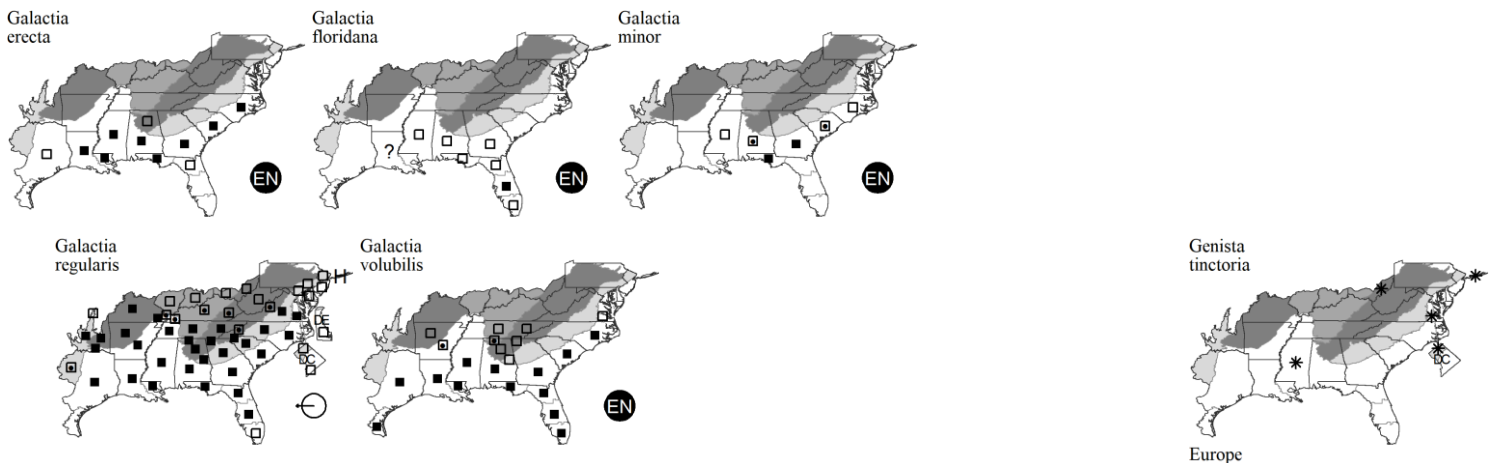

Galactia erecta (Walter) Vail. ERECT MILKPEA. **Hab:** Longleaf pine sandhills. **Dist:** Se. NC south to Panhandle FL, west to e. TX. **Phen:** Apr-Jul; Jul-Sep. **ID Notes:** "*Galactia erecta* is distinct in its erect habit, slender rhizomes, subsessile leaflets, and flowers in axillary-sessile clusters" (Nesom 2015). **Syn:** = FI3, FNA, K1, K3, K4, RAB, S, SE3, Tx, WH3, Duncan (1979), Franck (2017), Isely (1998), Nesom (2015a), Ward & Hall (2004). **NatureServe G4** (Apparently Secure).

Galactia floridana Torrey & A. Gray. FLORIDA MILKPEA. **Hab:** Longleaf pine sandhills and other xeric sands. **Dist:** S. GA south to s. FL, west to s. MS. **Phen:** Mar-Aug (-Sep). **Comm:** "The species is recognized by its procumbent, densely short-tomentose to hirsute-villous stems, relatively large, thick leaves (compare *G. microphylla*), and large flowers" (Nesom 2015). **Syn:** = FNA, K4, Nesom (2015a), Ward & Hall (2004); = *Galactia floridana* var. *floridana* - S; < *Galactia floridana* Torrey & A. Gray - K1, K3, SE3, Duncan (1979), Franck (2017), Isely (1998), (also see *G. volubilis* var. *fasciculata*); < *Galactia volubilis* (Linnaeus) Britton - WH3.

Galactia minor W.H. Duncan. LITTLE MILKPEA. **Hab:** Longleaf pine sandhills. **Dist:** Sc. NC south to Panhandle FL, west to s. MS. **Phen:** Jun-Aug (-Oct); Jul-Oct. **Tax:** "*Galactia minor* is a distinct species with procumbent, antrorsely strigulose stems, small, congested leaves with glabrous adaxial surfaces and raised venation, few flowers on a short inflorescence axis, and relatively large corollas" (Nesom 2015). **Syn:** = FNA, K4, Duncan (1979), Franck (2017), Nesom (2015a), Ward & Hall (2004); = *Galactia floridana* Torrey & A. Gray var. *microphylla* Chapman - S; = *Galactia microphylla* (Chapman) Hall & Ward ex Isely - K1, SE3, Isely (1998); < *Galactia regularis* (Linnaeus) Britton, Sterns, & Poggenburg - RAB, misapplied; < *Galactia volubilis* (Linnaeus) Britton - WH3.

Galactia regularis (Linnaeus) Britton, Sterns, & Poggenburg. **Hab:** Dry forests and woodlands. **Dist:** Se. NY west to MO and OK, south to s. FL and se. TX. **Phen:** Jul-Sep; Aug-Oct. **Comm:** "*Galactia regularis* refers to the species widespread in the eastern USA, with leaflets mostly elliptic to broadly elliptic, relatively small flowers, and twining stems hirsute-villous with deflexed hairs" (Nesom 2015). **Syn:** = FI3, FNA, GrPl, K4, NY, WH3, Duncan (1979), Franck (2017), Nesom (2015a), Ward & Hall (2004); = *Galactia volubilis* (Linnaeus) Britton - K1, S, SE3, Tn, Isely (1998), misapplied; > *Galactia macreei* M.A. Curtis - C, F, G, RAB, Tx; < *Galactia volubilis* (Linnaeus) Britton - Ar, NcTx, WV, (misapplied); > *Galactia volubilis* (Linnaeus) Britton - C, F, G, Pa, RAB, Tx.

Galactia volubilis (Linnaeus) Britton. **Hab:** Longleaf pine sandhills, other dry forests and openings. **Dist:** Se. VA south to s. FL, west to c. AR and e. TX. **Phen:** (Apr-) May-Aug (-Sep). **Syn:** = FNA, K4, Nesom (2015a); = *Galactia volubilis* var. *volubilis* - Ward & Hall (2004); > *Galactia brachypoda* Torrey & A. Gray - S; > *Galactia brevipes* Small - S; < *Galactia regularis* (Linnaeus) Britton, Sterns, & Poggenburg - C, F, G, K1, Pa, RAB, SE3, Tx, Isely (1998), (misapplied); > *Galactia regularis* (Linnaeus) Britton, Sterns, & Poggenburg - S, misapplied; < *Galactia volubilis* (Linnaeus) Britton - Ar, WH3.

*Genista* Linnaeus 1753 (DYER'S GREENWEED)

A genus of about 80-90 species, shrubs, herbs, and small trees, native to Eurasia. References: Isely (1998).

Key to Map
Symbology:

N : no X : extirpated
P : planted
? : questionable

140. FABACEAE

* **Genista tinctoria** Linnaeus. DYER'S GREENWEED, DYER'S BROOM. **Hab:** Disturbed areas. **Dist:** Native of Europe. Not cited in Harvill et al. (1992), but described as naturalized in sterile soils south to VA in C, F, and G. **Phen:** Jun-Sep. **Syn:** = C, F, G, K1, K3, K4, NE, NY, Isely (1998). NatureServe GNR (Not Yet Ranked).

Gleditsia Linnaeus 1753 (HONEY LOCUST, WATER LOCUST)

A genus of 13-16 species, trees (and a shrub), scattered relictually in the Old and New Worlds, related to *Gymnocladus*. References: Isely (1975); SE3; Isely (1998); Robertson & Lee (1976); Schnabel & Wendel (1998).

Identification Notes: The hybrid *Gleditsia* × *texana* Sargent (pro sp.) [*G. aquatica* × *triacanthos*] occurs occasionally in the area of range overlap of its parents. It is intermediate (but variably so) between its parents.

- 1 Legume ovate, 3-5 (-8) cm long and 1-3-seeded; foliage glabrous (or slightly puberulent when young); [trees of frequently flooded swamps, often with *Taxodium*, rarely planted and escaped]..... *Gleditsia aquatica*
- 1 Legume elongate, 20-40 cm long and multi-seeded; foliage puberulent (even in age); [trees of moist to dry forests, frequently planted and escaped in disturbed areas]..... *Gleditsia triacanthos*

Gleditsia aquatica Marshall. WATER LOCUST. **Hab:** Swamp forests, marshes. **Dist:** E. SC south to c. peninsular FL, west to TX, and north in the interior to IN, IL, and MO (as a native species almost completely restricted to the Coastal Plain); occasionally cultivated north of its native range. **Phen:** Apr-May (-Jun); Jul-Nov. **Syn:** = Ar, C, F, Fl3, G, GW2, IL, K1, K3, K4, Mo2, NcTx, RAB, S, SE3, Tn, Tx, WH3, Isely (1975), Isely (1998), Robertson & Lee (1976). NatureServe G5 (Secure).

Gleditsia triacanthos Linnaeus. HONEY LOCUST, HONEYSHUCK. **Hab:** Woodlands, forests (generally bottomland), fencerows, often planted as a street tree. **Dist:** Native distribution is believed to be from w. NY (?) west to se. SD, south to Panhandle FL and TX (in and west of the Blue Ridge); its occurrence in the more eastern portions of our region (east of the Blue Ridge) appears to be as an adventive. Kimball, Whyte, & Crites (2010) found remains in an archeological site near Asheville NC (Blue Ridge) dated at ca. 500 A.D. **Phen:** Apr-early Jun; Jul-Nov. **Comm:** The trunks are normally beset with lengthy, branched thorns, but thornless trees (forma *inermis* Zabel) are encountered (and are usually favored for horticultural planting). **Syn:** = Ar, C, F, Fl3, G, GrPl, GW2, IL, K1, K3, K4, Mi, NcTx, NE, NY, Pa, RAB, S, SE3, Tn, Tx, Va, W, WH3, WV, Isely (1975), Isely (1998), Robertson & Lee (1976). NatureServe G5 (Secure).

**Glycine** Willdenow 1802 (SOYBEAN, SOYA)

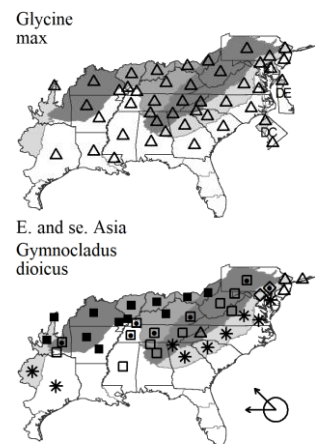

A genus of about 10-20 species, annual and perennial herbs, of Asia and Australia. References: Isely (1998).

* **Glycine max** (Linnaeus) Merrill. SOYBEAN. **Hab:** Abundantly cultivated as a crop, rarely persisting as a waif. **Dist:** Native of e. Asia. **Phen:** Jul-Oct. **Comm:** One of the most important legume crops in the world. **Syn:** = Ar, F, IL, K1, K3, K4, Mi, NcTx, NE, NY, RAB, SE3, Isely (1998). NatureServe GNR (Not Yet Ranked).

Gymnocladus Lamarck 1785 (KENTUCKY COFFEE-TREE)

A genus of 6 species, all trees, ours in e. North America and 5 species in e. Asia, related to *Gleditsia*. References: Isely (1975); SE3; Isely (1998); Lee (1976); Robertson & Lee (1976).

Gymnocladus dioica (Linnaeus) K. Koch. KENTUCKY COFFEE-TREE, KENTUCKY MAHOGANY. **Hab:** Native in bottomland and riparian forests, mesic upland forests and woodlands, stream banks, swamp margins, often along rivers; also in disturbed areas, persistent and weakly spreading from horticultural plantings. **Dist:** The original native range has been obscured, perhaps PA west to se. SD, south to w. VA, TN, n. AL, and OK. **Phen:** Apr-Jun; Aug-Nov (and persistent). **Syn:** = C, F, G, GrPl, IL, K1, K3, K4, Mi, Mo2, NcTx, NE, NY, Pa, RAB, S, SE3, Tn, Tx, Va, WV, Isely (1975), Isely (1998), Lee (1976), Robertson & Lee (1976). NatureServe G5 (Secure).

**Hylodesmum** H. Ohashi & R.R. Mill 2000 (FOREST TICK-TREFOIL)

A genus of ca. 15 species, perennial herbs, mainly of e. Asia and e. North America. This group has often been included in *Desmodium* as a section or subgenus, but is now shown to be amply distinct in morphology and also to form a monophyletic group based on molecular analysis. References: Ohashi & Mill (2000); Raveill (2006).

Hyldesum nudiflorum (Linnaeus) H. Ohashi & R.R. Mill. NAKED TICK-TREFOIL. **Hab:** Moist to dry forests. **Dist:** ME west to MN, south to Panhandle FL, n. peninsular FL, and TX. **Phen:** Jul-Aug (-Sep); Aug-Oct. **Syn:** = FI3, K3, K4, Mi, NE, NY, Va, WH3, Ohashi & Mill (2000); = *Desmodium nudiflorum* (Linnaeus) A.P. de Candolle – Ar, C, F, G, GrPl, Il, K1, Pa, RAB, SE3, Tn, Tx, W, WV, Isely (1998); = *Meibomia nudiflora* (Linnaeus) Kuntze – S. NatureServe G5 (Secure).

Hyldesum pauciflorum (Nuttall) H. Ohashi & R.R. Mill. FEW-FLOWERED TICK-TREFOIL. **Hab:** Moist forests. **Dist:** NY west to OH and IA, south to Panhandle FL and TX. **Phen:** Jun-Aug; Aug-Oct. **Syn:** = FI3, K3, K4, NY, Va, WH3, Ohashi & Mill (2000); = *Desmodium pauciflorum* (Nuttall) A.P. de Candolle – Ar, C, F, G, GrPl, Il, K1, NcTx, RAB, SE3, Tn, Tx, W, WV, Isely (1998); = *Meibomia pauciflora* (Nuttall) Kuntze – S. NatureServe G5 (Secure).

***Indigofera* Linnaeus 1753 (INDIGO)**

A genus of about 700-750 species, annual herbs, perennial herbs, and shrubs, nearly cosmopolitan in tropical and warm temperate regions. References: Franck (2018b) in Weakley et al (2018a); Isely (1998); Lievens & Vincent in FNA () (in prep).

- 4 Stem pubescence hirsute or pilose with long brownish hairs *Indigofera hirsuta*
- 4 Stem pubescence strigose-appressed.
- 5 Legume 7-9 mm long, ovoid, not falcate, indehiscent, with 2-3 seeds; corolla 6-9 mm long; [native species] *Indigofera caroliniana*
- 5 Legume 15-36 mm long, linear-cylindric, slightly to strongly falcate (or straight in *I. decora*), dehiscent, with 3-12 or more seeds; corolla either 5-6 mm long or 15-18 mm long; [introduced species].
- 7 Legume 15-20 mm long, strongly falcate *Indigofera suffruticosa*
- 7 Legume 28-36 mm long, slightly falcate *Indigofera tinctoria*

Indigofera caroliniana P. Miller. CAROLINA INDIGO. **Hab:** Longleaf pine sandhills, Florida scrub, maritime forests, other sandy forests and woodlands. **Dist:** E. NC south to s. FL, west to se. LA, a Southeastern Coastal Plain endemic. **Phen:** Jun-Aug; Jul-Oct. **Syn:** = FI3, K1, K3, K4, RAB, S, SE3, WH3, Isely (1998). NatureServe G4 (Apparently Secure).

* ***Indigofera hirsuta*** Linnaeus. HAIRY INDIGO. **Hab:** Sandy disturbed areas, such as wildlife 'food fields'. **Dist:** Native of the Old World tropics. First reported for SC by Nelson & Kelly (1997). **Phen:** Jan-Dec. **Comm:** Also known from other scattered locations in the Southeast, such as s. MS (S.W. Leonard, 2006, pers.comm.) and AL (Diamond & Woods 2009). **Syn:** = FI3, FNA, K1, K3, K4, SE3, WH3, Isely (1998). NatureServe GNR (Not Yet Ranked).

Indigofera suffruticosa P. Miller. WEST INDIAN INDIGO. **Hab:** Disturbed areas, dry sandy woodlands, formerly commonly cultivated; in NC, SC, and GA, formerly locally established as a weed in the period of its cultivation, but perhaps no longer present. **Dist:** Native of the New World tropics and subtropics, including the Southeastern United States. **Phen:** Jan-Dec. **Syn:** = Bah, FI3, FNA, K1, K3, K4, S, SE3, Tx, WH3, Isely (1998); ?

Indigofera anil Linnaeus. NatureServe G5 (Secure).

* ***Indigofera tinctoria*** Linnaeus. AFRICAN INDIGO. **Hab:** Formerly commonly cultivated, locally established as a weed at that time, perhaps no longer present in northern parts of our area, but persistent as a weed in southern Florida. **Dist:** Native of Africa. Both this species and *I. suffruticosa* were cultivated as an important export crop in the Coastal Plain of GA, SC, and (less so) NC in the seventeenth and eighteenth centuries. **Phen:** Jan-Dec. **Syn:** = Bah, FI3, FNA, K1, K3, K4, S, SE3, WH3, Isely (1998). NatureServe GNR (Not Yet Ranked).

140. FABACEAE

**Kummerowia** Schindler 1912 (KOREAN-CLOVER, JAPANESE-CLOVER)

A genus of 2 species, annual herbs, native to temperate e. Asia. *Kummerowia* differs from *Lespedeza* in its annual habit (vs. perennial), conspicuous stipules (vs. not conspicuous), inflorescence branching pattern (see Akiyama & Ohba 1985), and leaflets with striate, parallel, lateral veins (vs. with reticulate lateral veins). It is now generally regarded as distinct from *Lespedeza* at the generic level, though they are closely related. References: Akiyama & Ohba (1985); Isely (1998).

- 1 Mid-stem leaves with petioles 4-10 mm long; leaflets emarginate at the apex; leaflets conspicuously spreading-ciliate; stems antrorsely appressed-strigose; calyx covering 1/3-1/2 of the legume.....***Kummerowia stipulacea***
 1 Mid-stem leaves with petioles 1-2 (-4) mm long; leaflets not emarginate at the apex; leaflets inconspicuously appressed-ciliate; stems retrorsely appressed-strigose; calyx covering 1/2-4/5 of the legume.....***Kummerowia striata***

* ***Kummerowia stipulacea*** (Maximowicz) Makino. KOREAN LESPEDEZA, KOREAN-CLOVER. **Hab:** Fields, roadsides, disturbed areas. **Dist:** Native of e. Asia. **Phen:** Jul-Sep; Aug-Nov. **Syn:** = Ar, Il, K1, K3, K4, Mi, NcTx, NY, Pa, SE3, Tn, Va, Akiyama & Ohba (1985), Isely (1998); = *Lespedeza stipulacea* Maximowicz – C, F, G, GrPl, RAB, Tx, W, WV. NatureServe GNR (Not Yet Ranked).

* ***Kummerowia striata*** (Thunberg) Schindler. JAPANESE-CLOVER, COMMON LESPEDEZA. **Hab:** Fields, roadsides, disturbed areas. **Dist:** Native of e. Asia. **Phen:** Jul-Sep; Aug-Nov. **Syn:** = Ar, FI3, Il, K1, K3, NcTx, NE, NY, Pa, SE3, Tn, Va, WH3, Akiyama & Ohba (1985), Isely (1998); = *Lespedeza striata* (Thunberg) Hooker & Arnott – C, F, G, GrPl, RAB, S, Tx, W, WV. NatureServe GNR (Not Yet Ranked).

**Lackeya** Fortunato, L.P. Queiroz, & G.P. Lewis 1996

A monotypic genus, a perennial woody or semi-woody vine, of the Southeastern United States. References: Fortunato, de Queiroz, & Lewis (1996); Isely (1998); Lewis et al (2005); Maxwell (1979).

Lackeya multiflora (Torrey & A. Gray) Fortunato, L.P. Queiroz, & G.P. Lewis. **Hab:** Alluvial forests, streambanks, prairies. **Dist:** GA west to e. TX, north in the interior to w. TN, w. KY, and AR (sometimes attributed to FL, but excluded by Wunderlin & Hansen 2008, 2011). **Phen:** Jun-Jul. **Syn:** = K3, K4, Fortunato, de Queiroz, & Lewis (1996), Lewis et al (2005); = *Dioclea boykinii* A. Gray; = *Dioclea multiflora* (Torrey & A. Gray) C. Mohr – Ar, C, G, K1, Ky, S, SE3, Tn, Tx, Isely (1998); > *Galactia mohlenbrockii* var. *halei* (Alph. Wood) R.H. Maxwell – Maxwell (1979); > *Galactia mohlenbrockii* R.H. Maxwell var. *mohlenbrockii* – Il, Maxwell (1979). NatureServe G4 (Apparently Secure).

**Lathyrus** Linnaeus 1753 (WILD-PEA, VETCHLING)

A genus of about 150-160 species, annual and perennial herbs, of nearly cosmopolitan distribution. References: Isely (1998).

- 5 Leaflets absent (but with foliaceous stipules).....***Lathyrus aphaca***
 5 Leaflets 2.
 8 Stems with wings 0-1 (-2) mm wide; corolla 6-14 mm long; flowers 1-3 (-4) per raceme.
 9 Legume (in fruit) and ovary (in flower) hirsute with swollen-based hairs; corolla 9-14 mm long.....***Lathyrus hirsutus***
 9 Legume (in fruit) and ovary (in flower) glabrous; corolla 6-9 mm long.....***Lathyrus pusillus***
 8 Stems with wings 1-3 mm wide; corolla 13-30 mm long; flowers 2-12 per raceme.
 11 Stipules 4-10 mm wide; leaflets 2-5× as long as wide.....***Lathyrus latifolius***
 11 Stipules 2-3 mm wide; leaflets 6-15× as long as wide.....***Lathyrus sylvestris***

* ***Lathyrus aphaca*** Linnaeus. YELLOW VETCHLING. **Hab:** Disturbed areas. **Dist:** Native of Eurasia. Scattered in occurrence in the Southeast, including AL, TN, and KY (Kartesz 1999). **Phen:** May-Aug. **Syn:** = Ar, G, K1, K3, K4, NcTx, NE, SE3, Isely (1998). NatureServe GNR (Not Yet Ranked).

140. FABACEAE

* ***Lathyrus hirsutus*** Linnaeus. CALEY PEA, SINGLETARY PEA, ROUGH PEA. **Hab:** Roadsides, fields, disturbed areas. **Dist:** Native of Europe. **Phen:** Apr-Jul. **Syn:** = Ar, C, F, Fl3, G, Il, K1, K3, K4, Mi, NcTx, RAB, S, SE3, Tn, Tx, Va, W, WH3, Isely (1998). NatureServe GNR (Not Yet Ranked).

* ***Lathyrus latifolius*** Linnaeus. EVERLASTING PEA, PERENNIAL SWEET PEA. **Hab:** Roadsides, fencerows, disturbed areas. **Dist:** Native of Europe. **Phen:** May-Oct. **Syn:** = C, F, G, Il, K3, K4, Mi, NcTx, NE, NY, Pa, RAB, SE3, Tn, Tx, Va, W, WV, Isely (1998). NatureServe GNR (Not Yet Ranked).

Lathyrus pusillus Elliott. TINY PEA. **Hab:** Open areas in bottomlands, disturbed areas. **Dist:** E. VA, MO and KS, south to FL Panhandle and TX; disjunct in s. South America. The more eastern populations are scattered and curious. **Phen:** Apr-Jul. **Syn:** = Ar, F, Fl3, G, GrPl, K1, K3, K4, NcTx, RAB, S, SE3, Tx, Va, WH3, Isely (1998). NatureServe G5? (Secure).

* ***Lathyrus sylvestris*** Linnaeus. PERENNIAL PEA. **Hab:** Cultivated, and occasionally persisting, and more rarely naturalizing. **Dist:** Native of Europe. Reported as naturalizing in se. TN along a roadcut (Hart, Shaw, & Estes 2012). **Phen:** Jun-Sep. **Syn:** = C, F, G, K1, K3, K4, Mi, NE, NY, Pa, SE3, WV, Isely (1998). NatureServe GNR (Not Yet Ranked).

***Lespedeza* Michaux 1803 (LESPEDEZA)**

A genus of about 40 species, perennial herbs and shrubs, of temperate regions of e. Asia and e. North America. References: Akiyama (1988); Clewell & Stickell (1990); Clewell (1966a); Clewell (1966b); Isely (1986b); Isely (1998).

Identification Notes: Many species of *Lespedeza* hybridize, and most combinations may occur in our area. Some of the hybrids have been named in the past as varieties or species. Hybrids generally occur in mixed populations with both parents and can usually be identified by their intermediate morphology (identification much easier in the field where context is apparent than in the herbarium). See Isely (1990) and Clewell (1966a) for additional suggestions for the identification of hybrids.

- 1 Leaflets distinctly widest toward the tip, 3-5× as long as wide, the base and apex very differently shaped (the base narrowly cuneate, the tip rounded, truncate or even retuse); racemes reduced, with 2-3 flowers, shorter than the subtending leaves; [plants alien] ***Lespedeza cuneata***
- 1 Leaflets generally widest near the middle, 1-8 (-10)× as long as wide, the base and apex shaped similarly (i.e., both rounded, or both cuneate); racemes with 3-many flowers, shorter or longer than the subtending leaves; [plants native, except *L. virgata* and *L. daurica*].
- 4 Plants trailing at maturity (young stems erect to arching-ascending up to 2 dm tall, then lopping over); stems slender, wiry; corolla pink to purple.
- 6 Pubescence of the stem spreading (pilose), the hairs at more-or-less 90 degree angles to the stem.....***Lespedeza procumbens***
- 6 Pubescence of the stem appressed (strigose).
- 7 Plant trailing, typically mat-forming (after initial ascending growth); calyx of legumes produced from cleistogamous flowers 1/4-1/3 as long as the pod (cleistogamous flowers are clustered and sessile in leaf axils, in contrast to the chasmogamous flowers borne in groups on long, axillary, ascending peduncles); stems usually lacking axillary leaves; keel subequal to the wings, or shorter; stipules 2-4 (-5) mm long***Lespedeza repens***
- 7 Plant ascending (keyed here for rare sprawling individuals); calyx of legumes produced from cleistogamous flowers ca. 1/5 as long as the pod; stems often with axillary leaves distinctly smaller than the primary leaves; keel usually longer than the wings; stipules 3-5 (-6) mm long***Lespedeza frutescens***
- 4 Plants erect at maturity; stems generally stout, stiff; corolla pink, purple, white, cream, or mixed.
- 8 Plants in flower.
- 9 Corolla primarily white or cream (often with a purplish throat).
- 10 Raceme peduncles short (shorter than the subtending leaf), the inflorescence itself barely if at all exceeding the subtending leaf; calyx lobes 6-10 mm long; leaflets (2-) 2.5-5 (-8)× as long as wide..... ***Lespedeza capitata***
- 10 Raceme peduncles elongate (often longer than the subtending leaf), the inflorescence itself well-exserted beyond the subtending leaf; calyx lobes 3-7 mm long; leaflets either narrower or wider (see below).
- 11 Leaflets 4-8 (-10)× as long as wide, the margins essentially straight and parallel for most of the leaflet length; petioles of midstem and upper stem leaves 1-3 mm long..... ***Lespedeza angustifolia***
- 11 Leaflets 1.3-1.8× as long as wide, the margins obviously and strongly curving from base to apex; petioles of midstem and upper stem leaves mainly 10-15 mm long.
- 12 Leaves closely strigose on both surfaces with hairs 0.2-0.5 mm long, silvery when fresh; leaflets 1-2 cm long; petiole of midstem leaves not generally > 1 cm long, about the same length as the rachis; [plants of the Coastal Plain and, in NC and SC, the lower Piedmont]..... ***Lespedeza hirta* var. *curtissii***
- 12 Leaves glabrate, or strigose above only, at least some of the hairs (especially those on the veins below) > 0.5 mm long, green or grey (to somewhat silvery) when fresh; leaflets 1.5-4 (-5) cm long; petiole of midstem leaves 1-1.5 (-2) cm long, much exceeding the rachis; [plants widespread in our area]..... ***Lespedeza hirta* var. *hirta***
- 9 Corolla primarily pink or purple.
- 13 Peduncles of the racemes of chasmogamous (petaliferous) flowers longer than the subtending leaves; keel > 1 mm longer than the wings.
- 14 Stems to 7 dm long, herbaceous, not bushy-branched; petioles of medial leaves 0.5-2 cm long; chasmogamous panicles with 4-7 flowers; corolla 6-8 mm long; legumes of the chasmogamous flowers glabrate or inconspicuously strigulose, 5-7 mm long; [native].....***Lespedeza frutescens***
- 14 Stems 10-30 dm long, woody or suffrutescent, bushy-branched; petioles of medial leaves 2-4 cm long; chasmogamous panicles with 5-15 flowers; corolla 8-15 mm long; legumes of the chasmogamous flowers strigose, 7-8 mm long; [plants alien, planted in 'wildlife food plots' and persisting or spreading]; [section *Macrolespedeza*].

(2011). **Phen:** Jun-Sep. **Syn:** = C, GrPl, K1, K3, K4, NY, SE3, Isely (1981), Kramina et al (2018); < *Lotus corniculatus* Linnaeus – Isely (1998).

Lupinus Linnaeus 1753 (LUPINE)

A genus of about 200-250 species, annual herbs, perennial herbs, and shrubs, of temperate and tropical regions in North America, Mediterranean Europe, South America, and Africa (especially diverse in w. North America and South America). References: Isely (1998).

- 1 Leaves unifoliate; leaves and stems evergreen, overwintering (absent in midsummer); plant conspicuously pubescent.
 - 2 Standard with a white to creamy eyespot; hairs of the legume 1.5-3 mm long, villous or sericeous. ***Lupinus diffusus***
 - 2 Standard with a red or deep purple eyespot; hairs of the legume 3-5 mm long, villous. ***Lupinus villosus***
- 1 Leaves palmately compound; leaves and stems deciduous, dying back in winter; plant inconspicuously pubescent. ***Lupinus perennis* var. *gracilis***

Lupinus diffusus Nuttall. BLUE SANDHILL LUPINE. **Hab:** Longleaf pine sandhills, sandy roadsides. **Dist:** Se. NC south to s. FL, west to s. MS. **Phen:** Mar-May; Jun-Jul. **Comm:** I concur with Duncan & McCartney (1992) in recognizing *L. cumulicola* Small of peninsular FL as distinct from *L. diffusus*. Moreover, Atchison et al. (2014) showed that at least one additional taxon (here listed as *Lupinus species 1*) should be segregated from *L. diffusus* s.l. **Syn:** < *Lupinus diffusus* Nuttall – Fl3, K1, K3, K4, RAB, S, SE3, WH3, Isely (1998).

Lupinus perennis Linnaeus var. ***gracilis*** (Nuttall) Chapman. SOUTHERN SUNDIAL LUPINE. **Hab:** Longleaf pine sandhills and sandy or dry rocky roadsides. **Dist:** E. GA (immediately across the Savannah River from SC), south to n. FL and west to s. AL. **Comm:** The validity of this taxon is uncertain; the differences may be only clinal. **Syn:** = Isely (1998); = *Lupinus nuttallii* S. Watson – S; = *Lupinus perennis* Linnaeus ssp. *gracilis* (Nuttall) Dunn – K1, K3, K4, SE3; < *Lupinus perennis* – C, G, Pa, RAB, WH3. **NatureServe** G5TNR (Not Yet Ranked).

Lupinus villosus Willdenow. PINK SANDHILL LUPINE. **Hab:** Longleaf pine sandhills, sandy roadsides. **Dist:** Se. NC south to n. FL, west to se. LA. **Phen:** Apr-May; Jun-Aug. **Syn:** = Fl3, K1, K3, K4, RAB, S, SE3, WH3, Isely (1998). **NatureServe** G5 (Secure).

Macroptilium (Bentham) Urban 1928

A genus of about 20 species, annual and perennial herbs, of tropical and subtropical America. References: Isely (1998).

* ***Macroptilium lathyroides*** (Linnaeus) Urban. PHASEY BEAN, WILD BUSHBEAN. **Hab:** Disturbed areas. **Dist:** Native of tropical America. **Phen:** Jan-Dec. **Syn:** = Bah, Fl3, K1, K3, K4, SE3, WH3, Isely (1998); = *Phaseolus lathyroides* Linnaeus. **NatureServe** G5? (Secure).

Medicago Linnaeus 1753 (MEDICK, BUR-CLOVER)

A genus of about 80 species, annual and perennial herbs, of Eurasia and Africa. References: Isely (1998); Woods & Orcutt (2017).

* *Medicago sativa* Linnaeus. ALFALFA, LUCERNE, BLUE ALFALFA, YELLOW ALFALFA, SICKLE MEDICK. **Hab:** Roadsides, fields, disturbed areas. **Dist:** Native of Europe and sw. Asia. **Phen:** Apr-Jul. **Tax:** Havananda et al. (2010) explain the complex evolution of the *M. sativa* complex, including its selection for human uses. Small & Jomphe (1989) recognize various subspecies and varieties within the complex. Given the complex human-influenced set of morphotypes, of diploid, allotetraploid, and autotetraploid origin, their interfertility, and the difficulties of associating American material with European wild taxa, I reluctantly take the same approach as Yatskievych (2013) in treating *M. sativa* as a practical unit without taxonomic subdivisions. **Syn:** = Ar, Bah, NcTx; > *Medicago varia* – Mi; > *Medicago falcata* – F, G, Il, Mi, NE, NY, S, SE3, Isely (1998); > *Medicago falcata* × *sativa* – NY; > *Medicago sativa* Linnaeus – F, Fl3, G, Il, Mi, NE, NY, Pa, RAB, S, SE3, Tn, Tx, Va, W, WH3, WV, Isely (1998), Woods & Orcutt (2017); > *Medicago sativa* Linnaeus ssp. *falcata* (Linnaeus) Arcangeli – C, GrPl, K1, K3, K4; > *Medicago sativa* Linnaeus ssp. *sativa* – C, GrPl, K1, K3, K4.

*Melilotus* P. Miller 1754 (MELILOT, SWEETCLOVER, SOURCLOVER)

A genus of about 20 species, annual and perennial herbs, of temperate Eurasia and Africa. References: Isely (1998); Stace (2010).

- 1 Corolla white *Melilotus albus*
- 1 Corolla yellow.
- 2 Corolla 2-3.5 mm long; fruits < 3 mm long *Melilotus indicus*

Key to Map
Symbology:

? : questionable
X : extirpated

- 2 Corolla 5-7 mm long; fruits > 3 mm long..... *Melilotus officinalis*

* ***Melilotus albus*** Medikus. WHITE MELILOT, WHITE SWEETCLOVER. **Hab:** Fields, roadsides, disturbed areas. **Dist:** Native of Eurasia. **Phen:** Apr-Oct. **Tax:** The similar *M. albus* and *M. officinalis* are apparently incompatible (Isely 1998) and differ in less obvious ways than flower color; they should not be synonymized, as was done by Kartesz (1999, 2010). Other differences useful in the determination of faded herbarium specimens are given by Isely (1998) and Yatskievych (2013): corolla 3.5-5 mm long, the wing petals about as long as the keel, ovaries narrowed at base, mature fruits with a network of raised nerves (*M. albus*) vs. corolla 5-7 mm long, the wing petals generally longer than the keel, ovaries noticeably stalked at base, mature fruits with a pattern of cross-nerves or merely with irregular cross-wrinkles (*M. officinalis*). **Syn:** = Ar, Il, Mi, NcTx, NE, NY, Tx, Va, WH3, Isely (1998), Stace (2010); = *Melilotus alba* – Bah, C, F, G, GrPl, Pa, RAB, S, SE3, Tn, W, WV, orthographic variant; < *Melilotus officinalis* (Linnaeus) Pallas – K1, K3, K4.

* ***Melilotus indicus*** (Linnaeus) Allioni. SMALL MELILOT, SOURCLOVER, ALFALFILLA. **Hab:** Roadsides, disturbed areas. **Dist:** Native of Mediterranean Europe. **Phen:** Apr-Oct. **Syn:** = Ar, K1, K3, K4, NcTx, NE, NY, Tx, WH3, Isely (1998), Stace (2010); = *Melilotus indica* – Bah, C, F, G, RAB, S, SE3, orthographic variant. **NatureServe GNR** (Not Yet Ranked).

* ***Melilotus officinalis*** (Linnaeus) Pallas. YELLOW MELILOT, YELLOW SWEETCLOVER, RIBBED MELILOT. **Hab:** Fields, roadsides, disturbed areas. **Dist:** Native of Eurasia. **Phen:** Apr-Oct. **Syn:** = Ar, C, F, G, GrPl, Il, Mi, NcTx, NE, NY, Pa, RAB, S, SE3, Tn, Tx, Va, W, WH3, WV, Isely (1998), Stace (2010); < *Melilotus officinalis* (Linnaeus) Pallas – K1, K3, K4. **NatureServe GNR** (Not Yet Ranked).

Mimosa Linnaeus 1753 (MIMOSA)

A genus of about 500 species, herbs, shrubs, trees, and vines, of tropical, subtropical, and warm temperate areas, especially America. Barneby (1991) and Beard (1963) argue that there are no characters which serve to separate *Schrankia* from *Mimosa*. References: Barneby (1991); Grether & Simon (2018); Isely (1973); Isely (1973); Isely (1998); Weakley & Flores-Cruz (2017) in Weakley et al (2017).

Identification Notes: Unmistakable in our flora for its bipinnate leaves, with tiny (2-4 mm long) leaflets, responding to touch by closing.

- 5 Plant unarmed (rarely with widely scattered prickles), the stem with strigose hairs with bulbous bases, 0.5-3 mm long; capitula 1.5-3× as long as the diameter, 9-25 mm long..... *Mimosa strigillosa*
- 5 Plant well-armed with recurved, catclaw prickles; capitula spherical or nearly so, 1-1.2× as long as wide, 3.5-14 mm long..... *Mimosa microphylla*

Mimosa microphylla Dryander. EASTERN SENSITIVE-BRIAR. **Hab:** Longleaf pine sandhills, other dry woodlands and forests, dry disturbed areas. **Dist:** DE, WV, and KY south to s. FL and e. TX. **Phen:** Jun-Sep; Aug-Nov. **Tax:** A form with smaller fruits (3-5 cm long vs. 5-12 cm long) has been variously treated as a species [*Leptoglottis chapmanii*, *Schrankia chapmanii*] or a "recurrent fruit-form genotype" [phase *brachycarpa* of Isely (1973)]. This needs additional investigation. **Syn:** = K1, K3, K4, Tn, Va, Weakley & Flores-Cruz (2017) in Weakley et al (2017); = *Mimosa quadrivalvis* Linnaeus var. *angustata* (Torrey & A. Gray) Barneby – C, Fl3, WH3, Barneby (1991), Isely (1998); = *Morongia angustata* (Torrey & A. Gray) Britton; = *Schrankia microphylla* (Dryander) J.F. Macbride – F, G, RAB, Tx, W; = *Schrankia microphylla* (Dryander) J.F. Macbride var. *microphylla* – SE3; > *Leptoglottis chapmanii* Small ex Britton & Rose – S; > *Leptoglottis microphylla* (Dryander) Britton & Rose – S; > *Mimosa microphylla* Dryander; > *Morongia uncinata* (Willdenow) Britton; > *Schrankia chapmanii* (Small ex Britton & Rose) F.G. Hermann; > *Schrankia microphylla* – Isely (1973), Isely (1973); > *Schrankia uncinata* Willdenow. **NatureServe G5T5** (Secure).

Mimosa strigillosa Torrey & A. Gray. POWDERPUFF MIMOSA, VERGONZOSA. **Hab:** Floodplain forests, open wet areas, also cultivated. **Dist:** A Southeastern Coastal Plain endemic: e. GA south to FL, west to TX. It might be expected in se. SC. **Phen:** May-Oct. **Syn:** = Ar, Fl3, Il, K1, K3, K4, NcTx, S, SE3, Tx, WH3, Barneby (1991), Isely (1973), Isely (1973), Isely (1998). **NatureServe G4G5** (Apparently Secure).

Neptunia Loureiro 1790 (NEPTUNIA)

A genus of about 12 species, herbs, of the tropics and subtropics of America and Eurasia. References: Isely (1973); Isely (1998); Turner (1951); Windler (1966).

Key to Map
Symbology:

* : waif
EN : endemic

140. FABACEAE

- 3 Leaflets 9-15 pairs per pinna; stipules 2-4 mm long; all flowers perfect, with functional stamens; stipe of fruit 4-15 mm long.....*Neptunia lutea*
 3 Leaflets (12-) 15-25 (-35) pairs per pinna; stipules 4-10 mm long; flowers in the lower part of the inflorescence with flattened staminodes; stipe of fruit 2-5 mm long.
 *Neptunia pubescens*

Neptunia lutea (Leavenworth) Benth. YELLOW NEPTUNIA. **Hab:** Longleaf pine savannas, prairies, roadsides. **Dist:** AL west to OK and TX. **Phen:** Apr-Sep. **Syn:** = Ar, GrPl, K1, K3, K4, NcTx, S, SE3, Tx, Isely (1973), Isely (1998), Windler (1966); > *Neptunia lutea* var. *lutea* – Turner (1951); > *Neptunia lutea* var. *multipinnata* B.L. Turner – Turner (1951). NatureServe G5 (Secure).

Neptunia pubescens Benth. TROPICAL NEPTUNIA. **Hab:** Pine savannas, longleaf pine sandhills, Florida scrub, prairies, coastal prairies, roadsides. **Dist:** S. GA, AL, and FL west to s. TX, and south to Argentina. **Phen:** Apr-Nov. **Tax:** Turner (1951) treated *N. pubescens* in our area with two varieties differing from the typic (the type is from Lima, Peru); this distinction has not been followed by later authors. A modern reassessment is needed. Var. *floridana* has "leaflets glabrous or sparsely ciliate, the cilia scarcely 0.2 mm long, the under-surface completely glabrous or ciliate along the margin only; fruiting peduncles 6-11 cm long; calyx glabrous or with but 4-5 hairs along the lobes; petals glabrous" and ranges from s. FL along the Gulf Coast to s. FL. Var. *lindheimeri* has "leaflets conspicuously ciliate, most of the cilia 0.2-0.7 mm long, the undersurface near apex conspicuously so; stipules covered with a scattered short pubescence; fruiting peduncles 2.5-7 cm long; calyx lobes pubescent (10-20 cilia on each lobe); petals ciliate" and is distributed in se. and s. TX. **Syn:** = Fl3, K3, K4, WH3; = *Neptunia pubescens* Benth. var. *pubescens* – K1, SE3, Tx, Isely (1973), Isely (1998), Windler (1966); > *Neptunia floridana* Small – S; > *Neptunia pubescens* var. *floridana* (Small) B.L. Turner – Turner (1951); > *Neptunia pubescens* var. *lindheimeri* (B.L. Robinson) B.L. Turner – Turner (1951). NatureServe G5?TNR (Not Yet Ranked).

Orbexilum Rafinesque 1832 (SCURFPEA, SAMPSON'S-SNAKEROOT)

A genus of about 11 species, perennial herbs, of s. North America and Mexico (south to Chiapas). References: Grimes (1988); Grimes (1990); Isely (1998); Turner (2008); Vincent (2014).

- 6 Flowers 8-10 mm long; [of s. AL westward]..... *Orbexilum simplex*
 6 Flowers 5-7 mm long; [collectively widespread in our area].
 *Orbexilum pedunculatum*

Orbexilum pedunculatum (P. Miller) Rydberg. WESTERN SAMPSON'S-SNAKEROOT. **Hab:** Open woodlands, bluffs, prairies. **Dist:** S. OH, s. IN, s. IL, c. MO, and se. KS, south to sw. NC, sc. SC, sw. GA, w. Panhandle FL, s. AL, s. LA, and e. TX. **Phen:** May-Jul; Jul-Sep. **Syn:** = K4, Mi, NcTx, S, Tn, Turner (2008), Vincent (2014); = *Orbexilum pedunculatum* (P. Miller) Rydberg var. *pedunculatum* – Ar, C, K1, K3, SE3, Grimes (1988), Grimes (1990), Isely (1998); = *Psoralea melilotoides* Michaux, superfluous name; = *Psoralea psoralioides* (Walter) Cory var. *eglandulosa* (Elliott) F.L. Freeman – F, G, GrPl, GW2, RAB, Tx, W; > *Orbexilum pedunculatum* var. *gracile* (Torrey & A. Gray) Grimes – Il, misapplied. NatureServe G5T5? (Secure).

Orbexilum simplex (Nuttall ex Torrey & A. Gray) Rydberg. LEATHER-ROOT. **Hab:** Prairies, open woodlands. **Dist:** AR and OK south to s. AL, MS, e. and w. LA, and e. TX; perhaps disjunct in IL. **Phen:** May-Jun. **Syn:** = Ar, Il, K1, K3, NcTx, S, SE3, Grimes (1988), Grimes (1990), Isely (1998), Turner (2008); = *Psoralea simplex* Nuttall ex Torrey & A. Gray – Tx. NatureServe G4G5 (Apparently Secure).

Parkinsonia Linnaeus 1753 (JERUSALEM THORN)

A genus of about 10-30 species (if circumscribed, as here, to include *Cercidium*), shrubs and trees of sw. North America, Central America, and Africa. References: Isely (1975); Isely (1998); Robertson & Lee (1976).

- * *Parkinsonia aculeata* Linnaeus. JERUSALEM THORN, RETAMA, HORSE-BEAN, MEXICAN PALOVERDE. **Hab:** Sandy or gravelly areas along washes, disturbed areas. **Dist:** Native of sc. and sw. North America, rarely established or spread from cultivation in the eastern portions of our area, though somewhat more commonly so in much of FL. **Phen:** May. **Syn:** = Bah, K1, K3, K4, NcTx, S, SE3, Tx, WH3, Isely (1975), Isely (1998), Robertson & Lee (1976). NatureServe G5 (Secure).

Pediomelum Rydberg 1919 (BUCKROOT, PRAIRIE-TURNIP)

A genus of about 22 species, perennial herbs, of North America. References: Allison, Morris, & Egan (2006); Egan & Crandall (2008); Grimes (1988); Grimes (1990); Isely (1998).

Pediomelum tenuiflorum (Pursh) A.N. Egan. GRAY SCURF-PEA. **Hab:** Prairies. **Dist:** KY to MT, south to TX and n. Mexico (CHH, NLE, SON); disjunct in MS (as a waif). **Phen:** Apr-Jul (-Sep). **Tax:** This species belongs in *Pediomelum*, not *Psoralidium* (Egan & Crandall 2008). **Syn:** = K3, K4, Egan & Crandall (2008); = *Psoralea tenuiflora* Pursh – F, G, Tx; = *Psoralidium tenuiflorum* (Pursh) Rydberg – C, K1, Mex, NcTx, SE3, Grimes (1988), Grimes (1990), Isely (1998); > *Psoralea tenuiflora* Pursh var. *floribunda* (Nuttall) Rydberg – GrPl; > *Psoralea tenuiflora* Pursh var. *tenuiflora* – GrPl; > *Psoralidium tenuiflorum* var. *tenuiflorum* – Il. NatureServe G5 (Secure).

Phaseolus Linnaeus 1753 (BEAN)

A genus of about 80-85 species, annual and perennial herbs, of tropical and warm temperate America (now widely distributed worldwide in cultivation). References: Debouck (2021); Freytag & Debouck (2002); Isely (1998); Maréchal, Mascherpa, & Stainier (1978).

- 1 Raceme axes slender, flexuous; [native perennials]; [section *Paniculati*; subsection *Volubili*].
 - 2 Stems trailing; leaflets 1-4 cm long, strongly 3-lobed, suborbicular; leaflet surfaces strongly reticulate-veined; [longleaf pine sandhill habitats, NC to FL west to MS] *Phaseolus sinuatus*
 - 2 Stems climbing and twining on other vegetation (or trailing); leaflets 3-10 cm long, 3-lobed or not, ovate; leaflet surfaces only slightly reticulate; [various habitats; collectively widespread] *Phaseolus polystachios*
- 1 Raceme axes stout, stiff; [alien annuals, only weakly naturalized].
 *Phaseolus lunatus*

* ***Phaseolus lunatus*** Linnaeus. LIMA BEAN. **Hab:** Frequently cultivated (both commercially and in home gardens), rarely found as a waif. **Dist:** Native of tropical America, north to southern TAM. **Phen:** Jan-Dec. **Syn:** = Bah, K1, K3, K4, S, SE3, WH3, Debouck (2021), Freytag & Debouck (2002), Isely (1998), Maréchal, Mascherpa, & Stainier (1978); > *Phaseolus limensis* Macfadyen – F. NatureServe G4 (Apparently Secure).

Phaseolus polystachios (Linnaeus) Britton, Sterns, & Poggenburg. WILD BEAN, WILD KIDNEY BEAN. **Hab:** Thickets, woodlands, seemingly declining. **Dist:** S. ME west to OH, IL, and MO, south to s. FL and TX. **Phen:** Jul-Sep; Aug-Oct. **Syn:** = Ar, C, G, Il, Mi, NE, NY, Pa, RAB, SE3, Tn, Tx, Va, W, WV, Isely (1998); = *Phaseolus polystachios* var. *polystachios* – K1, K3, Mo1, WH3; = *Phaseolus polystachyus* – S, Debouck (2021), orthographic variant; = *Phaseolus polystachyus* ssp. *polystachyus* – K4, Freytag & Debouck (2002); = *Phaseolus polystachyus* var. *polystachyus* – Maréchal, Mascherpa, & Stainier (1978); > *Phaseolus polystachios* var. *aquiloniis* Fernald – F; > *Phaseolus polystachios* var. *polystachios* – F.

Phaseolus sinuatus (Nuttall) Torrey & A. Gray. SANDHILL BEAN. **Hab:** Longleaf pine sandhills, especially in loamier, more mesic swales. **Dist:** Sc. NC south to s. FL, west to s. MS, a Southeastern Coastal Plain endemic. **Phen:** Jul-Sep; Aug-Oct. **Tax:** Freytag & DeBouck (2002) describes *P. sinuatus* and *P. polystachios* as being "very distinct and there seems to be no intergradation", yet treated them as only subspecifically distinct; I choose to recognize them as species. Debouck (2021) concurred with species rank. **ID Notes:** *Phaseolus sinuatus* is not always easy to distinguish in sterile condition from *Strophostyles*. *Phaseolus sinuatus* has notable variegation of the leaflets, with irregular bands or spots of lighter green along the midvein and especially at the junctions of the midvein of each leaflet with the primary lateral veins. **Syn:** = RAB, S, SE3, W, Debouck (2021), Isely (1998); = *Phaseolus polystachios* (Linnaeus) Britton, Sterns, & Poggenburg var. *sinuatus* (Nuttall) R. Marechal, J.M. Mascherpa, & F. Stainier – K1, K3, WH3; = *Phaseolus polystachyus* ssp. *sinuatus* (Nuttall) Freytag – K4, Freytag & Debouck (2002); = *Phaseolus polystachyus* var. *sinuatus* (Nuttall) R. Marechal, J.M. Mascherpa, & F. Stainier – Maréchal, Mascherpa, & Stainier (1978). NatureServe G5T3? (Vulnerable).

*Pisum* Linnaeus 1753 (PEA)

A genus of 2-5 species, annual herbs, native to w. Asia and the Mediterranean region. References: Isely (1998).

* ***Pisum sativum*** Linnaeus. PEA, GARDEN PEA, ENGLISH PEA. **Hab:** Commonly cultivated in home gardens, rarely found as a waif. **Dist:** Native of w. Asia and Mediterranean Europe. **Phen:** Mar-May. **Syn:** = Ar, Il, K1, K3, K4, Mi, NE, NY, SE3, WH3, Isely (1998); > *Pisum sativum* var. *arvense* (Linnaeus) Poiret – F, RAB; > *Pisum sativum* var. *sativum* – F.

*Pueraria* A.P. de Candolle 1825 (KUDZU)

A genus of about 15 species, perennial vining herbs and shrubs, of tropical and subtropical Asia. References: Isely (1998); Ward (1998).

 (see introduction for more)

140. FABACEAE

* ***Pueraria montana*** (Loureiro) Merrill var. ***lobata*** (Willdenow) Maesen & S.M. Almeida ex Sanjappa & Predeep. KUDZU. **Hab:** Roadsides, waste areas. **Dist:** Native of e. Asia. **Phen:** Jul-Oct. **Comm:** Kudzu was strongly promoted in the 1920's and 1930's in the Southeastern United States as a stabilizer of eroded areas. Hundreds of Kudzu Clubs formed, and Kudzu Songbooks were published. It is now notorious as a weed and symbol of the South. Despite its notoriety in the popular press, kudzu is an ecologically relatively trivial (though conspicuous) weed, since it rarely produces viable seeds in our area, and generally does not invade high quality natural areas. The thickened rhizome can weigh as much as 150 kg, and is the source of a high quality cooking starch prized in the Orient. The purple flowers smell like artificial grape flavoring. The leaves are very frost-sensitive. **Syn:** = Ar, K1, K3, K4, Mi, NcTx, NE, NY, Tn, Va, WH3, Isely (1998), Ward (1998); = *Pueraria lobata* (Willdenow) Ohwi – C, F, G, GrPl, Pa, RAB, SE3, Tx, W, WV; = *Pueraria thunbergiana* (Siebold & Zuccarini) Benth – S; < *Pueraria montana* – Il. [NatureServe GNRTRN](#) (Not Yet Ranked).

***Rhynchosia*** Loureiro 1790 (SNOUTBEAN)

A genus of about 200-230 species, perennial herbs, of tropical and warm temperate regions, nearly cosmopolitan. References: Gear (1978); Isely (1998); Woods & Key (2009).

- 1 Leaves unifoliolate (rarely with a few upper leaves trifoliolate). ***Rhynchosia reniformis***
- 1 Leaves trifoliolate (rarely with a few lowermost leaves unifoliolate, these generally withering before flowering and fruiting).
 - 3 Plant erect; pubescence of the lower leaf surface not restricted to the veins (except in the rare upright forms of *R. difformis* keyed below).
 - 4 Terminal leaflet suborbicular, 1.0-1.3× as long as wide; plants ascending to erect (or more usually twining [keyed elsewhere]) ***Rhynchosia difformis***
 - 4 Terminal leaflet elliptic 1.6-2.5× as long as wide; plants erect.
 - 5 Plant lavishly branched, bushy (with something of the aspect of a *Baptisia*); terminal leaflets 0.5-2.0 cm long; pubescence of the lower leaf surface sparse, not velvety to the touch; flowers solitary (-3) in leaf axils. ***Rhynchosia cytisoides***
 - 5 Plant unbranched or with few well-developed branches in its upper portion; terminal leaflets (2.0-) 2.5-5 cm long; pubescence of the lower leaf surface grayish tomentose and velvety to the touch; flowers many, in racemes. ***Rhynchosia tomentosa***
 - 3 Plant trailing or twining; pubescence of the lower leaf surface mostly restricted to the veins.
 - 7 Calyx 8-14 mm long, about as long as the corolla; [plants collectively widespread in our area].
 - 8 Calyx 10-14 mm long; inflorescence (including peduncle) 5-25 cm at anthesis, elongating further in fruit, with flowers scattered; [MS and w, TN westward] ***Rhynchosia latifolia***
 - 8 Calyx 8-10 (-12) mm long; inflorescence (including peduncle) 1-2 cm long at anthesis, elongating to 4 (-8) cm, the flowers tightly packed; [collectively widespread in our area]. ***Rhynchosia difformis***
 - 7 Calyx 2.5-7 mm long, clearly shorter than the corolla; [plants of e. GA southward and westward]. ***Rhynchosia minima***

Rhynchosia cytisoides (Bertoloni) Wilbur. ROYAL SNOUTBEAN, BROOM SNOUTBEAN. **Hab:** Longleaf pine sandhills. **Dist:** Panhandle FL and s. AL west to MS. **Phen:** May-Jun. **Syn:** = FI3, K1, K3, K4, SE3, WH3, Isely (1998), Woods & Key (2009); = *Pitcheria galactioides* Nuttall – S. [NatureServe G3G5](#) (Apparently Secure).

Rhynchosia difformis (Elliott) A.P. de Candolle. **Hab:** Longleaf pine sandhills, other dry woodlands. **Dist:** Se. VA south to c. peninsular FL, west to e. TX. **Phen:** Jun-Aug; Jul-Oct. **Syn:** = C, F, FI3, G, K1, K3, K4, RAB, SE3, Tn, Tx, Va, WH3, Isely (1998), Woods & Key (2009); = *Rhynchosia tomentosa* (Linnaeus) Hooker & Arnott – S, misapplied.

Rhynchosia latifolia Nuttall. PRAIRIE SNOUTBEAN. **Hab:** Open woods, barrens, pinelands, dry woodlands, roadsides. **Dist:** W. TN, s. MO, and OK south to c. MS, s. LA, and se. TX. **Phen:** May-Jul. **Syn:** = Ar, K3, K4, NcTx, SE3, Tn, Tx, Isely (1998). [NatureServe G5](#) (Secure).

Rhynchosia minima (Linnaeus) A.P. de Candolle. LITTLE SNOUTBEAN. **Hab:** Hammocks, dry pine flatwoods, coastal sands, shelly areas. **Dist:** Se. SC (Beaufort County), e. GA, south to s. FL, west to s. TX; West Indies; Neotropics, Paleotropics. The record from Beaufort County, SC is reported by Bradley et al. [in prep.]. **Phen:** Jan-Dec. **Comm:** The species also occurs in the Old World, and the New World distribution is sometimes considered a result of introduction. Relocated in AL in 2015 (Diamond 2015). **Syn:** = Bah, FI3, K1, K3, K4, NcTx, SE3, WH3, Isely (1998), Woods & Key (2009); = *Dolicholus minimus* (Linnaeus) Medikus – S; > *Rhynchosia minima* (Linnaeus) A.P. de Candolle var. *diminifolia* Walraven – Tx; > *Rhynchosia minima* var. *minima* – Tx. NatureServe G5TNR (Not Yet Ranked).

Robinia Linnaeus 1753 (LOCUST)

A genus of 5-8 species, shrubs and trees, of e. and sw. North America. The Southern Appalachians are a center of diversity of *Robinia*, with active hybridization, introgression, and formation of local (sterile) races involved; a fully satisfying taxonomic treatment of such a situation is not possible. Isely & Peabody's (1984) and Peabody's (1984) treatment seems a reasonable approach, and I have largely followed it here, differing in the rank of some of the taxa. References: Ashe (1922); Isely & Peabody (1984); SE3; Isely (1998); Peabody (1984).

Identification Notes: The key is differently structured than that in RAB or SE; it is presented as an alternative. This treatment may be altered substantially prior to publication. A variety of hybrids (including some cultivars) are known, including the following: *Robinia* × *longiloba* Ashe (pro sp.) [*R. hispida* × *viscosa*], known from NC and SC; *Robinia* × *margaretiae* Ashe (pro sp.) [*R. hispida* × *pseudoacacia*], known from NC, SC, and GA; *Robinia* × *ambigua* Poir (pro sp.) [*R. pseudoacacia* × *viscosa*], known from NC; *Robinia hartwigii* × *hispida*, known from Whiteside Mountain, Jackson County, NC; *Robinia hartwigii* × *viscosa*, known from Whiteside Mountain, Jackson County, NC.

- 1 Corolla white, 1.5-2.0 cm long; peduncles, pedicels, and calyces velvety-puberulent, the hairs neither glandular nor hispid; plant a small to large tree *Robinia pseudoacacia*
- 1 Corolla pink to pink-purple (rarely white or nearly so), (1.5-) 2.0-2.5 cm long; peduncles, pedicels, and calyces glandular-pubescent, hispid, or with short-stalked to sessile glands; plant a shrub to small tree.
 - 2 Twigs and leafstalks conspicuously hispid with hairs 1-5 mm long, these stiff, thick-based, and typically persistent several years. *Robinia hispida* var. *hispida*
 - 2 Twigs and leafstalks either viscid with sessile or short-stalked glands, or densely glandular-pubescent (the hairs 0.5-2 mm long), or tomentulose, or sparsely hispid with weak, non-persistent hairs. *Robinia viscosa*

Robinia hispida Linnaeus var. *hispida*. COMMON BRISTLY LOCUST. **Hab:** Woodlands and forests, and as an escape in disturbed areas and roadsides. **Dist:** Probably originally endemic to the Southern Appalachians (and perhaps adjacent provinces) of NC, SC, GA, TN, and VA, now widely distributed in e. North America as an escape from cultivation. **Phen:** May-Jun. **Syn:** = C, F, K1, NE, NY, SE3, Isely & Peabody (1984), Peabody (1984); = *Robinia hispida* – G, S, Ashe (1922); < *Robinia hispida* – FL3, GrPl, IL, MI, NcTx, Pa, RAB, Tn, Tx, Va, W, WH3, WV; > *Robinia hispida* – S; < *Robinia hispida* Linnaeus var. *hispida* – K3, K4; > *Robinia pallida* Ashe – S; > *Robinia speciosa* Ashe – S. NatureServe G4T4 (Apparently Secure).

Robinia pseudoacacia Linnaeus. BLACK LOCUST. **Hab:** Forests, woodlands, disturbed areas, roadcuts. **Dist:** Native in the s. and c. Appalachians, from PA south to GA and AL, and the Interior Highlands, now much more widespread, throughout e. and c. North America, also widely cultivated and escaped in Europe. **Phen:** Apr-Jun; Jul-Nov. **Comm:** Often considered a weed tree; Correll & Johnston (1970) state "black locusts are weedy. 'dirty' trees and root-sprout perniciously, therefore they are to be avoided in cultivation, although they are widely touted by unscrupulous nursery-dealers as 'million-dollar shade trees' ". **Syn:** = Ar, C, FL3, IL, K1, K3, MI, NcTx, NE, NY, Pa, SE3, Tx, Va, W, WH3, Isely & Peabody (1984); = *Robinia pseudo-acacia* – F, GrPl, RAB, S, WV, orthographic variant; > *Robinia pseudo-acacia* var. *pseudo-acacia* – G, orthographic variant; > *Robinia pseudo-acacia* var. *rectissima* (Linnaeus) Raber – G. NatureServe G5 (Secure).

Robinia viscosa Ventenat. CLAMMY LOCUST. **Hab:** Mountain forests and woodlands, roadsides, disturbed areas, rare in wild, uncommon as an escape. **Dist:** Originally a Southern and Central Appalachian endemic, ranging from PA south through w. MD, w. VA, e. WV, w. NC, and e. TN, to n. GA and n. AL, now much more widespread as an escape from cultivation. **Phen:** May-Jul; Jul-Aug. **Comm:** Reported for GA Coastal Plain (Marion County) (Carter, Baker, & Morris 2009). **Syn:** = F, G, IL, MI, Pa, RAB, S, WV; = *Robinia viscosa* var. *viscosa* – C, K1, K3, K4, NE, NY, SE3, Ashe (1922), Isely & Peabody (1984); < *Robinia viscosa* Ventenat – W. NatureServe G3T3 (Vulnerable).

Securigera A.P. de Candolle 1805 (CROWN-VETCH)

A genus of about 12-13 species, annual and perennial herbs, of Eurasia. This genus is sometimes included in *Coronilla*, but is apparently better separated (Isely 1998). References: Isely (1998).

* **Securigera varia** (Linnaeus) Lassen. CROWN-VETCH. **Hab:** Roadbanks, woodland borders. **Dist:** Native of Europe. **Phen:** Jun-Sep. **Comm:** This species is widely used to stabilize roadcuts. **Syn:** = Ar, IL, K3, K4, MI, NE, NY,

Tn, Va, Isely (1998); = *Coronilla varia* Linnaeus – C, F, Fl3, G, GrPl, K1, NcTx, Pa, RAB, SE3, W, WH3, WV. NatureServe GNR (Not Yet Ranked).

Senna P. Miller 1754 (SENNA, SICKLEPOD, WILD COFFEE)

A genus of about 295-350 species, trees, shrubs, and herbs, of tropical and warm temperate areas. References: Irwin & Barneby (1982); Isely (1975); SE3; Isely (1998); Marazzi et al (2006); Robertson & Lee (1976).

Identification Notes: In the key, "gland" refers to the leafstalk glands, which are located on the petiole or associated with the point of attachment of one or more pairs of leaflets to the leaf rachis.

- 1 Herbs, 0.5-22 dm tall.
 - 6 Racemes spike-like, 3-6 (-10) dm long; legume 4-winged; glands 0; leaves with (6-) 7-14 pairs of leaflets; [section *Senna*, series *Pictae*].....*Senna alata*
 - 6 Racemes not spike-like, < 3 dm long; legume not winged; glands present on petiole or rachis of leaves; leaves with (3-) 4-9 (-10) pairs of leaflets.
 - 7 Leaves with 3 pairs of leaflets; leaflets obovate, 1.6-2.5× as long as wide, the widest point past the midpoint, the apex broadly rounded to obtuse; gland(s) positioned at the lowest pair of leaflets and sometimes also at the 2nd pair; [section *Chamaefistula*, section *Trigonelloideae*]..... *Senna obtusifolia*
 - 7 Leaves with (3-) 4-9 (-10) pairs of leaflets; leaflets ovate, lanceolate, or elliptic, 1.9-7× as long as wide, the widest below or near the midpoint, the apex acuminate, acute, or obtuse; gland(s) positioned variously (see below).
 - 10 Leaflets 1.5-3.0 cm wide, in 3-6 pairs; racemes with 1-5 flowers; [section *Chamaefistula*, series *Basiglandulosae*] *Senna occidentalis*
 - 10 Leaflets 0.7-2.0 cm wide, in 6-10 pairs; racemes with 5-10 (-25) flowers; [section *Chamaefistula*, series *Temperatae*]..... *Senna marilandica*
- 1 Shrubs and trees, 20-200 dm tall.
 - 13 Leaves with 5-16 (-18) pairs of leaflets.*Senna alata*
 - 13 Leaves with (1-) 2-7 pairs of leaflets. *Senna corymbosa*

* ***Senna alata*** (Linnaeus) Roxburgh. EMPEROR'S CANDLESTICKS, CANDLESTICK PLANT. **Hab:** Disturbed areas. **Dist:** Native of tropical America. Planted and slightly naturalized from s. AL and FL west to OK and TX. **Phen:** Sep-Nov. **Syn:** = K1, K3, K4, NcTx, SE3, WH3, Irwin & Barneby (1982), Isely (1998); = *Cassia alata* Linnaeus – Tx, Isely (1975). NatureServe G4 (Apparently Secure).

* ***Senna corymbosa*** (Lamarck) H.S. Irwin & Barneby. ARGENTINE SENNA. **Hab:** Cultivated as an ornamental, rarely persistent or spreading to disturbed areas. **Dist:** Native of South America. Reported for AL (Diamond & Woods 2009). **Phen:** Aug-Sep. **Syn:** = K1, K3, NcTx, SE3, WH3, Irwin & Barneby (1982), Isely (1998); = *Adipera corymbosa* (Lamarck) Britton & Rose – S; = *Cassia corymbosa* – Tx, Isely (1975), Robertson & Lee (1976). NatureServe GNR (Not Yet Ranked).

Senna marilandica (Linnaeus) Link. MARYLAND WILD SENNA. **Hab:** Dry to moist forests, especially on greenstone and diabase barrens and rocky woodlands, thickets, woodland borders, sometimes somewhat weedy. **Dist:** S. MA and s. NY west to e. NE, south to Panhandle FL and c. TX. **Phen:** Jul-Aug; Aug-Nov. **Syn:** = *Ditremexa medsgeri* (Shafer) Britton & Rose – S; < *Cassia marilandica* Linnaeus – F, G, GrPl, RAB, Tx, W, WV, Isely (1975), Robertson & Lee (1976); < *Senna marilandica* (Linnaeus) Link – Ar, C, Il, K1, K3, K4, Mo2, NcTx, Pa, SE3, Tn, Va, WH3, Irwin & Barneby (1982), Isely (1998).

* ***Senna obtusifolia*** (Linnaeus) H.S. Irwin & Barneby. SICKLEPOD, COFFEEWEED. **Hab:** Fields (especially soybean fields), disturbed areas. **Dist:** Probably native of the New World Tropics. The species is now pantropical. **Phen:** Jul-Sep; Aug-Nov. **Syn:** = Ar, C, GrPl, Il, K1, K3, K4, Mo2, NcTx, NE, NY, Pa, SE3, Tn, Va, WH3, Irwin & Barneby (1982), Isely (1998), Robertson & Lee (1976); = *Cassia obtusifolia* Linnaeus – Bah, RAB, Tx, W, Isely (1975); < *Cassia tora* Linnaeus – F, G, misapplied; < *Emelista tora* (Linnaeus) Britton & Rose – S, misapplied.

* ***Senna occidentalis*** (Linnaeus) Link. COFFEE SENNA. **Hab:** Disturbed places. **Dist:** Native of the Old World Tropics. The species is now pantropical. **Phen:** Jul-Aug; Aug-Nov. **Syn:** = Ar, C, GrPl, Il, K1, K3, K4, Mo2, NcTx, SE3, Va, WH3, Irwin & Barneby (1982), Isely (1998); = *Cassia occidentalis* Linnaeus – Bah, F, G, RAB, Isely (1975), Robertson & Lee (1976); = *Ditremexa occidentalis* (Linnaeus) Britton & Rose ex Britton & Wilson – S. NatureServe GNR (Not Yet Ranked).

Sesbania Adanson 1760 (RATTLEBOX, SESBAN)

A genus of about 60-70 species, annual herbs, perennial herbs, shrubs, and trees, of tropical, subtropical, and less commonly warm temperate regions of the Old and New World, here circumscribed to include *Glottidium*, following Lewis et al. (2005). References: Farruggia in FNA () (in prep); Farruggia, Lavin, & Wojciechowski (2018); Isely (1998).

- 1 Legume 10-40 cm long, 0.3-0.8 cm wide; legume ×-section terete, laterally compressed, or somewhat tetragonal (but not at all flanged or winged); seeds many (> 10) per legume; [sect. *Sesbania*]..... *Sesbania herbacea*
- 1 Legume 3-8 cm long, 0.6-1.6 cm wide; legume ×-section laterally compressed or obviously tetragonal (the corners flanged or prominently winged); seeds 1-10 per legume.
 - 4 Corolla 8-9 mm long; legume flattened; seeds 1-2 (-3) per legume; leaves with 8-13 (-18) pairs of leaflets; [sect. *Glottidium*] *Sesbania vesicaria*

Key to Map

- 4 Corolla 9-25 mm long; legume quadrangular or 4-winged; seeds 4-10 per legume; leaves with 10-35 pairs of leaflets; [sect. *Daubentonia*].
 5 Legume quadrangular or slightly flanged, 0.5-0.8 cm wide; corolla 9-12 mm long..... *Sesbania virgata*
 5 Legume conspicuously 4-winged longitudinally, 1-1.5 cm wide; corolla 13-25 mm long.
 6 Corolla yellow; pedicels 0.5-1.0 cm long; legume blunt or abruptly acuminate to a beak..... *Sesbania drummondii*
 6 Corolla orange or red; pedicels 0.5-1.2 (-1.5) cm long; legume acuminate or tapering to a beak..... *Sesbania punicea*

Sesbania drummondii (Rydborg) Cory. RATTLEBOX, POISON-BEAN. **Hab:** Disturbed areas, spoil, marsh edges, ditches. **Dist:** Native on the Gulf Coast west to s. TX and Mexico, the exact eastern edge of the native range uncertain, perhaps w. FL Panhandle. **Phen:** Jun-Sep. **Comm:** First reported for GA and SC by Townsend et al. (2000), where clearly introduced. **Syn:** = Ar, FNA, GW2, K1, K3, K4, NcTx, SE3, Tx, WH3, Isely (1998); = *Daubentonia drummondii* Rydborg – S. **NatureServe G4G5** (Apparently Secure).

Sesbania herbacea (P. Miller) McVaugh. SESBAN, COFFEE-WEED, INDIGO-WEED, PEATREE, BEQUILLA. **Hab:** Ditches, wet fields, disturbed moist and wet areas, perhaps native only in the deeper South. **Dist:** Native distribution uncertain, perhaps e. NC south to s. FL, west on the Coastal Plain and Mississippi Embayment to TX, south into Mexico. **Phen:** Jul-Sep; Aug-Nov. **Syn:** = Ar, FNA, K1, K3, NcTx, NE, WH3; = *Sesban exaltatus* (Rafinesque) Rydborg – S; = *Sesbania exaltata* (Rafinesque) Cory – C, F, G, IL, K4, RAB, SE3, Tn, Isely (1998); = *Sesbania macrocarpa* Muhlenberg ex Rafinesque – GrPl, GW2, Tx. **NatureServe G5?** (Secure).

* *Sesbania punicea* (Cavanilles) Benth. RATTLEBOX, SCARLET WISTERIA-TREE, RED SESBAN. **Hab:** Ditches, wet fields, marshes, ponded wetlands, wet pinelands. **Dist:** Native of South America. **Phen:** Jun-Oct; Aug-Nov. **Syn:** = Ar, FNA, GW2, K1, K3, K4, SE3, Tx, Va, WH3, Isely (1998); = *Daubentonia punicea* (Cavanilles) A.P. de Candolle – RAB, S. **NatureServe G4** (Apparently Secure).

Sesbania vesicaria (Jacquin) Elliott. BLADDERPOD, BAGPOD. **Hab:** Ditches, marshes, disturbed wet areas. **Dist:** The original native distribution of *S. vesicaria* is uncertain; its distribution is from ne. NC south to s. FL, west to e. OK and se. TX, and Isely (1998) states that it is unknown from outside the United States; occurrences in provinces inland of the Coastal Plain seem to represent introductions into artificial wetlands (such as ditches). **Phen:** Jul-Sep; Aug-Nov. **Syn:** = FNA, GW2, K3, K4, Tx, WH3; = *Glottidium vesicarium* (Jacquin) R.M. Harper – Ar, K1, NcTx, RAB, S, SE3, Isely (1998). **NatureServe G5** (Secure).

* *Sesbania virgata* (Cavanilles) Poir. WAND RIVER-HEMP. **Hab:** Disturbed areas. **Dist:** Native of South America. **Phen:** Jun-Oct; Aug-Nov. **Syn:** = FNA, K1, K3, K4, SE3, WH3, Isely (1998). **NatureServe G4** (Apparently Secure).

Strophostyles Elliott 1823 (SAND BEAN, WOOLLY BEAN, WILD BEAN, FUZZY BEAN)

A genus of 3 species, annual and perennial herbs, of North America. References: Delgado-Salinas in FNA () (in prep); Isely (1998); Pelotto & Del Pero Martínez (1998).

- 1 Legumes 2-4 cm long, permanently pubescent; corolla 5-8 mm long; leaves permanently pubescent on the upper surface; seeds glabrous..... *Strophostyles leiosperma*
 1 Legumes 3-8 cm long, glabrate at maturity; corolla 8-15 mm long; leaves usually glabrate on the upper surface; seeds pubescent.
 2 Bracteoles (immediately subtending the calyx) 2-3 mm long, equaling or exceeding the calyx tube; leaflets usually prominently 3-lobed; terminal leaflet 2.5-3.5 cm wide; plant an annual..... *Strophostyles helvola*
 2 Bracteoles (immediately subtending the calyx) 0.5-1.0 (-1.5) mm long, shorter than the calyx tube; leaflets not lobed; terminal leaflet 0.3-2.0 cm wide; plant a perennial..... *Strophostyles umbellata*

Strophostyles helvola (Linnaeus) Elliott. ANNUAL SAND BEAN, TRAILING FUZZY BEAN, AMBERIQUE BEAN. **Hab:** Coastal dunes, beaches, dry sandy woodlands, disturbed areas. **Dist:** QC west to MN and SD, south to n. peninsular FL and e. TX. **Phen:** Jun-Sep; Aug-Oct. **Tax:** See Isely (1986b) for a discussion of the orthography of the epithet. **Syn:** = C, G, GrPl, K3, K4, NE, NY, Pa, RAB, S, Tx, Va, WH3, WV; = *Strophostyles helvola* (Linnaeus) Elliott – K1, Mi, NcTx, SE3, Tn, W, Pelotto & Del Pero Martínez (1998), orthographic variant; > *Strophostyles helvola* var. *helvola* – F; > *Strophostyles helvola* var. *missouriensis* (S. Watson) Britton – F; > *Strophostyles helvola* var. *helvola* – IL; > *Strophostyles helvola* var. *missouriensis* (S. Watson) Britton – IL.

Strophostyles leiosperma (Torrey & A. Gray) Piper. SMALL-FLOWEDED SAND BEAN, SLICKSEED FUZZY BEAN. **Hab:** Prairies, glades, barrens, sand bars, disturbed areas. **Dist:** IN, WI, MN, and ND, south to FL Panhandle, AL, MS, LA, TX, NM, and AZ; also scattered eastward presumably as introductions. **Phen:** Jun-Sep; Aug-Oct. **Syn:** = Ar, C, F, FNA, G, GrPl, IL, K1, K3, K4, NcTx, NE, Pa, SE3, Tn, Tx, WH3, Pelotto & Del Pero Martínez (1998); = *Strophostyles pauciflora* (Benth.) S. Watson – S. **NatureServe G5** (Secure).

Strophostyles umbellata (Muhlenberg ex Willdenow) Britton. PERENNIAL SAND BEAN, PERENNIAL FUZZY BEAN. **Hab:** Dry sandy or rocky woodlands, disturbed areas. **Dist:** S. NY west to s. IN, s. MO, and KS, south to c. peninsular FL, s. TX, and COA. **Phen:** Jun-Oct; Aug-Oct. **Syn:** = Ar, C, F, FNA, G, IL, K1, K3, K4, Mex, NY, Pa, RAB, S, SE3, Tn, Tx, Va, W, WH3, Pelotto & Del Pero Martínez (1998); > *Strophostyles umbellata* var. *paludigena* Fernald – F; > *Strophostyles umbellata* var. *umbellata* – F.

140. FABACEAE

*Stylosanthes* Swartz 1788 (PENCIL-FLOWER)

A genus of about 25-50 species, annual and perennial herbs, pantropical and less commonly temperate. References: Isely (1998); Mohlenbrock (1957).

Identification Notes: The large, adnate stipules are distinctive. *Stylosanthes* fruits are loments with 2 segments, the terminal almost always fertile, and terminated by the persistent style, the lower often abortive.

Stylosanthes biflora (Linnaeus) Britton, Sterns, & Poggenburg. PENCIL-FLOWER. **Hab:** Longleaf pine sandhills, dry to moist (but not wet) pine savannas and flatwoods, dry forests, woodlands, woodland borders, glades, barrens, rock outcrops. **Dist:** S. NY west to OH, s. IL, and KS, south to c. peninsular FL and e. TX. **Phen:** Jun-Aug; Jul-Oct. **Tax:** Mohlenbrock (1957) studied variation in this species and did not choose to recognize variation taxonomically (see synonymy); a modern re-evaluation is perhaps warranted. **Syn:** = Ar, C, GrPl, Il, K1, K3, K4, NcTx, NY, Pa, RAB, SE3, Tn, Tx, Va, W, WH3, WV, Isely (1998), Mohlenbrock (1957); > *Stylosanthes biflora* (Linnaeus) Britton, Sterns, & Poggenburg – S; > *Stylosanthes biflora* var. *biflora* – F, G; > *Stylosanthes biflora* var. *hispidissima* (Michaux) Pollard & Ball – F, G; > *Stylosanthes riparia* Kearney – G, S; > *Stylosanthes riparia* var. *riparia* – F; > *Stylosanthes riparia* var. *setifera* Fernald – F. NatureServe G5 (Secure).

Tephrosia Persoon 1807 (GOAT'S-RUE)

A genus of about 350-400 species, perennial herbs, of tropical and warm temperate regions of the Old World and New World. References: Isely (1998); Ward (2004c); Wood (1949).

- 5 Corolla bicolored, the standard yellow and the wings pink; racemes terminal; stems erect; stamens monadelphous; leaves with (9-) 13-23 (-37) leaflets. *Tephrosia virginiana*
- 5 Corolla unicolored, initially white or pink, darkening in age to a dark maroon or purple; racemes opposite the leaves (the uppermost appearing terminal); stems decumbent or ascending; stamens diadelphous; leaves with (3-) 5-23 (-27) leaflets.
- 7 Upper stamen fused with the staminal sheath for part or most of its length (submonadelphous); leaves with (9-) 13-23 (-27) leaflets; [plants from s. AL westward] *Tephrosia onobrychoides*
- 7 Upper stamen completely separate from the staminal sheath (diadelphous); leaves with (3-) 5-17 (-19) leaflets; [plants collectively widespread in our area].
- 9 Petiole (1-) 2-4× as long as the lowest leaflets of the leaf; peduncle and rachis of inflorescence strongly flattened (2-angled, or rarely, 3-angled) in cross-section; leaflets averaging 25 mm long and 12 mm wide..... *Tephrosia florida*
- 9 Petiole 1/3-1× as long as the lowest leaflets of the leaf; peduncle and rachis of inflorescence terete or inconspicuously 2-4-angled in cross-section; leaflets averaging smaller.
- 10 Stem and fruit finely pubescent with hairs < 0.5 mm long; leaves with (3-) 5-11 (-13) leaflets; petiole 0-5 mm long. *Tephrosia chrysophylla*
- 10 Legume and stem coarse pubescent (villous) with hairs 1.0-1.5 mm long; leaves with (7-) 9-17 (-19) leaflets; petiole 2-15 mm long.
- 12 Inflorescence with 1-3 (-5) nodes; plants inconspicuously pubescent with gray hairs (the hairs appressed or spreading, short to fairly long); leaflets (3-) avg. 5-6 (-7) mm wide, mostly acute; [plants of the Coastal Plain of NC and SC] *Tephrosia hispidula*
- 12 Inflorescence with 2-20 nodes; plants conspicuously tawny long-pilose with rusty brown hairs; leaflets (6-) avg. 8 (-12) mm wide, mostly obtuse; [plants widespread in our area]..... *Tephrosia spicata*

Tephrosia chrysophylla Pursh. SPRAWLING GOAT'S-RUE. **Hab:** Longleaf pine sandhills. **Dist:** E. GA s. to s. FL, and west to s. MS. **Phen:** May-Sep. **Comm:** Rather frequent hybrids between *T. chrysophylla* and *T. florida* are intermediate in morphology and have been found in AL, FL, GA, and MS; they have been given a hybrid binomial, *T. ×intermedia* (Small) Nesom & Zarucchi, replacing the later name *T. ×floridana* (Vail) Isely, which has been in regular use in the southeastern United States (Nesom & Zarucchi 2009). **Syn:** = K1, K3, K4, SE3, WH3, Isely (1998), Wood (1949); > *Cracca carpenteri* Rydberg – S; > *Cracca chapmanii* (Vail) Small – S; > *Cracca chrysophylla* (Pursh) Kuntze – S. NatureServe G4G5 (Apparently Secure).

Tephrosia florida (F.G. Dietrich) C.E. Wood. FLORIDA HOARYPEA, FLORIDA GOAT'S-RUE. **Hab:** Pine savannas and other pinelands. **Dist:** E. NC south to s. FL, west to se. LA, a Southeastern Coastal Plain endemic. **Phen:** May-Jul; Jun-Sep. **Tax:** See *T. chrysophylla* for discussion of hybrids between *T. chrysophylla* and *T. florida*. **Syn:** = K1, K3, K4, RAB, SE3, WH3, Isely (1998), Wood (1949); = *Cracca ambigua* (M.A. Curtis) Kuntze – S. NatureServe G4G5 (Apparently Secure).

Tephrosia hispidula (Michaux) Persoon. SPRAWLING HOARYPEA. **Hab:** Pine savannas and other pinelands. **Dist:** E. NC (se. VA?) south to c. peninsular FL, west to se. LA, a Southeastern Coastal Plain endemic. **Phen:** May-Aug; Jul-Oct. **Comm:** Fernald (1950) reports this species from se. VA. **Syn:** = F, K1, K3, K4, RAB, SE3, WH3, Isely (1998), Wood (1949); = *Cracca hispidula* (Michaux) Kuntze – S. NatureServe G4G5 (Apparently Secure).

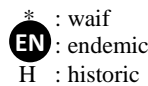

Tephrosia onobrychoides Nuttall. **Hab:** Dry pinelands. **Dist:** S. AL, n. AR, e. OK, south to s. LA, and sc. TX. **Phen:** Jun-Jul (-Sep). **Syn:** = Ar, K1, K3, K4, NcTx, SE3, Tx, Isely (1998), Wood (1949); = *Cracca onobrychoides* (Nuttall) Kuntze – S. NatureServe G4G5 (Apparently Secure).

Tephrosia spicata (Walter) Torrey & A. Gray. SPIKED HOARYPEA. **Hab:** Sandhills, oak and oak-pine woodlands. **Dist:** S. DE south to s. FL, west to w. LA, north in the interior to se., sc., and sw. TN and se. KY. **Phen:** Jun-Aug; Jul-Oct. **Syn:** = C, G, K1, K3, K4, RAB, SE3, Tn, Va, W, WH3,

***Trifolium*** Linnaeus 1753 (CLOVER)

A genus of about 240-250 species, annual and perennial herbs, nearly cosmopolitan (primarily north temperate). References: Chapel & Vincent (2013); Collins & Wieboldt (1992); Isely (1998); Zohary & Heller (1984).

Identification Notes: Draft key adapted from various published sources, including SE and C.

Unkeyed waifs: *Trifolium michelianum*

- 1 Flowers bright yellow (fading brown); [section *Chronosemium*].
 - 3 Standard with 5 obvious diagonal veins (striations); heads 8-13 mm in diameter, generally with 20-30 flowers; flowers 3.5-5 mm long; petiole of the terminal leaflet 1-3 mm long *Trifolium campestre*
 - 3 Standard inconspicuously veined; heads 5-8 mm in diameter, generally with 5-15 (-20) flowers; flowers 2.5-3.5 mm long; petiole of the terminal leaflet ca. 1 mm long *Trifolium dubium*
- 1 Flowers not white, pink, purplish, or red.
 - 4 Flowers borne on distinct pedicels, (1-) 2-10 mm long, these often curving or reflexing in age; flowers white, fading pink with age in most species; [native and alien species]; [section *Lotoidea*].
 - 5 Plants stoloniferous, all or some of the leaves alternate from ground level and long petioled. *Trifolium repens*
 - 5 Plants not stoloniferous, clumped (though sometimes with prostrate or lax stems).
 - 8 Calyx lobes narrowly triangular, about as long as the calyx tube (or longer in *T. hybridum*); stipules scarious-membranaceous; [plants introduced].
 - 9 Calyx lobes not scarious-margined, straight, equal to or longer than the tube *Trifolium hybridum*
 - 9 Calyx lobes scarious-margined, becoming divergent and twisted, about equal to the tube *Trifolium nigrescens*
 - 8 Calyx lobes subulate to lanceolate, distinctly longer than the calyx tube; stipules green, foliaceous; [plants rare natives].
 - 10 Flowers 4-6 mm long; calyx lobes lanceolate, foliaceous, 3-nerved, 0.4-0.8 mm wide *Trifolium carolinianum*
 - 10 Flowers 8-12 mm long; calyx lobes subulate, setaceous, 1-nerved, < 0.4 mm wide. *Trifolium reflexum*
 - 4 Flowers sessile or on very short pedicels (usually < 1 mm long); flowers pink, purplish, white, or scarlet; [alien species].
 - 13 Plants stoloniferous, all or some of the leaves alternate from ground level and long petioled. *Trifolium subterraneum*
 - 13 Plants not stoloniferous, the leaves clustered at or near ground level and/or produced on aerial stems.
 - 15 Heads subtended by a pseudo-involucre of 2 (-3) enlarged stipules and/or opposite or subopposite leaves; [section *Trifolium*].
 - 16 Flowers white (fading pink), 7-8 mm long; calyx tube both externally glabrous and 20-nerved *Trifolium lappaceum*
 - 16 Flowers red, pink-purple, or bicolored, either 11-20 mm long or 4-6 mm long; calyx tube not both externally glabrous and 20-nerved (externally pubescent, or 10-nerved, or both). *Trifolium pratense*
 - 15 Heads not subtended by a pseudo-involucre of leaves or expanded stipules.
 - 20 Calyx bladderly-inflated in fruit; corolla resupinate (inverted 180 degrees, such that the standard is lowermost); [section *Vesicaria*]. *Trifolium resupinatum*
 - 20 Calyx not bladderly-inflated in fruit; corolla orientation normal (standard uppermost).
 - 22 Corolla 3-6 mm long; [section *Trifolium*]. *Trifolium arvense*
 - 22 Corolla 10-18 mm long.
 - 23 Corolla crimson, 10-13 (-15) mm long; floral bracts absent; heads 1-1.5 (-2) cm in diameter; [section *Trifolium*] *Trifolium incarnatum*
 - 23 Corolla white, 15-18 mm long; floral bracts present; heads 2.5-3 cm in diameter; [section *Mistyllus*] *Trifolium vesiculosum*

* ***Trifolium arvense*** Linnaeus. RABBITFOOT CLOVER. **Hab:** Disturbed areas, shale barrens. **Dist:** Native of the Mediterranean region. **Phen:** Apr-Oct. **Syn:** = Ar, C, F, G, GrPl, Il, K1, K3, K4, Mi, NcTx, NE, NY, Pa, RAB, S, SE3, Tn, Va, W, WH3, WV, Isely (1998). Vachellia Wight & Arnott 1834 (ACACIA)

A genus of about 163 species, trees and shrubs, of tropical and subtropical America, Africa, Asia, and Australia. Formerly considered part of *Acacia*. References: Ebinger & Seigler in FNA () (in prep); Ebinger, Seigler, & Clarke (2002); Isely (1969); Isely (1998); Maslin, Miller, & Seigler (2003); Seigler & Ebinger (2005).

- 1 Pinna pairs 10-17 (-25) per leaf; leaflet pairs 20-30 per pinna..... *Vachellia macracantha*
 1 Pinna pairs 1-8 per leaf; leaflet pairs 2-20 pairs of leaflets..... *Vachellia densiflora*

Vachellia densiflora Alexander ex Small. SMALL'S SWEET ACACIA, HUISACHE. **Hab:** Sandy flats on barrier islands, maritime scrub, shell middens, disturbed uplands. **Dist:** FL Panhandle west along the coast to TX and Tamaulipas. **Syn:** = S; = *Acacia smallii* Isely – SE3, Isely (1969), Isely (1998); < *Acacia farnesiana* (Linnaeus) Willdenow – K1, NcTx, Tx, WH3; < *Acacia farnesiana* ssp. *farnesiana* – Ebinger, Seigler, & Clarke (2002); < *Vachellia farnesiana* var. *farnesiana* – FNA, K3, K4, Seigler & Ebinger (2005). **NatureServe G5** (Secure).

Vachellia macracantha (Humboldt & Bonpland ex Willdenow) Seigler & Ebinger. APOANAX, LONGSPINE ACACIA, PORKNUT. **Hab:** Coastal hammocks, also planted as an ornamental and rarely naturalized. **Dist:** S. and c. FL peninsula; Bahamas; Mexico, Central America, and South America. **Syn:** = FNA, K3, K4, WI, Seigler & Ebinger (2005); = *Acacia macracantha* Humboldt & Bonpland ex Willdenow – Bah, K1, SE3, WH3, Isely (1969), Isely (1998). **NatureServe G5** (Secure).

*Vicia* Linnaeus 1753 (VETCH, TARE)

A genus of about 150-160 species, annual and perennial herbs, of temperate Eurasia and North America. References: Isely (1998); Lassetter (1984); van de Wouw, Maxted, & Ford-Lloyd (2003).

- 1 Inflorescence nearly sessile, of 1-4 flowers clustered in the leaf axil; [alien species].
 3 Corolla 5-6 mm long; leaves with 4-6 (-8) leaflets..... *Vicia lathyroides*
 3 Corolla 10-30 mm long; leaflets 6-16 (-20).
 5 Calyx lobes all shorter than the calyx tube; corolla yellow, often streaked with purple, 25-30 mm long..... *Vicia grandiflora*
 5 Calyx lobes (at least the longer) about as long as the calyx tube; corolla pink, purple, lavender, white, or creamy yellow, 10-25 (-30) mm long.
 7 Calyx 7-11 (-12) mm long; corolla pink-purple to whitish, 10-18 mm long; leaflets 4-10× as long as wide..... *Vicia sativa* ssp. *nigra*
 7 Calyx 10-15 mm long; corolla generally pink-purple, 18-25 (-30) mm long; leaflets 2-5 (-7)× as long as wide..... *Vicia sativa* ssp. *sativa*
 1 Inflorescence pedunculate, of 2-many flowers along a well-developed raceme; [alien and native species].
 8 Peduncles 1-10 mm long; raceme axis 2-10 mm long, with 2-7 (-10) flowers.
 *Vicia faba*
 8 Peduncles usually > 10 mm long; raceme axis usually >10 mm long, with (1-) 2-many flowers.
 10 Corolla 10-25 mm long.
 13 Calyx swollen on one side; plant an annual; inflorescence secund.
 14 Plant glabrate or with pubescence of incurved or loosely appressed hairs < 1 mm long; lower calyx lobe lanceolate to linear-lanceolate, 1-2 (-3) mm long; leaflets 2-4 mm wide..... *Vicia villosa* ssp. *varia*
 14 Plant conspicuously villous, the hairs spreading and 1-2 mm long; lower calyx lobe acicular or weak, (2-) 3-4 mm long; leaflets 3-6 mm wide *Vicia villosa* ssp. *villosa*
 13 Calyx not swollen on one side; plant a rhizomatous perennial; inflorescence not secund.
 *Vicia caroliniana*
 10 Corolla 2.5-8 (-10) mm long.
 16 Plant a rhizomatous perennial.
 *Vicia caroliniana*
 16 Plant an annual.
 20 Legume symmetrically rounded at the apex; inflorescence with 1-2 (-4) flowers..... *Vicia tetrasperma*
 20 Legume asymmetrically acute at the apex; inflorescence with 1-15 flowers.
 21 Leaves with 2-4 leaflets; legume glabrous to inconspicuously puberulent..... *Vicia minutiflora*
 21 Leaves with (8-) 10-16 leaflets; legume glabrous or finely hirsute.
 22 Legume finely hirsute; calyx 2-2.5 mm long; corolla 2.5-4.5 mm long *Vicia hirsuta*
 22 Legume glabrous; calyx 2.8-3.7 mm long; corolla 4.5-8 mm long.
 23 Flowers opening before the peduncle elongates; young fruits often present and visible when flowers open; style 0.6-0.8 mm long; leaflets generally 11-15.
 *Vicia ludoviciana* var. *1* ('louisianica')
 23 Flowers opening after the peduncle elongates; young fruits not present when flowers open; style (0.6-) 0.8-1.4 (-1.7) mm long; leaflets (5-) 7-10 (-13).
 *Vicia ludoviciana* var. *ludoviciana*

140. FABACEAE

*Vigna* Savi 1824 (COWPEA)

A genus of about 60-150 species, annual and perennial herbs, pantropical, rarely extending into warm temperate regions. References: Delgado-Salinas in FNA () (in prep); Isely (1998); Maréchal, Mascherpa, & Stainier (1978).

Unkeyed waifs: *Vigna angularis*, *Vigna lasiocarpa*

- 1 Corolla yellow, 1.5-1.7 cm long; leaves somewhat fleshy-thickened; [plant native or introduced in maritime situations]; [section *Vigna*]..... *Vigna luteola*
 1 Corolla pink to purple, 1.5-2.5 cm long; leaves herbaceous; [plant a cultivated introduction]; [section *Catjang*]..... *Vigna unguiculata*

* ***Vigna angularis*** (Willdenow) Ohwi & H. Ohashi. ADZUKI BEAN. **Hab:** Waif from cultivation. **Dist:** Native of e. Asia. **Syn:** = K3, Isely (1998); = *Phaseolus angularis* (Willdenow) W.F. Wight - S. **NatureServe GNR** (Not Yet Ranked).

* ***Vigna lasiocarpa*** (Martius ex Benth) Verdcourt. **Hab:** Waif from cultivation. **Dist:** Native of Mexico to South America. **Syn:** = K4.

Vigna luteola (Jacquin) Benth. WILD COWPEA. **Hab:** Edges of freshwater tidal marshes, beaches, hammocks, disturbed areas, railroad embankments, low fields, in the outer Coastal Plain. **Dist:** Se. NC south to s. FL, west to se. TX, and in the New World tropics. **Phen:** Jul-Sep; Aug-Oct. **Comm:** Often weedy in appearance, and its nativity at a particular location difficult to judge. **Syn:** = Bah, GW2, K1, K3, K4, RAB, Tx, WH3, Isely (1998), Maréchal, Mascherpa, & Stainier (1978); = *Vigna marina* (Burman) Merrill, correct name according to some authors based on uncertain typification; ? *Vigna repens* (Linnaeus) Kuntze - S.

* ***Vigna unguiculata*** (Linnaeus) Walpers. BLACK-EYED PEA, FIELD PEA, COWPEA. **Hab:** Cultivated in commercial and home gardens, rarely persistent or occurring as a waif in disturbed areas. **Dist:** Native of tropical Africa. **Phen:** Jun-Aug; Jul-Sep. **Syn:** = Bah, II, K1, K3, K4, Mi, RAB, Tx, WH3, Isely (1998); = *Vigna unguiculata* - F13, misspelling; ? *Vigna sinensis* (Linnaeus) Savi - F, S; > *Vigna unguiculata* var. *unguiculata* - Maréchal, Mascherpa, & Stainier (1978). **NatureServe GNR** (Not Yet Ranked).

*Wisteria* Nuttall 1818 (WISTERIA)

A genus of about 6 species, woody vines, shrubs, and small trees, of temperate e. Asia and e. North America. Some research suggests that the Asian species should be placed in a separate genus (see Isely 1998 and Stritch 1984). References: Isely (1998); Stritch (1984); Valder (1995).

Identification Notes: Twining direction can be determined by looking at (or imagining) the vine twining around a branch or pole. Look at the pole or branch from the base (from the direction from which the vine is growing). If the vine is circling the branch or pole in a clockwise direction, that is dextrorse; if counterclockwise, that is sinistrorse. Identification of the two alien species and their hybrids is uncertain. Genetic sorting of morphological characters and horticultural selection mean that morphology is only poorly correlated with genetic origin. Trusty et al. (2007) found that 24 of 25 individuals tested from scattered sites around the Southeast showed genetic admixture (sometimes complicated) between *W. floribunda* and *W. sinensis*. Probably the great majority of material in the Southeast could be called *W. ×formosa*; the below key may work poorly or not at all for some material encountered.

- 1 Legume and ovary glabrous; pedicels 5-10 (-15) mm long; standard reflexed near the middle; seeds reniform; leaflet margins plane; leaflet apices acute to slightly acuminate; [native species of swamps and bottomland forests and thickets]
 2 Upper lip of the calyx <0.5× as long as the tube; inflorescence usually 4-15 cm long; pedicels and calyx with 0-few clavate glands *Wisteria frutescens* var. *frutescens*
 2 Upper lip of the calyx 0.7-1.2× as long as the tube; inflorescence usually 15-30 cm long; pedicels and calyx densely clavate-glandular *Wisteria frutescens* var. *macrostachya*
 1 Legume and ovary velvety pubescent; pedicels 15-20 mm long; standard reflexed at the base; seeds lenticular; leaflet margins undulate; leaflet apices mainly strongly acuminate; [introduced species, naturalized in a wide variety of situations].
 3 Standard 20-23.5 mm long, 21-23 mm wide; leaflets (7-) 9-11 (-13) per leaf; raceme to 33 cm long, with 25-95 flowers opening nearly simultaneously; vine twining clockwise (dextrorse; from lower left ascending to upper right)..... *Wisteria sinensis*
 3 Standard 16-18 mm long, 16-18 mm wide; leaflets 7-17 (-19) per leaf; raceme to 132 cm long, with 25-170 flowers opening nearly simultaneously or sequentially; vine twining counter-clockwise (sinistrorse; from lower right ascending to upper left).
 4 Auricles of the standard's callosity 1.1-1.2 mm long; leaflets (11-) 13-17 (-19) per leaf; raceme to 132 cm long, with the 50-170 flowers opening successively from base to the tip of the inflorescence, those at the base withering before those at the tip have opened *Wisteria floribunda*

4 Auricles of the standard's callosity 0.7-0.8 mm long; leaflets 7-17 per leaf; racemes to 36 cm long..... *Wisteria ×formosa*

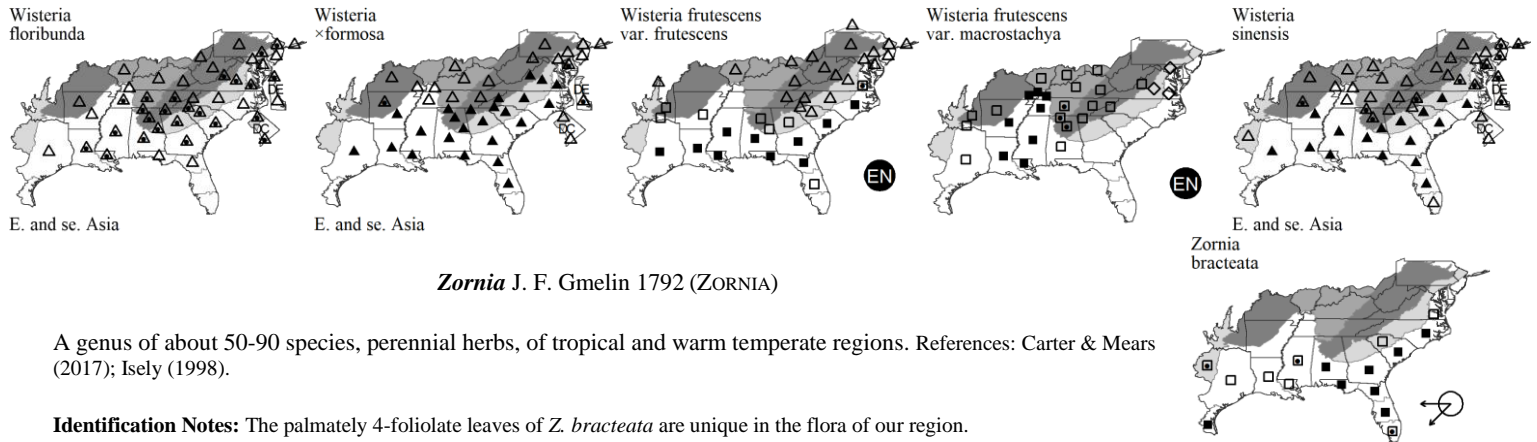

* ***Wisteria floribunda*** (Willdenow) A.P. de Candolle. JAPANESE WISTERIA. **Hab:** Commonly cultivated, escaped to urban, suburban, and rural forests and woodlands. **Dist:** Native of Japan. **Phen:** Apr-Jul; Jul-Nov. **Syn:** = Ar, C, F, G, K1, K3, K4, NE, NY, Pa, RAB, SE3, Tn, Tx, Va, WH3, Isely (1998), Valder (1995); = *Kraunhia floribunda* (Willdenow) Taubert – S; = *Rehsonia floribunda* (Willdenow) Stritch – II, Stritch (1984). **NatureServe GNR** (Not Yet Ranked).

* ***Wisteria ×formosa*** Rehder. HYBRID ASIAN WISTERIA. **Hab:** Cultivated, escaped to urban, suburban, and rural forests and woodlands, commonly cultivated and escaped; a cross of species native to China and Japan. **Dist:** Trusty et al. (2007, 2008) revealed that much of the invasive *Wisteria* in southeastern United States involves complex hybrids and backcrosses involving *W. floribunda* and *W. sinensis*. **Phen:** Apr-Jul; Jul-Nov. **Syn:** = K3, K4, Va, WH3; = *Rehsonia ×formosa* (Rehder) Stritch – Stritch (1984).

Wisteria frutescens (Linnaeus) Poiret var. *frutescens*. ATLANTIC WISTERIA, AMERICAN WISTERIA, SWAMP WISTERIA. **Hab:** Swamp forests, wet thickets. **Dist:** E. VA south to n. peninsular FL, west to TX, north in the interior to AR. **Phen:** Apr-May; Jun-Sep. **Syn:** = *Bradleia frutescens* (Linnaeus) Britton; = *Kraunhia frutescens* (Linnaeus) Greene – S; = *Wisteria frutescens* (Linnaeus) Poiret – C, F, G, Valder (1995); < *Wisteria frutescens* (Linnaeus) Poiret – Ar, GW2, IL, K1, K3, K4, NE, NY, Pa, RAB, SE3, Tn, Va, W, WH3, WV, Isely (1998).

Wisteria frutescens (Linnaeus) Poiret var. *macrostachya* Torrey & A. Gray. MISSISSIPPI WISTERIA, AMERICAN WISTERIA, SWAMP WISTERIA. **Hab:** Swamp forests, wet thickets. **Dist:** S. IN and s. MO south to LA, eastwards to w. VA and w. NC. **Phen:** Apr-May; Jun-Sep. **Tax:** This taxon may well warrant recognition as separate from *W. frutescens* at specific rank. **Syn:** = *Kraunhia macrostachya* (Torrey & A. Gray) Small – S; = *Wisteria macrostachya* (Torrey & A. Gray) Nuttall ex B.L. Robinson & Fernald – C, F, G, Tx, Valder (1995); < *Wisteria frutescens* (Linnaeus) Poiret – Ar, GW2, IL, K1, K3, Mi, NY, RAB, SE3, Tn, Va, W, Isely (1998).

* ***Wisteria sinensis*** (Sims) A.P. de Candolle. CHINESE WISTERIA. **Hab:** Commonly cultivated, escaped to a wide diversity of urban, suburban, and rural forests and woodlands. **Dist:** Native of China. **Phen:** Apr-Jul; Jul-Nov. **Syn:** = Ar, C, F, K1, K3, K4, Mi, NcTx, NE, NY, Pa, RAB, SE3, Tn, Tx, Va, WH3, Isely (1998); = *Rehsonia sinensis* (Sims) Stritch – II, Stritch (1984). **NatureServe GNR** (Not Yet Ranked).

A genus of about 50-90 species, perennial herbs, of tropical and warm temperate regions. References: Carter & Mears (2017); Isely (1998).

Identification Notes: The palmately 4-foliolate leaves of *Z. bracteata* are unique in the flora of our region.

Zornia bracteata Walter ex J.F. Gmelin. VIPERINA. **Hab:** Pine flatwoods, longleaf pine sandhills, pine rocklands, sandy roadsides, rarely disjunct inland in sandy soils. **Dist:** Se. VA south to s. FL, west to TX and e. Mexico; disjunct in w. SC in the uppermost Piedmont in the Blue Ridge Escarpment region. **Phen:** Jun-Aug; Jul-Oct. **Syn:** = C, F, G, K1, K3, K4, NcTx, RAB, S, SE3, Tx, Va, WH3, Isely (1998). **NatureServe G5?** (Secure).

142. POLYGALACEAE Hoffmannsegg & Link 1809 (MILKWORT FAMILY) [in FABALES]

A family of about 29 genera and about 1200 species, trees, shrubs, woody vines, and herbs, nearly cosmopolitan, but most diverse in tropical and subtropical areas. References: Abbott (2011); Abbott (2021) in FNA10 (2021); Eriksen & Persson in Kubitzki, Bayer, & Stevens (2007); Miller (1971b); Pastore & Abbott (2012); Pastore et al (2019).

Identification Notes: The Polygalaceae has a distinctive flower structure which can be confusing. The corolla consists of 3 fused petals, partly fused into a tube, and also fused with the stamens. The lower petal is called the keel; it is usually boatlike, and also lacerate, fringed, or lobed at its tip (in most species). The calyx is 5-lobed, the lobes usually of 3 distinct sizes. The two lateral sepals are called wings; they are generally large and petaloid (colored like petals). The upper sepal is usually the next largest; the two lower sepals are usually the smallest.

1 Corolla keel blunt, lacking a terminal crest or beak.

..... *Asemeia*

1 Corolla keel appendaged, with a terminal beak, or lobed or tufted crest.

..... *Polygala*

Asemeia Rafinesque 1833 (MILKWORT)

A genus of ca. 28 species, perennial herbs (sometimes suffrutescent), neotropical north to the se. United States. References: Abbott (2011); Abbott (2021) in FNA10 (2021); Bernardi (2000); Pastore & Abbott (2012).

Asemeia grandiflora (Walter) Small. SHOWY MILKWORT. **Hab:** Longleaf pine sandhills, dry sandy soils of roadsides and fields. **Dist:** S. NC south to s. FL, west to s. MS; West Indies, Mexico to Central America. **Phen:** (Dec-) May-Jul. **Tax:** Sometimes included in the neotropical *P. violacea* Aublet (Nicaragua to Paraguay) (as by Bernardi 2000), or alternatively subdivided into varieties or species (see synonymy); some at least of Small's species merit recognition, but are listed here as synonyms until additional studies are done. At a minimum, separation of *Asemeia grandiflora* from the "violacea entity" seems warranted, based on Pastore & Abbott's (2012) rangewide study. **Syn:** = FNA10, K3, Abbott (2011), Pastore & Abbott (2012); = *Polygala grandiflora* – Bah, RAB; > *Asemeia cumulicola* Small – S; > *Asemeia grandiflora* var. *angustifolia* – S; > *Asemeia grandiflora* (Walter) Small var. *grandiflora* – S; > *Asemeia leiodes* (Blake) Small – S; > *Asemeia miamiensis* Small – S; < *Asemeia violacea* (Aublet) J.F.B. Pastore & J.R. Abbott – Fl3, K4; > *Polygala corallicola* Small; > *Polygala grandiflora* Walter var. *grandiflora* – K1; < *Polygala violacea* Aublet – WH3, WI, Bernardi (2000).

Polygala Linnaeus 1753 (MILKWORT)

A genus of 300-400 species, trees, shrubs, and herbs, nearly cosmopolitan in distribution. The genus as currently circumscribed is clearly not monophyletic, even after the removal of some elements that are not closely related to the core of *Polygala*, and additional changes in generic circumscriptions are forthcoming (Abbott 2011; Pastore et al. 2019); it is unlikely that any of our species will remain in *Polygala* (which will be restricted to the Old World). Our taxa will likely be transferred to *Senega* (A.P. de Candolle) Spach. References: Eriksen & Persson in Kubitzki, Bayer, & Stevens (2007); Haines (2010); Neubig & Abbott (2020); Pastore (2013); Pastore et al (2019); Smith & Ward (1976); Sorrie & Weakley (2017a); Trauth-Nare & Naczi (1998).

Unkeyed taxa: *Polygala appendiculata*, *Polygala chapmanii*, *Polygala crenata*

- 1 Fresh flowers orange, yellow, greenish-yellow, or greenish white (if greenish white, then the inflorescence a terminal many-branched cyme); ["North America clade"].
 - 2 Inflorescence a dense pom-pom-like raceme, terminating leafy branches.
 - 3 Fresh flowers lemon-yellow or greenish yellow; subulate bracts of the inflorescence 4.5-6.5 mm long; plants 3-10 (-15) cm tall; lobes of lower petal (keel) 1.5-2.5 mm long..... *Polygala nana*
 - 3 Fresh flowers bright orange or bright yellow; subulate bracts of the inflorescence 2-4 mm long; plants 5-80 cm tall; lobes of lower petal (keel) 0.5-1.1 mm long..... *Polygala lutea*
 - 2 Inflorescence a terminal, many-branched cyme, the many individual branches loosely to densely flowered.
 - 5 Fresh flowers cream-white to greenish-white; [of GA southward]..... *Polygala baldwinii*
 - 5 Fresh flowers bright yellow; [collectively widespread in the Coastal Plain of our area].
 - 7 Plants 4.5-12 dm tall, the stem solitary; basal leaves 3.5-14 cm long, linear-lanceolate, about 15-20× as long as wide, persistent as a basal rosette; stem leaves linear-subulate, sharp-tipped, much reduced from the basal leaves, becoming bractlike upward; seeds glabrous, 0.7-0.9 mm long..... *Polygala cymosa*
 - 7 Plants 1-4 dm tall, the stems 1-several from the base; basal leaves 3-7 cm long, spatulate, about 10× as long as wide, usually not persistent after flowering; stem leaves narrowly spatulate to linear, blunt-tipped, only slightly reduced from the basal leaves; seeds pubescent, 0.5-0.7 mm long..... *Polygala ramosa*
- 1 Fresh flowers pink, purple, white, or green (if green or white, then the inflorescence a simple raceme, not a many-branched cyme).
 - 9 Leaves whorled, at least at the principal lower nodes; annual, from a slender taproot.
 - 10 Racemes 3-8 mm in diameter, pointed in outline; flowers sessile to pedicellate with pedicels < 1 mm long; ["Verticillatae clade"].
 - 11 Wings 2-3 mm long; plant perennial, usually multistemmed from the base and little or not branched above; racemes 30-240 mm long..... *Polygala boykinii* var. *boykinii*
 - 11 Wings 1-1.75 mm long; plant annual, unbranched or freely branched above.
 - 13 Internodes > 5 cm long, the whorls very distant from one another; seeds glabrous or nearly so; seeds fusiform..... *Polygala leptostachys*
 - 13 Internodes (most, at least) < 4 cm long; seeds pubescent; seeds ovoid to narrowly ovoid.
 - 14 Racemes 2-5 cm long, becoming interrupted below through persistence of the wings on the axis; wings equaling the fruit..... *Polygala ambigua*
 - 14 Racemes 0.5-1.5 cm long, the fruits falling promptly, thus the inflorescence compact and truncate below; wings shorter than the fruit..... *Polygala verticillata* var. *isocycla*
 - 10 Racemes 7-20 mm in diameter, rounded in outline (somewhat rounded to somewhat pointed in *P. hookeri*); flowers pedicellate; ["North America clade"].
 - 16 Racemes loosely flowered, with ca. 10 flowers per cm of length; raceme 7-12 mm in diameter, the tip pointed (obconical) in outline; full raceme (including the portion with dropped fruits) to 6 cm long..... *Polygala hookeri*
 - 16 Racemes densely flowered, with ca. 20 flowers per cm of length; raceme 7-20 mm in diameter, the tip rounded to truncate in outline; full raceme (including the portion with dropped fruits) to 4.5 cm long.
 - 17 Bracts of the inflorescence ca. 1 mm long; wings 1.5-2.5 mm wide, acute or short-mucronate at the tip; raceme peduncle (0.8-) 3-5 cm long..... *Polygala brevifolia*
 - 17 Bracts of the inflorescence 1.5-3 mm long; wings 3-4 mm wide, acuminate, the tips cuspidate; raceme peduncle 0-0.8 (-4.0) cm long..... *Polygala cruciata*
 - 9 Leaves all alternate; either annual, from a slender taproot, the stems solitary, or biennial to perennial, from a taproot, the stems solitary to several, or perennial, from a thick rhizome, the stems several.
 - 19 Leaves glaucous, somewhat succulent, linear; corolla 7-10 mm long, > 2× as long as the wings; ["North America clade"]..... *Polygala incarnata*
 - 19 Leaves green, herbaceous, usually broader than linear; corolla < 5 mm long, roughly equal to or shorter than the wings.
 - 20 Leaves reduced to subulate scales < 2 mm long; [e. GA west to MS, south to s. FL]; ["North America clade"]..... *Polygala setacea*
 - 20 Leaves (at least the larger) > 2 mm long, not subulate; [collectively widespread].

- 21 Perennial or biennial, usually several stems arising together from a rhizome or taproot.
 24 Corolla keel entire at the tip; wings 5-7 mm long, reniform-orbicular; plants lacking cleistogamous flowers *Asemeia*
 24 Corolla keel fringed at the tip; wings 4-6 mm long, elliptic; plants producing cleistogamous flowers in loose subterranean or surficial racemes;
 ["North America clade"] *Polygala polygama*
 21 Annual, the stems solitary; ["North America clade"].
 25 Corolla about 0.5× as long as the wings *Polygala sanguinea*
 25 Corolla about 1× as long as the wings.
 26 Inflorescence bracts dropping from the axis promptly following flowering *Polygala mariana*
 26 Inflorescence bracts persistent.
 27 Wings 3-5 mm long; pedicels 1.5-2.5 mm long; racemes 8-13 mm in diameter *Polygala curtisii*
 27 Wings 2-2.5 mm long; pedicels 0.5-1.5 mm long; racemes 5-6 mm in diameter *Polygala nuttallii*

Polygala ambigua Nuttall. LOOSE MILKWORT. **Hab:** Fields, woodlands, openings. **Dist:** ME west to MI, south to GA, AL, and OK. **Phen:** Jun-Sep. **Tax:** Through most of its range *P. ambigua* has wings 1.3-1.7 mm long; plants from se. VA south to SC and from the Ozarks have wings 2.0-2.6 mm long. These plants have been named as a variety of *P. verticillata*, var. *dolichoptera* Fernald. They may warrant taxonomic recognition, but need additional study, including resolution of our Coastal Plain plants and those of the Ozarks. **Syn:** = C, G, Il, K1, K3, K4, NE, S, Tn; = *Polygala verticillata* Linnaeus var. *ambigua* (Nuttall) Wood – GrPl, Pa, RAB, Tx; < *Polygala verticillata* – NY, W; > *Polygala verticillata* Linnaeus var. *ambigua* (Nuttall) Wood – F, WV; > *Polygala verticillata* var. *dolichoptera* Fernald – F, WV.

Polygala appendiculata Vellozo. SWAMP MILKWORT. **Hab:** Bogs and pond margins. **Dist:** Ne. and Panhandle FL west to e. TX; Mexico, Central America, and South America; Cuba. **Tax:** Pastore (2013) established that the correct name for this species is *P. appendiculata*. **Syn:** = Fl3, K3, K4; = *Polygala leptocaulis* Torrey & A. Gray – GW2, S, Tx, WI; = *Polygala tenella* Willdenow – WH3, misapplied. **NatureServe G4G5** (Apparently Secure).

Polygala baldwinii Nuttall. WHITE MILKWORT, BALDWIN'S MILKWORT. **Hab:** Wet pine savannas, marl prairies. **Dist:** E. GA south to s. FL, west to s. MS; e. TX; Cuba; Bahamas (Andros Island). **Phen:** (Jan-) Mar-Jul (Nov). **Syn:** =; = *Pilostaxis baldwinii* (Nuttall) Small – S, orthographic variant; = *Polygala baldwinii* var. *baldwinii* – GW2, Smith & Ward (1976); = *Polygala baldwinii* Nuttall; = *Pylostachya baldwinii* (Nuttall) Small; < *Polygala baldwinii* Nuttall – Bah, WI, orthographic variant.

Polygala boykinii Nuttall var. *boykinii*. BOYKIN'S MILKWORT. **Hab:** Longleaf pine flatwoods and savannas, seeps, prairies, calcareous glades. **Dist:** C. TN south through GA, AL, and MS to s. FL and w. LA. **Syn:** = K1, K3, K4; = *Polygala boykinii* – S; < *Polygala boykinii* – Fl3, Tn, WH3. **NatureServe G4TNR** (Not Yet Ranked).

Polygala brevifolia Nuttall. SHORTLEAF MILKWORT, LITTLE-LEAF MILKWORT. **Hab:** Pine savannas, pocosin margins, pocosin interiors after fire. **Dist:** NY (presumably Long Island) and NJ south to Panhandle FL, west to s. MS. **Phen:** Jun-Oct. **Syn:** = C, F, Fl3, G, GW2, K1, K3, K4, NY, RAB, S, WH3. **NatureServe G4G5** (Apparently Secure).

Polygala chapmanii Torrey & A. Gray. **Hab:** Pine savannas, seepage bogs. **Dist:** Panhandle FL and sw. GA west to s. MS. **Syn:** = Fl3, GW2, K1, K3, K4, S, WH3. **NatureServe G3G5** (Apparently Secure).

Polygala crenata C.W. James. SCALLOPED MILKWORT. **Hab:** Wet pine flatwoods, bogs, bayheads. **Dist:** FL Panhandle and AL west to TX; reported for GA (B.A. Sorrie, pers. comm.). **Phen:** Apr. **Comm:** {not yet keyed; synonymy incomplete}. **Syn:** = Fl3, GW2, K1, K3, K4, WH3. **NatureServe G4?** (Apparently Secure).

Polygala cruciata Linnaeus. DRUMHEADS. **Hab:** Bogs, damp or wet soil in openings. **Dist:** S. NJ south to s. FL, west to AR, se. OK, and e. TX; disjunct inland in se. TN. **Phen:** Jun-Oct. **Tax:** See Sorrie & Weakley (2017) for a discussion supporting recognition of *P. cruciata* and *P. aquilonia* at species rank. **Syn:** = K4, Sorrie & Weakley (2017a); = *Polygala cruciata* var. *cruciata* – F, K1; = *Polygala ramosior* (Nash) Small – S; < *Polygala cruciata* Linnaeus – Ar, C, Fl3, G, GW2, K3, NcTx, RAB, Tn, Tx, Va, WH3. **NatureServe G5T4T5** (Apparently Secure).

Polygala curtisii A. Gray. APPALACHIAN MILKWORT. **Hab:** Mafic barrens, old fields, thickets, openings. **Dist:** DE and se. PA (Rhoads & Block 2007) west to OH, south to SC, GA, and ne. MS. **Phen:** Jun-Oct. **Syn:** = C, F, G, K1, K3, K4, Pa, RAB, S, Tn, Va, W, WV. **NatureServe G5** (Secure).

Polygala cymosa Walter. TALL PINEBARREN MILKWORT. **Hab:** Pond-cypress savannas, Coastal Plain depression ponds, clay-based Carolina bays, other sites with seasonally flooded hydrology. **Dist:** E. NC south to s. FL, west to s. MS; disjunct in s. DE. **Phen:** Apr-Aug. **Syn:** = C, F, Fl3, G, GW2, K1, K3, K4, RAB, WH3, Smith & Ward (1976); = *Pilostaxis cymosa* (Walter) Small – S; = *Pylostachya cymosa* (Walter) Small. **NatureServe G5** (Secure).

Polygala hookeri Torrey & A. Gray. HOOKER'S MILKWORT. **Hab:** Pine savannas. **Dist:** Panhandle FL (and sw. GA?), west to s. MS and e. LA; disjunct in se. NC and ne. SC; reported for e. TX (Correll & Johnston 1970). **Syn:** = Fl3, GW2, K1, K3, K4, RAB, S, WH3. **NatureServe G3** (Vulnerable).

Polygala incarnata Linnaeus. PINK MILKWORT, PROCESSION-FLOWER. **Hab:** Pine savannas, woodlands, glades, upland dry prairies, fields. **Dist:** NY (Long Island) and se. PA (Rhoads & Block 2007) west to MI, WI, and IA, south to s. FL and TX; Mexico; Central America. **Phen:** Late Apr-Nov. **Syn:** = Ar, C, F, FI3, G, GrPl, GW2, II, K1, K3, K4, Mi, NcTx, NY, Pa, RAB, Tn, Tx, Va, W, WH3; = *Galypola incarnata* (Linnaeus) Nieuwland – S. **NatureServe G5** (Secure).

Polygala leptostachys Shuttleworth ex A. Gray. GEORGIA MILKWORT. **Hab:** Longleaf pine sandhills. **Dist:** Ne. FL south to c. peninsular FL, west to sw. GA (Jones & Coile 1988), s. AL (Sorrie & LeBlond 2008), s. MS (Sorrie & Leonard 1999). **Comm:** {not yet keyed; synonymy incomplete}. **Syn:** = FI3, K1, K3, K4, S, WH3. **NatureServe G3G4** (Vulnerable).

Polygala lutea Linnaeus. ORANGE MILKWORT, RED-HOT-POKER. **Hab:** Wet pine savannas, ditches, bogs, other wet areas. **Dist:** NY (Long Island), se. PA (Rhoads & Block 2007), and NJ south to s. FL, west to e. LA. **Phen:** Feb-Nov. **Syn:** = C, F, FI3, G, GW2, K1, K3, K4, NY, Pa, RAB, Va, WH3, Smith & Ward (1976); = *Pilostaxis lutea* (Linnaeus) Small – S; = *Pylostachya lutea* (Linnaeus) Small. **NatureServe G5** (Secure).

Polygala mariana P. Miller. MARYLAND MILKWORT. **Hab:** Bogs, pine savannas, other open wet habitats. **Dist:** S. NJ south to c. peninsular FL, west to TX; disjunct inland in sw. TN (Chester, Wofford, & Kral 1997). **Phen:** Jun-Oct. **Syn:** = Ar, C, FI3, G, GW2, K1, K3, K4, NY, RAB, Tn, Tx, Va, WH3; > *Polygala harperi* Small – F, S; > *Polygala mariana* P. Miller – F, S. **NatureServe G5** (Secure).

Polygala nana (Michaux) A.P. de Candolle. DWARF MILKWORT, CANDYROOT. **Hab:** Longleaf pine flatwoods, other open moist areas. **Dist:** E. GA south to s. FL, west to e. TX, with scattered populations inland to n. SC, w. NC, nw. GA, n. AL, c. TN (Chester, Wofford, & Kral 1997), and ne. MS. **Phen:** Dec-Jun (-Oct). **Syn:** = Ar, FI3, GW2, K1, K3, K4, RAB, Tn, Tx, WH3, Smith & Ward (1976); = *Pilostaxis nana* (Michaux) Rafinesque – S; = *Pylostachya nana* (Michaux) Rafinesque. **NatureServe G5** (Secure).

Polygala nuttallii Torrey & A. Gray. NUTTALL'S MILKWORT. **Hab:** pocosins, pine savannas, also in depression ponds (in Augusta and Rockingham counties, VA). **Dist:** MA south to ne. FL and e. Panhandle FL; disjunct inland in w. VA, c. TN (Chester, Wofford, & Kral 1997), sc. KY, and allegedly c. AR. **Phen:** Jun-Aug. **Syn:** = C, F, FI3, G, K1, K3, K4, NE, NY, Pa, RAB, S, Tn, W, WH3. **NatureServe G5** (Secure).

Polygala polygama Walter. BITTER MILKWORT, RACEMED MILKWORT. **Hab:** Longleaf pine sandhills, woodlands, woodland borders. **Dist:** NS, ON, and MN south to s. FL and TX. **Phen:** May-Jul; Jun-Jul. **Tax:** Two varieties are sometimes recognized. **Syn:** = FI3, K1, K3, K4, Mi, NE, Pa, RAB, Tn, Tx, Va, W, WH3; > *Polygala aboriginum* Small – S; > *Polygala polygama* Walter – S; > *Polygala polygama* var. *obtusata* – C, F, G, II, NcTx, WV; > *Polygala polygama* var. *polygama* – C, F, G.

Polygala ramosa Elliott. SHORT PINEBARREN MILKWORT, LOW PINEBARREN MILKWORT. **Hab:** Wet pine savannas, pocosin margins, bogs. **Dist:** S. NJ south to s. peninsular FL, west to e. TX; rarely disjunct inland. **Phen:** Apr-Oct. **Syn:** = C, F, FI3, G, GW2, K1, K3, K4, RAB, Tx, Va, WH3, Smith & Ward (1976); = *Pilostaxis ramosa* (Elliott) Small – S; = *Pylostachya ramosa* (Elliott) Small. **NatureServe G5** (Secure).

Polygala sanguinea Linnaeus. BLOOD MILKWORT, FIELD MILKWORT. **Hab:** Bogs, fens, seeps, prairies, woodlands, openings, woodland borders. **Dist:** NS and MN, south to nw. SC, n. GA, and e. TX. **Phen:** May-Aug. **Syn:** = Ar, C, F, G, GrPl, GW2, II, K1, K3, K4, Mi, NcTx, NE, NY, Pa, RAB, Tn, Tx, Va, W, WV; ? *Polygala viridescens* Linnaeus – S. **NatureServe G5** (Secure).

Polygala setacea Michaux. COASTAL PLAIN MILKWORT. **Hab:** Pine flatwoods and bogs. **Dist:** E. GA and Panhandle FL south to s. FL; disjunct in s. MS. **Comm:** Reported by Small (1933) as occurring north to NC and west to s. MS (apparently an error). **Syn:** = FI3, GW2, K1, K3, K4, S, WH3. **NatureServe G3G4** (Vulnerable).

Polygala verticillata Linnaeus var. *isocycla* Fernald. WHORLED MILKWORT. **Hab:** Dry woodlands, woodland borders, openings, fields. **Dist:** VT west to MB, south to Panhandle FL (Kunzer et al. 2009), s. FL, and TX. **Phen:** Jun-Sep. **Tax:** The validity and relative distributions, habitats, phenology of the two varieties need additional assessment in the herbarium and the field. **Syn:** = C, F, FI3, G, GrPl, II, K1, Pa, WH3, WV; = *Polygala verticillata* – S, misapplied; < *Polygala verticillata* – Ar, K3, K4, Mi, NcTx, NE, NY, Tn, Tx, Va, W; < *Polygala verticillata* Linnaeus var. *verticillata* – RAB.

143. ROSACEAE A.L. de Jussieu 1789 (ROSE FAMILY) [in ROSALES]

A family of about 85-95 genera and 2000-3000 species, trees, shrubs, and herbs, nearly cosmopolitan, but mainly boreal and temperate. References: Chen et al (2020); Eriksson et al (2003); Ertter (2007); Kalkman in Kubitzki et al (2004); Phipps (2014a) in FNA9 (2014); Potter et al (2007).

Subfamily Rosoideae

- Tribe Ulmarieae: *Filipendula*
- Tribe Roseae: *Rosa*
- Tribe Rubeae: *Dalibarda*, *Rubacer*, *Rubus*
- Tribe Sanguisorbeae: *Agrimonia*, *Poterium*, *Poteridium*, *Sanguisorba*
- Tribe Potentilleae: *Argentina*, *Potentilla*, *Aphanes*, *Dasiphora*, *Drymocallis*, *Fragaria*, *Sibbaldiopsis*
- Tribe Coluriae: *Geum*, *Waldsteinia*

Subfamily Amygdaloideae

- Tribe Amygdaleae: *Prunus*
- Tribe Neillieae: *Neillia*, *Physocarpus*
- Tribe Sorbarieae: *Sorbaria*
- Tribe Spiraeae: *Aruncus*, *Spiraea*
- Tribe Exochordeae: *Exochorda*
- Tribe Kerrieae: *Kerria*, *Neviusia*, *Rhodotypos*
- Tribe Gilleniae: *Gillenia*
- Tribe Maleae: *Amelanchier*, *Crataegus*, *Pyracantha*, *Sorbus*, *Pyrus*, *Rhaphiolepis*, *Eriobotrya*, *Pseudocycdonia*, *Chaenomeles*, *Photinia*, *Pourthiaea*, *Aronia*, *Cydonia*, *Malus*

- 1 Herbs or subshrubs (if woody at base, then < 3 dm tall).
 - 2 Leaves simple.....*Aphanes*
 - 2 Leaves compound (at least the lower and better developed)..... **Key B**
- 1 Trees, shrubs, or woody vines (with arching “canes” or climbing, arching, or scrambling stems).
 - 3 Leaves simple..... **Key C**
 - 3 Leaves compound..... **Key D**

Key B - Herbs and subshrubs with compound leaves

- 1 Leaves 2- to 3-ternately compound; [tribe *Spiraeae*].....*Aruncus*
- 1 Leaves 1-compound, either simply pinnately compound or simply palmately compound.
 - 2 Principal (basalmost) leaves pinnately compound, with (5-) 7-many leaflets (stem leaves sometimes 3-foliolate, especially in *Geum*).
 - 4 Lateral leaflets alternating between small and large, the terminal leaflet similar in size and shape to the larger lateral leaflets; terminal leaflet < 3 cm wide; hypanthium either conical or turbinate, armed with hooked bristles, the pistils 2, or hemispheric, the pistils >5.
 - *Agrimonia*
 - 4 Leaflets variable in size and shape, usually the terminal leaflet much larger than any of the lateral leaflets; terminal leaflet 3-20 cm wide; hypanthium either sauce-r-shaped or hemispheric to conical; pistils 5 or more.
 - *Geum*
 - 2 Principal (basal-most) leaves palmately compound, with 3-7 (-9) leaflets.
 - 10 Principal leaves sessile, 3-foliolate; fruit of follicles; leaves cauline; [tribe *Gillenieae*]..... *Gillenia*
 - 10 Principal leaves distinctly petiolate, the petiole often longer than the leaflets, 3-7 (-9)-foliolate; fruit of achenes; leaves basal and cauline.
 - 11 Principal leaves 5-7 (-9)-foliolate; [tribe *Potentilleae*]..... *Potentilla*
 - 11 Principal leaves 3-foliolate.
 - 12 Plants in flower.
 - 13 Petals yellow.
 - 14 Pistils 2-6; [tribe *Colurieae*] *Waldsteinia*
 - 14 Pistils (10-) numerous; [tribe *Potentilleae*]..... *Potentilla*
 - 13 Petals white (or slightly pinkish).
 - *Fragaria*
 - 12 Plants in fruit (or sterile).
 - 18 Calyx lobes not subtended by bractlets.
 - *Waldsteinia*
 - 18 Calyx lobes subtended by 5 sepaloïd bractlets; [tribe *Potentilleae*].
 - 20 Fruit an aggregate of dry achenes *Potentilla*
 - 20 Fruit an accessory fruit of achenes borne on the surface of a fleshy, red receptacle.
 - 21 Fresh fruit reddish inside; leaflets serrate, 2.5-12 cm long; sepaloïd bracts narrowing to apex, untoothed..... *Fragaria*
 - 21 Fresh fruit whitish inside; leaflets crenate, 2-4 cm long; sepaloïd bracts widest at apex, 3-5-toothed *Potentilla indica*

Key C - Shrubs and trees with simple leaves

- 1 Ovary inferior; fruit indehiscent (pome); [tribe *Pyreae*].
 - 2 Upper surface of leaves bearing dark glandular trichomes along the midrib (most easily seen with a 10× hand lens); shrubs *Aronia*
 - 2 Upper surface of leaves lacking dark glandular trichomes along the midrib; shrubs and trees.
 - 3 Ovary and fruit 10-locular; inflorescence a raceme (rarely a fascicle); pome < 1 cm in diameter *Amelanchier*
 - 3 Ovary and fruit 5-locular; inflorescence a cyme, umbel, or fascicle (lacking an elongated central axis); pome 0.7-10 cm in diameter.
 - 4 Styles distinct; exocarps (carpels within pericarp) bony and seedlike; trees and shrubs, with thorns *Crataegus*
 - 4 Styles usually connate at base; exocarps leather or papery and easily opened to expose seeds; small trees, unarmed, or armed with sharp spur branches.
 - 5 Pome globose to ovoid, lacking stone cells; anthers yellow to white; styles connate at the base; leaves blunt to acuminate; [apples and crabapples] *Malus*
 - 5 Pome globose or pyriform, with stone cells; anthers reddish; styles distinct; leaves acute to acuminate; [pears] *Pyrus*
 - 1 Ovary superior; fruit dehiscent (aggregate of follicles, or capsule) or indehiscent (drupe, aggregate of drupelets, aggregate of achenes).
 - 8 Leaves singly serrate or entire, not lobed basally.
 - 9 Gynoecium of separate carpels; fruit an aggregate of follicles; [tribe *Spiraeae*] *Spiraea*
 - 9 Gynoecium of fused carpels; fruit either a fleshy drupe or a capsule.
 - 10 Ovary 5-angled in ×-section; fruit a 5-angled capsule; leaves obovate, obviously broadest towards the tip; [tribe *Osmaronieae*] *Exochorda racemosa*
 - 10 Ovary circular in ×-section; fruit a fleshy spherical drupe; leaves generally broadest near or below the middle; [tribe *Amygdaleae*] *Prunus*
 - 8 Leaves doubly serrate, also often lobed towards the base.
 *Neviusia alabamensis*

Key D - Shrubs and trees with compound leaves

- 4 Fruit a hip, developing from a globose to urceolate hypanthium, enclosing the ovaries and achenes, except for the apical orifice; leaflets usually acute to obtuse at the apex; leaflet margins crenulate or serrulate; [tribe *Roseae*] *Rosa*
- 4 Fruit an aggregate of drupelets, developing from a flattish or hemispheric hypanthium, with the ovaries and drupelets exposed; leaflets usually acuminate at the apex; leaflet margins serrate or doubly serrate; [tribe *Rubeae*] *Rubus*

Agrimonia Linnaeus 1753 (AGRIMONY)

A genus of about 10-15 species, perennial herbs, mainly north temperate. References: Kalkman in Kubitzki et al (2004); Kline & Sørensen (2008); Kline & Sørensen (2014) in FNA9 (2014); Robertson (1974).

- 1 Stem and inflorescence axis lacking sessile or short-stalked glistening glands (but with spreading or ascending non-glandular hairs).
 - 2 Stipules deeply incised, half-ovate; hirsute hairs of the stem 3 mm or longer; 0-1 pair of minor leaflets between major; mature fruiting hypanthium as broad as long or broader; hypanthium ridges rarely with eglandular hairs *Agrimonia microcarpa*
 - 2 Stipules toothed, not deeply, half-ovate to half-round; hirsute hairs of the stem 3 mm or shorter; 0-3 pair(s) of minor leaflets between major; mature fruiting hypanthium as long as broad or longer; hypanthium ridges usually with hirsute eglandular hairs *Agrimonia pubescens*
- 1 Stem and inflorescence with glistening glands, these either sessile, or short-stalked, or both (and also with spreading or ascending non-glandular hairs).
 - 4 Glistening glands of the stem and inflorescence axis short stalked, or both short-stalked and sessile.
 - 5 Lower inflorescence rachis with mostly erect hirsute eglandular hairs ca. 2 mm long; minor leaflets rarely only one pair between all major leaflet pairs; roots merely fibrous *Agrimonia gryposepala*
 - 5 Lower inflorescence rachis with mostly ascending hirsute eglandular hairs less than 1 mm long; minor leaflets one pair between major leaflet pairs; roots with fusiform tubers *Agrimonia rostellata*
 - 4 Glistening glands of the stem and inflorescence axis only sessile.
 - 7 Major leaflets obovate to elliptic, apex obtuse to acute; flowers mostly alternate along inflorescence axis; [Coastal Plain pinelands; e. SC south to c. peninsular FL and west to e. TX] *Agrimonia incisa*
 - 7 Major leaflets lanceolate to narrowly elliptic, apex acuminate to rarely acute; flowers mostly sub-opposite along inflorescence axis; [bottomlands, marshes; CT west to s. MI and SD, south to FL, TX, the West Indies and Mexico] *Agrimonia parviflora*

Agrimonia gryposepala Walloth. COMMON AGRIMONY, SWAMP AGRIMONY. **Hab:** Mesic forests, thickets, marshes, bogs, wet meadows, wet forests, especially in base-rich substrates. **Dist:** ME and ON west to MT, south to NJ, w. NC, e. TN, IN, and KS; also in CA and NM. **Phen:** Jul-Aug; Jul-Oct. **Syn:** = C, F, FNA9, G, GrPl, II, K1, K3, K4, Mi, NE, NY, Pa, RAB, S, Tn, Va, W, Kline & Sørensen (2008), Robertson (1974). **NatureServe** G5 (Secure).

Agrimonia incisa Torrey & A. Gray. PINELAND AGRIMONY. **Hab:** Pinelands, disturbed areas associated with pinelands. **Dist:** E. SC south to c. peninsular FL and west to e. TX (also reported from NC, but no specimen has been seen). **Phen:** Jul-early Sep. **Syn:** = C, FNA9, K1, K3, K4, RAB, S, WH3, Kline & Sørensen (2008), Robertson (1974). **NatureServe** G3 (Vulnerable).

Agrimonia microcarpa Walloth. LOW AGRIMONY. **Hab:** Dry to moist forests and woodlands. **Dist:** NJ south to n. FL, west to e. TX. **Phen:** Jul-Sep; Aug-Oct. **Syn:** = Ar, C, F, FNA9, G, K1, K3, K4, NcTx, NE, Pa, S, Tn, Tx, Va, W, WH3, Kline & Sørensen (2008), Robertson (1974); = *Agrimonia pubescens* Walloth var. *microcarpa* (Walloth) H.E. Ahles – RAB; > *Agrimonia microcarpa* Walloth – S; > *Agrimonia platycarpa* Walloth – S. **NatureServe** G5 (Secure).

Agrimonia parviflora Aiton. SOUTHERN AGRIMONY. **Hab:** Marshes, bottomland forests, wet pastures. **Dist:** CT west to s. MI and SD, south to FL, TX, the West Indies and Mexico. **Phen:** Jul-Sep; Jul-Oct. **Syn:** = Ar, C, F, FNA9, G, GrPl, K1, K3, K4, Mi, NcTx, NE, NY, Pa, RAB, S, Tn, Tx, Va, W, Kline & Sørensen (2008), Robertson (1974); > *Agrimonia platycarpa* Walloth. **NatureServe** G5 (Secure).

Agrimonia pubescens Walloth. DOWNY AGRIMONY. **Hab:** Dry to moist forests and woodlands, especially in base-rich soils. **Dist:** ME west to MI and SD, south to NC, GA, and OK. **Phen:** Jul-Sep; Aug-Oct. **Syn:** = Ar, C, F, FNA9, G, GrPl, II, K3, K4, Mi, NE, NY, Pa, Tn, Va, Kline & Sørensen (2008); = *Agrimonia pubescens* var. *pubescens* – RAB; > *Agrimonia bicknellii* (Kearney) Rydberg – K1, S, Robertson (1974); > *Agrimonia pubescens* Walloth – K1, S, W, Robertson (1974).

Agrimonia rostellata Wallroth. WOODLAND AGRIMONY. **Hab:** Moist to wet forests and woodlands, especially in base-rich soils. **Dist:** CT west to IN and KS, south to SC, GA, Panhandle FL, LA, and OK. **Phen:** Jul-Aug; Jul-Oct. **Syn:** = Ar, C, F, FNA9, G, GrPl, Il, K1, K3, K4, Mi, NcTx, NE, NY, Pa, RAB, S, Tn, Tx, Va, W, Kline & Sørensen (2008), Robertson (1974). NatureServe G5 (Secure).

Amelanchier Medikus 1789 (SERVICEBERRY, SARVIS, SHADBUSH, JUNE BERRY, "MAY CHERRY", "CURRANT")

A genus of about 20-40 species, shrubs and trees, north temperate. References: Campbell et al (2014) in FNA9 (2014); Kalkman in Kubitzki et al (2004); Robertson (1974).

8 Inflorescences erect; petals 6-12 mm.

8 Inflorescences drooping; petals 10-20 mm long.

..... **Amelanchier canadensis**

..... **Amelanchier arborea**

Amelanchier arborea (F. Michaux) Fernald. DOWNY SERVICEBERRY. **Hab:** Dry to moist forests, seepage and depression wetlands. **Dist:** NS west to MN, south to Panhandle FL and e. TX (Holmes, Singhurst, & Loos 2014). **Phen:** Mar-May; May-Aug. **Syn:** = Ar, C, F, FNA9, G, Il, K3, K4, Mi, NcTx, NE, NY, Pa, Tn, Tx, Va, W; > *Amelanchier alabamensis* Britton – S; < *Amelanchier arborea* (F. Michaux) Fernald – GrPl, WH3; > *Amelanchier arborea* var. *alabamensis* (Britton) G.N. Jones – K1, Robertson (1974); > *Amelanchier arborea* var. *arborea* – K1, RAB, Robertson (1974); > *Amelanchier arborea* var. *austromontana* (W.W. Ashe) H.E. Ahles – K1, RAB, Robertson (1974); > *Amelanchier canadensis* (Linnaeus) Medikus – S, misapplied.

Amelanchier canadensis (Linnaeus) Medikus. EASTERN SERVICEBERRY. **Hab:** Pocosins, acidic wetlands, bogs, wet pine flatwoods, maritime forests. **Dist:** NS and NB south to GA, mainly on the Coastal Plain. **Phen:** Mar-Apr; May-Jun. **Syn:** = C, FNA9, GW2, Il, K1, NE, Pa, RAB, Tn, Va, W; = *Amelanchier canadensis* var. *canadensis* Michaux – K3, K4; = *Amelanchier oblongifolia* (Torrey & A. Gray) Roemer – S; < *Amelanchier canadensis* (Linnaeus) Medikus – G; > *Amelanchier canadensis* var. *canadensis* Michaux – F, NY, Robertson (1974); > *Amelanchier canadensis* var. *subintegra* Fernald – F, Robertson (1974).

Aphanes Linnaeus 1753 (PARSLEY-PIERT)

A genus of about 20 species, herbs, of tropical and temperate Old World. *Aphanes* has usually been accepted by Europeans as distinct from *Alchemilla*, but Kalkman (in Kubitzki 2004) retains it (with some doubt) in *Alchemilla*, as a subgenus and Eriksson et al. (2003) and Gehrke et al. (2008) include it in *Alchemilla* based on molecular evidence. *Aphanes* appears to be monophyletic and is morphologically distinctive; Gehrke et al. (2008) prefer a broad circumscription of *Alchemilla* to naming an additional monophyletic clade of African species as a separate genus. References: Eriksson et al (2003); Kalkman in Kubitzki et al (2004); McNeill & Erter (2014) in FNA9 (2014); Robertson (1974).

* **Aphanes australis** Rydberg. PARSLEY-PIERT. **Hab:** Lawns, fields, pastures, roadsides. **Dist:** Native of Europe. **Phen:** Late Mar-May. **Comm:** This plant is inconspicuous and often overlooked. **Syn:** = FNA9, K3, K4, NY, S, Va, WH3; = *Alchemilla microcarpa* Boissier & Reuter – F, G, RAB, Tx, W, Robertson (1974), misapplied; = *Aphanes inexpectatus* W. Lippert; = *Aphanes microcarpa* (Boissier & Reuter) Rothmaler – Ar, C, K1, Tn, misapplied.

Aronia Medikus 1789 (CHOKEBERRY)

A genus of 3 species, of e. North America (south into Central America). In North American floristic literature, *Aronia* has sometimes been treated as a component of *Pyrus*, *Sorbus*, or *Photinia* (see synonymy below). Robertson et al. (1991) included *Aronia* in *Photinia*. Kalkman in Kubitzki (2004) agrees that *Aronia* and *Photinia* should be combined, but points out that *Aronia* is the older name and therefore must be used for the combined genus. Guo et al. (2011) and Lo & Donoghue (2012) separate *Photinia*, *Aronia*, and *Pourthiaea* at generic rank, a decision followed here; while *Aronia* and

Key to Map
Symbology:

* : waif
EN : endemic
H : historic

N : no X : extirpated

? : questionable

143. ROSACEAE

Pourthiaea are closely related (sister), *Photinia* is not closely related to either and is sister to *Pyracantha* (Lo & Donoghue 2012). References: Guo et al (2011); Hardin (1973); Kalkman in Kubitzki et al (2004); Lo & Donoghue (2012); Pankhurst (2014) in FNA9 (2014); Robertson (1974); Robertson et al (1991).

Identification Notes: All our species of *Aronia* can be distinguished from other shrubs in our flora by the presence of several dark (usually purplish-black) glandular trichomes on the upper surface of the midrib, mostly toward the base of the leaf.

- 1 Lower surfaces of leaves, twigs, and inflorescence rachis glabrous; fruit black *Aronia melanocarpa*
 1 Lower surfaces of leaves, twigs, and inflorescence rachis pubescent; fruit bright red or dark purple. *Aronia arbutifolia*

Aronia arbutifolia (Linnaeus) Persoon. RED CHOKEBERRY. **Hab:** Bogs, pocosins, wet savannas, swamps, other wet habitats. **Dist:** NL (Newfoundland) south to c. peninsular FL and west to TX, mainly in the Coastal Plain, but extending inland in the south to WV and KY. **Phen:** Late Feb-May; Sep-Nov. **Syn:** = C, FNA9, G, GW2, K3, K4, NE, NY, S, Tn, Va, W, Guo et al (2011); = *Photinia pyrifolia* (Lamarck) K. Robertson & J.B. Phipps – Ar, K1, Pa, WH3, WV, Robertson et al (1991); = *Pyrus arbutifolia* (Linnaeus) Linnaeus f. – F, Tx, Robertson (1974); = *Sorbus arbutifolia* (Linnaeus) Heynhold var. *arbutifolia* – RAB. NatureServe G5 (Secure).

Aronia melanocarpa (Michaux) Elliott. BLACK CHOKEBERRY. **Hab:** Balds, forests, and openings and exposed rock outcrops at high elevations, bogs in the Mountains, seeps and headwater wetlands in the Coastal Plain and lower Piedmont. **Dist:** NL west to ON and MN, extending south to e. VA, ec. NC, n. GA, n. AL, MS, and MO. **Phen:** May-Jun; Aug-Sep. **Syn:** = C, FNA9, G, GW2, K3, K4, NE, NY, S, Tn, Va, Guo et al (2011); = *Photinia melanocarpa* (Michaux) J.B. Phipps – Ar, Il, K1, Pa, Robertson et al (1991); = *Pyrus melanocarpa* (Michaux) Willdenow – F, WV, Robertson (1974); = *Sorbus melanocarpa* (Michaux) Heynhold – RAB; < *Aronia melanocarpa* (Michaux) Elliott – W, (also see *A. prunifolia*).

Aruncus Linnaeus 1758 (GOAT'S-BEARD)

A genus of 2-3 species, perennial herbs, of temperate North America and Europe. References: Kalkman in Kubitzki et al (2004); Mellichamp (2014) in FNA9 (2014); Robertson (1974).

Identification Notes: *Aruncus dioicus* can be distinguished from the superficially closely similar *Astilbe bitemata* by the following characteristics: trichomes of foliage not glandular (vs. glandular in *Astilbe*), stamens 20 (vs. 10), carpels 3-4 (vs. 2), seeds < 1.5-2 mm long (vs. ca. 4 mm long), terminal leaflets usually unlobed (vs. terminal leaflets usually trilobed).

- 2 Follicles semi-ovoid, strongly convex on the back, about 1/2 as thick (measured radially) as long, 1.5-2.0 mm long; leaves somewhat lustrous, the lower surface glabrous to sparsely pubescent.....*Aruncus dioicus* var. *dioicus*
 2 Follicles nearly cylindric, about 1/3 as thick (measured radially) as long, 1.7-2.5 mm long; leaves dull, the lower surface pubescent*Aruncus dioicus* var. *pubescens*

Aruncus dioicus (Walter) Fernald var. *dioicus*. EASTERN GOAT'S-BEARD. **Hab:** Moist, nutrient-rich forests and woodland borders. **Dist:** NY (?) and PA west to IN, south to NC, SC, GA, and AL. **Phen:** May-Jun; Jun-Sep. **Syn:** = C, F, FNA9, Il, K1, K3, K4, NE, Robertson (1974); = *Aruncus allegheniensis* Rydberg – S; < *Aruncus aruncus* Karsten; < *Aruncus dioicus* – Pa, RAB, Tn, Va, W. NatureServe G5T5? (Secure).

Aruncus dioicus (Walter) Fernald var. *pubescens* (Rydberg) Fernald. MIDWESTERN GOAT'S-BEARD. **Hab:** Moist, nutrient-rich forests and woodland borders. **Dist:** W. VA, KY, and IL west to IA, south to n. MS, AR, and ne. OK. **Phen:** May-Jun; Jun-Sep. **Tax:** The validity of this variety and its exact distribution (if recognized) need further evaluation. Robertson (1974) states that the "two varieties intergrade completely, and it is questionable whether they should be maintained." **Syn:** = C, F, FNA9, Il, K1, K3, K4, Robertson (1974); = *Aruncus pubescens* Rydberg – S; < *Aruncus dioicus* – W. NatureServe G5TNR (Not Yet Ranked).

Chaenomeles Lindley 1821 (FLOWERING QUINCE)

A genus of 3-4 species, shrubs, of montane, temperate e. Asia. References: Catling & Mitrow (2014b) in FNA9 (2014); Christenhusz, Fay, & Byng (2018); Kalkman in Kubitzki et al (2004).

- 1 Branches scabrous, becoming warty in age; leaf margins crenate; fruit 2.3-4 cm in diameter..... *Chaenomeles japonica*
 1 Branches smooth, not becoming warty in age; leaf margins serrate; fruit 4-6 cm in diameter..... *Chaenomeles speciosa*

* *Chaenomeles japonica* (Thunberg) Lindley ex Spach. JAPANESE FLOWERING QUINCE. **Hab:** Rarely persisting or spreading from horticultural plantings. **Dist:** Native of Japan. **Phen:** Apr-May; Aug-Oct. **Syn:** = FNA9, Il, K3, NE, NY; = *Pyrus japonica* Thunberg. NatureServe GNR (Not Yet Ranked).
 * *Chaenomeles speciosa* (Sweet) Nakai. COMMON FLOWERING QUINCE. **Hab:** Frequently persisting and rarely spreading from horticultural plantings to suburban woodlands. **Dist:** Native of China. **Phen:** Jan-Apr. **Syn:** = Ar, C, FNA9, Il, K1, K3, K4, Mi, NE, NY, Pa; = *Pyrus speciosa* (Sweet) M.F. Fay & Christenhusz – Christenhusz, Fay, & Byng (2018). NatureServe GNR (Not Yet Ranked).

*Crataegus* Linnaeus 1753 (HAWTHORN, HAW, THORNAPPLE)

Contributed by Ron Lance

A genus of 100-500 species, shrubs and small trees, north temperate and Central America, most in e. North America. References: Ashe (1900a); Ashe (1900b); Ashe (1900c); Ashe (1901); Ashe (1903a); Ashe (1903b); Ashe (1916); Beadle (1913) in S2 (1913a); Chapman (1892); Chen et al (2020); Deam (1940); Eggleston (1913) in Britton & Brown (1913); Eriksson et al (2003); Eugenia, Stefanović, & Dickinson (2007); Harper (1928); Kalkman in Kubitzki et al (2004); Kalkman in Kubitzki et al (2004); Kruschke (1955); Kruschke (1965); Lance & Phipps (2000); Lance (1995); Lance (2011); Lance (2013); Lance (2014); Palmer (1924); Palmer (1925); Palmer (1926); Palmer (1935); Palmer (1956); Palmer (1960) in Vines (1960); Palmer (1969) in Braun (1969); Phipps & Dvorsky (2006); Phipps & Dvorsky (2007); Phipps & Dvorsky (2008); Phipps & O'Kennon (1997); Phipps (1988a); Phipps (1988b); Phipps (1990); Phipps (1998); Phipps (2006); Phipps (2007); Phipps (2012); Phipps (2014d) in FNA9 (2014); Phipps (2014d) in FNA9 (2014); Phipps (2014e) in FNA9 (2014); Phipps (2016); Phipps, Lance, & Dvorsky (2006); Phipps, O'Kennon, & Lance (2003); Phipps, O'Kennon, & Dvorsky (2006); Phipps, Yatskievych, & Wood (2007); Poindexter & Lance (2011); Potter et al (2007); Sargent (1903); Sargent (1908b); Sargent (1911a); Sargent (1913); Sargent (1920); Sargent (1921a); Sargent (1921b); Sargent (1922a); Tucker (1976).

Identification Notes: All references to leaves and petioles pertain to foliage on short shoots (floreal shoots, or spur shoots), unless otherwise specified. The term "terminal shoots" refers to elongating vegetative twigs, typically at the terminus of branches.

- 1 Leaf blades mostly ovate or deltate, widest below their midpoint; blade base subcordate, truncate, rounded, or abruptly contracted..... **Key A**
 1 Leaf blades elliptical, rhomboid, suborbicular, obovate or oblanceolate, widest at midpoint or beyond midpoint; blade base usually cuneate.
 2 Leaves conspicuously glandular on petiole and teeth, especially when young; leading twigs and branchlets geniculate..... **Key B**
 2 Leaves eglandular, or if glandular then twigs relatively straight, not conspicuously geniculate..... **Key C**

**Key A - hawthorns with leaf blades widest below midpoint;
 blade bases subcordate, truncate, rounded, or abruptly contracted**

- 1 Primary lateral veins of lobed leaves run to sinuses between lobes as well as to points of lobes, in some or most leaves [see also *Crataegus viridis*].
 2 Leaves usually pubescent or villous abaxially or on petiole, especially when young; inflorescence hairy (villous, pubescent or tomentose).
 *Crataegus marshallii*
 2 Leaves and inflorescence glabrous [commonly cultivated species]
 *Crataegus phaenopyrum*
 1 Primary lateral veins of lobed leaves run only to lobe points, excepting on vigorous sprouts.
 7 Leaves abaxially with whitish hair tufts in proximal main vein axils, especially in spring; [*Virides* series and hybrids].
 9 Leaves and inflorescences pubescent..... *Crataegus viridis* var. *velutina*
 9 Leaves glabrous, except for hair tufts.
 10 Leaves predominately lanceolate..... *Crataegus viridis* var. *lanceolata*
 10 Leaves predominately elliptic or rhomboid..... *Crataegus viridis* var. *viridis*
 7 Leaves lacking hair tufts; hairs, if present, dispersed over veins or surface of leaves.
 17 Leaves abaxially pubescent, veins tomentose; petiole stout, pubescent, eglandular; inflorescence tomentose; [*Molles* series]
 *Crataegus mollis* var. *mollis*
 17 Leaves variously pubescent or glabrous; petiole typically glandular, particularly in spring; inflorescence pubescent or glabrous.
 27 Petiole distinctly villous or pubescent, particularly early in growing season.
 31 Terminal shoot leaves ovate or tending toward oval or suborbicular, unlobed or very shallowly lobed.
 *Crataegus triflora*
 31 Terminal shoot leaves broadly ovate or deltate, often lobed 20% or more to midrib.

- 35 Sepals partly glandular-serrate or subentire; leaves often deltate. *Crataegus iracunda* var. *iracunda*
- 35 Sepals deeply gland-toothed or pectinate; most leaves ovate. *Crataegus intricata* var. *biltmoreana*
- 27 Petiole glabrous, or at most only sparsely hairy in spring
- 40 Calyx sessile on mature fruit.
- 41 Terminal shoot leaves commonly deltate; petiole length often 50-75% as long as blade
- 42 Leaves adaxially minutely strigose when young, abaxially glabrous *Crataegus macrosperma*
- 42 Leaves adaxially glabrous or remotely pubescent or strigose on veins of both surfaces *Crataegus iracunda* var. *iracunda*
- 41 Terminal shoot leaves mostly ovate or near rhombic; petiole length mostly 30-50 % as long as blade.
- 51 Inflorescence scabrous-pubescent; petiolar glands stipitate *Crataegus frugiferans*
- 51 Inflorescence sparsely hairy or glabrate; petiolar glands sessile. *Crataegus alleghaniensis*
- 40 Calyx collar elevated on mature fruit
- 57 Petiole remotely glandular in spring; sepals remotely glandular-serrate or subentire; [*Pruinosae* series]
- 65 Anthers ca. 0.5mm long; leaves elongate distally *Crataegus pruinosa* var. *gattereri*
- 65 Anthers ca. 1-2mm long; leaves ovate, not elongate distally..... *Crataegus pruinosa* var. *pruinosa*
- 57 Petiole distinctly and persistently glandular; sepals distinctly glandular-serrate.
- 66 Stamens 5 to 10; [*Intricatae* series].
- 67 Anthers white or yellow. *Crataegus intricata* var. *intricata*
- 67 Anthers pink, rose, or purple. *Crataegus intricata* var. *rubella*
- 66 Stamens 15-20; [*Pulcherrimae* series].
- 74 Leaves mostly unlobed and apex obtuse; terminal shoot leaves lobed 5-10% to midrib..... *Crataegus mendosa*
- 74 Leaves shallowly lobed, or if unlobed then apex acute; terminal shoot leaves lobed 10-60% to midrib.
- 75 Leaves ovate-lanceolate; margin outline nearly straight from about mid-blade to apex.
- 76 Terminal shoot leaves with 4 or 5 pairs of distinct lobes; often a suckering shrub..... *Crataegus incilis*
- 76 Terminal shoot leaves with 3 to 4 pairs of shallow lobes; usually arborescent..... *Crataegus sargentii*
- 75 Leaves ovate, broadly ovate or near rhombic or suborbicular; margin outline convex.
- 77 Petioles of smaller leaves winged 1/2 length; fruit often 10-15 mm. *Crataegus venusta*
- 77 Petioles of smaller leaves winged 1/3 or less of length; fruit usually <10 mm.
- 79 Terminal shoot leaf blades often broad as long, lobes rounded..... *Crataegus pulcherrima* var. *opima*
- 79 Terminal shoot leaf blades longer than broad, lobes obtuse to acute..... *Crataegus pulcherrima* var. *pulcherrima*

**Key B - hawthorns with leaf blades widest at midpoint or beyond midpoint; blade bases acute or cuneate;
leaves conspicuously glandular on petiole and teeth; twigs and branchlets geniculate**

- 12 Floreal leaves often rhomboid or broadly elliptical; twigs and branches usually not drooping. *Crataegus alleghaniensis*
- 12 Floreal leaves mostly obovate or spatulate; leading twigs or branches drooping or pendulous.
- 16 Leaves and inflorescence thinly hairy or glabrate.
- 17 Leaves and inflorescence sparsely hairy; pyrenes 3-5 per fruit *Crataegus florens*
- 17 Leaves and inflorescence essentially glabrous; pyrenes 2 or 3 per fruit *Crataegus teres*
- 16 Leaves and inflorescence densely hairy. *Crataegus alabamensis*

**Key C - hawthorns with leaf blades widest at midpoint or beyond midpoint; blade bases acute or cuneate;
leaves eglandular, or if glandular then twigs and branchlets not geniculate**

- 2 Leaves spatulate or oblanceolate, < 13 mm wide; fruit < 6 mm diameter; pyrenes about 3 mm long *Crataegus spathulata*
- 2 Leaves variously shaped but most > 13 mm wide; fruit > 6 mm; pyrenes 4 mm long or more.
- 3 Leaves abaxially with dense hair tufts in proximal main vein axils, especially in spring; [plants typically of wet or floodplain habitats].
- 4 Inflorescence simple, 1-5-flowered; fruit 10-15 mm diameter, lustrous red, mature in late spring. *Crataegus opaca*
- 4 Inflorescence compound, 5-20-flowered; fruit 5-15 mm diameter, dull red or orange-red, mature in autumn.
- 7 Petiole 5-10 mm long; terminal shoot leaves < 25 mm broad *Crataegus crus-galli* var. *pyracanthifolia*
- 7 Petiole > 10 mm long; terminal shoot leaves > 25 mm broad; [*Virides* series and hybrids].
- 8 Leaves glabrous, except for hair tufts.
- 10 Leaves frequently lanceolate *Crataegus viridis* var. *lanceolata*
- 10 Leaves rarely lanceolate, mostly elliptical or rhomboid. *Crataegus viridis* var. *viridis*
- 8 Leaves and/or inflorescences hairy, at least in spring. *Crataegus viridis* var. *velutina*
- 3 Leaves glabrous or with hairs scattered, not in tufts; [plants typically of upland habitats].
- 15 Pyrenes channeled or pitted on inner sides. *Crataegus calpodendron*
- 15 Pyrenes plane on inner sides.

- 23 Sepals foliaceous, equaling or exceeding petal length in flower and persistent on fruit; flowers usually 1-5 per inflorescence. *Crataegus uniflora*
- 23 Sepals not foliaceous, shorter than petals; flowers 5 or more per inflorescence
- 25 Thorns short (< 2 cm), or spinose spur shoots present; main lateral leaf veins run to sinuses and lobe tips in lobed leaves. *Crataegus brachyacantha*
- 25 Thorns usually > 2 cm long; main lateral leaf veins lead only to lobe tips in lobed leaves.
- 27 Petioles distinctly glandular, usually with 3 or more glands persistent.
- 28 Stamens 5-10 (-15) per flower.
- 29 Fruit flesh usually hard or dense; calyx collar elevated on fruit; leaves moderately lobed on terminal shoots.
- 30 Anthers white or yellow *Crataegus intricata* var. *intricata*
- 30 Anthers pink or purplish. *Crataegus intricata* var. *rubella*
- 29 Fruit flesh dense or soft; calyx collar sessile or nearly so on fruit; leaves shallowly lobed or unlobed on terminal shoots. *Crataegus alleghaniensis*
- 28 Stamens usually 20 per flower (often 30 or more in *C. triflora*).
- 35 Leaves pubescent, at least abaxially; anthers white or yellowish.
- 36 Sepals remotely glandular-serrate; petiolar glands sessile; fruit usually 8-12 mm diameter. *Crataegus collina*
- 36 Sepals deeply glandular-serrate; petiolar glands stalked; fruit usually > 12 mm diameter.
- 37 Leaves thin; inflorescence simple, 3-5-flowered; stamens usually 30 or more. *Crataegus triflora*
- 37 Leaves firm; inflorescence compound, > 5-flowered; stamens 20. *Crataegus ashei*
- 35 Leaves glabrous; anthers pink to purplish, rarely white.
- 39 Calyx collar sessile on fruit; fruit flesh soft and succulent at maturity. *Crataegus frugiferans*
- 39 Calyx collar often elevated on fruit; fruit flesh usually dense or dry; [*Pulcherrimae* series].
- 41 Terminal shoot leaves shallowly lobed or unlobed, apex obtuse, margins crenate-serrate *Crataegus mendosa*
- 41 Terminal shoot leaves shallowly to moderately lobed, apex usually acute, margins serrate.
- 42 Leaf margins often taper in a straight line from midpoint to apex *Crataegus sargentii*
- 42 Leaf margins usually convex or bowed from midpoint to apex.
- 43 Petioles of smaller leaves winged 1/3 or less of length; leaf lobes convex-sided. *Crataegus pulcherrima* var. *pulcherrima*
- 43 Petioles of smaller leaves winged 1/2 length; leaf lobes straight on inner/distal side. *Crataegus venusta*
- 27 Petioles eglandular, or occasionally with 1 or 2 glands deciduous or obscure after spring. xx
- 50 Mature leaves pubescent or villous on veins.
- 51 Terminal shoot leaves usually ovate or rhomboid. *Crataegus mollis* var. *meridionalis*
- 51 Terminal shoot leaves mostly obovate or broadly elliptical.
- 56 Styles and pyrenes usually 2 or 3; primary leaf veins rather obscure or not impressed; petiole winged to base.
- 57 Inflorescence tomentose; leaves pubescent abaxially; stamens 20 *Crataegus berberifolia* var. *berberifolia*
- 57 Inflorescence villous or glabrate; leaves usually villous; stamens 10 *Crataegus berberifolia* var. *engelmannii*
- 56 Styles and pyrenes 3-5; primary leaf veins impressed adaxially, conspicuous abaxially; petiole winged near blade. *Crataegus collina*
- 50 Mature leaves glabrous or glabrate.
- 62 Terminal shoot leaves 4.5-7 cm long; 1-3 styles and pyrenes. *Crataegus crus-galli* var. *crus-galli*
- 62 Terminal shoot leaves mostly 2.5-4 cm long; 3-5 styles and pyrenes. *Crataegus x mohrii*

Crataegus alabamensis Beadle. ALABAMA HAWTHORN. **Hab:** Upland pine and pine-oak forests over clay soil. **Dist:** S. AL, reported from n. FL. **Phen:** Apr; Aug-Sep. **Tax:** The typical form of *C. alabamensis* has crenate-serrate, pubescent foliage and tomentose inflorescence parts. The similar *C. ravenelii*, *C. florens*, *C. atrita*, and *C. teres* are progressively more glabrate and of wider ranges; these interpreted as varieties of *C. alabamensis* in Lance (2011, 2014) and separate species in Phipps & Dvorsky (2008). **Syn:** = FNA9, Lance (2014), Phipps, O'Kennon, & Lance (2003); > *Crataegus adunca* Beadle – S2; < *Crataegus flava* Aiton – K1, RAB, S.

Crataegus alleghaniensis Beadle. ALLEGHENY HAWTHORN. **Hab:** Upland pine and pine-oak forests with clay soils. **Dist:** E. c. and ne. GA to c. and n. AL; reported from n. MS, e. TN, sw NC. **Phen:** Apr; Aug-Sep. **Tax:** Broadly considered, this species includes a variety of morphological forms; a narrower view might hold some to specific levels. Alternatively, the overall intermediate morphology suggests possible hybrid origin of most or all of these entities, perhaps between members of the *Intricatae* and *Apricae* series. Generally, leaves are sharply serrate and shallowly incised-lobed; stamens 10-20 per flower and anthers pink to purple; fruit 8-12 mm, red, with soft flesh. The stamen counts vary from 10 in typical *C. alleghaniensis* to 12-20 in related forms sharing much of the same range. **Syn:** = FNA9, Tn, Lance (2014), Phipps, Lance, & Dvorsky (2006); > *Crataegus agrestina* Beadle – S2; > *Crataegus allagheniensis* – S2; > *Crataegus alleghaniensis* var. *alleghaniensis* – Lance (2014); > *Crataegus alleghaniensis* var. *mira* (Beadle) R.W. Lance – Lance (2014); > *Crataegus cullasagensis* Ashe – S2, Ashe (1900b); < *Crataegus flava* Aiton – RAB; > *Crataegus frugiferans* Beadle; > *Crataegus rigens* Beadle – S2.

Crataegus ashei Beadle. ASHE HAWTHORN. **Hab:** Prairies, hardwood forests, pine-hardwood flats, especially over calcareous clay soils. **Dist:** Core of range is central MS, where this species is locally common in Scott and Smith counties; sporadic in c. and s. AL, e. LA, se. AR (s. TN ?). **Tax:** Related to *C. triflora* Chapman and *C. harbisonii* Beadle. **Syn:** = FNA9, S2, Lance (2014), Phipps, Lance, & Dvorsky (2006); < *Crataegus harbisonii* Beadle – K1.

Crataegus berberifolia Torrey & A. Gray var. *berberifolia*. BARBERRY HAWTHORN. **Hab:** Mixed hardwood and pine forests. **Dist:** C. VA south to n. FL, west to TX, MO; most common in LA, s. AR, e. TX. **Phen:** Apr-May; Aug-Oct. **Comm:** Closely related to and sometimes intergrading with *C. crus-galli*; differing from that species by consistent pubescence on foliage, twigs, floral and fruit parts; 10-stamened forms of the normally

143. ROSACEAE

20-stamened *C. berberifolia* have been called *C. engelmannii* Sargent, here treated as *C. berberifolia* var. *engelmannii*. **Syn:** = C, FNA9, K1, S, S2, Lance (2014); < *Crataegus berberifolia* – Ar, K3. [NatureServe G5T4](#) (Apparently Secure).

***Crataegus berberifolia* Torrey & A. Gray var. *engelmannii* (Sargent) Eggleston. ENGELMANN'S HAWTHORN. **Hab:** Mixed hardwood and pine forests of uplands, usually in subxeric to xeric habitats, especially over basic to calcareous soils. **Dist:** Appears most common in MO and AR, mixed sporadically with the species eastward to e. TN, c. NC. **Phen:** Apr-May; Aug-Oct. **Tax:** Foliage is similar to typical var. *berberifolia* in most respects, except for a tendency to be more scabrous-pubescent and reticulate-veined; presence of 10 stamens per flower is typical. Occasional intergradation with *C. crus-galli* in mixed populations is evident. **Syn:** = FNA9, Lance (2014); < *Crataegus berberifolia* – Ar, K3, Tn; > *Crataegus engelmannii* Sargent – NcTx, S2; > *Crataegus sinistra* Beadle – S2; > *Crataegus torva* Beadle – S2. [NatureServe G5T4](#) (Apparently Secure).**

***Crataegus brachyacantha* Sargent & Engelman. BLUEBERRY HAWTHORN. **Hab:** Oak flatwoods, bottomland forests, margins of prairies and saline barrens, pine flatwoods. **Dist:** LA, s. AR, se. OK, e. TX; one historic, disjunct record in sw. GA. **Phen:** Apr; Sep. **ID Notes:** The only eastern hawthorn bearing black fruit, appearing blue due to an exterior waxy bloom. **Syn:** = FNA9, K1, K3, NcTx, S, S2, Lance (2014), Phipps (1998), Phipps, O'Kennon, & Lance (2003). [NatureServe G4](#) (Apparently Secure).**

***Crataegus calpodendron* (Ehrhart) Medikus. PEAR HAWTHORN. **Hab:** Mixed hardwood forests, open slopes, wooded ravines, streamsides, especially over basic or calcareous rocks. **Dist:** NY w. to MN, s. to GA, OK. This species is relatively common in its generally northern range, uncommon in its southern range extensions in uplands from VA to MO, and rare in the Coastal Plain of GA, AL. **Phen:** May-early Jun; Sep-Oct. **Comm:** Often found as a solitary specimen or in small local populations. One of the latest hawthorns in our area to flower. **Syn:** = C, FNA9, GrPl, K1, K3, Mi, Pa, RAB, S, Tn, W, Lance (2014); > *Crataegus calpodendron* var. *calpodendron* – F, G; > *Crataegus calpodendron* var. *globosa* (Sargent) E.J. Palmer – F, G; > *Crataegus calpodendron* var. *microcarpa* (Chapman) E.J. Palmer – F, G; > *Crataegus carrollensis* Sargent – Sargent (1922a); > *Crataegus chapmanii* Beadle – S2; ~ *Crataegus microcarpa* Chapm.; > *Crataegus tomentosa* Du Roi.**

***Crataegus collina* Chapman. HILLSIDE HAWTHORN. **Hab:** Hardwood and pine-oak forests of hills and valleys, brushy lands. *C. collina* occupies sub-xeric uplands in the Appalachian Region and is tolerant of lowland floodplains in GA, AL, TN. **Dist:** Sw. VA west to KS, south to c. GA, s. AL, c. MS, AR and OK. **Phen:** Mar-Apr; Aug-Oct. **Tax:** Allied to *C. punctata* Jacquin, but more southern in range and at lower elevations. The fruits rarely reach 12 mm in diameter, whereas those of *C. punctata* often range from 12-23 mm. This species is variable in leaf and vestiture, some local genotypes being conspicuously pubescent. Several varieties have been described for the western range of the species, considered in synonymy here. **Comm:** It is one of the earliest hawthorns to flower in spring. **Syn:** = S, Tn, W, Lance (2014); > *Crataegus amnicola* Beadle – S2; > *Crataegus collina* Chapman – S2; > *Crataegus collina* var. *collicola* (W.W. Ashe) – F, G; > *Crataegus collina* var. *collina* – F, FNA9, G; > *Crataegus ingens* Beadle – S2; < *Crataegus punctata* Jacquin – Ar, C, RAB.**

***Crataegus crus-galli* Linnaeus var. *crus-galli*. COCKSPUR HAWTHORN. **Hab:** Pastures, thickets, disturbed woodlands and forests, fencerows. **Dist:** Ranges throughout the eastern US, except c. and s. peninsular FL, sometimes forming extensive colonies. **Phen:** Apr-May; Sep-Oct. **Tax:** *C. crus-galli* is variable in the size and shape of leaves and minor flower and fruit characters, this accounting for an extensive synonymy. Most earlier names in the synonymy were applied by Charles Sargent. Plants having 3 to 5 styles and as many pyrenes are alternatively placed under *C. reverchonii* Sargent, these also exhibiting a tendency to have smaller, suborbiculate leaves on terminal shoots. Typical forms of *C. crus-galli* tend to have 1-2 styles and pyrenes, and with a range of leaf shapes from narrowly oblanceolate to nearly suborbiculate. **Syn:** = C, FNA9, Tn, W, Lance (2014); > *Crataegus algens* Beadle – S2; > *Crataegus arborea* Beadle – K1; > *Crataegus canbyi* Sargent; ? *Crataegus crus-galli* – S; < *Crataegus crus-galli* – Ar, Mi, NcTx, NE, Pa, RAB; > *Crataegus crus-galli* – K1; > *Crataegus crus-galli* Linnaeus var. *crus-galli* – F, G; > *Crataegus crus-galli* var. *exigua* (Sargent) Eggleston – G; > *Crataegus crus-galli* var. *macra* (Beadle) E.J. Palmer – F, G; ~ *Crataegus exigua* Sargent; > *Crataegus macra* Beadle – S2; > *Crataegus regalis* Beadle var. *regalis* – F.**

***Crataegus crus-galli* Linnaeus var. *pyracanthifolia* (Aiton) Sargent. NARROWLEAF COCKSPUR HAWTHORN. **Hab:** Bottomland forests, swamp borders, lowlands, sometimes locally abundant. **Dist:** DE south to n. FL, west to MO, e. TX. **Phen:** Apr-May; Oct. **Comm:** The narrow leaves may be glabrous or pubescent on the lower surface, varying as local genotypes. **Syn:** = FNA9, Tn, Lance (2014); > *Crataegus crus-galli* Linnaeus var. *pyracanthifolia* (Aiton) Sargent – F, G; > *Crataegus limnophylla* Sargent – K1; > *Crataegus pyracanthoides* Beadle – S2; > *Crataegus pyracanthoides* Beadle var. *arborea* (Beadle) E.J. Palmer – G. [NatureServe G3G5Q](#) (Apparently Secure).**

***Crataegus florens* Beadle. MISSISSIPPI HAWTHORN. **Hab:** Pine and pine-oak forests, subxeric to mesic habitats with sandy or clay soils. **Dist:** E. NC south to n. FL, west to LA. **Phen:** Mar-Apr; Aug-Sep. **ID Notes:** Distinctive characters include slightly pilose-pubescent inflorescences, slightly pubescent or glabrate leaves and 3-5 styles. **Syn:** = FNA9, Phipps, O'Kennon, & Lance (2003); < *Crataegus alabamensis* var. *florens* (Beadle) Lance – Lance (2014); > *Crataegus attrita* Beadle – S2, Lance (2014); < *Crataegus flava* Aiton – K1, RAB, S; > *Crataegus florens* Beadle – S2; > *Crataegus fortis* Beadle – S2; > *Crataegus insidiosa* Beadle – S2.**

Crataegus frugiferans Beadle. FRUITFUL HAWTHORN. **Hab:** Upland, open woodlands, brushy areas. **Dist:** C. and s. GA, n. FL w. to AL, MS. **Phen:** Late Mar-Apr; Aug-Sep. **Tax:** This taxon is sporadic and may represent interserial hybrid origin of *Crataegus alleghaniensis* with *C. collina* or another taxa. Possibly related or intermediate in some way is *C. mira* Beadle. **ID Notes:** The typically stipitate-glandular petioles and inflorescence stems may vary to sessile-glandular in some plants. **Syn:** = FNA9; = *Crataegus alleghaniensis* var. *mira* (Beadle) R.W. Lance – Lance (2014); > *Crataegus frugiferans* Beadle – S2; > *Crataegus rigens* Beadle – S2.

Crataegus incilis Beadle. CUTLEAF BEAUTIFUL HAWTHORN. **Hab:** Mixed pine and hardwood forests, wooded hills, rocky woods. **Dist:** Sw. GA and Panhandle FL, west to s. MS, north to ne. AL; locally abundant in the vicinity of lower Little River Canyon, AL and sporadically elsewhere in the known range. **Phen:** Late Mar-Apr; Aug-Sep. **ID Notes:** *C. incilis* is a usually shrubby relative of *C. pulcherrima* Ashe with a strong suckering habit and slender shoots exhibiting thin, distinctly incised leaves. The 4 or 5 pairs of lobes per leaf, cuneate leaf base and 5-8 mm fruit are also characteristic. **Syn:** = FNA9; = *Crataegus pulcherrima* Ashe var. *incilis* (Beadle) R.W. Lance – Lance (2014); > *Crataegus concinna* Beadle – S2.

Crataegus intricata Lange var. *biltmoreana* (Beadle) R.W. Lance. BILTMORE HAWTHORN. **Hab:** Wooded hills, rock outcrops, thickets. **Dist:** VT south to c. GA, west to AR, MO. **Phen:** Late Apr-May; Sep-Oct. **ID Notes:** Distinguished from other varieties of *C. intricata* by the hairiness of its vegetative and floral parts. **Syn:** = Tn, Lance (2014); = *Crataegus biltmoreana* Beadle – FNA9; > *Crataegus biltmoreana* Beadle – F, G, NE, S2; > *Crataegus confusa* Sargent – F; < *Crataegus intricata* Palmer – Ar; *Crataegus intricata* Lange var. *biltmoreana* (Beadle) R.W. Lance; > *Crataegus stonei* Sargent – F; > *Crataegus villicarpa* Sargent – F.

Crataegus intricata Lange var. *intricata*. ENTANGLED HAWTHORN. **Hab:** Pastures, wooded hills, rock outcrops, thickets. **Dist:** VT to MI, IL, s. to GA, AR; relatively common in the Appalachian region. **Phen:** Late Apr-May; Aug-Oct. **Tax:** Broadly defined, *C. intricata* is a variable taxon incorporating numerous genotypes and minor local forms. Significant entities are segregated into the several varieties. **ID Notes:** Basic defining characters are 10 stamens; white or yellowish anthers; hard, greenish or ruddy-blushed fruits with an elevated calyx; glabrous, glandular leaves; slender thorns and frequently shrubby habit. **Syn:** = C, K1, S, Tn, W, Lance (2014); ~ *Crataegus beadlei* Ashe.; < *Crataegus flabellata* (Bosc ex Spach) K. Koch – RAB; > *Crataegus foetida* Ashe; < *Crataegus intricata* Palmer – Ar, FNA9, Mi, Pa; *Crataegus intricata* Lange var. *intricata*; > *Crataegus intricata* Lange var. *intricata* – F, G; > *Crataegus lentula* Ashe – F; > *Crataegus rubescens* Ashe – F; > *Crataegus virgata* Ashe – F.

Crataegus intricata Lange var. *rubella* (Beadle) Kruschke. LITTLE RED HAWTHORN. **Hab:** Hardwood forests, rock outcrops, thickets. **Dist:** DE, MD, VA w. to MO, s. to GA, AL. **Phen:** Late Apr-May; Sep-Oct. **ID Notes:** Distinguished primarily by shallowly lobed or unlobed leaves, red fruit and purplish anthers. **Syn:** = Va, Lance (2014); > *Crataegus appositae* Sargent – F; < *Crataegus flabellata* (Bosc ex Spach) K. Koch – RAB; < *Crataegus intricata* Palmer – Ar; < *Crataegus rubella* Beadle – FNA9.

Crataegus iracunda Beadle var. *iracunda*. FOREST HAWTHORN. **Hab:** Swamps, bottomlands, moist slopes, wooded hills, overall uncommon but sometimes locally abundant. **Dist:** VA to SC, w. to s. AR, n. LA. **Phen:** Mar-late April; Sep-Oct. **Tax:** *C. iracunda* and its associated, allied taxa suggest a complex possibly derived as hybrids involving series *Tenuifoliae* and *Pruinosae*, all formerly included within series *Silvicolae* (F, G). Recent reassignment by Phipps (FNA9) suggests separation of taxa in this complex into series *Populneae* and *Tenuifoliae*. The southern forms of the *iracunda* complex tend to occasionally display sparse hairs or pubescence on the foliage and inflorescence stems, here attributed to the typical var. *iracunda*; the more glabrous northern forms to var. *populnea*. *C. iracunda* Beadle sensu stricto is morphologically similar to the more widespread species *C. macrosperma* Ashe and separation of sterile and juvenile plants in sympatric ranges can be problematic; a primary distinction of hard fruit flesh in *C. iracunda* and soft fruit flesh in *C. macrosperma* is not always available for comparison. **Syn:** = Lance (2014); = *Crataegus iracunda* Beadle – K1, Tn, Lance (2014); > *Crataegus drymophila* Sargent; < *Crataegus flabellata* (Bosc ex Spach) K. Koch – C, RAB; > *Crataegus iracunda* Beadle – FNA9, S2; > *Crataegus iracunda* Beadle var. *iracunda* – F, G; > *Crataegus iracunda* var. *silvicola* (Beadle) E.J. Palmer – F, G; > *Crataegus populnea* Ashe – G; > *Crataegus riparia* Ashe; > *Crataegus sectilis* Ashe; > *Crataegus shallotte* Ashe; > *Crataegus silvicola* Beadle – S2.

Crataegus macrosperma Ashe. EASTERN HAWTHORN. **Hab:** Mesic to subxeric hardwood forests, wooded slopes, rock outcrops, pastures, thickets, mountain balds and rocky summits. **Dist:** ME to MN, south to GA, AL, AR; *C. macrosperma* is widespread, particularly common in the Appalachians. **Phen:** Apr-early May; Sep-Oct. **ID Notes:** *C. macrosperma* is consistent in its adaxially lightly scabrous-pubescent young leaves, 5-10 stamens, and soft-textured mature fruit. The pyrenes are not unusually large (5-8 mm), so the epithet is somewhat a misnomer. **Syn:** = Ar, FNA9, K1, K3, Pa, Tn, W, Lance (2014); > *Crataegus brainerdii* Sargent – C, Pa, misapplied to material in our area; < *Crataegus flabellata* (Bosc ex Spach) K. Koch – RAB; > *Crataegus flabellata* (Bosc ex Spach) K. Koch – C; > *Crataegus fluviatilis* – Mi; < *Crataegus macrosperma* Ashe – S; > *Crataegus macrosperma* Ashe – S2; > *Crataegus macrosperma* var. *macrosperma* – F, G; > *Crataegus macrosperma* var. *roanensis* (Ashe) E.J. Palmer – F, G; > *Crataegus roanensis* Ashe – S2.

Crataegus marshallii Eggleston. PARSLEY HAWTHORN, PARSLEY HAW. **Hab:** Swamps, alluvial forests, mesic to subxeric upland slopes over mafic or calcareous rocks. **Dist:** Se. VA south to c. peninsular FL, west to e. TX, and north in the interior to n. AL, sc. and w. TN, n. MS, s. IL, se. MO, se. OK. **Phen:** Apr-early May; Sep-Oct. **ID Notes:** *Crataegus marshallii* is distinctive and immediately recognizable by its deeply incised, pubescent leaves with slender petioles, small (4-7 mm) fruits and the scaly, mottled trunk bark. **Syn:** = Ar, C, F, FNA9, G, K1, K3, NcTx, RAB, S, Tn, W, Lance (2014), Phipps (1998); = *Crataegus apiifolia* (Marshall) Michaux – S2. [NatureServe G5](#) (Secure).

Crataegus mendosa Beadle. ALBERTVILLE HAWTHORN. **Hab:** Mesic hardwood forests, mixed pine-hardwood forests, upland wooded hills over calcareous substrates and well-drained clays. **Dist:** Lower Piedmont and upper Coastal Plain of sc. SC, wc. GA, ne. and c. AL, and c. and s. MS. **Phen:** Apr; Sep. **Tax:** Allied to *C. pulcherrima* Ashe, and perhaps only a variant of it, *C. mendosa* is distributed northward and eastward beyond the bulk of the range of *C. pulcherrima*, and the only member of the *Pulcherrimae* series known to occur in SC. **ID Notes:** The often-obtuse leaf apex and accompanying obscure, blunt lobes and sub-crenate teeth are characteristic; the glabrous foliage coupled with 20 stamens per flower help separate this species from members of the *Intricatae* series. **Syn:** = FNA9, K1, N, S, S2, Lance (2014). [NatureServe G3Q](#) (Vulnerable).

Crataegus ×mohrii Beadle. MOHR'S HAWTHORN. **Hab:** Hardwood and pine-hardwood forest understories. **Dist:** Rare and sporadic from MS to GA, n. to TN. **Phen:** May; Sept.-Oct. **Tax:** The combination of short (2-4 cm), suborbicular terminal shoot leaves and 3-5 styles suggests an affinity to *C. reverchonii* Sargent, as per Phipps (2014d); alternatively, *C. ×mohrii* could be considered an intraserial intermediate of *C. reverchonii* and another member of *Crus-galli*, due to range considerations and its pilose inflorescences and yellow anthers. **Syn:** = *Crataegus mohrii* Beadle – F, K1, S; = *Crataegus reverchonii* var. *mohrii* (Beadle) J.B. Phipps – FNA9, Lance (2014); < *Crataegus reverchonii* Sargent – Tn.

Crataegus mollis (Torrey & A. Gray) Scheele var. *meridionalis* (Sargent) Lance. SOUTHERN DOWNY HAWTHORN. **Hab:** Prairies, streamsides, scrubland. **Dist:** Rare and sporadic in central and s. AL and MS, primarily distributed in the Black Belt / Jackson Prairie ecoregion. **Phen:** Mar-Apr; Oct-Nov. **ID Notes:** This southern form of *C. mollis* is distinguished by its elliptical, unlobed leaves; the range is east-peripheral to the range of typical *C. mollis*. **Syn:** = FNA9, K1; = *Crataegus meridionalis* Sargent; < *Crataegus mollis* – K3.

Crataegus mollis (Torrey & A. Gray) Scheele var. *mollis*. DOWNY HAWTHORN. **Hab:** Mesic forests, alluvial forests, prairies, streamsides, wooded uplands over basic or calcareous soils. **Dist:** MI to e. ND, s. to AL, TX south to s. TX, e. to nw. GA; an occurrence of this species in the mountains of VA is atypical of the majority of the range, which is mostly Midwestern, west and southwest of the Appalachians. **Phen:** Mar-Apr; Sep-Oct. **ID Notes:** The typical variety of *C. mollis* exhibits ovate to broadly ovate or deltate leaves heavily pubescent or tomentose abaxially, particularly in spring; similar vestiture is seen on the stout, eglandular petioles and inflorescence parts. The fruits of some local genotypes can reach 24 mm diameter, among the largest of the genus in the U.S. *C. mollis* often reaches treelike dimensions, to 10 m tall and trunk diameters to 30 cm. **Syn:** = C, Pa, S, Lance (2014); ?> *Crataegus albicans* Ashe – S; > *Crataegus cibaria* Beadle – S2; > *Crataegus cibilis* Ashe; > *Crataegus graviora* Beadle – S2; < *Crataegus mollis* – Ar, GrPl, K1, K3, Mi, Tn; > *Crataegus mollis* – S2; > *Crataegus mollis* (Torrey & A. Gray) Scheele var. *mollis* – F, G.

Crataegus opaca Hooker & Arnott. WESTERN MAYHAW. **Hab:** Bottomlands, swampy forests, lowland depressions and wetland soils where flooded for periods of the year. **Dist:** E. TX to Escambia and Santa Rosa counties, FL (Kunzer et al. 2009). **Phen:** Feb-Mar; Apr-May. **Comm:** Occasionally cultivated for its fruit production. **ID Notes:** The leaves of *C. opaca* differ from the eastern *C. aestivalis* in being predominately elliptical, with subentire to obscurely crenate or shallowly sinuate margins. **Syn:** = Ar, FNA9, K1, K3, Lance (2014), Phipps (1988a). NatureServe G5 (Secure).

Crataegus phaenopyrum (Linnaeus f.) Medikus. WASHINGTON HAWTHORN. **Hab:** Mesic upland woodlands, floodplain forests, pastures, thickets, disturbed areas, sometimes locally abundant. **Dist:** Native range presumed to be PA south to SC, west to sw. MO, AR; also c. and s. AL s. to n. FL; naturalized populations originating from widespread cultivation may be involved in parts of this range, with additional expansions becoming evident. **Phen:** May-early Jun; Sep-Oct. **Syn:** = Ar, C, FNA9, G, K1, K3, Mi, NcTx, Pa, RAB, S2, Tn, W, Lance (2014); > *Crataegus phaenopyrum* (Linnaeus f.) Medikus – F, S; > *Crataegus populifolia* – S; > *Crataegus youngii* Sargent – F. NatureServe G4? (Apparently Secure).

Crataegus pruinosa (H.L. Wendland) K. Koch var. *gatingeri* (Ashe) Lance. GATTINGER'S HAWTHORN. **Hab:** Hardwood and pine-hardwood woodlands, brush, pastures. **Dist:** PA to GA, west to MO, AR; extending south into the Coastal Plain in AL, MS, LA, and AR. **Phen:** Apr-May; Sep-Oct. **Tax:** This taxon bears some resemblance to the northerly *C. compacta* Sargent in its small anthers and elongate terminal lobe of the leaves. The entity *C. georgiana* Sargent may represent an intermediate of var. *gatingeri* and *C. iracunda* Beadle. **Syn:** = *Crataegus gatingeri* Ashe – F, FNA9; < *Crataegus flabellata* (Bosc ex Spach) K. Koch – RAB; > *Crataegus gatingeri* var. *gatingeri* – G; > *Crataegus gatingeri* var. *rigida* E.J. Palmer – G; > *Crataegus georgiana* Sargent – S2; > *Crataegus pruinosa* (H.L. Wendland) K. Koch var. *gatingeri* (Ashe) Lance – Va, Lance (2014).

Crataegus pruinosa (H.L. Wendland) K. Koch var. *pruinosa*. FROSTED HAWTHORN. **Hab:** Upland hardwood forests, pastures, rock outcrops, mountain summits and balds, sometimes colonial or locally abundant. **Dist:** ME to WI, IA, s. to NC, TN, AR. **Phen:** Apr-May; Sep-Oct. **Tax:** The presence of a waxy bloom on the mature fruit (pruinose) is not always evident. Foliage and floral parts are usually entirely glabrous on plants in our area. **Syn:** = C, FNA9, Pa, S, W; > *Crataegus arcana* Beadle – K1, S2; < *Crataegus flabellata* (Bosc ex Spach) K. Koch – RAB; > *Crataegus gatingeri* Ashe – F; > *Crataegus gatingeri* var. *gatingeri* – G; > *Crataegus gatingeri* var. *rigida* E.J. Palmer – G; > *Crataegus georgiana* Sargent – S2; < *Crataegus pruinosa* – Ar, GrPl; > *Crataegus pruinosa* – K1, Tn; > *Crataegus pruinosa* var. *delawarensis* (Sargent) E.J. Palmer – F, G; > *Crataegus pruinosa* (H.L. Wendland) K. Koch var. *gatingeri* (Ashe) Lance – Lance (2014); > *Crataegus pruinosa* (H.L. Wendland) K. Koch var. *pruinosa* – F, G, Lance (2014); > *Crataegus rugosa* – F, G; > *Crataegus rustica* Beadle – S2; > *Crataegus vicinalis* Beadle – S2.

Crataegus pulcherrima Ashe var. *opima* (Beadle) R.W. Lance. BROAD-LEAVED BEAUTIFUL HAWTHORN. **Hab:** Hardwood and hardwood-pine forests, ravines, mesic slopes. **Dist:** Sw. GA, s. & c. AL, MS, e. TX. **Phen:** Apr; Sep-Oct. **Tax:** Broadly defined, this variety incorporates several marginally distinct species described by Beadle, some of which are upheld as species in Phipps (2014d). **ID Notes:** This variety displays proportionally broader foliage than the typical variety, and usually has shallow, obtuse or rounded lobes. **Syn:** = Lance (2014); = *Crataegus opima* Beadle – FNA9; > *Crataegus abstrusa* Beadle – S2; > *Crataegus illustris* Beadle – S2; > *Crataegus inanis* Beadle – K1, S2; > *Crataegus opima* Beadle – S2, Phipps, O'Kennon, & Dvorsky (2006); < *Crataegus pulcherrima* – K3, S2, Phipps, O'Kennon, & Dvorsky (2006); > *Crataegus pulcherrima* – K1.

Crataegus pulcherrima Ashe var. **pulcherrima**. BEAUTIFUL HAWTHORN. **Hab:** Hardwood and hardwood-pine forests, ravines, mesic slopes, sometimes locally abundant. **Dist:** W. GA and Panhandle FL, w. to LA and extreme e. TX; disjunct populations have been reported from Richmond and Burke Cos, GA and McCormick Co, SC. **Phen:** Apr; Sep-Oct. **Tax:** Defined broadly, var. *pulcherrima* includes in synonymy a number of species described by Beadle, most of these not clearly distinct and sometimes intergrading in sympatric populations. The entities *C. pinetorum* Beadle and *C. tecta* Beadle, synonyms here, are held to species status by Phipps (FNA9). Suspected intraserial and interserial hybrids are occasionally found across the range, two of which may be *Crataegus cullasagensis* Ashe and *Crataegus agrestina* Beadle. **ID Notes:** Var. *pulcherrima* generally displays reasonable consistency in evenly incised leaf margins and straight, parallel primary veins, 20-stamened flowers, small (5-10 mm diameter) fruit and brown, furrowed trunk bark. **Syn:** = FNA9, Lance (2014); > *Crataegus abstrusa* Beadle – S2; > *Crataegus ancisa* Beadle – S2; > *Crataegus austrina* – S2, Lance (2014); > *Crataegus concinna* Beadle – S2; > *Crataegus contrita* Beadle – S2; > *Crataegus illustris* Beadle – S2; > *Crataegus incilis* Beadle – S2, Phipps, O'Kennon, & Dvorsky (2006); < *Crataegus intricata* Palmer – S; > *Crataegus lenis* Beadle – S2, S2; > *Crataegus macilenta* Beadle – S2, S2; > *Crataegus pinetorum* – K1, S2; > *Crataegus pulcherrima* – K1, S2, Phipps, O'Kennon, & Dvorsky (2006); > *Crataegus robur* Beadle – S2; > *Crataegus tecta* Beadle – S2.

Crataegus sargentii Beadle. SARGENT'S HAWTHORN. **Hab:** Upland forests, rocky woodlands, over calcareous or circumneutral substrates. **Dist:** W. GA, n. and c. AL, reported from c. MS and c. panhandle FL. **Phen:** Apr; Sep-Oct. **Tax:** Allied to *C. pulcherrima* Ashe, and having a core range mostly in the northern limits of the former. The entity *C. gilva* Beadle, morphologically similar and here included in synonymy, has leaves less inclined toward lobing and may warrant at least varietal status. **Syn:** = K1, Lance (2014); > *Crataegus assimilis* Beadle – S2, Phipps, O'Kennon, & Dvorsky (2006); > *Crataegus eximia* Beadle – FNA9, S2, Phipps, O'Kennon, & Dvorsky (2006); > *Crataegus gilva* Beadle – FNA9, S2, Phipps, O'Kennon, & Dvorsky (2006); < *Crataegus intricata* Palmer – S; > *Crataegus sargentii* Beadle – FNA9, S2, Phipps, O'Kennon, & Dvorsky (2006).

Crataegus spathulata Michaux. LITTLEHIP HAWTHORN. **Hab:** Scrubland, pine-oak woodlands, bottomland forests, rocky uplands over mafic or calcareous substrates. **Dist:** Se. VA and c. NC south to panhandle FL, west to e. TX, north in the interior to c. TN, sw. MO, e. OK; sporadic in TN, sw. NC. **Phen:** Apr-May; Sep-Oct. **ID Notes:** This species is distinctive for its small, spatulate leaves (tending to be trilobed) and thin, flaking bark of the main trunk (multicolored green, brown, gray and yellowish). **Syn:** = Ar, C, F, FNA9, G, K1, K3, NcTx, RAB, S, S2, Tn, W, Lance (2014), Phipps (1998). **NatureServe G5 (Secure).**

Crataegus teres Beadle. SMOOTH ALABAMA HAWTHORN. **Hab:** Pine-oak forests, sandy woodlands. **Dist:** S. AL, possibly e. to GA. **Phen:** Mar-Apr; Aug-Sep. **Tax:** Similar and assumed closely allied to *C. florens* Beadle, or possibly of intermediate origin. **ID Notes:** *Crataegus teres* is an unusual, glabrate entity of the series *Lacrimatae*, superficially resembling unrelated *C. crus-galli*. **Syn:** = FNA9, S2, V; = *Crataegus alabamensis* var. *teres* (Beadle) Lance – Lance (2014); < *Crataegus flava* Aiton – K1, S.

Crataegus triflora Chapman. THREEFLOWER HAWTHORN. **Hab:** Wooded ravines, mesic slopes, limestone outcrops, flatwoods, prairies. **Dist:** Nw. GA to n. MS, s. to s. AL, MS; disjunct populations in prairie sites of Houston Co, GA, c. LA, s. AR (possibly in se. TN?). **Phen:** Apr-May; Sep-Oct. **Tax:** The related *C. austromontana* Beadle may be a local genotype or hybrid that appears to be extinct. **ID Notes:** Usually a multi-stemmed shrub 1-3 m tall, rarely to 6 m. *C. triflora* produces some of the largest flowers in the genus (to 3 cm diameter), though frequently only 3 flowers are borne per inflorescence; occasional vigorous plants may bear 4-6 flowers per inflorescence. **Syn:** = K1, W, Lance (2014); > *Crataegus austromontana* Beadle – FNA9, K3, S2, Tn, Phipps, Lance, & Dvorsky (2006); > *Crataegus triflora* Chapman – Ar, FNA9, K3, S2, Tn, Phipps, Lance, & Dvorsky (2006).

Crataegus uniflora Münchhausen. ONEFLOWER HAWTHORN. **Hab:** Thin woodlands, disturbed lands, roadsides, rock outcrops, often in xeric or sub-xeric conditions. **Dist:** NY to peninsular FL, w. to IL, MO, OK, e. TX. **Phen:** Apr-May; Sep-Oct. **ID Notes:** Normally a shrubby species, 0.5-2 m in height, though local forms may reach 4 m, particularly in n. FL. Minor variation occurs in foliage, but fairly consistent are the slender thorns (2-7 cm long) and foliaceous calyx lobes persistent on the fruit. **Syn:** = Ar, C, F, FNA9, G, K1, K3, Pa, RAB, S, Tn, W, Lance (2014); > *Crataegus arenicola* Ashe; > *Crataegus gregalis* Beadle – S2; > *Crataegus pentaneura* Ashe – S2; > *Crataegus raleighensis* Ashe – S2; > *Crataegus uniflora* Münchhausen – S2.

Crataegus venusta Beadle. RED MOUNTAIN HAWTHORN. **Hab:** Rocky woodlands, brush, cutover forests. **Dist:** C. AL and Grundy County, TN. **Phen:** Apr-May; Sep-Oct. **Tax:** A sparsely documented taxa in the *Pulcherrimae* series, *C. venusta* suggests affinity to the more restricted Appalachian taxa *C. pallens* Beadle, but fruits are typically red or ruddy. **Syn:** = FNA9, S2, Tn, Lance (2014), Phipps, O'Kennon, & Dvorsky (2006); < *Crataegus sargentii* Beadle – K1.

Crataegus viridis Linnaeus var. **lanceolata** (Sargent) E.J. Palmer. LANCELEAF GREEN HAWTHORN. **Hab:** Moist forests and woodlands, streamsides, calcareous uplands. **Dist:** SC to FL, w. to e. TX, AR; range sympatric with much of the typical variety of the species. **Phen:** Late Mar-late Apr; Sep-Nov. **Tax:** Assignment of var. *lanceolata* is sometimes problematic due to intermediacy of leaf shapes seen in the wide variation of var. *viridis*; this taxon perhaps deserving forma status. **Syn:** = FNA9, Lance (2014); > *Crataegus interior* Beadle; > *Crataegus lanceolata* Sargent.

Crataegus viridis Linnaeus var. **velutina** (Sargent) J.B. Phipps. VELVET GREEN HAWTHORN. **Hab:** Bottomland forests, field borders, moist to wet woodlands. **Dist:** MS, AR, n. LA, e. TX. **Phen:** Late Mar-late Apr; Sep-Nov. **ID Notes:** This taxon is most distinctive in spring; the vestiture

143. ROSACEAE

wanes with the season and parts may be glabrate by autumn. **Syn:** = FNA9, Lance (2014); > *Crataegus micracantha* Sargent; > *Crataegus velutina* Sargent. NatureServe G5TNR (Not Yet Ranked).

***Crataegus viridis* Linnaeus var. *viridis*.** GREEN HAWTHORN, GREENHAW. **Hab:** Swamps, bottomland forests, alluvial woodlands, streamsides, wet flatwoods, and uplands where soils are often basic to calcareous. **Dist:** MD to n. FL, w. MO, c. TX; absent or rare on Appalachian Plateau. **Phen:** Late Mar-late Apr; Sep-Nov. **Comm:** One of our largest hawthorn species, frequently reaching treelike proportions (5-10 m tall, trunk 10-40 cm diameter). The orange-red fruits often persist on the bare branches into winter, sometimes until the following spring. Bark of the trunk is usually mottled with patterns of gray, reddish-brown, and greenish-gray coloration, due to the dehiscing layers of scales and plates. **Syn:** = F, FNA9, G, K1, K3, Lance (2014); > *Crataegus interior* Beadle – S2; > *Crataegus penita* Beadle – K1, S2; < *Crataegus viridis* Linnaeus – Ar, C, NcTx, RAB, S, Tn, W; > *Crataegus viridis* Linnaeus – S2; > *Crataegus vulsa* Beadle – K1, S2.

***Eriobotrya* Lindley 1821 (LOQUAT)**

A genus of about 15-30 species, trees and shrubs, native to e. Asia. Liu et al. (2020) propose merging *Eriobotrya* into *Rhaphiolepis*. We here retain *Eriobotrya*, in part because other, possibly better, taxonomic alternatives are available based on the results of Liu et al. (2020), and also because the name they proposed for the only species in our flora is invalid. References: Christenhusz, Fay, & Byng (2018); Kalkman in Kubitzki et al (2004); Liu et al (2020a); Liu et al (2020b); Phipps (2014c) in FNA9 (2014).

* ***Eriobotrya japonica* (Thunberg) Lindley.** LOQUAT, JAPANESE-MEDLAR. **Hab:** Suburban woodlands, uncommonly cultivated, sometimes naturalizing, and potentially invasive in the deeper South. **Dist:** Native of ec. China. Reported for Lowndes County, GA (Carter, Baker, & Morris 2009). Also reported for LA. Reported for SC (Congaree National Park, Richland County) and appearing in additional locations in SC (Bradley et al. [in prep]). Reported for AR (Serviss & Serviss 2020). **Tax:** We disagree with the regressive proposal to merge *Eriobotrya* (and many other genera) into *Pyrus* (Christenhusz, Fay, & Byng 2018). The less radical proposal to merge *Eriobotrya* into *Rhaphiolepis* (Liu et al. 2020a) needs additional consideration; the name in *Rhaphiolepis* proposed for our single species by Liu et al. (2020) is invalid, corrected in Liu et al. (2020b). **Syn:** = FNA9, K1, K3, K4, WH3; = *Pyrus bibas* (Loureiro) M.F. Fay & Christenhusz – Christenhusz, Fay, & Byng (2018); = *Rhaphiolepis bibas* (Loureiro) Galasso & Banfi – Liu et al (2020b); = *Rhaphiolepis loquata* B.B. Liu & J. Wen – Liu et al (2020a), invalid name. NatureServe GNR (Not Yet Ranked).

***Exochorda* Lindley 1858 (PEARLBUSH)**

A genus of about 4 species, shrubs, of e. Asia. References: Haines (2014) in FNA9 (2014); Kalkman in Kubitzki et al (2004).

* ***Exochorda racemosa* (Lindley) Rehder.** PEARLBUSH. **Hab:** Disturbed areas, woodland borders, suburban woodlands. **Dist:** Native of China. First reported for SC by Hill & Horn (1997) and for AL by Diamond (2014). This species appears to have substantial likelihood of increasingly naturalizing and becoming invasive. **Phen:** Mar-Apr. **Syn:** = Ar, C, FNA9, G, K1, K3, K4, NE, NY. NatureServe G5 (Secure).

***Fragaria* Linnaeus 1753 (STRAWBERRY)**

A genus of about 10-24 species, herbs, of temperate Eurasia, North America, and South America. References: Bird et al (2021); NE; Kalkman in Kubitzki et al (2004); Staudt (2014) in FNA9 (2014).

- 1 Fruit (at least the larger on a plant) usually > 1.5 cm thick; petals 10-15 mm long; leaves evergreen; [cultivated, rarely persistent] ***Fragaria ×ananassa* var. *ananassa***
- 1 Fruit 0.5-1.5 cm thick; petals 3-10 mm long; leaves deciduous (at least tardily so); [native] ***Fragaria virginiana***

* ***Fragaria ×ananassa* (Weston) Duchesne ex Rozier var. *ananassa* [*F. chiloensis* × *virginiana*].** GARDEN STRAWBERRY, CULTIVATED STRAWBERRY. **Hab:** Gardens, persistent on garden edges, commonly cultivated. **Phen:** Mar-May. **Tax:** An octoploid garden hybrid of the two octoploid species, *F. chiloensis* and *F. virginiana*. **Syn:** = K1; = *Fragaria ×ananassa* ssp. *ananassa* – FNA9, K3, K4; = *Fragaria ananassa* ssp. *ananassa* – NE; = *Fragaria chiloensis* × *virginiana* – NY; < *Fragaria ×ananassa* – F, GrPl, Il, RAB; < *Fragaria ananassa* – C, WV; < *Fragaria chiloensis* Duchesne var. *ananassa* – G.

***Fragaria virginiana* P. Miller.** WILD STRAWBERRY. **Hab:** Grasslands, roadsides, pastures, woodlands, grassy balds. **Dist:** NL (Newfoundland) west to MB, south to peninsular FL and TX. **Phen:** Apr-Jun. **Syn:** = C, Il, Mi, Pa, RAB, Tn, Va, W, WH3; = *Fragaria virginiana* ssp. *virginiana* – K4; > *Fragaria australis* (Rydberg) Rydberg – S; > *Fragaria grayana* Vilmorin ex J. Garden origin

Geum Linnaeus 1753 (AVENS)

A genus of 40-60 species, herbs, mainly of north temperate areas. Many researchers have advocated breaking *Geum* into varying numbers of segregate genera; even the most conservative of these divisions place *G. radiatum* in a genus separate from our other species (such as *Parageum*; see synonymy) and some would place *G. vernum* in *Stylipus*. Molecular studies (Smedmark 2006; Smedmark & Eriksson 2002) have made a case for a broad circumscription of *Geum*, including *Waldsteinia*, as many of the segregates are complexly and reticulately interrelated; more recent studies have pushed back against including *Waldsteinia* and some other segregates in *Geum* based on more detailed hypotheses of the phylogeny of the *Colurieae*. We here retain *Waldsteinia* at its traditional genus rank. Hough (2018) provides a useful report on various hybrids of our native *Geum*. References: Bolle (1933); Hough (2018); Kalkman in Kubitzki et al (2004); Král (1966); Phipps (2014b) in FNA9 (2014); Robertson (1974); Rohrer (2014a) in FNA9 (2014); Shattellroe et al (2021); Smedmark & Eriksson (2002); Smedmark (2006); Weakley & Gandhi (2008).

Geum
canadense

- 1 Style deciduous; leaves 3-foliolate or 3-lobed, lacking small leaflets toward the base; [subgenus or genus *Waldsteinia*]..... *Waldsteinia*
1 Style persistent; leaves various (see below).
7 Plant in flower.
..... *Geum canadense*
7 Plant in fruit.
..... *Geum canadense*

Geum canadense Jacquin. WHITE AVENS. **Hab:** Moist slope forests, bottomland forests, swamp forests, tidal swamps, rarely in submesic forests. **Dist:** NS west to ND, south to c. GA and TX; allegedly disjunct in Mexico (Villaseñor 2016). **Phen:** May-Jul; Jul-Nov. **Tax:** Some authors have recognized a number of varieties in *G. canadense* (see synonymy); some (at least) of these may warrant recognition. **Syn:** = Ar, C, FNA9, G, GrPl, GW2, K4, Mi, NY, Pa, RAB, S, Tn, Va, W, Robertson (1974); > *Geum canadense* var. *brevipes* Fernald – F, Bolle (1933); > *Geum canadense* var. *camporum* (Rydberg) Fernald & Weatherby – F, NcTx, Tx, Bolle (1933); > *Geum canadense* var. *canadense* – F, Il, K1, K3, NE, WV, Bolle (1933); > *Geum canadense* var. *grimesii* Fernald & Weatherby – F, Il, Bolle (1933); > *Geum canadense* var. *texanum* Fernald & Weatherby – K3, NcTx, Tx.

Gillenia Moench 1802 (INDIAN-PHYSIC, BOWMAN'S-ROOT)

A genus of 2 species, herbs, of e. North America. The contention that *Gillenia* is a later homonym of *Gillena* and must therefore be rejected for the later name *Porteranthus* has been ruled against (Robertson 1974; Brummitt 1988; Parkinson 1988). References: Kalkman in Kubitzki et al (2004); Nesom (2014b) in FNA9 (2014); Robertson (1974).

Gillenia
stipulata

Gillenia stipulata (Muhlenberg ex Willdenow) Nuttall. MIDWESTERN INDIAN-PHYSIC. **Hab:** Dry to mesic woodlands and forests, especially over circumneutral soils derived from mafic rocks (such as diabase or greenstone) or calcareous rocks. **Dist:** NY to KS, south to nw. GA and TX, and disjunct east of the Blue Ridge in sc. VA, c. NC, sc. SC (Bradley et al. [in prep.]), and c. GA. **Phen:** May-Jun; Jul-Oct. **Syn:** = Ar, F, FNA9, G, K3, K4, Mi, NY, RAB, Tx, Va, WV; = *Porteranthus stipulatus* (Muhlenberg ex Willdenow) Britton – C, GrPl, Il, K1, NcTx, S, Tn, W, Robertson (1974). **NatureServe G5** (Secure).

Malus P. Miller 1754 (APPLE, CRABAPPLE)

A genus of 25-55 species, trees and shrubs, north temperate. References: Dickson (2014) in FNA9 (2014); Kalkman in Kubitzki et al (2004); Qian, Liu, & Tang (2010); Robertson (1974).

- 1 Twigs not thorny; leaves involute or convolute in bud; leaves unlobed; [aliens, cultivated and persistent or escaping]; [section *Malus*].
..... *Malus domestica*
1 Twigs thorny; leaves folded (conduplicate) in bud; leaves often lobed; [natives and aliens].
7 Leaves permanently pubescent beneath; pedicels and hypanthium pubescent; [western, disjunct east to KY and MS]..... *Malus ioensis*
7 Leaves glabrous or nearly so; pedicels and hypanthium glabrous or with scattered long hairs; [widespread in our area].
8 Leaves elliptic to elliptic-lanceolate, 2.5-8 cm long, 1-4 cm wide, mostly > 2× as long as wide, subacute to obtuse at the tip..... *Malus angustifolia*

* ***Malus domestica*** (Suckow) Borkhausen. COMMON APPLE. **Hab:** Commonly cultivated throughout, especially in the Mountains and Piedmont, and long persistent. **Dist:** Native of Asia. **Phen:** Apr-May; Jul-Oct. **Tax:** Qian, Liu, & Tang's (2010) proposal to conserve the name *Malus domestica* (against *M. pumila*, *M. communis*, *M. frutescens*, and *Pyrus dioica*) was approved at the Shenzhen Botanical Congress held in Jul 2017. **Syn:** = Qian, Liu, & Tang (2010); = *Malus malus* (Linnaeus) Britton – S; = *Malus pumila* P. Miller – Ar, FNA9, Il, K1, K3, Mi, NE, NY, Pa, RAB, Tn, Va, W; = *Pyrus malus* Linnaeus – C, F, G, WV, Robertson (1974). **NatureServe G5** (Secure).

Malus ioensis (Alph. Wood) Britton. PRAIRIE CRABAPPLE, WESTERN CRABAPPLE, IOWA CRAB, BECHTEL CRAB. **Hab:** Forests, woodlands, fence-rows. **Dist:** MI, MN, e. SD, and w. NE, south to w. WV, KY, s. MS, se. LA, and c. TX. **Phen:** May. **Syn:** = Ar, FNA9, Il, K3, K4, WV; = *Malus ioensis* (Alph. Wood) Britton – Mi; = *Pyrus ioensis* (Wood) L.H. Bailey – C, F, G, GrPl, Tx; > *Malus ioensis* var. *ioensis* – K1.

Neviusia A. Gray 1858 (SNOW-WREATH)

A genus of 2 species, shrubs, of se. North America and California. References: Heikens (2014) in FNA9 (2014); Kalkman in Kubitzki et al (2004).

Neviusia alabamensis A. Gray. ALABAMA SNOW-WREATH. **Hab:** Limestone woodlands, bluffs, sinkholes, where there is seasonal moisture. **Dist:** Sc. TN (Chester, Wofford, & Kral 1997), nw. GA (Jones & Coile 1988), n. AL, and ne. MS (Tishomingo County); disjunct in AR and MO. **Phen:** Mar-May; May-Jul. **Syn:** = Ar, FNA9, K1, K3, K4, S, Tn. **NatureServe G3** (Vulnerable).

Photinia Lindley 1821 (PHOTINIA, REDTIP)

A genus of about 40 species, trees and shrubs, of Asia and Central America. References: Christenhusz, Fay, & Byng (2018); Guo et al (2011); Kalkman in Kubitzki et al (2004); Nesom (2014c) in FNA9 (2014).

Unkeyed waifs: *Photinia glabra*

* ***Photinia glabra*** (Thunberg) Franchet & Savatier. JAPANESE REDTIP. **Dist:** Native of e. Asia. **Syn:** = K4. **NatureServe GNR** (Not Yet Ranked).

* ***Photinia serratifolia*** (Desfontaines) Kalkman. TAIWANESE REDTIP. **Hab:** Suburban woodlands; uncommonly cultivated and rarely naturalizing. **Dist:** Native of e. Asia. **Phen:** Mar-Apr. **Syn:** = Ar, FNA9, K1, K3, K4, NcTx; = *Pyrus serratifolia* (Desfontaines) M.F. Fay & Christenhusz – Christenhusz, Fay, & Byng (2018). **NatureServe GNR** (Not Yet Ranked).

Potentilla Linnaeus 1753 (CINQUEFOIL, FIVE-FINGERS, POTENTILLA)

A genus of 350-400 species, depending on the controversial circumscription. *Potentilla* here follows the circumscription recommended by Eriksson, Persson, & Smedmark (2022), excluding *Alchemilla*, *Aphanes*, *Argentina*, *Comarum*, *Dasiphora*, *Drymocallis*, *Fragaria*, and *Sibbaldiopsis* (for our area), but including *Duchesnea*, following studies by Dobeš & Paule (2010), Soják (2010), Eriksson et al. (2003), and Eriksson, Persson, & Smedmark (2022). References: Eriksson et al. (2003); Eriksson, Donoghue, & Hibbs (1998); Eriksson, Persson, & Smedmark (2022); Ertter & Reveal (2014a) in FNA9 (2014); Ertter et al. (2014), Elven, Reveal, & Murray in FNA9 (2014); Kalkman in Kubitzki et al (2004); Robertson (1974).

- 3 Flowers solitary, on naked, axillary pedicels; leaves either palmately 3-5-foliolate or pinnately (5-) 7-21 (-31)-foliolate.
 4 Leaves 3-foliolate; fruit strawberry-like, fleshy and red, consisting of an expanded fleshy receptacle bearing superficial achenes; [formerly genus *Duchesnea*] *Potentilla indica*
 4 Leaves primarily 5-foliolate on a plant (some poorly developed leaves may be 3-4-foliolate); fruit a head of achenes, dry; [section *Potentilla*].
 7 Terminal leaflet (of well-developed leaves) toothed for < ½ its length, with 2-7 teeth per leaflet side; terminal leaflet usually < 2× as long as wide; lowest flower produced from the axil of the 1st stem leaf above the plant base, typically with only 1 leaf and pedicel at each subsequent node; plants often flowering on short stolons obscured by basal leaves; stem usually prostrate from the beginning, 0.3-0.8 mm in diameter..... *Potentilla canadensis*
 7 Terminal leaflet (of well-developed leaves) toothed for > ½ its length, with 4-8 (-13) teeth per leaflet side; terminal leaflet usually > 2× as long as wide; lowest flower produced from the axil of the 2nd stem leaf above the plant base, typically with 2 leaves and 1 pedicel at each subsequent node; plants only flowering on elongating stolons; stem usually erect initially, 0.9-1.4 mm in diameter..... *Potentilla simplex*
 3 Flowers in terminal cymes; leaves palmately 3-9-foliolate.
 *Potentilla recta*

Potentilla canadensis Linnaeus. RUNNING FIVE-FINGERS. **Hab:** Woodlands, forests, fields, lawns, disturbed areas. **Dist:** NS west to ON, south to GA, MS, and ne. **AR.** **Phen:** Mar-May; Apr-Jun. **Tax:** Two varieties are sometimes distinguished (see synonymy); their distinctiveness and relative habitats and distributions are obscure. Var. *canadensis* is alleged to have the middle leaflet of the larger leaves 1.5-4 cm long and plants silky-pilose, the pubescence appressed or loosely ascending. Var. *villosissima* Fernald is alleged to have the middle leaflet of the larger leaves 3-6 cm long and plants long-villous, the pubescence loosely spreading to reflexed. **Syn:** = Ar, C, FNA9, K3, K4, Mi, NE, NY, Pa, RAB, Tn, W; = *Potentilla caroliniana* Poiret – S; > *Potentilla canadensis* Linnaeus var. *canadensis* – F, G, K1, Va; > *Potentilla canadensis* var. *villosissima* – F, G, K1; > *Potentilla pumila* Poiret – S.

* ***Potentilla indica*** (Andrews) T. Wolf. SNAKEBERRY, MOCK STRAWBERRY, INDIAN STRAWBERRY. **Hab:** Disturbed areas, lawns, gardens, weedy clearings. **Dist:** Native of Asia. **Phen:** Feb-frost. **Comm:** . **ID Notes:** The strawberry-like fruit is not sweet; it can also be distinguished from *Fragaria* by its whitish interior flesh. The leaves are more coarsely and crenately toothed than *Fragaria*. **Syn:** = K3, K4, Mi, NE, NY, Va; = *Duchesnea indica* (Andrews) Focke – Ar, C, F, G, GrPl, Il, K1, NcTx, Pa, RAB, S, Tn, Tx, W, WH3, WV; > *Duchesnea indica* var. *indica* – FNA9. NatureServe G5TNR (Not Yet Ranked).

* ***Potentilla recta*** Linnaeus. SULPHUR FIVE-FINGERS, SULPHUR CINQUEFOIL. **Hab:** Fields, pastures, roadsides, other disturbed areas. **Dist:** Native of Europe. **Phen:** Apr-Jul; May-Aug. **Syn:** = Ar, C, F, F13, FNA9, G, GrPl, Il, K1, K3, K4, Mi, NcTx, NE, NY, Pa, RAB, Tn, Tx, Va, W, WH3, WV. NatureServe GNR (Not Yet Ranked).

Potentilla simplex Michaux. OLD-FIELD FIVE-FINGERS. **Hab:** Woodlands, fields, disturbed areas. **Dist:** NL (Newfoundland) and MN south to Panhandle FL, AL, and TX. **Phen:** Apr-Jun; Apr-Jul. **Syn:** = Ar, C, F13, FNA9, G, GrPl, K1, K3, K4, Mi, NcTx, NE, NY, Pa, RAB, Tx, Va, W, WH3, WV; > *Potentilla canadensis* Linnaeus – S, misapplied; > *Potentilla simplex* Michaux – S; > *Potentilla simplex* var. *argyrisma* Fernald – F, Il, Tn; > *Potentilla simplex* var. *calvescens* Fernald – F, Il; > *Potentilla simplex* var. *simplex* – F, Il, Tn.

*Prunus* Linnaeus 1753 (PLUM, CHERRY, SLOE, PEACH, APRICOT)

A genus of about 200 species, trees and shrubs, nearly cosmopolitan, but especially in north temperate regions. Liu et al. (2012) make a strong case for combining subgenus *Laurocerasus* into subgenus *Padus*. References: Catling, McKay-Kuja, & Mitrow (1999); Kalkman in Kubitzki et al (2004); Klooster et al (2018); Liu et al (2012); McVaugh (1951); Robertson (1974); Rohrer (2014b) in FNA9 (2014); Shaw & Small (2004); Yazbek & Oh (2013).

- 1 Flowers in elongate racemes of (12-) 20-many flowers; [black-cherries, subgenus *Padus*]..... **Key A**
 1 Flowers solitary, in fascicles, in umbellate or corymbose inflorescences, or in short racemes (*P. mahaleb*) of 1-12 flowers.
 2 Fruit glabrous; ovary glabrous or pubescent initially; flowers and fruit pedicellate, the pedicel > 4 mm long (except...)
 3 Stones globose, not 2-edged; sepals hairy or not; inflorescences subtended by leafy bracts arising from the same bud as the flowers (except *P. pensylvanica*, *P. susquehannae*, and *P. pumila*); [cherries, subgenera *Cerasus* and *Lithocerasus*]..... **Prunus avium**
 3 Stones somewhat to strongly flattened, 2-edged; sepals hairy on the upper surface (except *P. domestica*, *P. insititia*, and *P. cerasifera*); inflorescences without leafy bracts arising from the same bud as the flower; [plums, subgenus *Prunus*]..... **Key C**
 2 Fruit densely velvety or puberulent; ovary densely velvety or puberulent; flowers and fruits sessile or on pedicel 0-2 mm long.
 *Prunus persica*

Key A - BLACK-CHERRIES, subgenus *Padus*

- 1 Leaves evergreen, entire or serrate with few or rather many (but widely spaced) prominent teeth; petioles lacking 2 glands near junction with leaf blade. *Prunus caroliniana*
- 1 Leaves deciduous, regularly and rather finely toothed; petioles with 2 glands near the junction with the leaf blade. *Prunus serotina* var. *serotina*

Key C - PLUMS, subgenus *Prunus*

- 5 Leaf teeth gland-tipped (or with a scar where the gland has fallen); sepals with marginal glands (except *P. angustifolia*); ripe fruit yellow, orange, or red.
- 6 Leaves 3-6 cm long, often folded longitudinally; sepals lacking marginal glands..... *Prunus angustifolia*
- 6 Leaves (4-) 5-13 cm long, not folded (folded in *P. munsoniana* and *P. rivularis*); sepals with marginal glands. *Prunus munsoniana*
- 5 Leaf teeth glandless (or if glandular, then sharp-tipped); sepals without marginal glands; ripe fruit yellow, orange red, purple-red, purple, or black.
- 10 Petals 10-15 mm long; leaves 6-10 cm long, acuminate; fruit 2-2.5 cm long, red or yellow.
- 11 Leaves narrowly to broadly cuneate at the base; petiole usually lacking glands near its junction with the leaf blade; sepals glabrous on the lower side *Prunus americana*
- 11 Leaves broadly rounded at the base; petiole usually with glands near its junction with the leaf blade; sepals pubescent on the lower side..... *Prunus mexicana*
- 10 Petals 4-9 mm long; leaves 2-8 cm long, obtuse, acute, or slightly acuminate; fruit 0.9-1.5 cm long, dark purple, black, yellow, orange, or red. *Prunus umbellata*

Prunus americana Marshall. AMERICAN WILD PLUM. **Hab:** Upland forests, bottomland forests, fencerows, usually in mesic situations. **Dist:** ME to SK, south to n. peninsular FL, AR, OK, NM, and AZ. **Phen:** Mar-Apr; Jul-Aug. **Syn:** = C, FI3, FNA9, GrPl, K1, K3, K4, Mi, NE, NY, Pa, S, Tn, Va, W, WH3, WV, Robertson (1974); = *Prunus americana* var. *americana* – F, G, RAB; > *Prunus americana* var. *americana* – II; > *Prunus americana* Marshall var. *lanata* Sudworth – II. NatureServe G5 (Secure).

Prunus angustifolia Marshall. CHICKASAW PLUM, SANDHILL PLUM. **Hab:** Prairies, sand barrens, river banks, old fields, fencerows, abandoned fields, pastures, roadsides, disturbed areas; often in sandy or rocky soil. **Dist:** NJ, PA, IN, IL, MO, NE, and CO, south to FL, TX, and e. NM. The original native distribution is unclear; much of its more eastern distribution may be the result of early spread by native Americans. **Phen:** (Late Feb-) Mar-Apr; May-early Jul. **Syn:** = Ar, C, FI3, FNA9, G, II, K3, K4, Mi, NcTx, Pa, RAB, S, Tn, Tx, Va, W, WH3, WV, Robertson (1974); > *Prunus angustifolia* var. *angustifolia* – F, GrPl, K1.

* ***Prunus avium*** Linnaeus. SWEET CHERRY, MAZZARD CHERRY, BING CHERRY. **Hab:** Mesic and dry-mesic forests, old fields, other disturbed areas. **Dist:** Native of Eurasia. **Phen:** Mar-May; Jun-Jul. **Syn:** = C, F, FNA9, G, II, K1, K3, K4, Mi, NE, NY, Pa, RAB, S, Tn, Va, W, WV, Robertson (1974); = *Cerasus avium* (Linnaeus) Moench. NatureServe GNR (Not Yet Ranked).

Prunus caroliniana (P. Miller) Aiton. CAROLINA LAUREL CHERRY. **Hab:** Maritime forests and sandy hammocks in the Coastal Plain, escaped from cultivation to fencerows and suburban forests and thickets in more inland areas. **Dist:** Se. NC south to sc. Peninsular FL, west to AR and TX; mainly inland occurrences, especially off the Coastal Plain, are the result of naturalization from horticultural use. **Phen:** Feb-Apr; Sep-Oct. **Syn:** = Ar, FI3, FNA9, K1, K3, K4, NcTx, RAB, Tn, Tx, WH3, Robertson (1974); = *Laurocerasus caroliniana* (P. Miller) M. Roemer – S. NatureServe G5 (Secure).

Prunus mexicana S. Watson. BIG-TREE PLUM, MEXICAN PLUM. **Hab:** Streamsides, upland forests, fencerows. **Dist:** IN, IL, and IA, south to AL, MS, LA, TX, and Mexico; reports from farther east are apparently in error and based on pubescent material of *P. americana*. **Phen:** Mar-Apr; Aug-Oct. **Syn:** = Ar, C, FNA9, G, GrPl, II, K1, K3, K4, NcTx, S, Tn, Tx, Robertson (1974); = *Prunus americana* Marshall var. *lanata* Sudworth – F, II, misapplied. NatureServe G4G5 (Apparently Secure).

Prunus munsoniana W. Wight & Hedrick. MUNSON PLUM, WILD-GOOSE PLUM, MUNSON'S PLUM. **Hab:** Prairies, stream banks, woodland edges, pond margins, roadsides, old fields, pastures, old homesites. **Dist:** OH, IL, MO, and KS, south to MS and TX; disjunct (introduced?) in GA, NC, VA, and NJ. **Phen:** Apr-May; Jul-Aug. **Syn:** = Ar, C, F, G, GrPl, II, K1, K3, NcTx, S, Tx, Va, Robertson (1974); < *Prunus rivularis* Scheele – FNA9, K4.

* ***Prunus persica*** (Linnaeus) Batsch. PEACH. **Hab:** Roadsides, trash-heaps, old fields, fencerows, disturbed thickets; commonly cultivated and commonly escaped or persistent. **Dist:** Native of China. **Phen:** Mar-Apr; Jun-Aug. **Syn:** = Ar, C, F, FI3, FNA9, G, GrPl, II, K1, K3, K4, Mi, NcTx, NE, NY, Pa, RAB, Tn, Tx, Va, W, WH3, WV, Robertson (1974); = *Amygdalus persica* Linnaeus – S; > *Prunus persica* var. *nucipersica* (Suckow) C.K. Schneider. NatureServe G5 (Secure).

Prunus serotina Ehrhart var. *serotina*. EASTERN WILD BLACK CHERRY, BIRD CHERRY. **Hab:** Rich coves, bottomlands, northern hardwood forests, and in a wide variety of lower elevation habitats from dry to mesic, and weedy in fencerows. **Dist:** NS west to ND, south to c. peninsular FL and e. TX. **Phen:** Apr-May; Jul-Aug. **Tax:** Several other varieties occur in sc. and sw. North America, from c. TX westward. In the Piedmont and Coastal Plain, *P. serotina* is generally a small, scrubby tree of fencerows and an understory tree in forests and woodlands, but in the Mountains reaching large sizes and full canopy stature. **Syn:** = K1, K3, K4, NcTx, NE, NY, Va; = *Padus serotina* (Ehrhart) Agardh; = *Prunus serotina* ssp. *serotina* – Y, Robertson (1974); < *Padus virginiana* – S, misapplied; < *Prunus serotina* – Ar, C, F, G, GrPl, II, Mi, Pa, Tn, W; < *Prunus serotina* Ehrhart var. *serotina* – FI3, FNA9, RAB, WH3.

143. ROSACEAE

Prunus umbellata Elliott. HOG PLUM, FLATWOODS PLUM. **Hab:** Upland, usually xeric, sandy or rocky forests and woodlands. **Dist:** S. NC, TN, and AR south to c. peninsular FL and TX. **Phen:** Mar-Apr; Aug-Sep. **Tax:** Fox, Godfrey, & Blomquist (1952) report *Prunus mitis* for s. NC (Cleveland County). It is presently unclear how best to treat variation in this complex. **Syn:** = Ar, FI3, FNA9, K3, K4, Mi, NcTx, RAB, Tx, WH3, Robertson (1974); > *Prunus injuncunda* Small – S; > *Prunus mitis* Beadle – S; > *Prunus umbellata* Elliott – S; > *Prunus umbellata* Elliott var. *injuncunda* (Small) Sargent – K1; > *Prunus umbellata* Elliott var. *umbellata* – K1.

**Pyracantha** M.J. Roemer 1847 (FIRETHORN, PYRACANTHA)

A genus of about 10 species, shrubs, of s. Europe east to e. Asia. References: Feng et al (2021); Kalkman in Kubitzki et al (2004); Lance & Zika (2014) in FNA9 (2014); Nesom (2010); Robertson (1974).

- 1 Leaf margins crenulate to serrulate for at least ½ the length of the blade.
 - 2 Leaf blades oblanceolate or obovate, the apices obtuse, emarginate, or short-apiculate; hypanthium and pedicels glabrate *Pyracantha fortuneana*
 - 2 Leaf blades lanceolate, oblong, oblanceolate, ovate-lanceolate, elliptic, or ovate, the apices usually acute or short-apiculate; hypanthium and pedicels finely hairy *Pyracantha coccinea*
- 1 Leaf margins usually entire, rarely remotely serrulate and only towards the leaf apex. *Pyracantha koidzumii*

* **Pyracantha coccinea** M.J. Roemer. SCARLET FIRETHORN. **Hab:** Planted, persistent around old homesites, and rarely escaped to woodlands. **Dist:** Native of se. Europe and Asia Minor. Reported for AL, LA, OK, SC, TN, and TX (Nesom 2010a). **Syn:** = FNA9, K1, K3, K4, NY, Nesom (2010), Robertson (1974); = *Cotoneaster pyracantha* (Linnaeus) Spach – F, S; = *Crataegus pyracantha* Linnaeus. NatureServe GNR (Not Yet Ranked).

* **Pyracantha fortuneana** (Maximowicz) H.L. Li. CHINESE FIRETHORN. **Hab:** Fencerows, invading disturbed calcareous prairies, spreading from horticultural use. **Dist:** Native of China. Reported for AL, SC, and TX (Nesom 2010a). Serviss et al. (2018) discuss its occurrence in AR. **Phen:** May-Jul; Oct-Dec. **Syn:** = FNA9, K1, K3, WH3, Nesom (2010); > *Pyracantha crenatiserrata* (Hance) Rehder; < *Pyracantha crenulata* (D. Don) Roemer – K4. NatureServe GNR (Not Yet Ranked).

* **Pyracantha koidzumii** (Hayata) Rehder. FORMOSAN FIRETHORN. **Hab:** Planted, rarely escaped to woodlands. **Dist:** Native of Taiwan. **Tax:** Reported for AL, AR, FL, GA, LA, MS, OK, SC, TX (Nesom 2010a). See Serviss et al. (2018) for discussion of its occurrence in AR. **Syn:** = Ar, FNA9, K1, K3, K4, NcTx, WH3, Nesom (2010), Robertson (1974). NatureServe GNR (Not Yet Ranked).

**Pyrus** Linnaeus 1753 (PEAR)

A genus of 10-20 species, trees and shrubs, of Eurasia and n. Africa. References: Catling & Mitrow (2014a) in FNA9 (2014); Kalkman in Kubitzki et al (2004); Robertson (1974); Zheng et al (2014).

- 1 Fruit pyriform (pear-shaped!); flowers 2.5-3 cm across; leaves crenate; styles 5 *Pyrus communis*
- 1 Fruit subglobose; flowers either 2-2.5 cm or 3-3.5 cm across; leaves serrate; styles 2 or 5 (rarely 3 or 4). *Pyrus calleryana*

* **Pyrus calleryana** Decaisne. BRADFORD PEAR, CALLERY PEAR. **Hab:** Commonly planted and persistent, now an aggressive naturalizer in fields, roadsides, and disturbed areas across most of our region. **Dist:** Native of China. **Phen:** Late Feb-Apr; Aug-Oct. **Tax:** Some of the stock naturalizing may be of hybrids and horticultural selections involving additional species, including *P. betulifolia* Bunge and *P. bretschneideri* Rehder. **Comm:** This species has become an aggressive naturalizer in much of our area (Nesom 2000c; Vincent 2005; Culley & Hardiman 2007). **Syn:** = Ar, FNA9, IL, K1, K3, K4, Mi, NcTx, NE, NY, Pa, Va, WH3. NatureServe GNR (Not Yet Ranked).

* **Pyrus communis** Linnaeus. COMMON PEAR. **Hab:** Planted, persistent around old houses and in orchards. **Dist:** Native of Europe. **Phen:** Apr; Aug-Oct. **Syn:** = C, F, FNA9, G, IL, K1, K3, K4, Mi, NcTx, NE, NY, Pa, RAB, S, Tx, WH3, WV, Robertson (1974). NatureServe G5 (Secure).

143. ROSACEAE

E. and se. Asia

Europe

Rosa Linnaeus 1753 (ROSE)

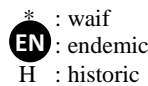

A genus of more than 100 species, shrubs or woody vines; mainly of north temperate regions. Many cultivars cannot be readily identified to species. References: Joly & Bruneau (2007); Kalkman in Kubitzki et al (2004); Lewis (2008); Lewis (2016); Lewis, Ertter, & Bruneau (2014) in FNA9 (2014); Robertson (1974).

Unkeyed taxa: *Rosa chinensis*

- 1 Stipules adnate to the petiole only basally, for $< \frac{1}{2}$ their length; vigorous climbing vines, 3-5 (-10) m tall; petals white.
 - 2 Stems brown-tomentose, stipitate-glandular; terminal leaflet petiolules 3-5 mm; pedicels tomentose, 3-6 mm; hypanthia subglobose, white tomentose; [section *Bracteatae*]..... ***Rosa bracteata***
 - 2 Stems glabrous, eglandular; terminal leaflet petiolules 9-13 mm; pedicels glabrous, 12-30 mm; hypanthia cupulate, densely setose [section *Laevigatae*] ***Rosa laevigata***
- 1 Stipules adnate to the petiole $> \frac{1}{2}$ their length; vigorous climbing vines or shrubs, 0.3-4 m tall; petals white, pink, rose-purple, or yellow.
 - 3 Styles connate into a column which protrudes from the orifice by 3-6 mm (sometimes separating in fruit); stipule margins and auricles deeply lacinate (or entire to ciliate in *R. setigera*); vines, climbing and scrambling to 4 m tall; [section *Systylae*].
 - 4 Leaflets 3-5; stipule margins and auricles mostly entire or ciliate; inflorescences laxly corymbose; flowers 3-5 cm in diameter, petals single, rose-purple to pink; carpels 20-25, styles glabrous, exserted 5-6 mm beyond the orifice; [native] ***Rosa setigera***
 - 4 Leaflets (5-) 7-9; stipule margins and auricles deeply lacinate; inflorescences paniculate; flowers 1.5-2.5 cm in diameter, petals single or double, white to shades of pink; carpels 6-20; styles glabrous or pubescent, exserted 3-5 mm beyond the orifice; [alien].
 - 5 Pedicels 18-25 mm, glabrous, eglandular; flowers 2-2.5 cm in diameter, hypanthium elongate-ovoid, 4-6.5 mm x 2-3 mm, eglandular; carpels 12-20, styles pubescent, exserted 3.5-5 mm beyond orifices (1.5-2 mm in diameter) of flat discs (3-4 mm in diameter)..... ***Rosa luciae***
 - 5 Pedicels 5-12 mm, tomentose, stipitate glandular at least near the base; flowers 1.5-2.5 cm in diameter; hypanthium 2 mm x 1-1.5 mm, eglandular or stipitate-glandular; carpels 6-11, styles glabrous, exserted 3-4 mm beyond the orifice (0.5-1 mm in diameter) of conical discs (2-3 mm in diameter)..... ***Rosa multiflora***
 - 3 Styles distinct, usually only the stigmas protruding from the orifice, by 0-4 mm; stipule margins and auricles entire to serrate, not lacinate; shrubs, erect or arching, to 0.3-5 m tall.
 - 6 Sepals entire, tapering to apex, persistent on fruit and erect or nearly erect; flowers generally solitary, or with 1-3 laterals. ***Rosa spinosissima***
 - 6 Sepals either lobed or with broadened apices, or if entire then spreading, reflexed, or deciduous from fruit; flowers solitary or corymbose.
 - 8 Inflorescence of a solitary flower (rarely with a few laterals), the paired bracts on the pedicel caducous; [section *Gallicae*]..... ***Rosa gallica***
 - 8 Inflorescence either corymbose, or of a solitary flower and its pedicel subtended by persistent bracts.
 - 10 Sepals disparate in size and shape, the outer pinnatifid with leafy segments; orifice of the hypanthium ca. 1 mm in diameter, the styles slightly exserted; [aliens]; [section *Caninae*]. ***Rosa rubiginosa* var. *rubiginosa***
 - 10 Sepals alike, all entire or with a few scarcely leafy teeth near the base; orifice of the hypanthium ca. 2-4 mm in diameter, the opening blocked by the stigmas; [natives and aliens]; [section *Cinnamomeae*].
 - 15 Hypanthium glabrous. ***Rosa foliolosa***
 - 15 Hypanthium with glands.
 - 18 Bristles present on new branches.
 - 20 Fertile branches armed with straight, thin or rarely stout, circular or somewhat flattened infrastipular prickles, lacking internodal prickles or aciculi (or if these present, few and scattered); stems mostly thin, pendent or upright; hypanthia (later hips) and pedicels stipitate-glandular (rarely eglandular) ***Rosa carolina* ssp. *carolina***
 - 20 Fertile branches armed with straight, thin or often stout, circular or flattened infrastipular prickles, with internodal prickles of small prickles, aciculi, or stipitate glands, usually densely covering branches and adjacent stems; stems mostly thick, or upright; hypanthia (later hips) and pedicels stipitate-glandular or eglandular ***Rosa carolina* ssp. *subserulata***
 - 18 Bristles absent on new branches.
 - 21 Leaflets 3.5-5x as long as wide; leaves with (5-) 7-9 (-11) leaflets; petals white; [c. MS westward] ***Rosa palustris***
 - 21 Leaflets 1-3x as long as wide; leaves with (3-) 5-7 (-9) leaflets; petals pink; [collectively widespread].
 - 22 Hypanthium typically with > 86 glands; terminal leaflet oblong, generally with 20-30 small teeth per side..... ***Rosa carolina* ssp. *carolina***
 - 22 Hypanthium typically with < 86 glands; terminal leaflet ovate, elliptic, or obovate, with 10-18 (-23) small teeth per side.
 - 24 Fertile branches armed with straight, thin or rarely stout, circular or somewhat flattened infrastipular prickles, lacking internodal prickles or aciculi (or if these present, few and scattered); stems mostly thin, pendent or upright; hypanthia (later hips) and pedicels stipitate-glandular (rarely eglandular) ***Rosa carolina* ssp. *carolina***
 - 24 Fertile branches armed with straight, thin or often stout, circular or flattened infrastipular prickles, with internodal prickles of small prickles, aciculi, or stipitate glands, usually densely covering branches and adjacent stems; stems mostly thick, upright; hypanthia (later hips) and pedicels stipitate-glandular or eglandular..... ***Rosa carolina* ssp. *subserulata***

143. ROSACEAE

* *Rosa bracteata* J.C. Wendland. MCCARTNEY ROSE, CHICKASAW ROSE. **Hab:** Disturbed areas, suburban borders, persistent after cultivation. **Dist:** Native of China. **Phen:** May-Nov; Jul-Nov. **Syn:** = Ar, C, F, FNA9, G, K1, K3, K4, NcTx, RAB, S, Tx, Va, WH3, Robertson (1974). [NatureServe G5](#) (Secure).

Rosa carolina Linnaeus ssp. *carolina*. CAROLINA ROSE. **Hab:** Upland forests, woodlands, pastures, roadsides. **Dist:** NB and ON south to FL and TX. **Phen:** May-Jun; Aug-Oct. **Syn:** = FNA9, K3, K4, Mi, NE, NY, Tn, Va; < *Rosa carolina* – Ar, C, G, GrPl, NcTx, Pa, RAB, Tx, W, WH3, Joly & Bruneau (2007), Robertson (1974); > *Rosa carolina* – S; < *Rosa carolina* var. *carolina* – K1; > *Rosa carolina* var. *carolina* – F, Il; > *Rosa carolina* var. *grandiflora* (Baker) Rehder – F; > *Rosa carolina* var. *villosa* (Best) Rehder – F, Il; > *Rosa lyoni* Pursh – S; > *Rosa serrulata* Rafinesque – S.

Rosa carolina Linnaeus ssp. *subserulata* (Rydberg) W.H. Lewis. CAROLINA ROSE. **Hab:** Glades and barrens. **Dist:** VT, ON, MI, and MO, south to SC, AL, and TX. **Phen:** May-Jul; Aug-Oct. **Syn:** = FNA9, K3, K4, Mi, NE, NY, Tn, Va; ? *Rosa carolina* – S; < *Rosa carolina* – Ar, C, G, GrPl, NcTx, Pa, RAB, Tx, W, Joly & Bruneau (2007), Robertson (1974); < *Rosa carolina* var. *carolina* – K1; > *Rosa carolina* var. *carolina* – F; ? *Rosa carolina* var. *grandiflora* (Baker) Rehder – F; ? *Rosa carolina* var. *villosa* (Best) Rehder – F; ? *Rosa lyoni* Pursh – S; ? *Rosa serrulata* Rafinesque – S.

* *Rosa chinensis* Thunberg. CHINESE ROSE. **Hab:** Suburban woodlands. **Dist:** Native of China. Reported for AL, MS, and VA (Kartesz 2010). **Syn:** = Ar, K1, K3, K4. [NatureServe GNR](#) (Not Yet Ranked).

Rosa foliolosa Nuttall ex Torrey & A. Gray. WHITE PRAIRIE ROSE. **Hab:** Prairies, sandy oak woodlands, roadsides. **Dist:** Sw. MO, se. KS, and w. OK south to w. AR, and e. and c. TX. Report from MS is a misidentification (J. Kees, pers.comm. 2021). **Phen:** Apr-Jul. **Syn:** = Ar, FNA9, GrPl, K1, K3, K4, NcTx; > *Rosa foliolosa* Nuttall ex Torrey & A. Gray – Tx; > *Rosa ignota* Shinnars – Tx. [NatureServe G5](#) (Secure).

* *Rosa gallica* Linnaeus. FRENCH ROSE. **Hab:** Disturbed areas. **Dist:** Native of Europe. **Phen:** May-Jul; Sep-Oct. **Comm:** There is a question as to whether the name *R. gallica* can be used; if not, it would be replaced with *R. austriaca*. Represented by many cultivated forms, some involving complex hybridization with other species. *R. ×damascena* P. Miller is apparently a hybrid of *R. gallica* and *R. moschata* J. Hermann. **Syn:** = C, F, FNA9, G, Il, K1, K3, K4, Mi, NE, NY, Pa, RAB, Robertson (1974); > *Rosa gallica* Linnaeus. [NatureServe GNR](#) (Not Yet Ranked).

* *Rosa laevigata* Michaux. CHEROKEE ROSE. **Hab:** Roadsides, moist forests. **Dist:** Native of China. Apparently introduced into the se. United States very early, where encountered by André Michaux in the 1790s and named by him as an apparent native species. **Phen:** Late Mar-Jun; Sep-Oct. **Syn:** = Ar, FNA9, K1, K3, K4, NcTx, RAB, S, Tx, WH3, Robertson (1974). [NatureServe GNR](#) (Not Yet Ranked).

* *Rosa luciae* Franchet & Rochebrune ex Crépin. MEMORIAL ROSE, DOROTHY PERKINS ROSE, LUCIE ROSE. **Hab:** Roadbanks, railroad embankments, disturbed areas. **Dist:** Native of e. Asia. See Duncan (1985) for documentation for GA. **Phen:** May-Jul; Sep-Oct. **Syn:** = K4, NY; = *Rosa luciae* Franchet & Rochebrune ex Crépin – FNA9, NE, Va, orthographic variant; > *Rosa wichuraiana* Crépin – Ar, C, F, G, K1, K2, Pa, W, WH3, Robertson (1974); > *Rosa wichuraiana* – Il, RAB, orthographic variant. [NatureServe GNR](#) (Not Yet Ranked).

* *Rosa multiflora* Thunberg ex Murray. MULTIFLORA ROSE. **Hab:** Pastures, thickets, bottomlands, upland forests, bogs. **Dist:** Native of Asia, aggressively invasive. **Phen:** May-Jun; Sep-Oct. **Syn:** = Ar, C, F, FNA9, G, GrPl, Il, K1, K3, K4, Mi, NcTx, NE, NY, Pa, RAB, S, Tn, Tx, Va, W, WH3, WV, Robertson (1974). [NatureServe GNR](#) (Not Yet Ranked).

Rosa palustris Marshall. SWAMP ROSE. **Hab:** Swamp forests, bogs, fens, seeps, streamsides, tidal swamps, beaver ponds. **Dist:** NB and ON south to c. peninsular FL, MS, and ne. AR. **Phen:** May-Jul (-Aug); Sep-Oct. **Syn:** = Ar, C, F, FNA9, G, GW2, Il, K4, Mi, NE, NY, Pa, RAB, Tn, Va, W, WH3, WV, Joly & Bruneau (2007), Robertson (1974); > *Rosa floridana* Rydberg – S; > *Rosa lancifolia* Small – S; > *Rosa obtusiuscula* Rydberg – K1, K3, S; > *Rosa palustris* Marshall – K1, K3, S.

* *Rosa rubiginosa* Linnaeus var. *rubiginosa*. EGLANTINE ROSE, SWEETBRIAR ROSE. **Hab:** Pastures, disturbed areas. **Dist:** Native of Europe. **Phen:** May-Jun; Sep-Oct. **Tax:** The name *R. eglanteria* was formally rejected in favor of *R. rubiginosa* (Brummitt 2005). **Syn:** = FNA9, K4; = *Rosa eglanteria* Linnaeus – Ar, C, F, G, Il, K1, NcTx, Pa, RAB, Tx, W, WV, Robertson (1974), rejected name; = *Rosa rubiginosa* – NE, NY; < *Rosa rubiginosa* – K3, Mi, S, Tn, Va.

Rosa setigera Michaux. OZARK ROSE, CLIMBING PRAIRIE ROSE. **Hab:** Dry-mesic to mesic upland forests and woodlands, prairies, bluffs, bottomland and riparian forests, stream banks, pastures, old fields, roadsides; nativity uncertain in portions of our area. **Dist:** ME west to WI and NE, south to FL and TX. **Phen:** May-Jun; Sep-Oct. **Syn:** = Ar, C, FNA9, K3, K4, Mi, NE, NY, Pa, RAB, S, Tn, Va, W, WH3; > *Rosa setigera* var. *setigera* – F, G, GrPl, Il, K1, Tx, WV, Robertson (1974); > *Rosa setigera* var. *tomentosa* Torrey & A. Gray – F, G, GrPl, Il, K1, NcTx, Tx, WV, Robertson (1974).

* *Rosa spinosissima* Linnaeus. SCOTCH ROSE. **Hab:** Cultivated and rarely escaped. **Dist:** Native of Eurasia. **Phen:** May-Jun. **Syn:** = F, FNA9, G, Il, K1, K3, K4, Mi, NE, NY; > *Rosa pimpinellifolia* Linnaeus – C. [NatureServe G5](#) (Secure).

143. ROSACEAE

**Rubus** Linnaeus 1753 (BLACKBERRY, RASPBERRY, DEWBERRY, WINEBERRY, BRAMBLE)

A genus of about 250 species (if treated conservatively) or 2000-3000 microspecies, shrubs (and a few herbs), almost cosmopolitan in temperate areas. While the recent approach of grouping taxa into very broad "species" is not very satisfying, it is impossible at this time to create a coherent finer-scale taxonomy for *Rubus* across the region, and this treatment must be considered (like all before it) highly provisional. There also remain issues of generic circumscription, with morphologically divergent clades (sometimes of single species) basal to the rest of the genus (Carter et al. 2019), and here treated as separate genera (e.g. *Dalibarda* and *Rubacer* in our region). References: Alice & Campbell (1999); Alice et al (2014) in FNA9 (2014); Carter et al (2019); Kalkman in Kubitzki et al (2004); Ladd & Thomas (2015); Robertson (1974); Widrechner (1998).

Identification Notes: With *Dalibarda* and *Rubacer* removed from *Rubus*, all of our species except *R. pubescens* have biennial stems. The first year the stems remain sterile and are termed primocanes. The second year, these stems produce lateral branches with flowers and are termed floricanes. Primocane and florican leaves differ substantially in many species (less so in others).

- 4 Fruit separating from the receptacle, the receptacle remaining on the pedicel; stems either strongly white-glaucous (*R. occidentalis*), or densely beset with slender-based prickles and bristles (*R. idaeus*), or densely hairy with 3-5 mm long glandular hairs (*R. phoenicolasius*), or if not as above then the leaves pinnately 5-9-foliolate (*R. illecebrosus*) or with a rhombic terminal leaflet about as wide as long and densely white-tomentose below (*R. parvifolius*); [raspberries]. **Rubus occidentalis**
- 4 Fruit retaining the receptacle; stems or leaves not as described above, except if beset with slender-based prickles and bristles then also < 1 m tall; [blackberries and dewberries].
 - 5 Canes very coarse, scrambling, often 2-5 m long, heavily armed; inflorescence cymose-paniculate; branches and pedicels of the floricanes armed with strong, flattened prickles (recurved cat's-claw, or nearly straight in *R. bifrons*); [alien, generally in disturbed habitats]; [Eurasian blackberries]. **Key B**
 - 5 Canes delicate to coarse, arching or trailing, 0-4 m long, unarmed to strongly armed; inflorescence racemiform; branches and pedicels of the floricanes generally unarmed; [native, though often in disturbed habitats].
 - 6 Primocanes prostrate, creeping, or low-arching, rooting at the tip or also at the nodes; [dewberries]. **Key C**
 - 6 Primocanes erect, ascending, or high-arching, not rooting; [native blackberries]. **Key D**

Key B - Eurasian blackberries

- 2 Prickles nearly straight; stems glabrescent; petals pale pink to deep pink. **Rubus bifrons**
- 2 Prickles recurved; stems canescent above; petals white to pale pink. **Rubus pascuus**

Key C - Dewberries

- 2 Stems primarily armed with narrow-based prickles or even narrower bristles, with or without stout-based prickles as well. **Rubus trivialis**
- 2 Stems armed with stout-based, usually recurved prickles (bristles lacking, though weak, stalked glands may be present); leaf undersurfaces nearly glabrous or softly pubescent; leaves deciduous.
 - 4 Leaf undersurface thinly hairy, not soft to the touch (when fully developed).
 - 5 Primocane leaves with 3 leaflets; inflorescences with 1 (-3) flowers, 5-8 cm long. **Rubus enslenii**
 - 5 Primocane leaves with 3-5 leaflets; inflorescences with 1-12 flowers, 5-20 cm long. **Rubus flagellaris**
 - 4 Leaf undersurface densely hairy, soft to the touch.
 - 8 Inflorescence axes with stalked glands (use 10× magnification). **Rubus leviculius**
 - 8 Inflorescence axes lacking stalked glands. **Rubus aboriginum**

Key D - American blackberries

- 3 Leaflets oblanceolate to obovate, definitely wider beyond the middle, generally obtuse or rounded at the tip; leaves densely white- or gray-tomentose beneath; [primarily of the Coastal Plain]. **Rubus cuneifolius**
- 3 Leaflets lanceolate to ovate, widest below or near the middle, generally acute or acuminate at the tip; leaves glabrous to pubescent beneath, but the pubescence not notably tight and white or gray; [collectively widespread].
 - 8 Primocane leaves with central leaflets ovate-elliptic to nearly orbicular; floricanes generally arching to low-arching, 5-13 (+) dm tall; inflorescences leafy-racemose. **Rubus pensilvanicus**
 - 8 Primocane leaves with central leaflets narrowly elliptic, elliptic, or obovate; floricanes generally erect to arching, 7-40 dm tall; inflorescences various. **Rubus argutus**

143. ROSACEAE

Rubus trivialis Michaux. SOUTHERN DEWBERRY, COASTAL PLAIN DEWBERRY. **Hab:** Roadsides, old fields, thickets, disturbed areas. **Dist:** E. MD south to s. FL, west to TX, north in the interior to MO. **Phen:** Mar-Apr; late Apr-May. **Syn:** = C, F, FNA9, G, GrPl, GW2, IL, K1, K3, K4, NcTx, RAB, Tn, Va, W, WH3; > *Rubus lucidus* Rydberg – S; > *Rubus nessianus* Bailey – Tx; > *Rubus trivialis* Michaux – S, Tx.

*Spiraea* Linnaeus 1753 (SPIRAEA, MEADOWSWEET, HARDHACK)

A genus of about 80-120 species, shrubs, of north temperate areas (especially Asia). Many species and hybrids are cultivated, and additional taxa to those treated below may be encountered as persistent or escaped. References: Kalkman in Kubitzki et al (2004); Lis (2014) in FNA9 (2014); Mink, Singhurst, & Holmes (2011b); Rehder (1940); Robertson (1974); Uttal (1974).

Unkeyed waifs: *Spiraea hypericifolia*, *Spiraea nipponica*

- 1 Inflorescence a simple umbel; flowers white; [section *Chamaedryon*]; [alien].
 - 2 Flowers 10-15 mm in diameter.
 - 3 Leaves 2-7 cm long, coarsely serrate and sometimes also slightly 3-lobed; inflorescences with > 6 flowers..... *Spiraea cantoniensis*
 - 3 Leaves 1-4 (-5) cm long, finely serrulate, not lobed; inflorescences with 3-6 flowers *Spiraea prunifolia*
 - 2 Flowers 6-10 mm in diameter. *Spiraea thunbergii*
- 1 Inflorescence a compound corymb or panicle; flowers white, pink, or red; [native or alien].
 - 9 Lower leaf surface densely tomentose with white, tawny, or rusty tomentum which obscures the surface. *Spiraea tomentosa*
 - 9 Lower leaf surface glabrous or with a few scattered hairs that do not obscure the surface. *Spiraea salicifolia*

* *Spiraea cantoniensis* Loureiro. **Hab:** Roadsides. **Dist:** Native of Asia. *S. cantoniensis* has been collected twice on Fort Bragg, NC, by Phil Crutchfield (specimen at Fort Bragg) (Sorrie, pers. comm.). Also reported for other scattered states in e. North America (AL, AR, LA, NY (Kartesz 1999, FNA). **Phen:** May-Jun; Jun-Sep. **Syn:** = Ar, FNA9, K1, K3, K4, NY. NatureServe GNR (Not Yet Ranked).

* *Spiraea hypericifolia* Linnaeus. EUROPEAN MEADOWSWEET. **Hab:** Longleaf sandhills and mesic pine-oak forests. **Dist:** Native of Europe. Reported for ne. TX (Mink, Singhurst, & Holmes (2011b)). **Syn:** = FNA9, Mink, Singhurst, & Holmes (2011b); > *Spiraea hypericifolia* ssp. *hypericifolia* – K4.

* *Spiraea nipponica* Maximowicz. SNOWMOUND MEADOWSWEET. **Dist:** Naïve of e. Asia. Reported for e. MS (Lauderdale County) by Kartesz (2020). **Syn:** = K4.

* *Spiraea prunifolia* Siebold & Zuccarini. BRIDAL-WREATH SPIRAEA. **Hab:** Cultivated, escaped or persisting. **Dist:** Native of China, Korea, and Taiwan. **Phen:** Apr-Aug; May-Nov. **Syn:** = Ar, C, FNA9, G, GrPl, IL, K1, K3, K4, NE, NY, Pa, Tn, Va; > *Spiraea prunifolia* var. *plena* C.K. Schneider; > *Spiraea prunifolia* var. *prunifolia*. NatureServe G5 (Secure).

* *Spiraea salicifolia* Linnaeus. WILLOWLEAF SPIRAEA. **Hab:** Cultivated, escaped or persisting. **Dist:** Native of Eurasia. **Phen:** Jun-Aug; Jul-Sep. **Syn:** = C, FNA9, GrPl, K1, K3, K4, Mi. NatureServe GNR (Not Yet Ranked).

* *Spiraea thunbergii* Siebold ex Blume. THUNBERG'S MEADOWSWEET. **Hab:** Roadsides, old homesites. **Dist:** Native of Asia. *S. thunbergii* has been collected from roadside at Fort Bragg, NC, by Phil Crutchfield (specimen at Fort Bragg) (Sorrie, pers. comm.). Also GA, MS, and MD (FNA9) and additional states (Kartesz 2020). **Phen:** Mar-May; Apr-Oct. **Syn:** = Ar, C, FNA9, GrPl, IL, K1, K3, K4, NE, NY. NatureServe GNR (Not Yet Ranked).

Spiraea tomentosa Linnaeus. HARDHACK, STEEPLEBUSH, ROSY MEADOWSWEET. **Hab:** Bogs, wet meadows. **Dist:** NS west to MN, south to SC, ne. GA, c. TN, ne. AL, and AR. **Phen:** Jul-Sep; Sep-Oct. **Syn:** = Ar, GW2, IL, K1, K3, K4, Mi, NE, NY, Pa, RAB, S, Tn, Va, W, WV; ? *Spiraea subcanescens* Rydberg; > *Spiraea tomentosa* var. *rosea* (Rafinesque) Fernald – C, F, FNA9, G, Robertson (1974); > *Spiraea tomentosa* var. *tomentosa* – C, F, FNA9, G, Robertson (1974).

Waldsteinia Willdenow 1799 (BARREN-STRAWBERRY)

A genus of about 7 species, perennial herbs, of disjunct areas in the Northern Hemisphere. Sometimes included in *Geum*. Protopopova, Pavlichenko, and Stepanov (2021) supported its treatment as a genus separate from *Geum*. References: Eriksson et al (2003); Kalkman in Kubitzki et al (2004); Phipps (2014b) in FNA9 (2014); Potter et al (2007); Protopopova, Pavlichenko, & Stepanov (2021); Smedmark & Eriksson (2002); Smedmark (2006); Weakley & Gandhi (2008).

Waldsteinia doniana Trattinnick. SOUTHERN BARREN STRAWBERRY. **Hab:** Forests, streambanks. **Dist:** VA and KY south to GA and AL. **Phen:** (Jan-) Mar-May; May-Jun. **Syn:** = *S*; = *Geum donianum* (Trattinnick) Weakley & Gandhi – Va, Weakley & Gandhi (2008); = *Waldsteinia fragarioides* ssp. *doniana* (Trattinnick) Teppner – K1, Tn, Robertson (1974); = *Waldsteinia fragarioides* (Michaux) Trattinnick var. *parviflora* (Small) Fernald – C, F; = *Waldsteinia parviflora* Small – FNA9, G; < *Geum fragarioides* (Michaux) Smedmark = K3, V – K3, K4, Smedmark (2006); < *Waldsteinia fragarioides* (Michaux) Trattinnick – RAB, W, Bolle (1933).

146. ELAEAGNACEAE A.L. de Jussieu 1789 (OLEASTER FAMILY) [in ROSALES]

A family of 3 genera and 30-50 species, shrubs, small trees, and lianas, of temperate Eurasia and North America, and tropical Asia and Australia. References: Bartish & Swenson in Kubitzki et al (2004).

Elaeagnus Linnaeus 1753 (SILVERBERRY, OLEASTER, RUSSIAN-OLIVE)

A genus of 20-45 species, shrubs and small trees, of Asia (mostly) and North America. References: Bartish & Swenson in Kubitzki et al (2004).

- 1 Flowering in the fall (Oct-Nov) and fruiting in the spring (Mar-Apr); leaves evergreen; branches usually thorny..... *Elaeagnus pungens*
- 1 Flowering in the spring and fruiting in late summer or fall; leaves deciduous (somewhat coriaceous in texture and semi-persistent); branches thorny or not.
 - 3 Leaves remaining silvery on the upper surface; fruit silver at maturity..... *Elaeagnus commutata*
 - 3 Leaves becoming glabrescent and green above at maturity; fruit red at maturity..... *Elaeagnus umbellata*

* ***Elaeagnus commutata*** Bernhardt ex Rydberg. AMERICAN SILVERBERRY. **Hab:** Disturbed areas, especially in suburban or urban woodlands.

Dist: Native of w. North America. **Phen:** May; Sep. **Syn:** = C, F, G, GrPl, K3, K4, Pa. NatureServe G5 (Secure).

* ***Elaeagnus pungens*** Thunberg. THORNY-OLIVE, AUTUMN SILVERBERRY. **Hab:** Forests and woodlands in suburban areas, spread by birds. **Dist:** Native of Japan. **Phen:** Oct-Nov; Mar-Apr. **Syn:** = Ar, K1, K3, K4, NcTx, NE, RAB, Tn, Va, WH3. NatureServe GNR (Not Yet Ranked).

* ***Elaeagnus umbellata*** Thunberg. ORIENTAL SILVERLEAF, AUTUMN-OLIVE, SPRING SILVERBERRY. **Hab:** Forests and woodlands, spread by birds. **Dist:** Native of Japan and China. **Phen:** Apr-May; Aug-Sep. **Comm:** This species has become a noxious weed shrub, still unfortunately sometimes promoted for "wildlife plantings". The rapidity of its increase may be judged by its treatment in Strausbaugh & Core (1978) as not definitely naturalized in WV; Harmon, Ford-Werntz, & Grafton (2006) map it for every county of WV. **Syn:** = Ar, C, F, G, Il, K3, K4, Mi, NY, Pa, RAB, Va, W, WH3, WV; = *Elaeagnus umbellatus* – S, orthographic variant; > *Elaeagnus umbellata* var. *parviflora* – Tn, orthographic error; > *Elaeagnus umbellata* Thunberg var. *parvifolia* (Royle) C.K. Schneider – K1, NE. NatureServe GNRTNR (Not Yet Ranked).

147. RHAMNACEAE A.L. de Jussieu 1789 (BUCKTHORN FAMILY) [in ROSALES]

A family of about 50-52 genera and 900-950 species, mostly trees, shrubs, and lianas, cosmopolitan in distribution but concentrated in tropical and subtropical areas. The tribal classification used in the key is that of Richardson et al. (2000b). References: Brizicky (1964a); Medan & Schirarend in Kubitzki et al (2004); Nesom (2016b) in FNA12 (2016); Richardson et al (2000a); Richardson et al (2000b).

- 1 Leaves opposite (to subopposite).
 - 3 Leaves (2-) 4-10 (-13) cm long; inflorescence a fascicle or flower solitary; sepals 4; petals 4; flowers functionally unisexual (the stamens rudimentary in the pistillate flowers); [aliens, mainly inland and/or northwards in our area]..... *Rhamnus*
 - 3 Leaves 1.5-4 (-6) cm long; inflorescences a panicle-like thyse; sepals 5; petals 5; flowers bisexual; [native, of the Coastal Plain]..... *Sageretia*
- 1 Leaves alternate.
 - 6 Plant a woody vine. *Berchemia scandens*
 - 6 Plant a shrub (sometimes clambering) or small tree.
 - 8 Leaves with 3 (-5) prominent veins from near the base (and 1-3 additional pairs of veins along the midvein); leaf margins toothed (serrate or crenate).
 - 10 Plants armed with stipular spines; fruit either fleshy (a drupe with 1 stone), or dry (a 1-seeded samara).

Key to Map
Symbology:

* : waif
EN : endemic
H : historic

N : no X : extirpated
P : planted
? : questionable

- *Ziziphus*
- 10 Plants not spiny; fruit dry, a 3-locular capsular with many seeds; [tribal placement uncertain].
- *Ceanothus*
- 8 Leaves either with prominently pinnate venation (the lowermost lateral veins no more prominent than others) or with no prominent lateral veins; leaf margins either entire or toothed (serrate or crenate).
- 17 Winter buds naked, pubescent; flowers perfect, sepals, stamens, and petals 5; style undivided; leaves with 8-10 lateral veins on either side of the midvein... .. *Frangula*
- 17 Winter buds with bud scales; flowers functionally unisexual, sepals and stamens 4 or 5 (the stamens rudimentary in the pistillate flowers), petals 0 or 4 (never 5); style divided for 1/3 to 2/3 its length into 2, 4 or 5 segments; leaves with (2-) 3-9 lateral veins on either side of the midvein..... *Endotropis*

***Berchemia* Necker 1825 (SUPPLEJACK)**

A genus of about 30 species, lianas, shrubs, and trees, of tropical to warm temperate Asia and se. North America. *Berchemia scandens* is the only New World species, and sister (as "*Berchemia* clade I") to the rest of the (Asian) genus (clades II, III, and IV). Huang et al. (2021) removed the two African species sometimes included in *Berchemia* to *Phyllogeiton*. References: Brizicky (1964a); Huang et al (2021); Medan & Schirarend in Kubitzki et al (2004); Nesom (2016c) in FNA12 (2016).

Identification Notes: The young stems are shining and red, orange, or green; older stems can reach at least 18 cm in diameter, with bark medium gray and smooth (though often marred by sap wells drilled by Yellow-bellied Sapsuckers). The smooth bark and neatly pinnately-veined leaves are distinctive.

***Berchemia scandens* (Hill) K. Koch. SUPPLEJACK, AMERICAN RATTAN, ALABAMA SUPPLEJACK, CAROLINA SUPPLEJACK. **Hab:** Swamp forests, bottomlands, streambanks, also upland in mesic to even xeric forests, woodlands, glades, and prairies over calcareous rock or sediment. **Dist:** Se. VA south to s. FL, west to TX, north in the interior to nc. TN, w. TN, s. IL, and s. MO; Mexico (Chiapas) and Guatemala. **Phen:** Apr-May; Aug-Oct. **Comm:** *Berchemia scandens* climbs high into the crowns of swamp trees. **ID Notes:** The smooth gray bark on larger vines (often marred by sapsucker wells) is distinctive even when the leaves are high overhead; vines can be at least 18 cm in diameter. Younger twigs are bright green (or reddish tinted if sungrown), and the neatly pinnate venation is also distinctive. **Syn:** = C, F, FNA12, G, GW2, II, K1, K3, K4, NcTx, RAB, S, Tn, Tx, Va, WH3, Brizicky (1964a). NatureServe G5 (Secure).**

***Ceanothus* Linnaeus 1753 (REDROOT, NEW JERSEY TEA, CEANOTHUS)**

A genus of about 58 species, shrubs, mostly in California. References: Brizicky (1964a); Coile (1988a); Fross & Wilken (2006); Medan & Schirarend in Kubitzki et al (2004); Schmidt & Wilken (2016) in FNA12 (2016).

- 3 Leaves 2-4 (-6) cm long, mostly 1-2 cm wide; [primarily of sandy habitats of the Coastal Plain and rarely Piedmont] *Ceanothus americanus* var. *intermedius*
- 3 Leaves (3-) 4-10 cm long, mostly 2.5-6 cm wide; [of various habitats of the Piedmont, Mountains, and rarely Coastal Plain]
- 4 Lower surface of leaves persistently and densely short-hairy; leaves obtuse to subacute..... *Ceanothus americanus* var. *pitcheri*
- 4 Lower surface of leaves glabrous or with scattered hairs mainly on the main veins; leaves acute to acuminate..... *Ceanothus americanus* var. *americanus*

***Ceanothus americanus* Linnaeus var. *americanus*. COMMON NEW JERSEY TEA, NORTHEASTERN CEANOTHUS. **Hab:** Woodland borders, dry woodlands, glady openings, dry ridge forests and woodlands (pine or oak) in the Mountains. **Dist:** ME west to WI, south to FL Panhandle and AL. **Phen:** May-Jun; Jun-Jul. **Syn:** = C, F, G, II, Brizicky (1964a), Coile (1988a), Fross & Wilken (2006); = *Ceanothus americanus* – S; < *Ceanothus americanus* – FNA12, K1, K3, K4, Mi, NE, NY, Pa, RAB, Va, W, WH3.**

***Ceanothus americanus* Linnaeus var. *intermedius* (Pursh) Torrey & A. Gray. SOUTHEASTERN NEW JERSEY TEA, SOUTHEASTERN CEANOTHUS. **Hab:** Longleaf pine sandhills, dry sandy woodlands and forests, rocky openings around granitic or quartzitic rocks in the Piedmont. **Dist:** NJ (or possibly MA) south to c. peninsular FL, west to LA, mostly on the Coastal Plain, but disjunct inland to sandy soils around outcrops of siliceous rocks. **Phen:** May-Jun; Jun-Jul. **Tax:** The recognition of infraspecific taxa in the variable *C. americanus* is uncertain; var. *intermedius* may either represent ecological forms, or the variation may be too clinal to make taxonomic recognition rewarding. However, material sorts relatively easily, with some intermediates from the Piedmont; varietal status seems provisionally appropriate. **Syn:** = C, F, G, Brizicky (1964a), Coile (1988a), Fross & Wilken (2006); = *Ceanothus intermedius* Pursh – S; < *Ceanothus americanus* – FNA12, K1, K3, K4, RAB, Tn, Va, W, WH3.**

***Ceanothus americanus* Linnaeus var. *pitcheri* Torrey & A. Gray. HAIRY NEW JERSEY TEA, MIDWESTERN CEANOTHUS. **Hab:** Prairies, woodland margins. **Dist:** IN west to IA and NE, south to nw. GA and e. and c. TX. **Phen:** Apr-Aug. **ID Notes:** This variety seems to be more floriferous and showy than the other two varieties, with inflorescences from the axils of many upper leaves per stem. **Syn:** = C, F, G, GrPl, II, Tx, Brizicky (1964a), Coile (1988a), Fross & Wilken (2006); < *Ceanothus americanus* – FNA12, K1, K3, K4, NE, S.**

147. RHAMNACEAE

Ceanothus americanus
var. americanusCeanothus americanus
var. intermediusCeanothus americanus
var. pitcheri*Endotropis* Rafinesque 1825 (AMERICAN BUCKTHORN)

A genus of about 5 species, shrubs and small trees, of North America (including Mexico). Hauenschild et al. (2016b) discussed at length the rationale for recognizing *Ventia* and *Frangula* (in our flora) and *Oreohertzogia* as genera separate from *Rhamnus*. Hauenschild (2016c) corrected the name of *Ventia* to *Endotropis* Rafinesque and *Oreohertzogia* to *Atadinus* Rafinesque. References: Bolmgren & Oxelman (2004); Brizicky (1964a); Hauenschild et al (2016a); Hauenschild et al (2016b); Hauenschild et al (2016c); Johnston (1975); Medan & Schirarend in Kubitzki et al (2004); Nesom & Sawyer (2016) in FNA12 (2016).

Endotropis lanceolata (Pursh) Hauenschild. LANCE-LEAVED BUCKTHORN. **Hab:** Dry to moist thickets and woodlands over calcareous rocks, bottomland hardwood forests. **Dist:** PA west to WI and SD, south to AL and TX. **Phen:** Apr-May. **Tax:** Two varieties with partial geographic separation are sometimes recognized. Var. *lanceolata* ranges from PA south to AL, mostly in the Appalachians, and has young leaves and young branches pubescent and mature leaves soft pubescent below. Var. *glabrata* Gleason ranges from OH west to SD, south to w. VA (Ludwig 1999), KY, c. TN, AR, and KS, and has young leaves and young branches glabrous or with scattered hairs and mature leaves glabrous below. Johnston (1975) did not recognize infraspecific taxa, Yatskievych (2013) states that "intermediate plants are relatively widespread in the midwestern states", and Nesom & Sawyer in FNA (2016) state that "plants with hirtellous-pubescent stems and leaves ... are more restricted in distribution than glabrous plants, but the distinction often seems arbitrary". **Syn:** = *Rhamnus lanceolata* Pursh – Ar, FNA12, Pa, S, Tn, Tx, W, WV, Johnston (1975); > *Endotropis lanceolata* (Pursh) Hauenschild ssp. *glabrata* (Gleason) Hauenschild – Hauenschild et al (2016c); > *Endotropis lanceolata* (Pursh) Hauenschild ssp. *lanceolata* – Hauenschild et al (2016c); > *Rhamnus lanceolata* ssp. *glabrata* (Gleason) Kartesz & Gandhi – K1, K3, K4, NcTx; > *Rhamnus lanceolata* ssp. *lanceolata* – K1, K3, K4; > *Rhamnus lanceolata* var. *glabrata* – C, F, G, GrPl, Il, Va, Brizicky (1964a); > *Rhamnus lanceolata* var. *lanceolata* – C, F, G, Il, Va, Brizicky (1964a); > *Ventia lanceolata* ssp. *glabrata* (Gleason) Hauenschild – Hauenschild et al (2016b); > *Ventia lanceolata* ssp. *lanceolata* – Hauenschild et al (2016b).

*Frangula* P. Miller 1754 (BUCKTHORN)

A genus of ca. 50 species, shrubs and small trees, of the northern hemisphere. The distinctions between *Frangula* and *Rhamnus s.l.* are many and meaningful; their separation at the generic level seems warranted based on morphological and molecular analyses (Richardson et al. 2000a; Bolmgren & Oxelman 2004; Hauenschild et al. 2016a, 2016b). References: Brizicky (1964a); Hauenschild et al (2016a); Hauenschild et al (2016b); Medan & Schirarend in Kubitzki et al (2004); Nesom in FNA () (in prep); Sawyer & Nesom (2016) in FNA12 (2016).

Frangula caroliniana (Walter) A. Gray. CAROLINA BUCKTHORN, INDIAN-CHERRY. **Hab:** Dry to moist barrens, woodlands, and forests, Coastal Plain limestone bluffs and shell middens, especially over mafic or calcareous rocks. **Dist:** Sw. VA west to s. OH and s. MO, south to c. peninsular FL and TX. **Phen:** May-Jun. **Syn:** = Ar, FNA12, K1, K3, K4, NcTx, Va; = *Rhamnus caroliniana* Walter – RAB, S, Tn, Tx, W, WH3; > *Frangula caroliniana* var. *caroliniana* – Il; > *Frangula caroliniana* (Walter) A. Gray var. *mollis* (Fernald) Mohlenbrock, – Il; > *Rhamnus caroliniana* Walter var. *caroliniana* – C, F, G, Brizicky (1964a); > *Rhamnus caroliniana* var. *mollis* Fernald – C, F, G, Brizicky (1964a). NatureServe G5 (Secure).

*Rhamnus* Linnaeus 1753 (BUCKTHORN)

A genus of ca. 150 species, trees and shrubs, of the northern hemisphere. The recognition of *Frangula* as separate from *Rhamnus* is supported by molecular phylogeny (Bolmgren & Oxelman 2004). References: Bolmgren & Oxelman (2004); Brizicky (1964a); Hauenschild et al (2016b); Johnston (1975); Medan & Schirarend in Kubitzki et al (2004); Nesom & Sawyer (2016) in FNA12 (2016).

- 1 Leaves alternate; plant a shrub to 2 (-4) m tall; fruit with 2-3 stones; sepals 4 or 5; petals 4 or 0; [natives of various, calcareous habitats]..... *Endotropis*
- 1 Leaves opposite (to subopposite); plant a large shrub or small tree, to 10 m tall; fruit with 2-4 stones; sepals 4; petals 4; [aliens, mostly of moist (but not boggy) soils]..... *Rhamnus cathartica*

Key to Map

147. RHAMNACEAE

* ***Rhamnus cathartica*** Linnaeus. COMMON BUCKTHORN, EUROPEAN BUCKTHORN. **Hab:** Disturbed areas. **Dist:** Native of Eurasia. Reported for VA by Harvill et al. (1991), but the report was actually based on specimens of *R. davurica* (Virginia Botanical Associates 2019); bonafide specimens have since been found in Arlington, Giles, Tazewell, and Wythe counties (Virginia Botanical Associates 2019); reported as "now escaping and widespread near Roaches Run", Arlington County, VA (Steury 2011). **Phen:** Apr-Jun. **Syn:** = C, F, FNA12, G, GrPl, Il, K1, K3, K4, Mi, NE, NY, Pa, Tn, Va, Brizicky (1964a), Hauenschild et al (2016b). NatureServe GNR (Not Yet Ranked).

***Sageretia*** Brongniart 1827 (MOCK BUCKTHORN)

A genus of about 35 species, shrubs and trees, of tropical to warm temperate areas of Africa, Asia, and America. References: Brizicky (1964a); Medan & Schirarend in Kubitzki et al (2004); Nesom (1993c); Nesom (2016g) in FNA12 (2016).

Sageretia minutiflora (Michaux) C. Mohr. SMALL-FLOWERED BUCKTHORN. **Hab:** Shell middens and shell hammocks, dry calcareous hammocks and maritime forests. **Dist:** Se. NC south to s. FL, west to s. MS. **Phen:** Aug-Sep; Oct-Nov. **Tax:** *S. minutiflora* is apparently most closely related to *S. elegans* (Kunth) Brongniart, which ranges from s. Mexico south to s. South America. **Syn:** = FNA12, K1, K3, K4, RAB, S, WH3, Brizicky (1964a), Nesom (1993c). NatureServe G4 (Apparently Secure).

***Ziziphus*** P. Miller 1754 (JUJUBE)

A genus of 85-100 species, shrubs and trees, of tropical and warm temperate areas. References: Brizicky (1964a); Medan & Schirarend in Kubitzki et al (2004); Nesom (2016) in FNA12 (2016).

* ***Ziziphus jujuba*** P. Miller. CHINESE JUJUBE, COMMON JUJUBE, CHINESE DATE. **Hab:** Disturbed areas. **Dist:** Native of Eurasia. Reported from ec. GA (Jones & Coile 1988). **Phen:** May. **Comm:** Cultivated at least as far north as NC. *Z. jujuba* has been 'conserved' over *Z. zizyphus*. **Syn:** = FNA12, K3, K4, Tx, WH3, Brizicky (1964a); = *Ziziphus zizyphus* (Linnaeus) Karsten – K1, NcTx; = *Zizyphus zizyphus* (Linnaeus) Karsten – S, orthographic variant. NatureServe GNR (Not Yet Ranked).

148. ULMACEAE Mirbel 1815 (ELM FAMILY) [in ROSALES]

As here circumscribed (excluding *Celtis* and relatives), a family of 6-7 genera and about 35 species, of temperate, subtropical, and boreal Northern Hemisphere, rarely extending into the Southern Hemisphere). Zavada & Kim (1996) discuss compelling reasons to remove *Celtis* from the Ulmaceae. References: Sherman-Broyles, Barker, & Schultz (1997) in FNA3 (1997); Todzia in Kubitzki, Rohwer, & Bittrich (1993); Zavada & Kim (1996).

- 1 Leaves strongly 3-veined from the base, the venation otherwise pinnate; fruit a drupe with thin flesh.....*Celtis*
- 1 Leaf venation pinnate throughout, the venation strictly pinnate; fruit dry, a samara (flat and winged) or nutlike (with or without fleshy protuberances).
 - 2 Fruit a samara (flat and winged); primary lateral veins mostly parallel and unforked to the leaf margin *Ulmus*
 - 2 Fruit nutlike (globular, with or without fleshy protuberances); primary lateral veins either mostly parallel and unforked to the leaf margin, or mostly forking before reaching the margin. *Planera*

Planera J.F. Gmelin 1791 (PLANER-TREE, WATER-ELM)

A monotypic genus, a tree, of temperate se. North America. References: Barker (1997) in FNA3 (1997); Todzia in Kubitzki, Rohwer, & Bittrich (1993).

Planera aquatica (Walter) J.F. Gmelin. PLANER-TREE, WATER-ELM. **Hab:** River swamps where flooded (often to depths of 1-2 m) in the winter. **Dist:** Se. NC (limited to the Waccamaw and Lumber rivers) south to n. FL, west to e. TX, and north in the Mississippi Embayment to w. TN, w. KY, s. IL, and se. MO. **Phen:** Apr. **Syn:** = Ar, C, F, FNA3, G, GW2, K1, K3, K4, RAB, S, Tn, Tx, WH3. NatureServe G5 (Secure).

***Ulmus*** Linnaeus 1753 (ELM)

A genus of about 25-30 species, trees (rarely shrubs), of temperate and boreal regions of the Northern Hemisphere (most diverse in c. and n. Asia). Subgeneric classification shown in the key follows Whittemore et al. (2021). References: Kurz & Godfrey (1962); Sherman-Broyles (1997) in FNA3 (1997); Todzia in Kubitzki, Rohwer, & Bittrich (1993); Whittemore & Olsen (2011); Whittemore et al (2021); Wiegrefe, Sytsma, & Guries (1994).

- 1 Leaf blades mostly < 7 cm long, the base symmetrical to somewhat oblique.
 - 3 Leaf apex acute; flowers appearing in the late winter to late spring; calyx lobes 5, broadly rounded; upper surfaces of leaves glabrous to somewhat scabrous; [widespread in our area]..... *Ulmus alata*

Key to Map
Symbology:

* : waif
EN : endemic

N : no
P : planted
? : questionable
X : extirpated

148. *ULMACEAE*

- 3 Leaf apex obtuse; flowers appearing in the late summer to fall; calyx lobes 6-9, linear; upper surfaces of leaves harshly scabrous; [w. TN and w. MS westward; disjunct in FL]..... *Ulmus crassifolia*
- 1 Leaf blades mostly > 7 cm long, the base moderately to strongly oblique (rarely nearly symmetrical).
- 5 Leaf uppersurface slightly to very strongly scabrous; leaf undersurface tomentose or villous, with tufts of hairs in the vein axils; flowers and fruits sessile or subsessile (on pedicels 0-2 mm long), in dense non-pendulous fascicles..... *Ulmus rubra*
- 5 Leaf uppersurface glabrous (or slightly to moderately scabrous, especially on stump sprouts or seedlings); leaf undersurface glabrous to tomentose, with or without tufts of hairs in the vein axils; flowers and fruits pedicellate (on pedicels 5-20 mm long), pendulous, in fascicles or racemes.
- 8 Leaf undersurfaces glabrous or slightly pubescent, but always with tufts of hairs in the vein axils; branches never with corky wings; inflorescence a fascicle; [widespread in our area]; [subgenus *Oreoptelea*, section *Blepharocarpus*].
- 9 Leaf bases strongly oblique; larger leaves 10-15 cm long; primary leaf teeth acuminate, often curved inward; [widespread in our area]..... *Ulmus americana* var. *americana*
- 9 Leaf bases moderately oblique (rarely nearly symmetrical); larger leaves 7-10 cm long; primary leaf teeth acute, not curved; [moist calcareous sites in the Coastal Plain from se. NC southwards] *Ulmus americana* var. *floridana*
- 8 Leaf undersurfaces moderately white or yellowish soft-pubescent, lacking prominent tufts of hairs in the vein axils (differing from the general pubescence of the surface); branches often developing corky wings; inflorescence a raceme or racemose cyme; [calcareous areas west of the Blue Ridge (w. PA, WV, KY, e. TN, nw. GA, and AL westwards)]; [subgenus *Oreoptelea*, section *Chaetoptelea*].
- *Ulmus serotina*

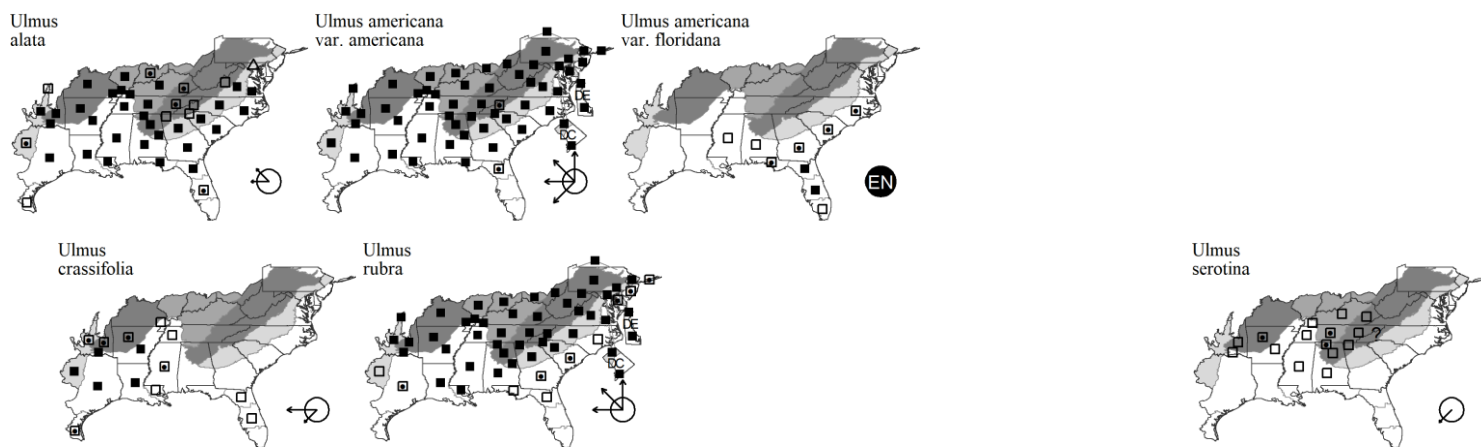

Ulmus alata Michaux. WINGED ELM. **Hab:** Rock outcrops, dry and mesic forests and woodlands, bottomlands, old fields, disturbed areas. **Dist:** N. VA west to MO, south to c. peninsular FL and c. TX. **Phen:** Feb-Mar; Mar-Apr. **Syn:** = Ar, C, F, FNA3, G, GrPl, GW2, Il, K1, K3, K4, NcTx, RAB, S, Tn, Va, W, WH3, Kurz & Godfrey (1962). NatureServe G5 (Secure).

Ulmus americana Linnaeus var. *americana*. AMERICAN ELM, WHITE ELM. **Hab:** Swamps, bottomland forests, moist slopes, especially on relatively or strongly nutrient-rich substrates. **Dist:** NS, NB, and QC west to se. SK, south to n. FL, c. TX, and Mexico. **Phen:** Feb-Mar; Mar-Apr. **Tax:** It now appears that *U. americana* (in the broad sense) is a polyploid complex, with tetraploids throughout its distribution and diploids south of the glacial maximum (Whittemore & Olson 2011). **Comm:** Ascomycetous fungi, *Ophiostoma ulmi* and *O. novo-ulmi*, are the cause of the Dutch Elm disease. In our area, the effects of the disease appear to have been variable, with less impact southwards and in natural populations (as compared to suburban or urban plantings). **Syn:** = Kurz & Godfrey (1962); = *Ulmus americana* – S; < *Ulmus americana* – Ar, C, F, FNA3, G, GrPl, GW2, Il, K1, K3, K4, Mi, NcTx, NE, NY, Pa, RAB, Tn, Tx, Va, W, WH3, WV.

Ulmus americana Linnaeus var. *floridana* (Chapman) Little. FLORIDA ELM. **Hab:** Shell middens, other calcareous forests. **Dist:** Se. NC (north at least to Carteret County) south to c. peninsular FL, west to Panhandle FL and s. AL (H. Horne, pers. comm., 2013). **Phen:** Jan-Mar; Feb-Apr. **Syn:** = Kurz & Godfrey (1962); = *Ulmus floridana* Chapman – S; < *Ulmus americana* – C, F, FNA3, G, GW2, K1, K3, K4, RAB, W, WH3.

Ulmus crassifolia Nuttall. CEDAR ELM. **Hab:** Bottomland forests, hardwood flatwoods; rarely river bluffs and ravines. **Dist:** W. TN, s. MO, and OK south to MS, LA, TX, and Mexico; disjunct in e. Panhandle FL. **Phen:** Jul-Oct. **Syn:** = Ar, FNA3, GW2, K1, K3, K4, NcTx, S, Tn, Tx, WH3, Kurz & Godfrey (1962). NatureServe G5 (Secure).

Ulmus rubra Muhlenberg. SLIPPERY ELM, RED ELM. **Hab:** Moist to fairly dry calcareous forests, rich bottomlands, rich cove forests in the low Mountains. **Dist:** ME, QC, and ON west to MN and ND, south to Panhandle FL and c. TX. **Phen:** Feb-Apr; Mar-May. **Comm:** *U. rubra* is susceptible to Dutch Elm Disease (see *U. americana*). **Syn:** = Ar, C, F, FNA3, G, GrPl, Il, K1, K3, K4, Mi, NcTx, NE, NY, Pa, RAB, Tn, Tx, Va, W, WH3, WV, Kurz & Godfrey (1962); = *Ulmus fulva* Michaux – S. NatureServe G5 (Secure).

Ulmus serotina Sargent. SEPTEMBER ELM. **Hab:** Dry-mesic to mesic upland forests, bottomland and riparian forests, stream banks, bluffs, lake and pond margins, flatwoods; especially over limestone. **Dist:** KY, s. IL, and e. OK south to e. TN, nw. GA, AL, and MS; allegedly disjunct in ne. Mexico (COA and NLE) (Villaseñor 2016). Rugel collected this species on the French Broad River in 1842, the location attributed to NC by Mohr (1901). **Syn:** = Ar, C, F, FNA3, G, K1, K3, K4, S, Tn. NatureServe G4 (Apparently Secure).

149. *CANNABACEAE* Martinov 1820 (HOPS FAMILY) [in ROSALES]

As circumscribed to include the Celtidaceae, a family of 14 genera and about 120 species, trees, shrubs, woody vines, herbs, and herbaceous vines, of cosmopolitan distribution. Zavada & Kim (1996) discuss compelling reasons to recognize the Celtidaceae as a family distinct from the Ulmaceae. The distinctiveness of the Celtidaceae from the Cannabaceae and Moraceae is more questionable; and Yang et al. (2013), Sytsma et al. (2002), and

many others conclude that Celtidaceae should be considered a part of Cannabaceae. References: Kubitzki, Rohwer, & Bittrich (1993); Sherman-Broyles, Barker, & Schultz (1997) in FNA3 (1997); Small (1997) in FNA3 (1997); Sytsma et al (2002); Todzia in Kubitzki, Rohwer, & Bittrich (1993); Zavada & Kim (1996).

1 Tree or shrub; leaves simple and unlobed.

1 Herb or vine; leaves either compound or lobed.

..... *Celtis*

..... *Cannabis*

Cannabis Linnaeus 1753 (HEMP, MARIJUANA)

A genus of 1-3 species, herbs, originally native to c. Asia. *Cannabis* was formerly widely cultivated nearly worldwide for the fiber hemp; it is now better known as a drug. References: Hillig & Mahlberg (2004); Kubitzki, Rohwer, & Bittrich (1993); Small (1997) in FNA3 (1997).

* ***Cannabis sativa*** Linnaeus. HEMP, MARIJUANA. **Hab:** Disturbed areas and clandestinely cultivated plots. **Dist:** Native of Asia. Though perhaps not truly naturalized or persistent, *Cannabis* is treated here since clandestine cultivated plots are encountered by the field biologist, especially in fairly remote areas in the mountainous parts of our area. **Phen:** Jun-Oct. **Syn:** = F, FNA22, G, Mi, NcTx, NE, NY, Pa, WH3, WV; *Cannabis sativa* Linnaeus; > *Cannabis sativa* ssp. *indica* (Lamarck) E. Small & Cronquist – K3, K4, Tn; > *Cannabis sativa* ssp. *sativa* – Tn; > *Cannabis sativa* Linnaeus ssp. *sativa* var. *sativa* – C, GrPl, K1, K3, K4; > *Cannabis sativa* ssp. *sativa* var. *spontanea* Vavilov – GrPl, K3, K4; > *Cannabis sativa* var. *sativa* – Il; > *Cannabis sativa* var. *spontanea* Vavilov – Il.

Celtis Linnaeus 1753 (HACKBERRY)

A genus of about 100 species, trees, shrubs, and woody vines, widespread in tropical, subtropical, and temperate regions worldwide. References: Henrickson (2010); Sherman-Broyles, Barker, & Schultz (1997) in FNA3 (1997); Todzia in Kubitzki, Rohwer, & Bittrich (1993); Whittemore in Mo3 (2013).

5 Leaf blades (fully-formed leaves subtending fruits) 7-12 cm long, the longer side with 23-40 teeth, the shorter with 12-27 teeth; secondary veins 5-8 on each side of the midvein, the basalmost reaching the leaf margin at a point 1/3 to 1/2 the length of the leaf above the base; fruits 8-10 mm long..... *Celtis occidentalis*

5 Leaf blades (fully-formed leaves subtending fruits) 2.0-8.5 cm long, each side with 0-15 (-23?) teeth; secondary veins 3-5 on each side of the midvein, the basalmost reaching the leaf margin at a point 1/3 to 2/3 the length of the leaf above the base; fruits 5-10 mm long.

7 Plants shrubs or small trees, to 7 m tall, with ascending trunks and horizontal or arching leaders; bark often nearly smooth (sometimes with corky warts near the base or around wounds); leaf undersurface glaucous or pale green, usually distinctly lighter than the upper surface; flower stalks usually hairy (puberulent); twigs usually moderately to densely hairy (sometimes glabrous); anthers small and indehiscent, pollen malformed and generally sterile (< 10% of the grains stainable with acetocarmine)..... *Celtis pumila*

7 Plants usually trees, to 30 m tall, typically single-trunked, with erect leaders; bark with corky warts on trunks and major branches; leaf undersurface usually bright green, little if at all paler than the uppersurface; flower stalks glabrous (rarely with a few hairs); twigs glabrous or sparsely hairy; anthers well-developed, dehiscent, pollen copious, regular, and fertile (> 95% of the grains stainable with acetocarmine).

..... *Celtis laevigata*

Celtis laevigata Willdenow. SOUTHERN HACKBERRY, SUGARBERRY. **Hab:** Bottomland forests, especially on natural levees, upland calcareous forests and woodlands, shell middens. **Dist:** MD, WV, IN, IL, MO and KS south to s. FL and TX. **Phen:** Apr-May; Aug-Oct. **Syn:** = *Celtis laevigata* var. *laevigata*; = *Celtis mississippiensis* Bosc – S; < *Celtis laevigata* Willdenow – Ar, C, FNA3, G, GW2, K3, K4, RAB, Tn, Va, W, WH3; > *Celtis laevigata* var. *laevigata* – F, GrPl, Il, Tx; > *Celtis laevigata* var. *texana* Sargent – F, GrPl, Il, Tx.

Celtis occidentalis Linnaeus. NORTHERN HACKBERRY. **Hab:** Xeric to mesic glades, outcrops, barrens, woodlands, and bottomland forests, usually over calcareous substrates. **Dist:** NH, QC, MB, and MT south to Panhandle FL, nc. TX, and ne. NM. **Phen:** Mar-May; Aug-Oct. **Syn:** = Ar, C, FNA3, G, K1, K3, K4, Mi, NE, NY, Pa, S, Tn, Tx, Va, W, WV; = *Celtis occidentalis* var. *occidentalis* – RAB; < *Celtis occidentalis* Linnaeus – WH3; > *Celtis occidentalis* var. *canina* (Rafinesque) Sargent – F, GrPl, Il; > *Celtis occidentalis* var. *occidentalis* – F, GrPl, Il; > *Celtis occidentalis* var. *pumila* (Pursh) A. Gray – F, GrPl, Il, misapplied.

Celtis pumila Pursh. DWARF HACKBERRY, GEORGIA HACKBERRY. **Hab:** Xeric to mesic glades, outcrops, barrens, woodlands, exposed bluffs, stream banks, and disturbed areas, often over calcareous substrate. **Dist:** NJ, PA, IN, IL, and KS south to Panhandle FL and TX. **Phen:** Apr-May; Aug-Oct. **Tax:** *C. pumila* Pursh has priority over *C. tenuifolia* Nuttall; the description in Pursh's flora ("a small straggling bush"), and more critically the type specimen, conform to what has more generally been known as *C. tenuifolia* (Whittemore in Yatskievych 2013). This species is mainly an apomictic triploid. **Syn:** = NY; = *Celtis georgiana* Small – S; = *Celtis occidentalis* var. *georgiana* (Small) H.E. Ahles – RAB; = *Celtis tenuifolia* Nuttall – Ar, C, FNA3, G, GrPl, K1, K3, K4, Mi, Pa, Tn, Va, W, WV; < *Celtis occidentalis* Linnaeus – WH3; > *Celtis tenuifolia* var. *georgiana* (Small) Fernald & Schubert – F, Il, Tx; > *Celtis tenuifolia* var. *tenuifolia* – F, Il, Tx.

150. MORACEAE Gaudichaud-Beaupré 1835 (MULBERRY FAMILY) [in ROSALES]

A family of about 38 genera and 1100 species, trees, shrubs, vines, and herbs, of tropical, subtropical, and (few) warm temperate areas. Tribal classification follows Gardner et al. (2021). References: Gardner et al (2021); Rohwer & Berg in Kubitzki, Rohwer, & Bittrich (1993); Wunderlin (1997) in FNA3 (1997).

- 1 Herb, < 1.0 m tall; stems and leaves without latex; [tribe Dorstenieae] *Fatoua villosa*
- 1 Shrub or tree, at maturity over 1 m tall, or woody vine growing appressed to masonry; stems and leaves bearing translucent to milky-white latex.
 - 3 Stipules connate, the stipule scar encircling the twig; inflorescence a syconium (the flowers borne on the inner walls of the fleshy receptacle); [tribe Ficeae] *Ficus*
 - 3 Stipules free, the stipule scar not encircling the twig; inflorescence a spike, head, or catkin (the flowers borne exposed on a contracted or elongated axis or receptacle).
 - 4 Leaves entire, unlobed or shallowly 3 (-5)-lobed; stems with axillary spines [tribe Chlorophoreae] *Maclura*
 - 4 Leaves serrate, often also 3-15-lobed (the lobes sometimes deep); stems not armed.
 - 5 Stems and leaves hirsute; leaves alternate, opposite, and whorled; [tribe Dorstenieae] *Broussonetia papyrifera*
 - 5 Stems and leaves glabrous to pubescent; leaves alternate; [tribe Moreae] *Morus*

Broussonetia L'Héritier ex Ventenat 1799 (PAPER MULBERRY)

A genus of about 8 species, trees, shrubs, and vines, of tropical and subtropical Asia and Madagascar. References: Endress & Bittrich in Kubitzki, Rohwer, & Bittrich (1993); Wunderlin (1997) in FNA3 (1997).

* ***Broussonetia papyrifera*** (Linnaeus) L'Héritier ex Ventenat. PAPER MULBERRY. **Hab:** Urban lots, disturbed areas, roadsides. **Dist:** Native of e. Asia. **Phen:** Apr-May. **Syn:** = Ar, C, F, FNA3, G, GrPl, Il, K1, K3, K4, NcTx, NE, NY, Pa, RAB, Tn, Tx, Va, W, WH3; = *Papyrus papyrifera* (Linnaeus) Kuntze – S. [NatureServe GNR](#) (Not Yet Ranked).

Fatoua Gaudichaud-Beaupré 1830 (CRABWEED)

A genus of 2-3 species, herbs or weak shrubs, of Asia, Madagascar, and Australia. References: Endress & Bittrich in Kubitzki, Rohwer, & Bittrich (1993); Kral (1981c); Massey (1975); Miller & Wood (2003); Vincent (2004); Wunderlin (1997) in FNA3 (1997).

* ***Fatoua villosa*** (Thunberg) Nakai. CRABWEED, MULBERRY-WEED, FOOLISH-WEED. **Hab:** Disturbed areas, vegetable and flower gardens, landscaped areas around institutional buildings. **Dist:** Native of Asia (apparently se. Asian islands). As discussed by Massey (1975) and Vincent (2004), *Fatoua* was first reported in the United States (Louisiana) in the early 1960s. As of 2004, its distribution in North America had spread to include 28 states and the District of Columbia, including most states except the Great Plains and Rocky Mountains had spread (Vincent 2004, Sundell et al. 1999, Miller & Wood 2003). Since all early collections seem to be in and around greenhouses and nurseries, it is likely that it has been introduced in horticultural material, perhaps repeatedly (Kral 1981b). *Fatoua* appears to have become a fairly aggressive weed in eastern North America. It can be expected to continue to spread, and has the potential to become noxious. **Phen:** Jul-Nov. **ID Notes:** *Fatoua villosa* has alternate, ovate leaves with cordate bases, borne on long petioles (about as long as the leaf blade), the inflorescences are dense cymes borne on peduncles in the axils of leaves. Pubescence of the stem and foliage is uncinulate, giving the plant a "tacky" feel. An excellent illustration appears in Correll & Correll (1982). **Syn:** = Ar, Bah, FNA3, Il, K1, K3, K4, Mi, NcTx, NE, NY, Va, WH3, Massey (1975), Vincent (2004). [NatureServe GNR](#) (Not Yet Ranked).

Ficus Linnaeus 1753 (FIG)

A genus of about 750 species, trees, shrubs, and vines, of tropical, subtropical, and warm temperate areas. Rasplus et al. (2021) and discussed the evolution, phylogeny, and sectional classification of the genus. References: Endress & Bittrich in Kubitzki, Rohwer, & Bittrich (1993); Rasplus et al (2021); Wunderlin (1997) in FNA3 (1997).

* ***Ficus carica*** Linnaeus. EDIBLE FIG, GARDEN FIG. **Hab:** Grown for its fruits, persistent from plantings, persisting and naturalizing particularly on barrier islands, where it sometimes forms thickets on dunes, or otherwise in the outer Coastal Plain, where proximity to the ocean ameliorates cold winter temperatures. **Dist:** Native of w. Asia. **Phen:** May-Aug; Jul-Oct. **Comm:** This is the common cultivated fig, grown for its fruit in the Mid-east for millennia. **Syn:** = F, Fl3, FNA3, K1, K3, K4, Mi, NcTx, NY, RAB, S, Tx, WH3. [NatureServe GNR](#) (Not Yet Ranked).

Maclura Nuttall 1818 (OSAGE-ORANGE)

A genus of 11-12 species, trees, of sc. North America, e. Asia, tropical Asia, Africa, and South America. Generic circumscription and sectional classification follow Gardner et al. (2017). References: Endress & Bittrich in Kubitzki, Rohwer, & Bittrich (1993); Gardner et al (2017); Rehder (1940); Wunderlin (1997) in FNA3 (1997).

 P : planted
 ? : questionable

Maclura pomifera (Rafinesque) C.K. Schneider. OSAGE-ORANGE, BOW-WOOD, BOIS-D'ARC, HEDGE-APPLE.

Hab: Dry-mesic to mesic upland forests and woodlands, bottomland and riparian forests, stream banks, fencerows, old fields, pastures, prairies, roadsides, naturalized beyond its native range from extensive planting in the eighteenth and nineteenth centuries. **Dist:** The native distribution is obscured by early introduction eastwards and spread from cultivation, probably native to an area from sw. AR and OK south to w. LA and e. and c. TX, but possibly native also in areas like the Black Belt of MS and AL. **Phen:** Apr-Jun; Aug-Oct. **Comm:** The large fruits are unmistakable: yellowish-green, grapefruit-sized, and wrinkled, reminiscent of a giant, spherical mulberry fruit. The wood is extremely heavy, fine-grained, a bright yellow-orange when fresh, but darkening with age, famous for making bows and also used in cabinetry. **Syn:** = Ar, C, F, FNA3, G, GrPl, Il, K1, K3, K4, Mi, NcTx, NE, NY, Pa, RAB, Tn, Tx, Va, W, WH3, WV, Gardner et al (2017); = *Toxylon pomiferum* Rafinesque ex Sargent – S. NatureServe G5 (Secure).

Morus Linnaeus 1753 (MULBERRY)

A genus of about 10-15 species, trees, of warm temperate, subtropical, and tropical areas. References: Endress & Bittrich in Kubitzki, Rohwer, & Bittrich (1993); Galla et al (2009); Gardner et al (2021); Saar et al (2012); Wunderlin (1997) in FNA3 (1997).

Identification Notes: When not in flower or fruit, *Tilia* and *Morus* are often confused. They can be easily told apart by leaf venation. *Morus* has the main leaf veins splitting towards the margin but then rejoining to form a rather prominent, looping (scalloped) marginal vein; the basal veins 3, palmate, sometimes an additional prominent vein on each side joining the lateral vein above its divergence from the petiole end; and the main lateral leaf veins (above the basal veins) mainly alternate. *Tilia* has the main leaf veins splitting several times towards the leaf margin and leading into the teeth without rejoining and forming a marginal vein; the basal veins 5, palmate, all joining together at the summit of the petiole; and the main lateral leaf veins (above the basal veins) usually opposite.

- 2 Upper leaf surface glossy, glabrous or slightly scabrous; lower leaf surface glabrous, or slightly pubescent on the veins and in the vein axils only; ripe fruits black, purple, red, pink, or white; pistillate inflorescences 5-8 mm long (in flower)..... **Morus alba**
- 2 Upper leaf surface dull, scabrous; lower leaf surface pubescent on the veins, veinlets, and the surface between the veins; ripe fruits black or purple; pistillate inflorescences 8-12 mm long (in flower)..... **Morus rubra**

* **Morus alba** Linnaeus. WHITE MULBERRY, SILKWORM MULBERRY, RUSSIAN MULBERRY. **Hab:** Disturbed areas, vacant lots, roadsides, moist forests. **Dist:** Native of e. Asia. **Phen:** Mar-May; May-Jun. **Syn:** = Ar, C, F, FNA3, G, GrPl, GW2, K1, K3, K4, Mi, NcTx, NE, NY, Pa, RAB, S, Tx, Va, W, WH3, WV, Galla et al (2009), Saar et al (2012); > *Morus alba* Linnaeus – Il, S; > *Morus alba* var. *tatarica* (Linnaeus) Seringe; > *Morus nigra* Linnaeus – S, misapplied as to our material; > *Morus tatarica* Linnaeus – Il.

Morus rubra Linnaeus. RED MULBERRY. **Hab:** Bottomland forests, mesic slopes, disturbed areas, suburban woodlands. **Dist:** MA, VT, NY, MI, WI, and se. SD south to s. FL and w. TX, and into Mexico. **Phen:** Apr-May; May-Jun. **Tax:** *M. murrayana* D.E. Saar & S.J. Galla (or alternatively treated as a variety of *M. rubra*) has recently been described as distinct from *M. rubra* and occurring widely in eastern North America (KY, TN, MO, IL, IN, MS, LA, VA, NC, and AL) (Galla et al. 2009; Saar et al. 2012). It is alleged to differ from *M. rubra* by its leaves to 38 cm long (vs. to 15 cm long), the outer three leaves on branchlets almost always > 15 cm long (vs. < 15 cm long), leaves with caudate apex (vs. acute to acuminate apex); mature fruit to 4 cm long and 1.5 cm wide but often thinner, with much size variation on a single individual (vs. mature fruit to 3 cm long). All the alleged characters appear to be highly variable and correlated with vigor. **Comm:** The fruits are very variable in quality from tree to tree. **Syn:** = Ar, C, F, G, GrPl, GW2, K3, K4, Mi, NcTx, NE, NY, Pa, RAB, S, Tn, Va, W, WH3, WV; > *Morus murrayana* D.E. Saar & S.J. Galla – Il, Galla et al (2009); > *Morus rubra* Linnaeus – Il, Galla et al (2009); > *Morus rubra* var. *murrayana* (D.E. Saar & S.J. Galla) D.E. Saar – Gardner et al (2021), Saar et al (2012); > *Morus rubra* var. *rubra* – K1, Tx, Gardner et al (2021), Saar et al (2012); > *Morus rubra* Linnaeus var. *tomentosa* (Rafinesque) Bureau – Tx.

151. URTICACEAE A.L. de Jussieu 1789 (NETTLE FAMILY) [in ROSALES]

A family of about 45 genera and 1000 species, herbs, shrubs, vines, and trees, of cosmopolitan distribution in tropical, subtropical, and temperate regions. References: Boufford (1997) in FNA3 (1997); Friis in Kubitzki, Rohwer, & Bittrich (1993); Miller (1971a); Wu et al (2018).

- 2 Leaves opposite.
 - 3 Plant with stinging trichomes, these having a distinct bulbous or cylindrical base, and a stiff, translucent apex; [tribe *Urticeae*]..... **Urtica**
 - 3 Plant without stinging trichomes (or these minute and not apparent), the non-stinging hairs (if present) soft and flexible, lacking a bulbous or cylindrical base.
 - 4 Flowers in axillary spikes; foliage dull, yellow-green; leaves 3-veined from the base, the 2 main side veins reaching the margin about 2/3s of the way from blade base to blade tip, the midvein with 1-2 or more prominent secondary veins borne near or past the midpoint and at a sharply acute angle to the midvein, these arching to the leaf margin; [tribe *Boehmerieae*]..... **Boehmeria cylindrica**
 - 4 Flowers in axillary panicles or fascicles; foliage shiny, bright green; leaves 3-veined from the base, the 2 main side veins extending to the apex of the blade, the midvein with many secondary veins borne along its length at a nearly right angle, and connecting to the 2 main side veins rather than reaching the leaf margin; [tribe *Lecantheae*]..... **Pilea**
- 2 Leaves alternate (at least above, if not throughout).

151. URTICACEAE

- 5 Leaves toothed; plant either with or without stinging trichomes.
 6 Flowers in axillary spikes; woody herb to 4 m tall, without stinging trichomes; leaf undersurfaces white-pubescent; [tribe *Boehmerieae*] *Boehmeria nivea*
 6 Flowers in terminal or axillary panicles; herb to 1.5 m tall, with stinging trichomes; leaf undersurfaces green; [tribe *Urticeae*] *Laportea*
 5 Leaves entire; plants without stinging trichomes. *Parietaria*

Boehmeria Jacquin 1760 (SWAMP-NETTLE)

A genus of about 50-80 species, trees, shrubs, and perennial herbs, of warm temperate, subtropical, and tropical regions of the Old World and New World. Wu et al. (2018) showed *Boehmeria* to be polyphyletic, with *B. nivea* likely to be separated from the genus. References: Boufford (1997) in FNA3 (1997); Friis in Kubitzki, Rohwer, & Bittrich (1993); Wu et al (2018).

- 1 Leaves opposite (upper leaves sometimes subopposite or alternate); leaf lower surface glabrous, puberulent, or short-pilose, the pubescence not obscuring the green leaf surface; inflorescences (axillary) spikes, often leafy at their apices; herb to 1.5 m tall; [subgenus *Duretia*] *Boehmeria cylindrica*
 1 Leaves alternate; leaf lower surface white-tomentose, the pubescence obscuring the green leaf surface; inflorescences (axillary) paniculately branched, never leafy at their apices; herb or shrub to 4 m tall; [subgenus *Tilocnide*] *Boehmeria nivea*

Boehmeria cylindrica (Linnaeus) Swartz. SWAMP-NETTLE. **Hab:** Swamp forests, bottomland forests, bogs, tidal marshes, other marshes, other wetlands. **Dist:** QC and MN south to FL and NM; West Indies; Mexico, Central America, and South America. **Phen:** Jul-Aug; Sep-Oct. **Syn:** = Ar, C, FNA3, G, GrPl, GW2, K1, K3, K4, Mi, NcTx, NE, NY, Pa, RAB, Tn, Va, W, WH3, WI; > *Boehmeria cylindrica* (Linnaeus) Swartz – S; > *Boehmeria cylindrica* var. *cylindrica* – F, Il, Tx; > *Boehmeria cylindrica* var. *drummondiana* (Weddell) Weddell – F, Il, Tx; > *Boehmeria decurrens* Small – S; > *Boehmeria drummondiana* Weddell – S.

* ***Boehmeria nivea*** (Linnaeus) Gaudichaud-Beaupré. RAMIE. **Hab:** Disturbed suburban areas, waste ground. **Dist:** Native of Asia. Reported for Lowndes County, GA (Carter, Baker, & Morris 2009). **Tax:** *Boehmeria nivea* will be removed from *Boehmeria*, either to a monotypic genus, *Ramium* (see synonymy) or perhaps to be included in related genera, such as *Sarcochlamys* Gaudichaud, *Archiboehmeria* C.J. Chen, or *Astrothalamus* C.B. Robinson (all natives of se. Asia). **Comm:** This plant has been cultivated for the fiber of its stems, which is extracted and used for fabric in a manner reminiscent of linen (which is made from stem fibers of *Linum usitatissimum*). **Syn:** = FNA3, K1, K3, K4, RAB, Tx, WH3; = *Ramium niveum* (Linnaeus) Small – S, the genus name illegitimate. **NatureServe GNR** (Not Yet Ranked).

*Laportea* Gaudichaud-Beaupré 1830 (WOOD-NETTLE)

A genus of about 21 species, shrubs, perennial herbs, and annual herbs, of tropical and warm temperate e. Asia and temperate e. North America. References: Boufford (1997) in FNA3 (1997); Friis in Kubitzki, Rohwer, & Bittrich (1993).

Laportea canadensis (Linnaeus) Weddell. WOOD-NETTLE. **Hab:** Moist, nutrient-rich forests, seepage swamps, especially abundant in cove forests in the Mountains and bottomlands in the Piedmont. **Dist:** NS and se. MB south to Panhandle FL and OK. **Phen:** May-Aug; late Jul-Oct. **Comm:** By mid-summer, *Laportea* often becomes the aspect dominant in rich, moist cove forests of the mountains (especially those with extensive seepage), visually replacing the diverse spring flora. The stinging hairs can penetrate pants made of light-weight or loosely woven fabrics. **Syn:** = Ar, C, F, FNA3, G, GrPl, GW2, Il, K1, K3, K4, Mi, NE, NY, Pa, RAB, Tn, Va, W, WH3, WV; ? *Urticasterum divaricatum* (Linnaeus) Kuntze – S. **NatureServe G5** (Secure).

*Parietaria* Linnaeus 1753 (PELLITORY)

A genus of about 20 species, annual and perennial herbs, of nearly cosmopolitan distribution. References: Boufford (1997) in FNA3 (1997); Friis in Kubitzki, Rohwer, & Bittrich (1993); Hinton (1968).

- 1 Main lateral veins diverging from the midvein above the usually narrowly cuneate leaf base; larger leaves 2-5× as long as wide; achene 0.9-1.2 mm long *Parietaria pensylvanica*
 1 Main lateral veins diverging from the midvein at the usually truncate, rounded, or broadly cuneate leaf base; larger leaves 1-2× as long as wide; achene either 0.6-0.9 or 1.0-1.4 mm long.
 3 Achene 0.6-0.9 mm long, with a flanged stipe, the mucro located symmetrically at the pole of the achene; leaf blades 0.7-2.7 cm long *Parietaria floridana*
 3 Achene 1.0-1.4 mm long, without a flanged stipe, the mucro located asymmetrically; leaf blades 1.0-6.5 cm long *Parietaria praetermissa*

151. URTICACEAE

Parietaria floridana Nuttall. FLORIDA PELLITORY. **Hab:** Coastal shores, sometimes weedy in calcareous situations or around greenhouses. **Dist:** DE south to FL and west to TX, on the outer Coastal Plain; Bahamas. Reported for c. KY (Adanick & Medley 2020). **Phen:** Mar-frost; Apr-frost. **Tax:** Perhaps conspecific with *P. debilis*. **ID Notes:** This species has smaller leaves than *P. praetermissa*. **Syn:** = Ar, FNA3, GW2, K1, K3, K4, Tx, WH3, Hinton (1968); = *Parietaria nummularia* Small – C, F, S; < *Parietaria debilis* Forster – WI.

Parietaria pensylvanica Muhlenberg ex Willdenow. PENNSYLVANIA PELLITORY, ROCK PELLITORY. **Hab:** In circumneutral soils, such as in thin soils at the bases of calcareous or subcalcareous cliffs or on calcareous shale barrens, rich floodplain soils. **Dist:** ME west to BC, south to e. NC, w. NC, SC (Gaddy 2014), AL, Panhandle FL, TX, NV, and Mexico. **Phen:** Apr-Oct; May-Oct. **Tax:** Two varieties are sometimes delimited, var. *pensylvanica* eastern and northern and var. *obtusata* (Rydborg ex Small) Shinnors southwestern. **Syn:** = Ar, C, FNA3, G, GrPl, GW2, Il, K1, K3, K4, Mi, NE, NY, Pa, RAB, S, Tn, Va, W, WH3; > *Parietaria obtusata* Rydborg – Tx; > *Parietaria pensylvanica* Muhlenberg ex Willdenow – F, Tx, WV, sensu stricto; > *Parietaria pensylvanica* var. *obtusata* (Rydborg ex Small) Shinnors – NcTx; > *Parietaria pensylvanica* var. *pensylvanica* – NcTx.

Parietaria praetermissa Hinton. COASTAL PELLITORY. **Hab:** Shell middens, coastal hammocks. **Dist:** E. NC south to s. FL and west to w. LA. **Phen:** Mar-frost; Apr-frost. **Syn:** = FNA3, GW2, K1, K3, K4, WH3, Hinton (1968); = *Parietaria floridana* Nuttall – C, F, RAB, S, misapplied.

**Pilea** Lindley 1821 (CLEARWEED)

A genus of about 250 species, annual and perennial herbs, nearly cosmopolitan in tropical and warm temperate regions of the Old World and the New World. References: Boufford (1997) in FNA3 (1997); Floden & Engelhardt (2019); Friis in Kubitzki, Rohwer, & Bittrich (1993).

1 Leaf margins dentate; leaves 2-13 cm long, the 2 leaves of a pair equal in size.

..... **Pilea pumila**

1 Leaf margins entire; leaves 0.1-1.0 (-1.8) cm long, the 2 leaves of a pair slightly to strongly unequal in size.

..... **Pilea microphylla**

Pilea microphylla (Linnaeus) Liebm. ROCKWEED, ARTILLERYWEED. **Hab:** Marl prairies, hammocks, pine rocklands, old rock and brick walls, urban areas, hammocks, especially in thin soil over limestone. **Dist:** FL (perhaps more widespread as a native in the Southeastern US than just FL); West Indies; Mexico, Central America, and South America. Although listed by RAB for the Carolinas as "a weed in and around greenhouses, not established as part of our flora", this species is well-established and weedy in Charleston, SC and Savannah, GA. Native at least in FL, and perhaps further north, the original distribution unclear. **Phen:** Jan-Dec. **Syn:** = Ar, Bah, FNA3, K1, K3, K4, RAB, S, WH3; > *Pilea microphylla* var. *microphylla* – WI. **NatureServe G5TNR** (Not Yet Ranked).

Pilea pumila (Linnaeus) A. Gray. GREENFRUIT CLEARWEED, COOLWORT, RICHWEED. **Hab:** Swamp forests, bottomlands, freshwater marshes, tidal marshes, disturbed wet ground. **Dist:** QC west to MN, south to FL, LA, and OK. Sometimes considered to also occur in e. Asia, or these populations separated as *P. mongolica* Weddell, the course followed here. Additional study is needed. **Phen:** Aug-Sep (-Nov); Sep-Nov. **Syn:** = Ar, C, FNA3, G, GrPl, GW2, Il, K1, K3, K4, Mi, Pa, RAB, Tn, Va, W, WH3, WV; = *Pilea pumila* var. *pumila* – NE, NY; < *Adicea pumila* (Linnaeus) Rafinesque – S; > *Pilea pumila* var. *deamii* (Lunell) Fernald – F, K1, NcTx, Tx; > *Pilea pumila* var. *pumila* – F, K1, Tx.

**Urtica** Linnaeus 1753 (STINGING NETTLE)

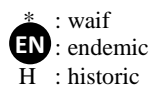

A genus of about 80 species, annual and perennial herbs, nearly cosmopolitan, but primarily in temperate regions of the Northern Hemisphere. References: Boufford (1997) in FNA3 (1997); Friis in Kubitzki, Rohwer, & Bittrich (1993); Grosse-Veldmann & Weigend (2017); Henning et al (2014); Woodland (1982); Woodland et al (1982).

1 Tap-rooted annual; stipules 1-3 mm long, spreading or deflexed; inflorescences usually shorter than the subtending leaf petiole, each panicle consisting of a mixture of pistillate and staminate flowers.

2 Flower clusters subglobose; mature achenes ovate, 1-1.5 mm long, < 1 mm wide; leaf teeth generally blunt, the sides of the tooth convex; [American clade] **Urtica chamaedryoides**

2 Flower clusters elongate; mature achenes triangular, 1.5-2.5 mm long, 1-1.5 mm wide; leaf teeth generally sharp, the sides of the tooth straight; [Urtica urens clade] **Urtica urens**

Key to Map
Symbology:

(see introduction for more)

151. URTICACEAE

- 1 Rhizomatous perennial; stipules 5-15 mm long, erect; inflorescences usually surpassing the subtending leaf petiole, each panicle of either pistillate or staminate flowers; [*Urtica dioica* clade].

..... *Urtica gracilis* ssp. *gracilis*

Urtica chamaedryoides Pursh. DWARF STINGING NETTLE, HEARTLEAF NETTLE, ORTIGUILLA. **Hab:** Rich moist soil, usually on floodplains. **Dist:** WV, KY, se. MO and OK south to FL, TX, and Mexico; very rare east of the Blue Ridge. Notable disjunct eastern locations include Stevens Creek (McCormick County, SC), Congaree Swamp (Richland County, SC), and various sites on very rich levees of the Roanoke River (NC). **Phen:** Sep-May; Nov-Jul. **Comm:** Gaddy & Rayner (1980) report the common winter flowering of this species in our area. **Syn:** = Ar, C, F, FNA3, G, GrPl, Il, K1, K3, K4, NcTx, NY, RAB, S, WH3, Grosse-Veldmann & Weigend (2017), Woodland (1982); > *Urtica chamaedryoides* var. *chamaedryoides* – Tx; > *Urtica chamaedryoides* Pursh var. *runyonii* Correll – Tx. **NatureServe G4G5** (Apparently Secure).

Urtica gracilis Aiton ssp. *gracilis*. AMERICAN STINGING NETTLE. **Hab:** Bottomland forests and edges, particularly over limestone or mafic rocks. **Dist:** NL (Labrador) and NS west to AK, south to sw. VA, w. NC, s. OH, s. IL, s. MO, n. TX, s. NM, and se. AZ. **Phen:** May-Jul; Jul-Sep. **Tax:** The native stinging nettle of North America is best treated as specifically distinct from *U. dioica* of Europe. Woodland (1982) and Woodland, Bassett, Crompton, & Forget (1982) showed that *U. gracilis* differs from *U. dioica* in a variety of morphologic characters (see key), chromosome number ($2n = 26$ for *U. gracilis*, $2n = 52$ for *U. dioica*), breeding system (monoecy vs. dioecy), and distribution (North American vs. Eurasian); furthermore, the two taxa could not be crossed. Woodland (1982) chose subspecific status, apparently to emphasize the close relationship of the two (and a third taxa in w. North America). The combination of morphological distinctiveness, allopatry, major differences in species biology, and incompatibility warrants separation as species. F (as *U. procera*), G (as *U. dioica* var. *procera*) and S include NC in the range; Woodland (1982), however, showed the range as extending only south to VA. Henning et al. (2014) further validate the idea that American "*U. dioica*" is specifically distinct from European *U. dioica*. **Syn:** = NY, Grosse-Veldmann & Weigend (2017), Henning et al (2014); = *Urtica dioica* Linnaeus ssp. *gracilis* (Aiton) Selander – FNA3, GrPl, K1, K3, K4, Mi, NE, Pa, Tn, Woodland (1982); = *Urtica dioica* Linnaeus var. *procera* (Muhlenberg ex Willdenow) Weddell – C, G; = *Urtica gracilis* Aiton – Ar, Il, S, Tx, Va, WV; < *Urtica dioica* – RAB, W; > *Urtica gracilis* Aiton – F; > *Urtica procera* Muhlenberg – F.

* ***Urtica urens*** Linnaeus. BURNING NETTLE, DOG-NETTLE, SMALL NETTLE. **Hab:** Disturbed areas. **Dist:** Native of Eurasia. **Phen:** Apr-May; May-Jul. **Syn:** = C, F, FNA3, G, Il, K1, K3, K4, Mi, NE, NY, Pa, RAB, S, Tx, WH3, WV, Grosse-Veldmann & Weigend (2017), Woodland (1982). **NatureServe GNR** (Not Yet Ranked).

153. FAGACEAE Dumortier 1829 (BEECH FAMILY) [in FAGALES]

A family of about 8 genera and 620-1050 species, trees and shrubs, mostly of the Northern Hemisphere, but extending into se. Asia and Australia. References: Elias (1971a); Govaerts & Frodin (1998); Kubitzki, Rohwer, & Bittrich (1993); Nixon (1997a) in FNA3 (1997).

- 1 Fruits partially enclosed in a scaly cup; leaves lobed, toothed, crenate, or entire..... *Quercus*
 1 Fruits enclosed in a spiny or prickly bur; leaves toothed.
 2 Nuts rounded or flattened on one or two sides; bur with long, straight spines; winter buds < 1 cm long; leaves elliptic or oblanceolate, some of them usually > 12 cm long..... *Castanea*
 2 Nuts sharply triangular; bur with short, recurved prickles; winter buds 1.5-2.5 cm long; leaves ovate, 6-12 cm long..... *Fagus*

Castanea P. Miller 1754 (CHESTNUT, CHINQUAPIN)

A genus of 8-10 species, trees and shrubs, of temperate regions of the Northern Hemisphere. References: Johnson (1988); Kubitzki, Rohwer, & Bittrich (1993); Nixon (1997a) in FNA3 (1997); Perkins et al (2021); Spriggs & Fertakos (2021); Stanford (1998).

- 1 Leaves elliptic to oblanceolate, mostly < 15 cm long, the apices acute to obtuse; twigs puberulent; spine-covered husk of fruit splitting into 2 sections, enclosing 1 nut; nut circular in cross-section, 7-19 mm in diameter; pistillate dichasia of 1 flower; leaves with stellate trichomes, with few bulbous-based trichomes when young, puberulent, pilose, tomentulose, or tomentose in age (usually rather densely so).
 2 Longest spines of the fruit husk usually > 10 mm long; young twigs glabrous; petiole 8-10 (-15) mm long; [plants of n. AL and westward]..... *Castanea ozarkensis*
 2 Longest spines of the fruit husk usually < 10 mm long; young twigs puberulent; petiole 3-7 (-10) mm long; [plants widespread in our area]..... *Castanea pumila*
 1 Leaves elliptic, oblanceolate or lanceolate, 8-30 cm long, the apices acuminate, sometimes only shortly so; spine-covered husk of fruit splitting into 4 sections, enclosing 1-3 (-5) nuts; nut flattened on at least one side, 18-30 mm in diameter; pistillate dichasia of 3 flowers; leaves with or without stellate trichomes; twigs puberulent or glabrous.
 3 Undersurface of leaves densely covered with bulbous-based trichomes when young, essentially glabrous in age; leaves mostly > 15 cm long, generally long-acuminate; twigs glabrous; trees single-trunked; spines of fruit husk weak, easily bent
 4 Leaf margins ciliate; young twigs glaucous; burs with 1 nut..... *Castanea alabamensis*
 4 Leaf margins not ciliate; young twigs glabrous (but not glaucous); burs with (2-) 3 (-5) nuts..... *Castanea dentata*

- 3 Undersurface of leaves persistently and densely tomentose beneath; leaves mostly < 15 cm long, generally short-acuminate; twigs puberulent; trees multi-trunked from base; spines of fruit husk stiff.

..... *Castanea mollissima*

Castanea alabamensis Ashe. ALABAMA CHINQUAPIN. **Hab:** Dry forests and woodlands. **Dist:** Endemic to nw. GA and n. AL (and perhaps e. MS). **Syn:** = S; < *Castanea ozarkensis* Ashe – FNA3, K4; < *Castanea pumila* (Linnaeus) P. Miller – K3.

Castanea dentata (Marshall) Borkhausen. AMERICAN CHESTNUT. **Hab:** Mesic and xeric forests. **Dist:** S. ME, s. ON, MI, c. IN, s. IL, south to c. NC, c. GA, Panhandle FL, and sc. MS. **Phen:** Jun-Jul; Sep-Oct. **Comm:** Formerly one of the most important, largest, and most abundant forest trees in the Mountains of our area, *C. dentata* was severely affected by chestnut blight, *Cryphonectria parasitica* (Murrill) Barr, introduced at New York City in 1904 on nursery stock of *C. mollissima*. Blight spread steadily southward, reaching our area in the 1920's and 1930's. *C. dentata* remains rather abundant, but now occurs only as stump sprouts and small trees, usually reinfected by blight persisting on oaks and killed at about the size of first fruit production. The accidental introduction of chestnut blight and the subsequent profound alteration of the role of chestnut is one of the most tragic ecological disasters to have affected our area. *Castanea × neglecta* Dode (pro sp.) [*C. dentata* × *pumila*], occurs in our area; "the leaves of the hybrid resemble those of *C. dentata* in size and shape but have the vestiture and stellate trichomes of *C. pumila*" (Johnson 1988). **Syn:** = C, F, FI2, FNA3, G, II, K1, K3, K4, Mi, NE, NY, Pa, RAB, S, Tn, Va, W, WH3, Johnson (1988). **NatureServe G3** (Vulnerable).

* *Castanea mollissima* Blume. CHINESE CHESTNUT. **Hab:** Forests. **Dist:** Native of China. This species is relatively resistant to chestnut blight and has been planted widely as an ornamental and nut tree; it sometimes naturalizes and appears nearly native. **Phen:** Jun-Jul; Sep. **Comm:** Reported for NC (Macon County) by Pittillo & Brown (1988). **Syn:** = Ar, C, FI2, FNA3, II, K1, K3, K4, Mi, NE, Pa, WH3. **NatureServe GNR** (Not Yet Ranked).

Castanea ozarkensis Ashe. OZARK CHINQUAPIN. **Hab:** Dry to dry-mesic upland woodlands and forests, bluffs, glade margins, usually in acid soils derived from sandstone or chert. **Dist:** S. MO, e. OK, and w. AR; disjunct in c. AL, where now apparently extirpated by blight. **Phen:** May-Jul; Sep-Oct. **Comm:** *C. ozarkensis* is related to *C. pumila*, though showing some relation as well to *C. dentata*. *C. ozarkensis* is more susceptible to blight than *C. pumila*. **Syn:** = S; = *Castanea pumila* P. Miller var. *ozarkensis* (Ashe) G.E. Tucker – Ar, K1, Johnson (1988); < *Castanea ozarkensis* Ashe – FNA3, K3, K4. **NatureServe G5T3** (Vulnerable).

Castanea pumila (Linnaeus) P. Miller. COMMON CHINQUAPIN. **Hab:** Xeric forests and woodlands, generally in fire-maintained habitats. **Dist:** NJ, s. PA, n. KY, and s. MO, south to c. peninsular FL and se. TX. **Phen:** May-Jul; Sep-Oct. **Tax:** Some of the taxa previously recognized at specific or varietal rank may indeed warrant taxonomic recognition, but results are preliminary (J. Shaw, pers. comm., 2019). **Comm:** It is relatively resistant to chestnut blight. Riley, Vincent, & Widrechner (2020) remove *C. pumila* from OH's flora. **Syn:** = FI2, FNA3, K3, K4, NE, NY, Pa, Tn, Va, WH3; = *Castanea pumila* var. *pumila* – Ar, C, K1, Johnson (1988); > *Castanea alnifolia* Nuttall – S; > *Castanea alnifolia* Nuttall var. *alnifolia* – RAB, Tx; > *Castanea alnifolia* Nuttall var. *floridana* Sargent – RAB, Tx; > *Castanea ashei* (Sudworth) Sudworth – S; > *Castanea floridana* (Sargent) Ashe – S; > *Castanea pumila* (Linnaeus) P. Miller – G, S, W; > *Castanea pumila* var. *ashei* Sudworth – F, RAB, Tx; > *Castanea pumila* (Linnaeus) P. Miller var. *margarettae* W.W. Ashe; > *Castanea pumila* var. *pumila* – F, RAB, Tx. **NatureServe G5T5?** (Secure).

Fagus Linnaeus 1753 (BEECH)

A genus of about 10 species, trees, of temperate regions of the Northern Hemisphere. Our native trees belong to subgenus *Fagus*, section *Grandifolia* (Shen 1992). References: Cooper & Mercer (1977); Elias (1971a); Govaerts & Frodin (1998); Kubitzki, Rohwer, & Bittrich (1993); Nixon (1997a) in FNA3 (1997); Shen (1992); Stanford (1998).

Fagus grandifolia Ehrhart var. *caroliniana* (Loudon) Fernald & Rehder. WHITE BEECH, AMERICAN BEECH. **Hab:** Moist forests, from near sea level to low elevations in the Mountains, mostly below 1050 meters (3500 feet). **Dist:** Se. MA, OH, IN, s. IL, s. MI (?), and MO south to Panhandle FL and e. TX. **Phen:** Mar-May; Sep-Oct. **Tax:** Several subspecies, varieties, or phases of *Fagus grandifolia* have been described, and their taxonomic recognition is controversial. The most recent monographer, Shen (1992), recognizes three subspecies, one of which is limited to Mexico, the other two as treated here but at the subspecific level. I have here chosen to recognize two intergradient varieties in our area. A third variety, var. *mexicana* (Martínez) Little, of the mountains of México, is apparently most closely related to var. *grandifolia*. Cooper & Mercer (1977) studied variation in NC, concluding that two genetic races or varieties were present, the montane var. *grandifolia* and the Piedmont and Coastal Plain var. *caroliniana*, but that patterns of variation were complicated. Hardin & Johnson (1985) and Hardin (1992, 1985) note that variation is "more-or-less" clinal, variation within populations is great, and they do not favor recognition of infraspecific taxa. Depending on one's tolerance or intolerance for intergradational varieties, one may choose to recognize one or two taxa in our area. **Syn:** = C, F, G, II, Tx, Elias (1971a); = *Fagus ferruginea* Aiton; = *Fagus grandifolia* ssp. *caroliniana* (Loudon) Camp ex Shen – Shen (1992), nomen nudum; < *Fagus grandifolia* – Ar, FNA3, K1, K3, K4, NE, NY, Pa, RAB, S, Tn, Va, W, WH3, WV, Cooper & Mercer (1977); < *Fagus grandifolia* ssp. *grandifolia* – Govaerts & Frodin (1998).

Quercus Linnaeus 1753 (OAK)

A genus of about 350-530 species, trees and shrubs, of temperate, subtropical, and rarely tropical regions of the Northern Hemisphere. Oaks are the predominant tree genus of our region, with a variety of species dominating much of the landscape in nearly every ecological situation. Only in a few specialized (and usually in some sense edaphically extreme) communities are oaks generally entirely absent: deepest Coastal Plain swamps, some Coastal Plain depression ponds, wettest pine savannas, pocosins, spruce-fir forests, highest elevation northern hardwood forests, and mountain bogs. Our native oaks are divided into three well-marked sections; other sections occur outside our area and two are present as naturalized introductions. North American red oaks (section *Lobatae* of subgenus *Quercus*) are characterized by acorns maturing in two years (in one year in *Q. elliotii*), styles elongate, abortive ovules are at the top of the seed, leaves and leaf lobes bristle-tipped, inner surface of the acorn shell velvety-pubescent, and acorns rooting in the spring. White oaks (section *Quercus* of subgenus *Quercus*) are characterized by acorns maturing in a single year, styles short or absent, abortive ovules at the base of the seed, leaves and leaf lobes not bristle-tipped, inner surface of the acorn shell smooth, and acorns rooting in the autumn. Nineteen of our *Quercus* species are in this group: *Q. alba*, *Q. austrina*, *Q. bicolor*, *Q. boyntonii*, *Q. chapmanii*, *Q. durandii* var. *breviloba*, *Q. durandii* var. *durandii*, *Q. lyrata*, *Q. macrocarpa* var. *macrocarpa*, *Q. margaretiae*, *Q. michauxii*, *Q. mohriana*, *Q. montana*, *Q. muehlenbergii*, *Q. oglethorpensis*, *Q. prinoides*, *Q. robur*, *Q. similis*, *Q. stellata*. The live oaks of the southeastern Coastal Plain, e. and c. TX, and Central America are section *Virentes* of subgenus *Quercus* (*Q. fusiformis*, *Q. geminata*, *Q. minima*, *Q. virginiana*). Hybrids within each section are frequent and diverse; hybrids do not naturally occur between the sections. References: Denk et al (2017); Duncan & Duncan (1988); Godfrey (1988); Hardin (1979b); Hunt (1990); Hunt (1994); Jensen in FNA (1997) in FNA3 (1997); Kubitzki, Rohwer, & Bittrich (1993); Manos & Hipp (2021); Mummaw (2018); Nixon & Muller (1997) in FNA3 (1997); Nixon in FNA (1997b) in FNA3 (1997); Stein, Binion, & Acciavatti (2003); Ward (2007d); Wilbur & Ho (2008); Wilbur (2002b).

Fifteen oak species in our area are typical of upland Coastal Plain communities with at least occasional fire: *Q. arkansana*, *Q. chapmanii*, *Q. geminata*, *Q. hemisphaerica*, *Q. incana*, *Q. laevis*, *Q. margaretiae*, *Q. marilandica* var. *ashei*, *Q. marilandica* var. *marilandica*, *Q. minima*, *Q. myrtifolia*, *Q. stellata*, and less typically *Q. falcata*, *Q. nigra*, *Q. velutina*, and *Q. virginiana*. Fire suppression of Coastal Plain communities, especially of longleaf pine sandhills, leads to an unnatural increase in the stature and abundance of oaks present. In frequent fire conditions, most oaks will persist as short, shrubby fire sprouts. Additional suggestions of how to recognize fire sprouts of these species are given below. In general, leaves of fire sprouts are larger and more deeply lobed than normal leaves. In species of the red oak group, the bristle tips are larger and more pronounced. Increased size in leaves is particularly noticeable when an area previously long fire-suppressed is burned (the large underground root system and nutritional resources of a small tree destroyed by fire being devoted to a few very vigorous sprouts). Fire sprouts are often in sunny conditions, which tend to make oak leaves more deeply lobed and more coriaceous than shaded leaves. White oaks with lobed leaves: *Q. margaretiae* – often forms dense clonal, stoloniferous patches in frequent fire conditions. Tends to retain standard leaf characteristics. *Q. stellata* – less prone to formal clonal patches. Sprout leaves often very large, with exaggerated lobing. Red oaks normally with deeply lobed leaves: *Q. laevis* – not clonal. Vigorous sprouter, leaves more deeply lobed than any other fire red oak. Small sprouts often have vertical leaf orientation characteristic of adults, though vigorous fire sprouts have more normally disposed leaves. Sprout leaves sometimes very large, with very long, curving lobes. *Q. falcata* – not clonal. Sprout leaves generally less lobed than typical adult leaves, more like forma triloba, but larger and coarser in texture, difficult to distinguish in shape from *Q. marilandica* var. *marilandica* and *Q. velutina*. See pubescence differences in main key. *Q. velutina* – not clonal. Leaves variable, sometimes minimally lobed and closely resembling *Q. marilandica* var. *marilandica* and *Q. falcata*. See pubescence differences in main key. Red oaks normally with unlobed leaves: *Q. marilandica* var. *marilandica* – sprout leaves sometimes coarsely (though never deeply) lobed. Texture often very coriaceous, shiny, and very stiff. See pubescence characters in main key. *Q. nigra* – not very typically in fire-prone situations, except as a weedy invader. Young saplings, as well as fire sprouts, often with wildly different leaves than the typical adult form, frequently deeply lobed (for excellent illustrations showing variability in leaf shapes, see p. 329 of Godfrey, 1988 and pp. 51-52 of Godfrey & Wooten, 1981). Leaves always smaller and more glabrous than those of other fire oaks (except *Q. hemisphaerica*). *Q. incana* – generally not strongly clonal and stoloniferous even in frequently burned situations; fire sprouts and vigorous shoots more prone to lobing than adult trees; even fire shoots, though, usually with only one to several lobes, and the characteristic bluish-green characteristic holds; see comments above on *Q. elliotii*. *Q. elliotii* – strongly clonal via a stoloniferous "runner", never treelike; leaves never lobed, even on fire sprouts, though fire sprout leaves can be larger (to 15 cm long and 5 cm wide); very difficult to tell from fire sprouts or seedlings of *Q. incana*, best separated by leaf pubescence (white in *Q. elliotii*, gray in *Q. incana*), margin (slightly revolute in *Q. elliotii*, flat in *Q. incana*), leaf veneration (planate in *Q. incana*, rolled in *Q. elliotii*), and acorn maturation (1 year in *Q. elliotii*, with acorns often on small plants, 2 years in *Q. incana*, with small plants rarely producing acorns). *Q. hemisphaerica* – not clonal; leaves of vigorous shoots and fire sprouts often shallowly lobed, the lobing usually fairly neat and regular, triangular-ascending, and with bristle tips. Live oaks: *Q. geminata* – sometimes clonal; leaves, even of sprouts, not normally with lobes or teeth. *Q. virginiana* – sometimes clonal; leaves of vigorous summer shoots (but apparently not spring shoots) often coarsely toothed, very similar to similar leaves of *Q. hemisphaerica*, but lacking bristle tips (instead the translucent margin with a darker, thickened callus at the tip of the tooth). *Q. minima* – always clonal; leaves often with teeth or lobes. Some oaks with ambiguous leaves are keyed in both Key A and Key D or in both Key B and Key C. The leaves of juvenile (seedling or sapling) branches, fire-sprout shoots, or other vigorous shoots (resulting from similar stimuli such as insect damage) are often much different than typical leaves and are not accounted for in these keys (see discussion at end of generic treatment). Hybrids are frequently encountered; they, too, are not keyed here, but can usually be identified (with difficulty) by their intermediate morphology and by parental context. Trichome types are useful in making and confirming identifications of oaks, since certain types are restricted to various groups of species. Hand lenses of 10× or 20× can be useful, but a dissecting scope with 20× to 40× dissecting microscope is far preferable. See Hardin (1992, 1976, 1979), and Thomson & Mohlenbrock (1979).

Identification Notes: Many oak species are well-adapted to ecological situations in which fires frequently burn the ground layer. Fire-maintained communities of the Piedmont and Mountains typically have oaks such as *Q. stellata*, *Q. marilandica* var. *marilandica*, *Q. ilicifolia*, and *Q. prinoides*. The two latter species are normally shrubby, and have become rarer because of fire suppression (they require fire to prevent larger trees from outcompeting them). In contrast, *Q. stellata* and *Q. marilandica* var. *marilandica* become larger and more frequent in fire-suppressed conditions.

 ? : questionable

- 1 Most of the leaves on a relatively mature tree entire and unlobed (some species frequently with some leaves on a tree, especially those on young or vigorous growth, that are toothed or shallowly lobed, the teeth or lobes generally few and irregular in size or location); [primarily either "laurel oaks" of section *Lobatae* or "live oaks" of section *Virentes*]..... **Key A**
- 1 Most of the leaves on a relatively mature tree lobed or toothed.
- 2 Venation of the leaves neatly and evenly pinnate, the 3-17 (or more) main lateral veins on each side distinctly parallel to each other, each ending in a tooth or shallow, crenate lobe extending $< \frac{1}{4}$ of the way to the midrib; ["chestnut oaks" of sections *Quercus*, *Cerris*, and *Cyclobalanopsis*] **Key B**
- 2 Venation of the leaves pinnate, but more branched and irregular, the 1-7 main lateral veins on each side rebranching into prominent side veins, the leaf usually distinctly lobed, at least some of the lobes of some of the leaves of a tree extending $> \frac{1}{4}$ of the way to the midrib.
- 3 Apices of the lobes or teeth obtuse (rarely acute), lacking bristle tips; scales of the acorn cup thickened and tuberculate, not obviously imbricate; ["white oaks" of section *Quercus*]..... **Key C**
- 3 Apices of the lobes or teeth acuminate (rarely acute), and with bristle tips; scales of the acorn cup flat and imbricate; ["red oaks" of section *Lobatae*]..... **Key D**

Key A - Leaves (most of them) entire and unlobed (Laurel Oaks and Live Oaks)

- 1 Leaves broadly obovate or spatulate, 1-2.5 (-3)× as long as wide.
- 2 Leaves 10-30 cm long, with rounded, subcordate, truncate, or oblique bases; lower leaf surfaces thinly to densely pubescent with tawny to orange glandlike hairs; [section *Lobatae*; subsection *Phellos*]..... *Quercus marilandica* var. *marilandica*
- 2 Leaves 2-10 (-15) cm long, mostly with cuneate or rounded bases (in some species sometimes subcordate, truncate, or oblique); lower leaf surfaces glabrous, glabrescent, or pubescent, but the pubescence not orange and glandlike.
- 5 Twigs of the current year densely and finely hairy, obscuring the surface; [scrubby trees of sandhills from se. SC southward to FL, west to s. AL]; [section *Quercus*; subsection *Stellatae*]..... *Quercus chapmanii*
- 5 Twigs of the year glabrous or sparsely pubescent; [shrubs, scrubby small trees, or large trees of various habitats, and collectively widespread in our area].
- 6 Leaves grayish beneath; [section *Quercus*; subsection *Stellatae*]..... *Quercus durandii* var. *durandii*
- 6 Leaves bright green or orange-scurfy beneath; [section *Lobatae*; subsection *Phellos*].
- 9 Leaves evergreen, (including the petiole) usually < 4 cm long (sometimes to 9 cm long) and < 2 cm wide (to 6 cm wide); lower leaf surface usually entirely glabrous at maturity (rarely with pubescence in the vein axils); leaf blades rarely lobed; [shrub to scrubby tree of sandhills in se. SC and southward]..... *Quercus myrtifolia*
- 9 Leaves deciduous, (including the petiole) usually > 5.5 cm long (rarely smaller) and usually 3-5 cm wide; lower leaf surface usually with tufts of hairs in the main vein axils beneath; leaf blades often lobed.
- 10 Leaves with broadly cuneate to rounded leaf bases, the blades 5-15 cm long; lower leaf surfaces generally pubescent across the surface, and also with tufts in the axils; [of sw. GA westward]..... *Quercus arkansana*
- 10 Leaves with cuneate bases, the blades 5-10 (-15) cm long; lower leaf surfaces glabrous, except for tufts of hairs in the vein axils; [widespread in our area]..... *Quercus nigra*
- 1 Leaves linear, elliptic, or narrowly obovate, 2-10× as long as wide.
- 11 Leaves (at maturity) glabrous or at most sparsely pubescent on the surface below, though often with tufts of hairs in the main vein axils.
- 12 Twigs of the year densely and finely hairy, obscuring the surface; leaves (at maturity) sparsely pubescent beneath; [scrubby trees of sandhills from se. SC south to FL, west to s. AL]; [section *Quercus*; subsection *Stellatae*]..... *Quercus chapmanii*
- 12 Twigs of the year glabrous or sparsely pubescent; leaves (at maturity) bright green and glabrous beneath, though often with tufts of hairs in the main vein axils; [medium to large trees, more widespread, mostly of moist habitats, except *Q. hemisphaerica*]; [section *Lobatae*; section *Phellos*].
- 13 Leaves predominantly lanceolate, mostly 6-12 cm long and 0.7-2 cm wide, most of them 5-8× as long as wide, the apex acute; mature leaves with tufts of hairs in the vein axils below, and sometimes also some pubescence on the blade surface near the midrib; blades never with lobes or teeth; leaves deciduous in autumn; young leaves bronze red, emerging tightly rolled lengthwise and appearing linear; [trees of bottomlands and upland depression swamps, mesic uplands, and also weedy and frequent in disturbed successional habitats]..... *Quercus phellos*
- 13 Leaves predominantly oblanceolate, obovate, or rhombic, mostly 2.5-10 cm long and 1.5-4 cm wide, most of them 2-5× as long as wide, the apex acute, obtuse, or rounded; mature leaves with or without tufts of hairs in the vein axils below, lacking pubescence on the blade surface; blades sometimes with 1-5 lateral lobes or teeth; leaves persisting until spring, or tardily and irregularly deciduous in winter; young leaves red, yellow, or green, not emerging tightly rolled lengthwise; [trees primarily either of swamp forests, maritime forests, or sandhills, not typically weedy].
- 14 Mature leaves entirely glabrous below; leaves mostly with acute apices and bristle tips (rarely a few rounded), mostly 2.5-8 cm long and 1-2 (-3) cm wide, the upper surface shiny, the vein network not readily visible when backlit; leaves evergreen (persisting until spring); petiole 0.5-2 mm long; leaves of vigorous growth often with dentate lobes; [trees of dry sandy habitats, such as sandhills, maritime forests, and dry hammocks]..... *Quercus hemisphaerica*
- 14 Mature leaves with tufts of stellate trichomes in the vein axils; leaves mostly with rounded apices (rarely a few acute and then bristle-tipped), mostly 5-10 cm long and (1.8-) 2-4 cm wide, the upper surface dull, the vein network readily visible when backlit; leaves tardily deciduous (at least northwards in the Southeast); petiole 2-6 mm long; leaves of vigorous growth rarely lobed, and then not dentate; [trees of moist habitats, such as floodplain forests, mesic slopes, and moist hammocks]..... *Quercus laurifolia*
- 11 Leaves (at maturity) persistently and densely pubescent on the surface below, the pubescence in some species so dense and tight as to be difficult to perceive without at least 10× magnification.
- 15 Leaves bristle-tipped (sometimes the bristle fallen or broken off, but leaving a truncate scar), deciduous in autumn; multi-armed trichomes of the rosulate or multiradiate types, many of the arms ascending or erect (never with the stellate or fused-stellate trichomes characteristic of the live oaks); acorns maturing in 2 years (immature acorns present through the winter on fruiting trees); [section *Lobatae*; subsection *Phellos*].
- 16 Leaves (including petiole) mostly 10-17 cm long, 3.5-7 cm wide; lower leaf surface (at maturity) sparsely to moderately densely pubescent with soft hairs; leaves lustrous dark-green above; [trees of the Mountains, Piedmont, and rarely Coastal Plain]..... *Quercus imbricaria*
- 16 Leaves (including petiole) mostly 4-11 cm long, 0.5-3.0 cm wide; lower leaf surface densely covered with soft hairs; leaves lustrous dark-green or bluish-green above; [stoloniferous shrubs and small to medium trees of the Coastal Plain].
- 17 Leaves 0.5-1.5 cm wide, mostly 4-8× as long as wide, lustrous dark-green above; acorns 8-12 mm long; petioles 1-3 mm long; [plant a stoloniferous shrub, to 1 m tall (or to 2 m in fire-suppressed pinelands)]..... *Quercus elliotii*
- 17 Leaves 1.5-3.0 cm wide, mostly 2-4× as long as wide, dull bluish-green above; acorns 10-15 mm long; petioles 4-15 mm long; [plant a small to medium tree]..... *Quercus incana*

N : no X : extirpated
P : planted
? : questionable

- 15 Leaves not bristle-tipped, evergreen (overwintering, falling with the expansion of new leaves in the spring) or deciduous (in *Q. oglethorpensis* and *Q. mohriana*); multi-armed trichomes of the fused-stellate and stellate types, the arms parallel to the leaf surface, radiating from a well developed disc that appears as a white eye or dot at 20-40× magnification (or rosulate or multiradiate in *Q. oglethorpensis* and *Q. mohriana*); acorns maturing in 1 year (immature acorns not present through the winter, unless aborted).
- 18 Stellate hairs of the leaf undersurfaces at least in part erect or semi-erect, sometimes also with appressed stellae; leaves either deciduous in autumn or evergreen to tardily deciduous; bark gray.
- *Quercus oglethorpensis*
- 18 Stellate hairs of the leaf undersurfaces appressed to the surface; leaves evergreen (overwintering, falling with the expansion of new leaves in the spring); bark (on the tree species) brownish, deeply furrowed; [trees and stoloniferous shrubs either of sandy habitats of the Coastal Plain of GA, NC, SC, and VA or of rocky limestone areas of c. OK and c. TX]; [section *Virentes*].
- 20 Plant a stoloniferous shrub, to 1 m tall (or to 2 m in fire-suppressed pinelands) and producing acorns at that size..... *Quercus minima*
- 20 Plant a small to large tree, not producing acorns until >2m tall.
- 21 Leaf blades with the margins strongly revolute, and also the sides of the blades generally rolled downward and obscuring part of the lower surface, the leaf appearing boatlike (the depth of the "boat" often approaching the width of the leaf); midvein and major lateral veins impressed on the upper surface and raised on the lower surface (the lower surface therefore appearing rugose); buds dark brown; cup scales gray-tipped; pubescence of the lower surface stellate, both appressed and erect, the individual stellae readily visible at 20× magnification (sometimes at 10× magnification); acorns (1-) 2 (-6) per stalk; [typically a small tree of dry sands] *Quercus geminata*
- 21 Leaf blades flat, or the margins slightly to strongly revolute, the sides of the blade sometimes rolled downward, usually not obscuring part of the lower surface, the leaf not boatlike (the leaf much wider than deep); midvein and major lateral veins not impressed (or very slightly so) on the upper surface and only very slightly, if at all, raised on the lower surface (the lower surface therefore not appearing notably rugose); buds red-brown; cup scales red-tipped; pubescence of the lower surface stellate, all of it tightly appressed, the individual stellae readily visible only at 30× magnification (sometimes barely distinguishable at 20× magnification); acorns 1-2 per stalk.
- *Quercus virginiana*

Key B - Leaves with even crenations or teeth (Chestnut Oaks)

- 3 Scales of the acorn cup prolonged and long tapered; lateral veins terminating in a well-developed bristle; [species planted, and naturalizing]; [section *Cerris*; "East Asia group"] *Quercus acutissima*
- 3 Scales of the acorn cup acute to obtuse; lateral veins terminating in a minute mucro or hardened projection; [species native]; [section *Quercus*].
- 5 Leaves mostly obovate (but sometimes narrower and broadest near the middle of the leaf blade or towards the base, especially on sun leaves), with rounded teeth (crenations), the teeth sometimes with a minute mucro; hairs of the leaf undersurface clustered in sessile, stellate-appearing clusters of 2-8 hairs; acorns 2.5-3.5 cm long; large trees; [section *Quercus*; subsection *Albae*].
- 6 Hairs of the leaf undersurface in clusters with a diameter of 0.15-0.5 mm, dense to sparse; bark of mature trees light gray, loose, breaking into plates or scales.
- *Quercus michauxii*
- 6 Hairs of the leaf undersurface asymmetric, appressed-stellate, with a diameter of 0.1-0.25 mm, sparse; bark of mature trees dark gray, tight, deeply furrowed ..
- *Quercus montana*
- 5 Leaves mostly narrowly elliptic, narrowly ovate, or narrowly obovate (but sometimes broadly obovate), with sharp ascending, often incurved teeth, the teeth ending in a hardened projection; hairs of the leaf undersurface tiny and stellate, with 6-10 rays parallel to the leaf surface; acorns 1-2 cm long; medium to large trees or stoloniferous shrubs; [section *Quercus*; subsection *Prinoideae*].
- 7 Medium to large tree; veins ending in teeth usually 7-13 on each side of the leaf; leaves 8-20 cm long and 4-10 cm wide; [dry to moist calcareous woodlands and forests]..... *Quercus muehlenbergii*
- 7 Stoloniferous shrub to 5 m tall; veins ending in teeth usually 3-8 (-9) on each side of the leaf; leaves 4-10 (-14) cm long and 2-6 (-8) cm wide; [dry, often sandy and acid woodlands] *Quercus prinoides*

Key C - Leaves with lobes not bristle-tipped (White Oaks)

- 1 Lower surfaces of mature leaves glabrous.
- 2 Leaf lobes with acute apices; sinuses often both broad and "flat-bottomed" (with portions parallel to the midrib); acorn cup covering 2/3 to 3/4 of acorn; [section *Quercus*; subsection *Prinoideae*]..... *Quercus lyrata*
- 2 Leaf lobes with obtuse apices; sinuses narrow (often notch-like), narrowly to broadly rounded or triangular (lacking portions parallel to the midrib); acorn cup covering < 1/4 to 1/2 of acorn.
- 3 Leaves mostly 4-10 (-17) cm long, 2-5 (-9) cm wide, with 1-5 shallow lobes or undulations, extending 1/8 to 1/2 of the way to the midrib; acorn cup flat at the base, covering < 1/4 of the acorn; [section *Quercus*; subsection *Stellatae*].
- *Quercus durandii* var. *durandii*
- 3 Leaves mostly 7-20 cm long, 3-10 cm wide, with 3-11 lobes, extending 1/4 to 5/6 of the way to the midrib (if the lobing < 1/2 of the way to the midrib, then the acorn cup rounded at the base and covering 1/4 to 1/2 of the acorn).
- 6 Leaves with 7-11 lobes (the sinuses usually deep, those of the larger leaves usually about 2/3 to 5/6 of the way to the midrib), 10-20 cm long, 5-10 cm wide; terminal bud rounded or globose; basal scales of acorn cup thickened, the thickening giving the cup a knobby texture; [section *Quercus*; subsection *Albae*] *Quercus alba*
- 6 Leaves with 3-7 lobes (the sinuses usually shallow, those of the larger leaves usually ranging from 1/4 to 1/2 of the way to the midrib), 7-15 cm long, 3-8 cm wide; basal scales of the acorn cup thin, appressed, the cup having a rough but not knobby texture; [section *Quercus*; subsection *Stellatae*] *Quercus austrina*
- 1 Lower surfaces of mature leaves pubescent, the pubescence varying from dense to sparse (sometimes minute and requiring 10× magnification to be readily visible).
- 7 Lower surfaces of mature leaves whitish to pale green, with a mixture of minute, sessile, stellate hairs with horizontal tips and longer stellate hairs with erect ascending tips; leaves shallowly lobed (if so, the lobes 9-19) to deeply lobed (if so, the lobes with acute apices), the sinuses extending 1/4 to 4/5 of the way to the midrib; [section *Quercus*; subsection *Prinoideae*].
- 9 Upper scales of the acorn cups thin and acute; acorn cup covering 1/2 to 3/4 of the acorn; [swamps in the Coastal Plain and lower Piedmont of GA, NC, SC, and VA] *Quercus lyrata*
- 9 Upper scales of the acorn cups long-attenuate into nearly terete awns; acorn cup covering 1/3 to 1/2 of the acorn; [Mountains of VA] *Quercus macrocarpa* var. *macrocarpa*

Key to Map
Symbology:

←rare ←uncommon ←common
(see introduction for more)

* : waif
EN : endemic
H : historic

N : no X : extirpated
P : planted
? : questionable

- 7 Lower surfaces of mature leaves gray, green, pale green, or yellowish, glabrescent or densely pubescent, the hairs few-branched and erect; leaves mostly relatively deeply and obtusely lobed, rarely shallowly lobed (if so, the lobes 3-7), the sinuses extending 1/2 to 4/5 of the way to the midrib, the total number of lobes 3-7; acorns sessile or nearly so.
- 10 Leaf lobes with acute apices; acorn cup covering 2/3 to 3/4 of acorn; [section *Quercus*; subsection *Prinoideae*] *Quercus lyrata*
- 10 Leaf lobes with obtuse to rounded apices; acorn cup covering 1/3 to 1/2 of acorn; [section *Quercus*; subsection *Stellatae*].
- 11 Woody twigs of the season glabrous or with scattered, deciduous 2-forked hairs; petioles of mature leaves 3-10 (-15) mm long; leaf blades (2.5-) 4-8 (-13.5) cm long, irregularly and often rather shallowly 3-5 (-7) lobed, the overall form of the leaf only rarely cruciform; largest lateral lobes usually at the midpoint of the blade (or even below it), the lobes usually not sublobed, tapering from base to tip; [xeric sandy sites in the Coastal Plain from se. VA southwards to c. peninsular and westwards to c. OK and c. TX] *Quercus margaretae*
- 11 Woody twigs of the season densely and persistently stellate-pubescent, especially toward the tip of the twig; petioles of mature leaves 15-20 mm long (*Q. stellata*) or 3-10 (-15) mm long (*Q. boyntonii* and *Q. similis*); leaf blades (5-) 7.5-15 (-20) cm long, usually 5-lobed, the overall form of the leaf typically cruciform (*Q. stellata*) or not (*Q. boyntonii* and *Q. similis*); largest lateral lobes of the leaves usually above the midpoint of the blade, these lobes either often sublobed or squarish in shape, usually wider near their tips than at their bases (*Q. stellata*) or not sublobed, tapering from base to tip (*Q. boyntonii* and *Q. similis*); [collectively widespread in our area].
- 12 Leaves usually cruciform, the largest lateral lobes often sublobed or squarish in shape, usually wider near their tips than at their bases, and borne at right angles to the midrib; upper leaf blade surface glabrous; [usually of dry to dry-mesic upland situations, widespread in our area] *Quercus stellata*
- 12 Leaves not cruciform, the largest lateral lobes usually not sublobed, the lobes tapering from base to tip, and borne at ascending angles relative to the midrib; upper leaf blade surface at least sparsely stellate-puberulent (even late into the season); [of temporarily flooded calcareous swamps of the Coastal Plain, from SC (NC?) southward and westward (*Q. similis*) or localized on sandstone in nc. AL (*Q. boyntonii*)]. *Quercus similis*

Key D - Leaves with lobes or teeth bristle-tipped (Red Oaks)

- 1 Leaves shallowly 3-lobed near the broad apex (some leaves of sprout or juvenile shoots may be more lobed); [section *Lobatae*; subsection *Phellos*].
- 2 Leaf blades 5-15 cm long; lower leaf surfaces glabrous, except for tufts of hairs in the vein axils (or pubescent across the surface in *Q. arkansana*).
- 3 Leaves with broadly cuneate to rounded leaf bases, the blades 5-15 cm long; lower leaf surfaces generally pubescent across the surface, and also with tufts in the axils; [of sw. GA westward] *Quercus arkansana*
- 3 Leaves with cuneate bases, the blades 5-10 (-15) cm long; lower leaf surfaces glabrous, except for tufts of hairs in the vein axils; [widespread in our area] *Quercus nigra*
- 2 Leaf blades 10-30 cm long; lower leaf surfaces pubescent across the surface (and often also with denser tufts of hairs in the vein axils).
- 4 Petioles short and stout, 5-15 mm long; lower leaf surfaces thinly to densely pubescent with a mixture of tawny or orange glandlike hairs and stellate hairs whose structure is easily visible at 10× magnification *Quercus marilandica* var. *marilandica*
- 4 Petioles long and slender, (14-) 20-50 mm long; lower leaf surfaces densely puberulent with tawny stellate hairs whose structure is barely visible at 10× magnification *Quercus falcata*
- 1 Leaves shallowly to deeply 5-12-lobed (some of the leaves of *Q. georgiana* only 3-lobed), the lobes primarily lateral.
- 6 Mature leaves pubescent beneath on the surface with stellate hairs.
- 8 Petioles 0.5-1.0 (-1.8) cm long, generally twisted such that the blade is oriented in a vertical plane; leaves all deeply lobed, some of the sinuses extending > 4/5 of the way to the midrib; pubescence of the lower leaf surface greenish yellow, matted, and glandlike, usually sloughing off by late in the year; [section *Lobatae*; subsection *Phellos*] *Quercus laevis*
- 8 Petioles 2-5 cm long, not twisted so that the blade is oriented in a vertical plane; leaves shallowly to deeply lobed, some of the leaves on a tree generally shallowly lobed, none of the sinuses extending > 2/3 of the way to the midrib; pubescence of the lower leaf surface tawny or gray, stellate, not glandlike, persistent or sloughing off by late in the year.
- 9 Acorns 12-20 mm long, in a cup 15-25 mm across and 10-12 mm deep; mature leaves loosely and rather coarsely pubescent (the stellate hairs conspicuous and readily distinguishable at 10× magnification), often becoming nearly or entirely glabrous by late in the year (except for tufts of hairs in the vein axils); terminal bud 4-angled, 7-10 mm long, densely gray-tomentose; [section *Lobatae*; subsection *Coccineae*] *Quercus velutina*
- 9 Acorns 10-15 mm long, in a cup 12-14 mm across and 4-5 mm deep; mature leaves densely and finely pubescent (the stellate hairs minute and scarcely distinguishable at 10× magnification), the pubescence permanent; terminal bud only obscurely angled (if at all), 5-8 mm long, brown-puberulent; [section *Lobatae*; subsection *Phellos*].
- 10 Base of blades of sun-leaves typically rounded, thus forming a U-shape (some leaves cuneate, angled, or oblique); terminal lobe of leaves generally long-attenuated, narrow (its sides nearly parallel for much of its length), and curved to one side (falcate) (note that trees with the trilobed leaf form will key out above); leaves with 3-7 well-developed lobes, these often very irregular in size, shape, spacing, and orientation; pubescence of lower leaf surface normally tawny (when fresh) *Quercus falcata*
- 10 Base of blades of sun-leaves typically cuneate or angled, thus forming a V-shape (some leaves somewhat U-shaped or oblique); terminal lobe of leaves generally short, broadly triangular (its sides normally tapering toward the tip for most of their length), not strongly curved to one side; leaves with 5-9 well-developed lobes, these generally rather uniform in size, shape, spacing, and orientation; pubescence of leaf surface gray *Quercus pagoda*
- 6 Mature leaves glabrous beneath on the surface, with tufts of hairs in the main vein axils beneath.
- 11 Petioles 0.5-1.0 (-1.8) cm long, generally twisted such that the blade is oriented in a vertical plane; inner cup-scales of the acorn cup inflexed, thus the cup appearing to have a broadly rounded rim; [section *Lobatae*; subsection *Phellos*] *Quercus laevis*
- 11 Petioles 2.0-7 cm long, not twisted so that the blade is oriented in a vertical plane; inner cup-scales of the acorn cup not inflexed, thus the cup appearing to have a sharp rim appressed against the acorn.
- 12 Terminal buds 4-angled, 7-10 mm long, the bud scales densely gray-tomentose; [section *Lobatae*; subsection *Coccineae*] *Quercus velutina*
- 12 Terminal buds not 4-angled, 3-5 (-7) mm long, the bud scales glabrous or with ciliate margins.
- 13 Leaves relatively shallowly lobed, the sinuses extending up to 2/3 of the way to the midrib; upper leaf surface dull, not lustrous; [section *Lobatae*; subsection *Coccineae*] *Quercus rubra* var. *rubra*
- 13 Leaves relatively deeply lobed, the sinuses extending 2/3 to 9/10 of the way to the midrib; upper leaf surface lustrous.
- 16 Terminal bud moderately to strongly silver or reddish pubescent in its upper half; [section *Lobatae*; subsection *Coccineae*] *Quercus coccinea*
- 16 Terminal bud glabrous or with a few scattered hairs.

Key to Map

(see introduction for more)

N : no X : extirpated
P : planted
? : questionable

- 19 Primary leaf lobes (and the secondary veins leading to them) largely alternate; acorn cup with thin (< 1.5 mm in cross section) walls, deeply goblet-shaped, covering 1/3-1/2 of the nut, the inner surface pubescent; [section *Lobatae*; subsection *Palustres*]..... *Quercus texana*
- 19 Primary leaf lobes (and the secondary veins leading to them) opposite or sub-opposite; acorn cup with thick (> 1.5 mm in cross section) walls, saucer- or cup-shaped, covering 1/4-1/3 of the nut, inner surface glabrous or with ring of hairs around scar.
- 22 Nuts (8-) 10-14 (-16) mm long; mature leaf blades mostly 7-12 cm long, 5-11 cm wide (averaging about 9 cm long and 8 cm wide), with 5-7 lobes; [section *Lobatae*; subsection *Palustres*]..... *Quercus palustris*
- 22 Nuts 14-30 mm long; mature leaf blades mostly (7.5-) 10-20 cm long, 6-15 cm wide (averaging about 13 cm long and 11 cm wide), with (5-) 7-9 (-11) lobes; [section *Lobatae*; subsection *Coccineae*]..... *Quercus shumardii*

* *Quercus acutissima* Carruthers. SAWTOOTH OAK. **Hab:** Commonly cultivated as a suburban street tree and also widely planted in 'wildlife food plots', rarely naturalizing. **Dist:** Native of Japan. This species has been a popular recommendation for 'wildlife plantings' in the recent past, and entire stands can be encountered in relatively remote areas, planted by federal and state land management agencies; why 'wildlife' species in our area need more oak trees is somewhat mystifying! **Comm:** See Whittemore (2004) for additional information. Spreading from plantings in Knoxville, TN (D. Estes, pers. comm., 2007). **Syn:** = Ar, Il, K1, K3, K4, Pa, Va; ? *Quercus acutissima* ssp. *acutissima*. NatureServe GNR (Not Yet Ranked).

Quercus alba Linnaeus. WHITE OAK. **Hab:** Mesic to xeric forests. **Dist:** ME west to MN, south to Panhandle FL and e. TX. **Phen:** Apr; Sep-Nov (of the same year). **Tax:** Hardin (1975) discusses introgression between *Q. alba* and many other species of *Quercus* subgenus *Quercus*. **Comm:** Historically, one of the most valuable timber trees of eastern North America. *Q. alba* is probably the most abundant native plant in our area, and in eastern North America, based on biomass, leaf area, and ubiquity. **Syn:** = Ar, C, F, FI2, FNA3, G, GrPl, Il, K1, K3, K4, Mi, NcTx, NcTx, NE, NY, Pa, RAB, Tn, Tx, Va, W, WH3, WV; < *Quercus alba* Linnaeus – S.

Quercus arkansana Sargent. ARKANSAS OAK. **Hab:** Dry bluffs. **Dist:** Sw. and wc. GA and Panhandle FL west in a fragmented distribution to sw. AR and e. TX. **Syn:** = Ar, FI2, FNA3, K1, K3, K4, S, WH3; > *Quercus caput-rivuli* Ashe. NatureServe G3 (Vulnerable).

Quercus austrina Small. BLUFF OAK. **Hab:** River bluffs, mesic hammocks, dry hammocks, natural levees of brownwater rivers, over mafic rocks, on shell or calcareous sediments. **Dist:** Essentially a Southeastern Coastal Plain endemic: se. NC south to n. FL and west to MS, and apparently disjunct in sw. AR. **Phen:** Apr; Oct (of the same year). **Syn:** = Ar, FI2, FNA3, K1, K3, K4, RAB, WH3; < *Quercus alba* Linnaeus – S.

Quercus chapmanii Sargent. CHAPMAN OAK. **Hab:** Dry pinelands, longleaf sandhills, scrubby flatwoods, Florida scrub. **Dist:** A Southeastern Coastal Plain endemic: se. SC south to s. FL, west to sw. AL. **Phen:** Feb-Mar; Sep-Nov (of the same year). **Syn:** = FI2, FNA3, K1, K3, K4, RAB, S, WH3. NatureServe G4G5 (Apparently Secure).

E. and se. Asia

Quercus coccinea Münchhausen. SCARLET OAK. **Hab:** Xeric upland forests. **Dist:** Centered in the Appalachians, from s. ME south to c. AL, but ranging west to MS, ne. AR (Crowleys Ridge), s. IL, and s. MI. **Phen:** Apr-May; Sep-Nov (of the second year). **Syn:** = Ar, C, F, FNA3, G, Il, K3, K4, NE, NY, Pa, RAB, S, Tn, Va, W, WV; > *Quercus coccinea* var. *coccinea* – K1; > *Quercus coccinea* var. *tuberculata* Sargent – K1.

Quercus durandii Buckley var. *durandii*. DURAND'S OAK, BASTARD OAK, DURAND'S WHITE OAK. **Hab:** Calcareous bluffs, glades, prairies, ravines, hardwood flatwoods, bottomland forests. **Dist:** Se. SC south to FL Panhandle, west to e. TX and sw. AR. **Phen:** Apr-May; Sep-Nov (of the same year). **Tax:** The name *Q. sinuata* was interpreted by Ward (2007d) as most likely to apply to the hybrid *Q. falcata* × *phellos*, and he neotypified the name based on that basis. **Syn:** = *Quercus sinuata* Walter var. *sinuata* – FNA3, K1, K3, K4, NcTx, Tx; > *Quercus durandii* Buckley – RAB, S; < *Quercus sinuata* – Ar. NatureServe G4G5T4 (Apparently Secure).

Quercus elliotii Wilbur. RUNNING OAK. **Hab:** Pine flatwoods, especially on loamy soils in the Middle Coastal Plain, pine rocklands. **Dist:** A Southeastern Coastal Plain endemic: se. NC south to s. FL and west to s. MS. **Phen:** Mar-Apr; Sep (of the first year). **Tax:** Wilbur (2002b) and Wilbur & Ho (2008) discussed the reasons for rejecting the traditional use of *Q. pumila* for this species; Walter's diagnosis stated that *Q. pumila* has leaves that are glabrous and glaucous below, ruling out application to this species. Ward (2007d) disagreed and defended the traditional usage. **Syn:** = K3, K4, Wilbur & Ho (2008), Wilbur (2002b); = *Quercus pumila* Walter – FI2, FNA3, K1, RAB, S, WH3, Hunt (1990), Ward (2007d), misapplied. NatureServe G3G5 (Apparently Secure).

Quercus falcata Michaux. SPANISH OAK, SOUTHERN RED OAK. **Hab:** Upland forests, usually xeric or submesic, but occasionally in mesic situations. **Dist:** Widespread in se. North America, north to e. OK, s. MO, s. IL, s. IN, s. OH, WV, se. PA, NJ, and reported (apparently without specimen documentation) from Long Island, NY. **Phen:** Apr-May; Sep-Nov (of the second year). **Comm:** "*Q. triloba* Michaux", the form with the leaves only shallowly trilobed at the apex, can cause confusion. Though even medium-sized trees sometimes have leaves only of this form (rather than the typical form, deeply 5-7-lobed, the terminal lobe long-attenuate and falcate), it has no taxonomic merit. **Syn:** = Ar, C, FI2, FNA3, Il, K1, K3, K4, NcTx, Pa, Tn, Va, W, WH3, WV; = *Quercus falcata* var. *falcata* – G, GW2, RAB; = *Quercus rubra* – S, misapplied; ? *Quercus digitata* Sudworth; < *Quercus falcata* Michaux – Tx; > *Quercus falcata* var. *falcata* – F; > *Quercus falcata* var. *triloba* (Michaux) Nuttall – F; > *Quercus triloba* Michaux.

Quercus geminata Small. SAND LIVE OAK. **Hab:** Xeric sandhills (northward restricted to areas very near the coast), Florida scrub, coastal dry hammocks. **Dist:** A Southeastern Coastal Plain endemic: se. NC south to s. FL, and west to s. MS. **Phen:** Apr; Sep-Nov (of the same year). **Comm:** The alleged occurrence of *Q. geminata* as far north as se. VA is apparently based on ambiguous specimens that probably are only *Q. virginiana* (the so-called var. *maritima*). A careful study of the genetics, morphology, and ecology of *Q. geminata* and *Q. virginiana* supports their recognition as separate species (Cavender-Bares & Pahlisch 2009). *Q. geminata* flowers about 2-3 weeks later than *Q. virginiana* when growing in close proximity. **Syn:** = FI2, FNA3, GW2, K1, K3, S, WH3; < *Quercus virginiana* P. Miller – RAB.

Quercus hemisphaerica Bartram ex Willdenow. SAND LAUREL OAK, DARLINGTON OAK. **Hab:** Longleaf pine sandhills, dry hammocks, and other dry, sandy soils, a component of maritime forests with *Q. virginiana*, and widely planted as a street tree in most parts of our region. **Dist:** Essentially a Southeastern Coastal Plain endemic: se. VA south to c. FL and west to s. TX, north uncommonly in the interior to nc. AL, n. MS, and s. AR. **Phen:** Mar-Apr; Sep-Nov (of the second year). **Comm:** Often confused with *Q. laurifolia* (see the key for distinctions). *Q. hemisphaerica* is the semi-evergreen laurel oak planted widely as a street tree in southern cities, often intermixed with the strictly deciduous *Q. phellos*. **Syn:** = Ar, C, F, FNA3, K3, K4, Tx, Va, Hunt (1990); = *Quercus laurifolia* Michaux – S, misapplied; > *Quercus hemisphaerica* var. *hemisphaerica* – K1; > *Quercus hemisphaerica* var. *maritima* (Michaux) Muller – K1; < *Quercus laurifolia* Michaux – F12, RAB, WH3.

Quercus imbricaria Michaux. SHINGLE OAK. **Hab:** Rich soils of upper floodplains of rivers and creeks, often at the base of the slope into the upland, also on lower slopes, upland depression swamps, and in drier forests over diabase, limestone, or other calcareous or mafic claypan soils, rarely extending to 5100 feet elevation. **Dist:** Primarily midwestern, ranging from NJ, PA, n. OH, s. MI, n. IL, and c. IA, south to e. VA, nc. and w. NC, sc. TN, n. AL, and n. AR. **Phen:** Apr-May; Oct (of the second year). **Syn:** = Ar, C, F, FNA3, G, GrPl, II, K1, K3, K4, Mi, NE, NY, Pa, RAB, S, Tn, Va, W, WV, Hunt (1990). NatureServe G5 (Secure).

Quercus incana Bartram. BLUEJACK OAK. **Hab:** Sandhills, primarily in somewhat loamier textured, submesic soils, inland from the Coastal Plain on coarse sandy alluvium or upland ridges over quartzite or other acidic rocks. **Dist:** Primarily a species of the Southeastern Coastal Plain, but rarely extending inland into the Piedmont (especially on coarse sandy alluvium): se. VA south to c. peninsular FL and west to e. TX, sw. AR, and se. OK. **Phen:** Apr; Sep-Nov (of the second year). **ID Notes:** This oak is recognizable even at a distance by its bluish color. **Syn:** = Ar, F, F12, FNA3, K1, K3, K4, NcTx, RAB, Va, WH3, Hunt (1990); = *Quercus cinerea* Michaux – C, G, S; ? *Quercus humilis* Walter. NatureServe G5 (Secure).

Quercus laevis Walter. TURKEY OAK. **Hab:** Longleaf pine sandhills, primarily in very xeric soils of deep sandy deposits (Carolina bay rims, old beach dunes, early Cenozoic deposits of the Sandhills Province), or inland from the Coastal Plain on dry ridges and slopes over quartzite or other acidic rock types. **Dist:** Essentially a Southeastern Coastal Plain endemic: se. VA south to s. FL and west to e. LA. **Phen:** Apr; Sep-Oct (of the second year). **Comm:** The leaves turn an intense orange-red in the autumn (Nov). **Syn:** = C, F, F12, FNA3, G, K1, K3, K4, RAB, S, Va, WH3, Hunt (1990); = *Quercus catesbaei* Michaux. NatureServe G5 (Secure).

Quercus laurifolia Michaux. LAUREL OAK. **Hab:** Mesic to seasonally flooded soils of floodplains, also (rarely) mesic slopes and swamps in maritime forests. **Dist:** A Southeastern Coastal Plain endemic: se. VA south to s. FL and west to e. TX and s. AR. **Phen:** Mar-Apr; Sep-Nov (of the second year). **ID Notes:** Sometimes confused with *Q. hemisphaerica*, but (in addition to the key characters above) *Q. laurifolia* has blunter leaf tips, flowers about 2 weeks earlier, and generally occupies much moister habitats. **Syn:** = Ar, C, F, FNA3, G, GW2, K1, K3, K4, Tx, Va, Hunt (1990); = *Quercus obtusa* (Willdenow) Ashe – S; < *Quercus laurifolia* Michaux – F12, RAB, WH3.

Quercus lyrata Walter. OVERCUP OAK. **Hab:** Seasonally rather deeply and frequently flooded soils of floodplains of the Coastal Plain, less commonly in seasonally flooded swamps in Triassic basins in the lower Piedmont, and rarely in upland depression swamps of the Piedmont (developed over clays weathered from mafic rocks) and Coastal Plain. **Dist:** Primarily a species of the Southeastern Coastal Plain: DE south to Panhandle FL, west to e. TX and se. OK, north in the inland to w. TN, s. IN, s. IL, and se. MO. **Phen:** Mar-May; Sep-Oct (of the same year). **Comm:** Of our oaks, *Q. lyrata* tolerates the wettest habitats, both in terms of depth and duration of flooding. **Syn:** = Ar, C, F, F12, FNA3, G, GW2, II, K1, K3, K4, NcTx, RAB, S, Tn, Tx, Va, WH3. NatureServe G5 (Secure).

Quercus macrocarpa Michaux var. *macrocarpa*. BUR OAK, MOSSY CUP OAK. **Hab:** Rich bottomland forests, sometimes in drier forests, woodlands, oak savannas, and prairie edges, and then usually over limestone or other calcareous rocks. **Dist:** NB and QC west to s. MB, south to nw. VA, KY, TN, LA, and TX. **Phen:** Mar-May; Sep-Oct (of the same year). **Comm:** Variation in this species needs additional study; *Q. macrocarpa* in our area is the typical variety or subspecies if other taxa are recognized. **Syn:** = GrPl, K1, K3, K4; < *Quercus macrocarpa* – Ar, C, F, FNA3, G, GW2, II, Mi, NcTx, NE, NY, Pa, S, Tn, Tx, Va, W, WV. NatureServe G5T5 (Secure).

Quercus margaretiae Ashe ex Small. SAND POST OAK, MARGARET'S OAK. **Hab:** Longleaf pine sandhills, typically in slightly loamy or clayey soils, not usual in the deepest and most xeric sands; outside of the distribution of *Pinus palustris*, in deep sandy, loamy, or rocky sites; also dry bluff forests. **Dist:** Primarily a species of the Southeastern Coastal Plain: se. VA south to FL and west to c. TX and OK. **Phen:** Apr; Sep-Nov (of the same year). **Tax:** As stated by Fernald (1950), this oak was "chivalrously named [by W.W. Ashe] in 1903 for Margaret Henry Wilcox, who two years later became Mrs. Ashe". There has been controversy, however, over the spelling of the specific epithet; it should be corrected to '*margaretiae*' (Weakley & McCormick 2020). **Syn:** *Quercus margareta* – Ar, orthographic variant; = *Quercus margareta* – C, FNA3, G, RAB, S, Tn, WH3, orthographic variant; = *Quercus margaretae* Ashe ex Small – F12, K3, K4, Va, orthographic variant; = *Quercus margarettiae* Ashe ex Small – K1, NcTx, orthographic variant; = *Quercus stellata* var. *margareta* (Ashe ex Small) Sargent – F, GrPl, orthographic variant; > *Quercus drummondii* Liebmann – Tx; > *Quercus margareta* – Tx. NatureServe G5 (Secure).

Quercus marilandica Münchhausen var. **marilandica**. BLACKJACK OAK. **Hab:** Upland forests and woodlands, usually on periodically droughty soils, as over shrink-swell clays, sandstones, deep sands, sands with clay lenses, and shallow soils over acidic bedrock. **Dist:** NY (Long Island), NJ, se. PA, w. VA, s. OH, s. IN, c. IL, s. IA, and se. NE south to s. GA, Panhandle FL, and sc. TX (west to the Prairie border). **Phen:** Apr-May; Sep-Nov (of the second year). **Comm:** There are historical accounts of the existence of prairies or barrens in the vicinity of Charlotte in the late eighteenth century, known as the "the blackjack lands". These areas were described as open and prairie-like, until the early nineteenth century, when they became dominated by dense forests of blackjack oak. The previously open condition was almost certainly maintained by fire, perhaps set by the Waxhaw Indians. Blackjack oak has long been considered an indicator of 'poor' soil (from an agricultural perspective), as in Guthrie (1820), who states in his discussion of NC, "the Black Jack land is generally poor, ... and is avoided by farmers, as unproductive". **Syn:** = Ar, K1, NY, Va, Hunt (1990); < *Quercus marilandica* – C, F, FI2, FNA3, G, GrPl, Il, K3, K4, NcTx, Pa, RAB, S, Tn, Tx, W, WH3, WV. *NatureServe G5T4T5* (Apparently Secure).

Quercus michauxii Nuttall. BASKET OAK, SWAMP CHESTNUT OAK. **Hab:** Bottomland forests, especially in fertile soils of upper terraces where flooded only infrequently and for short periods, upland depression ponds, sometimes on moist lower slopes. **Dist:** NJ south to n. peninsular FL and west to e. TX and se. OK, north in the interior to s. IL and s. IN. **Phen:** Apr-May; Sep-Oct (of the same year). **Tax:** See discussion under *Q. montana* about the application of the name *Q. prinus* Linnaeus. **Syn:** = Ar, C, F, FI2, FNA3, G, GW2, Il, K1, K3, K4, RAB, Tn, Va, W, WH3; = *Quercus prinus* Linnaeus – S, Tx, name rejected (possibly misapplied and a source of confusion).

Quercus minima (Sargent) Small. DWARF LIVE OAK. **Hab:** Pine flatwoods, coastal fringe sandhills, pine rocklands. **Dist:** A Southeastern Coastal Plain endemic: se. NC (New Hanover County) south to s. FL, west to s. MS. **Phen:** Apr; Sep-Nov (of the same year). **Syn:** = FI2, FNA3, K1, K3, K4, S, WH3.

Quercus montana Willdenow. ROCK CHESTNUT OAK, MOUNTAIN OAK. **Hab:** Xeric forests of ridges and slopes, shale barrens, occasionally in mesic situations especially where rocky. **Dist:** Primarily Appalachian but broadly distributed in e. North America: s. ME, NY, MI, s. UN, s. IL, and se. MO (Smith & Parker 2005) south to c. GA, c. AL, ne. MS (and LA?). **Phen:** Apr; Sep-Nov (of the same year). **Tax:** The proper application of the Linnaean "*Q. prinus*" has been controversial and unclear, having been debated and variously applied for well over a century. The name "*Q. prinus*" has nomenclatural priority over either "*Q. montana*" or "*Q. michauxii*", but it is not clear which species was intended; after centuries of uncertainty, Whittemore & Nixon (2005) proposed its formal rejection and the proposal was formally and unanimously accepted (Brummitt 2007). **Syn:** = FNA3, K3, K4, Mi, NE, NY, Pa, S, Tn, Va, W; = *Quercus prinus* Linnaeus – C, F, G, Il, K1, RAB, WV, name rejected (probably misapplied, and a source of confusion).

Quercus muehlenbergii Engelman. YELLOW OAK, CHINQUAPIN OAK. **Hab:** Slopes and bluffs, on soils derived from calcareous or mafic rocks. **Dist:** S. New England and ON west to WI, se. MN, and IA, south to nw. FL, TX, and n. Mexico (CHH, COA, NLE, SON, TAM). **Phen:** Apr-May; Oct-Nov (of the same year). **Tax:** The species was originally named as "*Quercus mühlenbergii*", which must be corrected under the Shenzhen Code to '*muehlenbergii*'. **Comm:** The similar *Q. montana* sometimes has a few leaves with somewhat sharply lobed leaves, but these are minutely mucronate and lack the well-developed callus of *Q. muehlenbergii*. Additionally, *Q. muehlenbergii* has a flaky, light gray bark, very different from the dark gray, deeply furrowed bark of *Q. montana*. **Syn:** = Ar, C, F, FI2, GrPl, K1, K3, K4, Mex, Mi, NcTx, NE, NY, RAB, Tx, Va, WH3, WV; = *Quercus muehlenbergii* – FNA3, Il, Pa, S, Tn, W, orthographic variant; = *Quercus prinoides* Willdenow var. *acuminata* (Michaux) Gleason – G. *NatureServe G5* (Secure).

Quercus myrtifolia Willdenow. MYRTLE OAK. **Hab:** Longleaf pine sandhills, Florida scrub, oak scrub, dry flatwoods, coastal dunes. **Dist:** A Southeastern Coastal Plain endemic: se. SC south to s. FL, west to se. MS. **Phen:** Feb-Mar; Sep (of the second year). **Syn:** = FI2, FNA3, K1, K3, K4, RAB, WH3, Hunt (1990); < *Quercus myrtifolia* Willdenow – S.

Quercus nigra Linnaeus. WATER OAK, PADDLE OAK. **Hab:** Bottomland forests, especially on levees or second terraces where flooded infrequently and for short periods, less commonly on mesic slopes, but also now widely distributed and common as a "weed tree" in upland situations. **Dist:** Primarily a species of the Southeastern Coastal Plain: s. NJ south to s. FL and west to e. TX and se. OK, north in the interior to se. TN, c. TN, w. and sc. KY (Clark et al. 2005), se. MO, and e. OK. **Phen:** Apr; Sep-Nov (of the second year). **Comm:** Seedlings and fire sprouts of this species are highly variable in leaf morphology; see discussion at end of generic treatment. **Syn:** = Ar, C, FI2, FNA3, G, GW2, Il, K1, K3, K4, NcTx, RAB, S, Tn, Va, W, WH3, Hunt (1990); = *Quercus aquatica* Walter; > *Quercus nigra* var. *heterophylla* (Aiton) W.W. Ashe – F; > *Quercus nigra* var. *nigra* – F.

Quercus oglethorpensis Duncan. OGLETHORPE OAK. **Hab:** Bottomland forests, upland oak flats over clays (Iredell and Enon soils). **Dist:** Widely scattered from nc. SC, to adjacent ec. And c. GA, AL (Sorrie pers. comm. 2002), c. MS, and ne. LA. **Phen:** Apr; Sep-Oct (of the same year). **Syn:** = FNA3, GW2, K1, K3, K4, RAB. *NatureServe G3* (Vulnerable).

Quercus pagoda Rafinesque. CHERRYBARK OAK, SWAMP SPANISH OAK. **Hab:** Bottomland forests, especially on second terraces, also mesic to dry-mesic upland sites, especially where somewhat base-rich. **Dist:** A Southeastern Coastal Plain endemic: e. and c. VA south to nw. FL and west to se. TX and north in the interior to e. TN, s. IL, and s. IN. **Phen:** Apr-May; Sep-Nov (of the second year). **Syn:** = Ar, C, FI2, FNA3, Il, K1, K3, K4, S, Tn,

153. FAGACEAE

Va, WH3; = *Quercus falcata* var. *pagodifolia* Elliott – F, G, GW2, RAB; = *Quercus pagodifolia* (Elliott) Ashe; = *Quercus rubra* Linnaeus var. *pagodaefolia* Ashe; < *Quercus falcata* Michaux – Tx.

Quercus palustris Münchhausen. PIN OAK. **Hab:** Hardwood flatwoods, bottomland forests, swamps, sinkhole ponds, sloughs, wet prairies, upland sag ponds; also widely planted as a street tree in towns and cities. **Dist:** MA and NY west to se. IA and e. KS, south to c. NC, nw. GA, sc. TN, n. AR, and e. OK. **Phen:** Mar-May; Oct-Nov (of the second year). **Syn:** = Ar, C, F, FNA3, G, GrPl, GW2, IL, K1, K3, K4, Mi, NE, NY, Pa, RAB, S, Tn, Va, W, WV. *NatureServe G5* (Secure).

Quercus phellos Linnaeus. WILLOW OAK, "PIN OAK". **Hab:** Bottomland forests, especially on natural levees and second terraces, also in upland depression swamps developed on clay soils and in upland clay hardpan situations, weedy and successional on slopes and upland sites as a "weed tree" following disturbance, and widely planted as a street tree in towns and cities. **Dist:** Primarily a species of the Southeastern Coastal Plain: NY (Long Island), s. NJ, and se. PA south to s. GA and Panhandle FL, west to e. TX and se. OK, north in the interior to e. TN, s. KY, w. KY, s. IL, and se. MO, and e. OK. **Phen:** Mar-May; Sep-Nov (of the second year). **Syn:** = Ar, C, F, F12, FNA3, G, GW2, IL, K1, K3, K4, NcTx, NE, NY, Pa, RAB, S, Tn, Tx, Va, W, WH3, Hunt (1990). *NatureServe G5* (Secure).

Quercus prinoides Willdenow. DWARF CHINQUAPIN OAK. **Hab:** Xeric upland glades, barrens, and woodlands, on clay soils derived from mafic or calcareous rocks or in sandy acidic soils, probably in sites which naturally burned rather frequently. **Dist:** MA and s. MI south to NC, Panhandle FL (L. Anderson, pers.comm., 2021), OK, and TX. **Phen:** Apr; Aug-Sep (of the same year). **Comm:** Fire suppression in the sites where this rare oak occurs has nearly or entirely extirpated it from much of our area. **Syn:** = Ar, C, FNA3, GrPl, K1, K3, K4, Mi, NE, NY, Pa, RAB, S, Tn, Va, W; = *Quercus prinoides* var. *prinoides* – G; > *Quercus prinoides* var. *prinoides* – F; > *Quercus prinoides* var. *rufescens* Rehder – F. *NatureServe G5* (Secure).

Quercus rubra Linnaeus var. *rubra*. RED OAK. **Hab:** Moist to fairly dry forests of slopes, coves, and ravines, below 1000 meters elevation.

Dist: Widespread in e. North America, south to e. VA, GA, AL, MS, AR, and OK. **Phen:** Apr; Aug-Sep (of the second year). **Syn:** = F, FNA3, K1, Mi, RAB, WV; = *Quercus borealis* Michaux f. var. *maxima* (Marshall) W.W. Ashe – G, GrPl; = *Quercus maxima* (Marshall) W.W. Ashe – S; < *Quercus rubra* – Ar, C, IL, K3, K4, NE, NY, Pa, Tn, Va, W. *NatureServe G5T5* (Secure).

Quercus shumardii Buckley. SHUMARD OAK. **Hab:** Moist and fertile soils of bottomlands and moist slopes, also in xeric sites over calcareous rocks (such as limestone). **Dist:** Sc. PA, OH, s. MI, IN, s. IL, MO, and e. KS south to n. peninsular FL and TX. **Phen:** Apr; Sep-Oct (of the second year). **Tax:** A number of varieties have been recognized in *Q. shumardii*, and the morphological and habitat variation needs additional study. Var. *schneckii* (Britton) Sargent is apparently distributed in calcareous uplands west of the Blue Ridge, especially on dry limestone slopes. It is allegedly distinguished by the acorn cups rounded to turbinate below (vs. flattened and saucer-shaped in var. *shumardii*). Hess & Stoyneff (1998) tentatively concluded that no varieties should be recognized within *Q. shumardii*. Additional study is needed. **Syn:** = C, F12, FNA3, K3, K4, Mi, NcTx, NY, Pa, RAB, S, Tn, Tx, Va, W, WH3; = *Quercus shumardii* var. *shumardii* – Ar; > *Quercus shumardii* var. *schneckii* (Britton) Sargent – F, G, GrPl, IL, K1, WV, misapplied; > *Quercus shumardii* var. *shumardii* – F, G, GrPl, IL, K1, WV.

Quercus similis W.W. Ashe. SWAMP POST OAK, DELTA OAK. **Hab:** Hardwood flatwoods and bottomland hardwood forests, especially over calcareous or subcalcareous substrates. **Dist:** SC south to GA, west to e. TX; disjunct in c. TN. **Comm:** *Q. similis* resembles *Q. stellata*, differing in its less definitely cross-shaped leaves and its distinctly wetland habitat. **Syn:** = Ar, FNA3, K1, K3, Tn, Tx; = *Quercus ashei* Sterret; = *Quercus stellata* Wangenheim var. *paludosa* Sargent; < *Quercus stellata* Wangenheim.

Quercus stellata Wangenheim. POST OAK. **Hab:** Upland forests and woodlands, especially in clay or rocky soils and in communities at least formerly exposed to fire. **Dist:** Se. MA, s. NY, s. PA, s. OH, s. IN, s. IA, and e. KS south to n. peninsular FL and c. and se. TX. **Phen:** Apr; Sep-Nov (of the same year). **Tax:** In KS, OK, and TX, post oak is one of the trees that forms the Prairie boundary. There is no question of the distinctness of *Q. margaretiae* from *Q. stellata*. See *Q. similis*. **Syn:** = Ar, C, F12, FNA3, G, IL, K1, K3, K4, NcTx, NE, NY, Pa, RAB, S, Tn, Tx, Va, W, WH3, WV; = *Quercus stellata* var. *stellata* – F, GrPl; = *Quercus villosa* Walter; < *Quercus stellata* Wangenheim.

Quercus texana Buckley. NUTTALL OAK, TEXAS RED OAK. **Hab:** Bottomland hardwood forests, hardwood flatwoods, swamps, also now widely planted well east of its native distribution. **Dist:** AL, TN, w. KY (Clark et al. 2005), s. IL, se. MO, south and west to e. TX. **Phen:** Apr-May. **Syn:** = Ar, FNA3, IL, K1, K3, Tn; = *Quercus nuttallii* E.J. Palmer – F, GW2; = *Quercus shumardii* Buckley var. *texana* (Buckley) W.W. Ashe.

Quercus velutina Lamarck. BLACK OAK, QUERCITRON. **Hab:** Upland forests and woodlands, especially in fairly xeric and sandy soils. **Dist:** ME west to MN and NE, south to Panhandle FL and TX. **Phen:** Apr-May; Sep-Oct (of the second year). **Syn:** = Ar, C, F, F12, FNA3, G, GrPl, IL, K1, K3, K4, Mi, NcTx, NE, NY, Pa, RAB, S, Tn, Tx, Va, W, WH3, WV. *NatureServe G5* (Secure).

Quercus virginiana P. Miller. LIVE OAK. **Hab:** Locally common to abundant in maritime forests and maritime scrub on barrier islands, more rarely inland (though regularly on the mainland from se. NC south, and extending substantially inland from s. SC south), sometimes in dry, fire-maintained habitats more usually occupied by *Q. geminata*, also planted (especially in the outer Coastal Plain). **Dist:** A Southeastern Coastal Plain

153. FAGACEAE

endemic: se. VA south to s. FL and west to TX. Villaseñor (2016) lists *Q. virginiana* as also fairly widespread in Mexico (CHH, COA, NLE, SLP, TAM, VER). **Phen:** Apr; Sep-Nov (of the same year). **Comm:** *Q. fusiformis* Small of TX has sometimes been treated as a variety of *Q. virginiana*, but is best separated as a species. Flowering before *Q. geminata* when growing together. **Syn:** = Ar, Fl2, FNA3, GW2, K1, K3, K4, Mex, NcTx, S, Va, WH3; = *Quercus sempervirens* Walter; > *Quercus geminata* Small – C, misapplied; > *Quercus minima* (Sargent) Small – Tx, misapplied; < *Quercus virginiana* P. Miller – G, RAB; > *Quercus virginiana* P. Miller – C, Tx; > *Quercus virginiana* var. *maritima* (Michaux) Sargent – F, misapplied; > *Quercus virginiana* var. *virginiana* – F.

154. MYRICACEAE Richard ex Kunth 1817 (BAYBERRY FAMILY) [in FAGALES]

A family of about 3-5 genera and 55 species, trees and shrubs, nearly cosmopolitan. See *Morella* for discussion of our three genera. References: Bornstein (1997) in FNA3 (1997); Elias (1971b); Kubitzki, Rohwer, & Bittrich (1993); Wilbur (1994).

Morella Loureiro 1790 (BAYBERRY, WAX-MYRTLE, CANDLEBERRY)

Wilbur (1994) makes a compelling case for the recognition of three genera among eastern North American Myricaceae, and for application of the name *Myrica* to *Myrica gale*. The typification of the genus *Myrica* with *Myrica gale* Linnaeus has been confirmed (Brummitt 1999); thus, the familiar southeastern species placed by many authors in *Myrica* must take another name. Wilbur (1994) prefers to treat our species as subgenus *Cerothamnus* (Tidestrom) Wilbur of genus *Morella* Loureiro; subgenus *Morella* is restricted to e. Asia, the Philippines, and Malaysia, and differs in a number of ways from subgenus *Cerothamnus*, including its fleshy and succulent, rather than waxy and hard, berries. Small maintained *Cerothamnus* at the generic level. Wilbur's inclusion of *Cerothamnus* in *Morella* may well be warranted (and is followed here), but I disagree with his provisional decision to include the taxon treated below as *Morella pumila* in *Morella cerifera*, and the taxon treated below as *Morella pensylvanica* in *Morella caroliniensis*, though their appropriate rank may be questioned. References: Bornstein (1997) in FNA3 (1997); Kubitzki, Rohwer, & Bittrich (1993); Wilbur (1994); Wilbur (2002a).

- 1 Fresh leaves odorless when crushed; staminate flowers with 6-10 stamens (or as few as 3 in distal flowers); leaves usually entire; [of s. GA south and west]; [subgenus *Cerothamnus*, series *Faya*] *Morella inodora*
- 1 Fresh leaves aromatic when crushed; staminate flowers with 3-5 (-7) stamens; leaves usually serrate, at least near the tip; [collectively widespread in our area]; [subgenus *Cerothamnus*, series *Cerothamnus*].
 - 2 Leaves oblanceolate (generally narrowly so), most of them 0.5-1.5 cm wide, 4-6× as long as wide, evergreen; mature fruits 2.0-3.5 mm in diameter.
 - 3 Medium shrub to small tree (usually 2-10 m tall), not stoloniferous; leaves of fertile branches 4-9 cm long, 8-20 mm wide; [of a wide range of wetland habitats, including wet Coastal Plain pinelands; also planted and naturalized in upland sites] *Morella cerifera*
 - 3 Small shrub (usually < 1 m tall), strongly stoloniferous; leaves of fertile branches 1.5-5 cm long, 3-13 mm wide; [restricted to Coastal Plain pinelands (or areas formerly so)] *Morella pumila*
 - 2 Leaves elliptic to broadly oblanceolate, most of them 1.5-4 (-5.2) cm wide, 2-4× as long as wide, evergreen to deciduous; mature fruits 3.0-7.0 mm in diameter. *Morella caroliniensis*

Morella caroliniensis (P. Miller) Small. POCOSIN BAYBERRY, EVERGREEN BAYBERRY. **Hab:** Pocosins, wet savannas and pine flatwoods, sandhill seepage bogs, and other peaty or sandy-peaty wetlands. **Dist:** Primarily limited to the Southeastern Coastal Plain, from NJ south to FL and west to TX and AR. **Phen:** Apr; Aug-Oct. **Tax:** *Morella caroliniensis* and *Morella pensylvanica* are not conspecific. **Syn:** = K1, K3, K4, Va; = *Myrica caroliniensis* P. Miller – WH3; = *Myrica heterophylla* Rafinesque – Ar, C, FNA3, RAB, Tx, W, Elias (1971b); < *Cerothamnus caroliniensis* – S; < *Morella caroliniensis* (P. Miller) Small – Wilbur (1994); > *Myrica heterophylla* var. *curtissii* (Chevallier) Fernald – F; > *Myrica heterophylla* var. *heterophylla* – F; < *Myrica pensylvanica* Loiseleur – G, Pa. **NatureServe G5** (Secure).

Morella cerifera (Linnaeus) Small. COMMON WAX-MYRTLE, SOUTHERN BAYBERRY. **Hab:** Interdune swales (where often dominant), pocosins, brackish marshes, other wet to moist habitats, now also widely planted (including in the Piedmont) as an ornamental or landscaping shrub and persistent or naturalizing in suburban woodlands. **Dist:** As a native, widespread in the Coastal Plain of Southeastern United States: NJ south to FL and west to TX; Bahamas; West Indies; Central America. **Phen:** Apr; Aug-Oct. **Comm:** Our most common *Morella*, and also the largest, sometimes becoming a small tree, to at least 15 m tall and 25 cm DBH. See *Morella pumila* for a discussion of the controversial taxonomy of *Morella cerifera* and *Morella pumila*. **Syn:** = K3, K4, Va; = *Cerothamnus ceriferus* (Linnaeus) Small – S; = *Myrica cerifera* – F, G, NcTx, Tx; = *Myrica cerifera* Linnaeus var. *cerifera* – RAB, Elias (1971b); < *Morella cerifera* (Linnaeus) Small – II, K1, Wilbur (1994); < *Myrica cerifera* – Ar, C, FNA3, GW2, WH3.

Morella inodora (Bartram) Small. ODORLESS BAYBERRY. **Hab:** Acid wetlands, especially in wooded, acid, streamhead "bogs" and bayheads, often associated with *Magnolia virginiana*, *Tamala palustris*, *Cyrtilla racemiflora*, *Cliftonia monophylla*, and *Lorinseria areolata*. **Dist:** A Southeastern Coastal Plain endemic: se. GA west to s. MS. **Syn:** = K1, K3, K4, Wilbur (1994); = *Cerothamnus inodorus* (Bartram) Small – S; = *Myrica inodora* Bartram – FNA3, GW2, WH3, Elias (1971b). **NatureServe G4** (Apparently Secure).

Morella pumila (Michaux) Small. DWARF BAYBERRY, DWARF WAX-MYRTLE. **Hab:** Savannas, pine flatwoods, relatively moist to extremely dry sites in sandhills (under *Quercus laevis* and *Q. geminata*). **Dist:** A Southeastern Coastal Plain endemic: se. VA south to s. FL and west to e. TX. **Phen:** Mar-Apr; Aug-Oct. **Tax:** Some authors dismiss the distinction between this taxon and *Morella cerifera* as merely environmental, while others

154. MYRICACEAE

treat the two as distinct at the varietal or specific level. In our area at least, they appear to be genetically distinct. They often occur in close proximity (though their typical habitats differ, they can be seen side by side in wet spodosolic pine savannas, sometimes also intermixed with *Morella caroliniensis*), and maintain their distinctiveness. There are some observations that there is a phenologic difference, with *Morella pumila* peak flowering 3 weeks later than *Morella cerifera* (J. Townsend, pers. comm., 2002; A. Weakley, 2018). Though the issue remains unresolved, the stoloniferous growth of *Morella pumila* is not merely a fire response; I here maintain the two as distinct, pending further research. **Syn:** = K3, K4, Va; = *Cerothamnus pumilus* (Michaux) Small – S; = *Myrica cerifera* Linnaeus var. *pumila* Michaux – RAB, Elias (1971b); = *Myrica pusilla* Rafinesque – F, G, Tx; < *Morella cerifera* (Linnaeus) Small – K1, Wilbur (1994); < *Myrica cerifera* – C, FNA3, GW2, WH3.

155. JUGLANDACEAE A.P. de Candolle 1818 (WALNUT FAMILY) [in FAGALES]

A family of about 8 genera and 60 species, trees and shrubs, mostly temperate. References: Elias (1972); Manos & Stone (2001); Stone in Kubitzki, Rohwer, & Bittrich (1993); Stone (1997a) in FNA3 (1997).

- 2 Fruit with husk dehiscent into 4 valves; pith of twigs continuous; leaves with (3-) 5-17 (-19) leaflets, the largest usually the terminal or final 2 lateral; nut with shell smooth, ridged, or irregularly wrinkled (but not deeply furrowed); terminal buds with imbricate (overlapping) or valvate scales; [tribe *Juglandae*, subtribe *Caryinae*]..... *Carya*
- 2 Fruit with husk indehiscent; pith of twigs chambered (not always developing until autumn of the first year's growth); leaves with (7-) 11-19 (-23) leaflets, the largest usually about halfway up the leaf; nut with shell deeply furrowed in a complex corrugated pattern; terminal buds with valvate; [tribe *Juglandae*, subtribe *Juglandinae*]..... *Juglans*

Carya Nuttall 1818 (HICKORY)

Contributed by Alan S. Weakley & Robert K. Peet

A genus of about 18 species, trees, of e. North America (south into s. Mexico), and e. Asia. *Carya* in our area is separated into two sections, section *Apocarya* (*C. aquatica*, *C. cordiformis*, *C. illinoensis*) and section *Carya* (*C. carolinae-septentrionalis*, *C. floridana*, *C. glabra*, *C. laciniosa*, *C. myristiciformis*, *C. ovalis*, *C. ovata*, *C. pallida*, *C. texana*, *C. tomentosa*). The southeastern United States is the center of diversity of *Carya*. Our area includes all 13 North American species, and 13 of 18 species worldwide. Section *Rhamphocarya* includes a single Asian species. The remaining 4 species in the genus are all in section *Apocarya*: *C. palmeri* Manning of Mexico and 3 Asian species. *C. cordiformis*, *C. aquatica*, *C. illinoensis*, *C. myristiciformis*, *C. laciniosa*, *C. ovata*, and *C. carolinae-septentrionalis* are diploids, with $n = 16$. *C. pallida*, *C. floridana*, *C. texana*, *C. glabra*, *C. ovalis*, and *C. tomentosa* are tetraploids with $n = 32$ (Stone 1961). As suggested by Stone, Adrouny, & Flake (1969), it seems possible that reticulate evolution involving extant or extinct diploid species is responsible for some of the difficulties in the *C. glabra-ovalis* complex. Many hybrids have been described, but some are questionable. Additionally, Hardin & Stone (1984) state that "most of these hybrids are localized and have not led to introgressive populations, or at least none that have been recognized". Ecologically, *Carya* is one of the more diverse and ubiquitous genera of trees in our area, surpassed in number of species, abundance, and ecological amplitude only by *Quercus* and *Pinus*. This has led to a long tradition of describing large parts of our area (in particular the Piedmont) as being characterized by "oak-hickory" or "oak-pine-hickory" forests (e.g. Küchler 1964; Greller 1988; Schafale & Weakley 1990; Skeen, Doerr, & Van Lear 1993). Ware (1992) and others have recently questioned this tradition, pointing out that *Carya* only rarely dominates or codominates, primarily in specialized circumstances (such as in soils with greater cation concentrations, derived from mafic rocks). The association of many (but certainly not all) species of hickories with soils with high base status was noted in print as early as 1820 in an account of the landscape of North Carolina. "The sandy pine barrens, and all the lands on which pine is the exclusive growth, are unfriendly to agriculture; but where the pine is intermixed with oak and hickory, the soil is good. Some of our strongest lands have tall pine, mixed not only with hickory and oak, but also with walnut and cherry, and such trees that indicate the best soil. Where hickory prevails, the land is strong" (Guthrie 1820). References: Elias (1972); Hardin & Stone (1984); Hardin (1952); Hardin (1992); Harrar & Harrar (1962); Little (1969); Manning (1950); Sargent (1918); Stone in Kubitzki, Rohwer, & Bittrich (1993); Stone (1961); Stone (1997b) in FNA3 (1997); Stone, Adrouny, & Flake (1969).

Identification Notes: Surface vestiture of leaves and bud scales is useful in distinguishing species of *Carya*. Some use of these characters can be made with a 10× or 20× hand lens; better still is a dissecting microscope. It is important to understand the different trichome types mentioned in the key (terminology follows Hardin 1990 and Hardin & Stone 1984). Short acicular trichomes are simple, unicellular trichomes tapered to a pointed tip, 0.10-0.35 mm long and with rough walls. Long acicular trichomes ("solitary" of Hardin & Stone 1984) are similar to short acicular, but are much larger, 0.45-1.6 mm long, and have smooth walls. Fasciculate trichomes are multicellular and have 2-8 straight or curved rays radiating from a clustered base. Multiradiate trichomes are similar to fasciculate, but have 8-17 rays, the inner (and usually more upright) rays attached basally above the outer (and usually more spreading) rays. Capitate glandular trichomes are unicellular or multicellular, and are distinguished by their bulbous or expanded tip; they are usually 0.02-0.1 mm long. Peltate scales are flat or dome-shaped shields or disks, slightly to strongly glandular, (sometimes regularly or irregularly lobed) and can be either sessile or stalked (they are often referred to as scales, resin dots, peltate glands, or lepidote scales). On the lower surfaces of leaflets, peltate scales are of two types: large peltate scales are 0.08-0.3 mm in diameter and are round, with smooth or slightly irregular margins, while small peltate scales are 0.025-0.12 mm in diameter and are either round, irregularly lobed or regularly 2- or 4-lobed.

- 1 Terminal buds elongate, flattened in cross-section, with 4-6 valvate scales; leaves with 7-13 (-19) leaflets, these symmetrical to strongly falcate; fruit sutures narrowly winged.
- 2 Leaves with 7-9 (-11) leaflets, these symmetrical to slightly falcate; fasciculate trichomes with 2-4 rays; terminal bud, 9-19 mm long, bright orangey yellow to dull orange-tan; [common and widely distributed tree in our area, typically in floodplain and slope forests] *Carya cordiformis*
- 2 Leaves with (7-) 9-19 leaflets, these slightly to strongly falcate; fasciculate trichomes with 2-8 rays; terminal bud { } mm long, brown to rusty-brown.
- 3 Leaves with (7-) 9-11 (-13) leaflets, the lower surfaces pubescent at least along the midrib and in the main vein axils; bark shaggy; lateral petiolules 0-2 mm long; nut flattened and angled in cross-section; kernel bitter; [native, of swamp forests, primarily in the Coastal Plain] *Carya aquatica*
- 3 Leaves with (7-) 11-19 leaflets, the lower surfaces nearly glabrous; bark scaly, with small exfoliating plates; lateral petiolules 0-7 mm long; nut round in cross-section; kernel sweet; [introduced, frequently cultivated, long persistent, and occasionally naturalized] *Carya illinoensis*
- 1 Terminal buds ovoid, terete in cross-section, with 6-15 imbricate scales; leaves with (3-) 5-9 (-11) leaflets, these symmetrical to slightly falcate; fruit sutures not winged (except *C. myristiciformis*).
- 4 Bark shaggy (on large trees separating in segments to a meter in length); leaves with (3-) 5 (-7) leaflets; serrations of the leaflets densely (or only moderately) ciliate when young, most densely so just below the tooth apex, the hairs sloughing with age but leaving a subapical tuft of white trichomes on at least some teeth; fallen foliage turning black.
- 5 Twigs slender, hardened first-year growth or second-year growth 1-3 mm in diameter; terminal bud 6-15 mm long, glabrous to sparsely puberulent (except for ciliate fringe on the scales), reddish-brown (usually turning black on drying); lower surface of leaflets nearly glabrous, except for tufts of trichomes in the main vein axils, and only slightly lepidote with a few, scattered scales, the large peltate scales yellow and round, the small peltate scales brown, 2- and 4-lobed; terminal leaflet 2-5 (-6) cm wide..... *Carya carolinae-septentrionalis*
- 5 Twigs stout, hardened first-year growth or second-year growth (2.5-) 3-6 mm in diameter; terminal bud 9-18 mm long, tomentose, tan to brown (rarely turning black on drying); lower surface of leaflets moderately to densely hirsute with acicular and fasciculate hairs (sometimes the hairs more or less limited to the main veins), and also moderately lepidote, the large peltate scales yellow and round, the small peltate scales dark brown and mostly round; terminal leaflet (4-) 6-15 cm wide..... *Carya ovata*
- 4 Bark tight (the ridges typically forming an interlocking diamond pattern), scaly, or shaggy (when shaggy, the separated segments normally much < 1 meter long); leaves with (3-) 5-9 (-11) leaflets; serrations of the leaflets glabrous or ciliate, but lacking subapical tufts of trichomes; fallen foliage not notably blackening.
- 6 Twigs stout; terminal buds 8-20 mm long; leaves with (5-) 7-9 (-11) leaflets; lower surface of leaflets moderately to densely hirsute with a mixture of acicular (single), fascicled (2-8 rays), and multiradiate (8-many rays) hairs; small peltate scales of the lower surface of leaflets all round; fruit husk 4-13 mm thick; nuts slightly to strongly 4-angled toward the apex.
- 7 Bark shaggy; petiole hirtellous; leaflet apex acuminate; lower surface of leaflets hirsute with acicular (single), 2-6-rayed fascicled, and occasional multiradiate hairs; fruit husk pubescent, lacking pustulate bumps; fruit 4-7 cm long; nut 3-6 cm long; [rare in our area]..... *Carya laciniosa*
- 7 Bark tight; petiole hirsute; leaflet apex acute; lower surface of leaflets densely hirsute with acicular (single) and abundant 2-8-rayed fascicled and multiradiate hairs; fruit husk glabrous, with pustulate bumps; fruit 3.5-5 cm long; nut 2.5-3.5 cm long; [common in our area]..... *Carya tomentosa*
- 6 Twigs slender; terminal buds 3-15 mm long; leaves with 3-7 (-9) leaflets; lower surface of leaflets mostly glabrous, except for along the midrib and primary veins, and sometimes hirsute on the surface with acicular (single) and infrequent fascicled (2-8 rays) hairs (lacking multiradiate trichomes); small peltate scales of the lower surface of leaflets of various types, 4-lobed and/or irregular scales often more frequent than round scales; fruit husk 2-5 mm thick; nuts either 4-angled or not toward the apex.
- 8 Terminal bud 3-15 mm long, either predominantly pubescent (also sparsely lepidote) or densely lepidote (*C. floridana*); leaves with 3-7 (-9) leaflets; lower surface of spring leaflets slightly to densely lepidote with irregular and round peltate scales (4-lobed peltate scales uncommon or absent).
- 10 Fruit husk indehiscent at maturity or tardily splitting to base along 1 suture; leaves with (3-) 5 (-7) leaflets, glabrous to pubescent beneath; petiole usually green; fruits ellipsoidal, pyriform, or subglobose; bark tight..... *Carya glabra*
- 10 Fruit husk splitting to base at maturity along 2-4 sutures; leaves with (5-) 7 leaflets, pubescent beneath; petiole reddish; fruits typically ellipsoidal; bark tight or often scaly or somewhat shaggy..... *Carya ovalis*
- 8 Terminal bud 4-10 mm long, predominantly lepidote (also pubescent); leaves with (5-) 7 (-9) leaflets; lower surface of spring leaflets densely lepidote with 4-lobed, irregular, and round peltate scales, giving the undersurface a reflective, silvery-tan, rusty-brown, or bronze sheen.
- 11 Lepidote scales initially silver, soon turning bronze, and giving the buds, young twigs, and undersurface of the leaves a metallic bronze sheen; fruit 2-3 cm long; [of calcareous swamps, bottomlands and slopes of the Coastal Plain of se. NC southward]..... *Carya myristiciformis*
- 11 Lepidote scales silvery-tan or rusty-brown, giving the buds, young twigs, and undersurface of the leaves a dull or slightly shiny tan, dull yellow, or rusty-brown color; fruit 3-5 cm long; [usually of upland and acidic forests and woodlands, collectively widespread in our area].
- 12 Undersurface of the leaflets with dense, silvery-tan large peltate scales, and fewer and less conspicuous fewer small peltate scales (thus the leaves appearing overall silvery-tan); petiole and rachis hirsute with fasciculate trichomes, and also with concentrations of hairs near the leaflet insertions; [widespread in our area, of upland and acidic forests and woodlands]..... *Carya pallida*
- 12 Undersurface of the leaflets with dense, rusty-brown small peltate scales, and fewer and less conspicuous silvery-tan large peltate scales (thus the leaves appearing overall rusty-brown); petiole and rachis with few fasciculate hairs (but densely scaly), and lacking concentrations of hairs near the leaflet insertions; [of the sc. United States, east to MS, w. KY, w. TN, and perhaps AL and GA, of upland or lowland, acidic or calcareous forests and woodlands]..... *Carya texana*

Carya aquatica (F. Michaux) Elliott. WATER HICKORY, BITTER PECAN. **Hab:** Swamp forests, where flooded during the winter months. **Dist:** Se. VA south to s. peninsular FL, west to e. TX, north inland to se. MO, s. IL, and se. OK. **Phen:** Mar-May; Oct. **Syn:** = Ar, C, F, FNA3, G, GW2, II, K1, K3, NcTx, RAB, Tn, Tx, Va, WH3; = *Hicoria aquatica* (Michaux f.) Britton – S. [NatureServe G5](#) (Secure).

Carya carolinae-septentrionalis (W.W. Ashe) Engler & Graebner. CAROLINA SHAGBARK HICKORY, CAROLINA HICKORY. **Hab:** Upland flats, especially those weathered from mafic rocks and with shrink-swell soils dominated by montmorillonitic clays, less typically on slopes and bottomlands. **Dist:** Sc. VA (Halifax County) south to GA, AL, and MS, and inland northward to c. TN and sc. KY. **Phen:** Apr-May; Oct. **Comm:** First reported for VA by Wieboldt et al. (1998). The taxonomic status of *C. carolinae-septentrionalis* has been controversial, with some workers reducing it to variety of *C. ovata* or not recognizing it at all; it seems to us morphologically and ecologically distinctive and to represent an independent evolutionary lineage. Hardin & Stone (1984) found differences in trichomes, and in a study of nut oils, Stone, Adrouny, & Flake (1969) found *C. ovata* "surprisingly distant" from *C. carolinae-septentrionalis*. There are reports that the two taxa are also phenologically separated, *C. carolinae-septentrionalis* leafing out about two weeks earlier than *C. ovata*, when growing together in the c. Piedmont of NC. Though usually ecologically and/or geographically segregated, the two species sometimes occur together or in close proximity to one another; they maintain their distinctness in such situations. **Syn:** = C, G, K1, K3, K4, RAB, Tn, Va; = *Carya australis* W.W. Ashe; = *Carya ovata* (P. Miller) K. Koch var. *australis* (W.W. Ashe) Little – FNA3; = *Carya ovata* var. *carolinae-septentrionalis* (W.W. Ashe) Reveal; = *Hicoria carolinae-septentrionalis* W.W. Ashe – S. [NatureServe G5](#) (Secure).

Carya cordiformis (Wangenheim) K. Koch. BITTERNUT HICKORY. **Hab:** Forests and woodlands, especially in rich, moist alluvial or slope forests. **Dist:** ME and s. QC west to MN and NE, south to Panhandle FL and e. TX. **Phen:** Apr-Jun; Oct. **Syn:** = Ar, C, F, FNA3, G, GrPl, GW2, Il, K1, K3, K4, Mi, NcTx, NE, NY, Pa, RAB, Tn, Tx, Va, W, WH3; > *Hicoria cordiformis* (Wangenheim) Britton var. *cordiformis* – S; > *Hicoria cordiformis* var. *latifolia* – S. NatureServe G5 (Secure).

Carya glabra (P. Miller) Sweet. PIGNUT HICKORY. **Hab:** In a very wide variety of forests and woodlands. **Dist:** S. NH west to s. MI, se. IA, and se. KS, south to c. peninsular FL and e. TX. **Phen:** Apr-May; Oct. **Tax:** The *C. glabra*-*C. ovalis* portion of this treatment is tentative; in our area, this group has been variously treated as consisting of between 1 and 10 (or more) taxa. Here we recognize two species (*C. glabra* and *C. ovalis*) and no varieties, but further study of variation in this group is needed. Var. *megacarpa* in particular seems to show correlation of morphological traits and geographic distribution, with larger fruits (2.5-5 cm long vs. 1.5-3.5 cm long), thicker husks (ca. 3.5 mm thick vs. ca. 2 mm thick), large terminal leaflets (often to 20-25 cm long, vs. 10-17 cm long), and a primarily southern Coastal Plain distribution. **Syn:** = C, GW2, K1, NY, RAB, Tn, Va, WH3; = *Carya glabra* var. *glabra* – W; < *Carya glabra* (P. Miller) Sweet – Ar, FNA3, K3, K4, Mi, NE, Pa; > *Carya glabra* var. *glabra* – F, G, Il; > *Carya glabra* var. *megacarpa* (Sargent) Sargent – F, G, Il; > *Carya leioderms* Sargent – Tx; > *Carya ovalis* (Wangenheim) Sargent var. *hirsuta* (W.W. Carya illinoensis (Wangenheim) K. Koch. PECAN. **Hab:** Bottomland forests, hardwood flatwoods, swamps, margins of fields, pastures, often along larger rivers; eastwards (out of native range) introduced and persistent around dwellings and in pecan orchards, escaped to suburban woodlands, rural forest edges and floodplains, also commonly cultivated. **Dist:** Sw. OH, IN, IL, e. IA south to AL, MS, LA, TX, and widespread in Mexico; now also widely spread eastwards as a result of cultivation. **Phen:** Apr-May; Oct. **Comm:** The spelling of the specific epithet has been a source of controversy. **Syn:** = C, FNA3, Il, K1, K3, K4, Mex, NcTx, Tn, Tx, Va, WH3; = *Carya illinoensis* – F, G, GrPl, GW2, RAB, orthographic variant; > *Hicoria pecan* (Marshall) Britton – S; > *Hicoria texana* LeConte – S. NatureServe G5 (Secure).

Carya laciniosa (F. Michaux) W.P.C. Barton. KINGNUT HICKORY, BIG SHELLBARK HICKORY. **Hab:** Bottomland forests, hardwood flatwoods, swamps; rarely in mesic upland forests and on rich lower slopes. **Dist:** NY and s. ON west to IA, south to NC, nw. GA, MS, and OK. **Phen:** Apr-May; Oct. **Comm:** This species is sometimes planted, but occurs native in nw. GA, along the Roanoke River (Halifax and Northampton counties, NC) and New Hope Creek (Durham County, NC). **ID Notes:** Leaf rachises tend to curl up and persist throughout the winter (bare of leaflets, which senesce and drop), creating a distinctive look. **Syn:** = Ar, C, F, FNA3, G, GrPl, GW2, Il, K1, K3, K4, Mi, NE, NY, Pa, RAB, Tn, Tx, W; = *Hicoria laciniosa* (Michaux f.) Sargent – S. NatureServe G5 (Secure).

Carya myristiciformis (F. Michaux) Elliott. NUTMEG HICKORY. **Hab:** Hardwood flatwoods, bottomland hardwood forests, riparian and upland calcareous woodlands, nonriverine swamps over calcareous substrates, including calcareous clays and coquina limestone ('marl'). **Dist:** Se. NC south to GA, and from wc. AL west to e. TX and se. OK; disjunct in Mexico (COA, NLE, SLP, TAM). **Phen:** Apr; Oct. **Comm:** The bronze sheen of the leaflets of this species is diagnostic. First reported for NC by Leonard (1971b). **Syn:** = Ar, FNA3, K1, K3, K4, Mex, NcTx; = *Carya myristicaeformis* – GW2, RAB, Tx, orthographic variant; = *Hicoria myristicaeformis* (Michaux f.) Britton – S. NatureServe G4 (Apparently Secure).

Carya ovalis (Wangenheim) Sargent. RED HICKORY. **Hab:** Forests and woodlands. **Dist:** MA west to WI, south to GA, MS, and AR. **Phen:** Apr-Jun; Oct. **Syn:** = C, K1, RAB, Tn, Va; = *Carya glabra* (P. Miller) Sweet var. *odorata* (Marshall) Little – W; = *Hicoria microcarpa* (Sargent) Sargent – S; < *Carya glabra* (P. 155. JUGLANDACEAE

Carya tomentosa (Lamarck) Nuttall. MOCKERNUT HICKORY, WHITE HICKORY. **Hab:** Forests and woodlands. **Dist:** MA west to IN and IA, south to n. peninsular FL and TX. **Phen:** Apr-May; Oct. **Tax:** There has been confusion and controversy for several centuries over the specific epithet. The oldest basionym available is *Juglans alba* Linnaeus, which apparently included disparate elements, including this taxon and *C. ovata*. Following a more circumscribed typification by Crantz in 1766, the epithet 'alba' should have been applied to this taxon, but continued to be applied in various ways. Rehder (1945) proposed that *C. alba* should be considered a *nomen ambiguum*, but agreed that it applied correctly to what has often been called *C. tomentosa*. He argued that the use of *C. alba* should be rejected "in order to avoid confusion and ambiguity". In 2008, Ward & Wiersema (2008) formally proposed rejection of *Juglans alba* (the basionym of *Carya alba*), and the Committee has recommended its rejection unanimously (Brummitt 2010). For further discussion see Rehder (1945), Howard & Staples (1983), Wunderlin, Hansen, & Hall (1985), and Brummitt (2010). **Comm:** One of the most common forest trees of much of our area. **Syn:** = C, F, FNA3, G, GrPl, Il, K3, K4, NE, NY, Pa, RAB, Tn, Va, W, WH3; = *Carya alba* (Linnaeus) Nuttall ex Elliott – Ar, K1, NcTx; = *Hicoria alba* (Linnaeus) Britton – S. [NatureServe G5](#) (Secure).

*Juglans* Linnaeus 1753 (WALNUT)

A genus of about 21 species, trees and shrubs, of Mediterranean Europe to e. Asia, and North America to Andean South America. References: Stanford (1998); Stanford, Harden, & Parks (2000); Stone in Kubitzki, Rohwer, & Bittrich (1993); Whittemore & Stone (1997) in FNA3 (1997).

- 4 Lower surface of the leaflets densely hirsute with 4-8-rayed fascicled hairs; fruits ellipsoid, densely pubescent with reddish-brown glandular hairs; leaf scars with a velvety ridge along the upper margin; leaves with (7-) 11-17 leaflets; pith dark brown; terminal buds 12-18 mm long; bark of mature trees pale..... *Juglans cinerea*
- 4 Lower surface of the leaflets hirsute with single and 2-rayed fascicled hairs; fruits spherical or nearly so, lepidote with peltate scales and occasional glandular hairs; leaf scars without a velvety ridge along the upper margin; leaves with (9-) 15-19 (-23) leaflets; pith light brown; terminal buds 8-10 mm long; bark of mature trees dark..... *Juglans nigra*

Juglans cinerea Linnaeus. BUTTERNUT, WHITE WALNUT. **Hab:** Moist, nutrient-rich forests. **Dist:** NB west to MN, south to n. GA and AR. **Phen:** Apr-May; Oct. **Comm:** This tree, formerly common, is afflicted with butternut canker disease, which now threatens its continued existence. **Syn:** = Ar, C, F, FNA3, G, GrPl, Il, K1, K3, K4, Mi, NE, NY, Pa, RAB, Tn, Va, W, WV; = *Wallia cinerea* (Linnaeus) Alefeld – S. [NatureServe G3](#) (Vulnerable). **Juglans nigra** Linnaeus. BLACK WALNUT. **Hab:** Moist, nutrient-rich forests of floodplains and slopes, calcareous hammocks. **Dist:** MA west to MN, south to Panhandle FL and TX. **Phen:** Apr; Oct. **Comm:** The dark brown wood is famous for cabinetry and other uses; it is one of the most prized of North American hardwoods. The nuts, though difficult to crack, are prized for their intense flavor. The husk is used as a dye. Country people dehusk the nuts by putting them in dirt or gravel driveways where the passage of car tires removes the husk but does not crack the nut. **Syn:** = Ar, C, F, FNA3, G, GrPl, Il, K1, K3, K4, Mi, NcTx, NE, NY, Pa, RAB, Tn, Tx, Va, W, WH3, WV; = *Wallia nigra* (Linnaeus) Alefeld – S. [NatureServe G5](#) (Secure).

158. BETULACEAE S.F. Gray 1822 (BIRCH FAMILY) [in FAGALES]

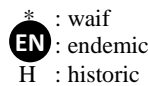

A family of 6 genera and about 150 species, primarily of subarctic to cold temperate regions of the Northern Hemisphere, but extending through Central America to n. South America. The two subfamilies recognized here are sometimes elevated to family status, as by Govaerts & Frodin (1998). References: Furlow (1990); Furlow (1997) in FNA3 (1997); Govaerts & Frodin (1998); Hardin (1971a); Kubitzki, Rohwer, & Bittrich (1993).

- 1 Scales of the pistillate catkins persistent; leafy involucre absent; fruit a small winged nut; [subfamily *Betuloideae*].
- 2 Pistillate scales woody, forming a persistent conelike catkin; plant a shrub, < 4 m tall (except *A. glutinosa*)..... *Alnus*
- 2 Pistillate scales deciduous with or soon after the fruits; plant a tree, > 10 m tall at maturity..... *Betula*
- 1 Scales of the pistillate catkins caducous; leafy involucre present, conspicuous; fruit an unwinged nut; [subfamily *Coryloideae*].
- 3 Nut spherical, 1-1.5 cm in diameter, closely enveloped by the involucre..... *Corylus*
- 3 Nut ovoid, 0.4-0.6 cm long, loosely or not at all enveloped by the involucre.
- 4 Infructescence bracts flat, 1-3 lobed, not enclosing the nut; bark gray, smooth; trunk moderately to strongly fluted; buds 4-angled..... *Carpinus*
- 4 Infructescence bracts inflated, loosely enclosing the nut; bark brown, shreddy; trunk not fluted; buds not 4-angled..... *Ostrya*

Alnus P. Miller 1754 (ALDER)

A genus of about 25-35 species, shrubs and trees, of subarctic to warm temperate regions of the Northern Hemisphere, and in montane situations south to n. South America. References: Banaev & Adel'shin (2009); Chen & Li (2004); Chery (2015); Furlow (1990); Furlow (1997) in FNA3 (1997); Gray (1842); Hardin (1971a); Kubitzki, Rohwer, & Bittrich (1993); Navarro et al (2003); Schrader & Graves (2002).

- 2 Pistillate catkins mostly 1-1.5 (-2) cm long, subsessile and often clustered together closely; typical leaves with 8-14 principal veins on each side of the midrib; [subgenus *Alnus*].

- *Alnus serrulata*
2 Pistillate catkins mostly 1.5-3 cm long, evidently pedunculate and therefore spaced; typical leaves with 5-8 principal veins on each side of the midrib.
..... *Alnus glutinosa*

* *Alnus glutinosa* (Linnaeus) Gaertner. BLACK ALDER, EUROPEAN ALDER. **Hab:** Disturbed areas, suburban woodlands. **Dist:** Native of Europe. Sometimes cultivated, especially northward, and naturalized at least as far south as s. PA (Rhoads & Klein 1993; Rhoads & Block 2007); it has also been reported for Morgan County, TN (Chester, Wofford, & Kral 1997). **Phen:** Mar-May. **Comm:** Reported as well-established in Washington County VA (Virginia Botanical Associates 2018). **Syn:** = C, F, FNA3, G, IL, K1, K3, K4, Mi, Mi, NE, NY, Pa; = *Alnus alnus* (Linnaeus) Britton. NatureServe GNR (Not Yet Ranked).

Alnus serrulata (Aiton) Willdenow. TAG ALDER, SMOOTH ALDER, HAZEL ALDER. **Hab:** Streambanks, bogs, wet thickets. **Dist:** NS west to s. QC, MO, and OK, south to ne. FL, Panhandle FL, and TX. **Phen:** Feb-Mar; Aug-Oct. **Syn:** = Ar, C, FNA3, G, GrPl, GW2, IL, K1, K3, K4, NcTx, NE, NY, Pa, RAB, Tn, Tx, Va, W, WH3, Furlow (1990), Hardin (1971a); = *Alnus rugosa* (Du Roi) Sprengel – S, misapplied; > *Alnus serrulata* var. *serrulata* – F; > *Alnus serrulata* var. *subelliptica* Fernald – F. NatureServe G5 (Secure).

*Betula* Linnaeus 1753 (BIRCH)

A genus of 35-100 species, trees, shrubs, and subshrubs, of subarctic and temperate regions of the Northern Hemisphere. The subgeneric classification shown follows Schenk et al. (2008). References: Furlow (1990); Furlow (1997) in FNA3 (1997); Govaerts & Frodin (1998); Grant & Thompson (1975); Hardin (1971a); Järvinen et al (2004); Kubitzki, Rohwer, & Bittrich (1993); Schenk et al (2008).

Betula nigra Linnaeus. RIVER BIRCH, RED BIRCH. **Hab:** Riverbanks, streambanks, floodplains, sandbars, disturbed uplands. **Dist:** NH west to se. MN and e. KS, south to ne. FL, FL Panhandle, and e. TX. **Phen:** Mar-Apr; May-Jun. **Syn:** = Ar, C, F, FNA3, G, GrPl, GW2, IL, K1, K3, K4, NcTx, NE, NY, Pa, RAB, S, Tn, Tx, Va, W, WH3, WV, Furlow (1990), Hardin (1971a). NatureServe G5 (Secure).

*Carpinus* Linnaeus 1753 (HORNBEAM, IRONWOOD, MUSCLE-TREE, WATER-BEECH, BLUE-BEECH)

A genus of about 26 species, trees, in temperate regions of the Northern Hemisphere, extending southward to se. Asia and Central America. The smooth gray bark gives *Carpinus* the names 'Water-beech' and 'Blue-beech', the fluted, sinewy appearance of the trunk the name 'Muscle-tree', and the very hard, heavy wood the name 'Ironwood'. References: Furlow (1987a); Furlow (1987b); Furlow (1990); Furlow (1997) in FNA3 (1997); Govaerts & Frodin (1998); Hardin (1971a); Kubitzki, Rohwer, & Bittrich (1993).

- 1 Leaves narrowly ovate to oblong-ovate, 3-8.5 cm long, 1-4.5 cm wide, the apex acute, secondary teeth small and blunt, the lower leaf surface lacking conspicuous dark glands; bracts of the infructescence with rounded to subacute tips and few, blunt teeth; [primarily of the Coastal Plain and lower Piedmont] *Carpinus caroliniana* var. *caroliniana*
1 Leaves ovate to elliptic, 5.8-12.5 cm long, 2.5-6.0 cm wide, usually abruptly narrowed to the tip (sometimes gradually tapered to a long, acuminate apex), the secondary teeth often almost as long as the primary teeth, sharp-tipped, the lower leaf surface with conspicuous dark-brown glands; bracts of the infructescence mostly sharp-tipped and bearing several sharp teeth; [primarily of the Mountains and Piedmont] *Carpinus caroliniana* var. *virginiana*

Carpinus caroliniana Walter var. *caroliniana*. COASTAL AMERICAN HORNBEAM, MUSCLETREE, LEANTREE, LECHILLO, WATER BEECH. **Hab:** Streambanks, riverbanks, bottomland forests, lower slopes, maritime forests. **Dist:** S. NJ, e. MD, and e. VA south to c. peninsular FL, west to e. TX, and north in the inland to s. MO and s. IL. **Phen:** Mar-May; Sep-Oct. **Tax:** The treatment as two taxa was established by Furlow (1987a, 1987b) largely through statistical methods. The two taxa have some morphologic and phytogeographic coherence, but intergradation appears to be extensive, and individual specimens (in the herbarium) or trees (in the field) may not be readily identifiable to variety. **Syn:** = C, F, IL; = *Carpinus caroliniana* ssp. *caroliniana* – Ar, FNA3, K1, K3, K4, Furlow (1987b), Furlow (1990); < *Carpinus caroliniana* – G, GW2, NcTx, RAB, S, Tn, Tx, Va, WH3, Hardin (1971a). NatureServe G5T4T5 (Apparently Secure).

Carpinus caroliniana Walter var. *virginiana* (Marshall) Fernald. INLAND AMERICAN HORNBEAM, BLUE BEECH. **Hab:** Rich cove forests, streambanks, riverbanks, bottomland forests, lower slopes. **Dist:** ME, QC and s. ON west to MN, south to e. VA, c. NC, n. GA, n. AL, n. MS, AR,

var. *caroliniana*

Carpinus caroliniana
var. *virginiana*

*Corylus* Linnaeus 1753 (HAZELNUT, FILBERT)

A genus of about 15-18 species, shrubs and trees, of temperate regions of the Northern Hemisphere. Eurasian species of this genus, *C. avellana* Linnaeus and *C. maxima* P. Miller, are the sources of commercial filberts or hazelnuts. They are sometimes cultivated in North America, especially in the Pacific Northwest. Our wild species are also excellent eating, but wild animals, especially squirrels, usually harvest them before they are ripe. References: Forest & Bruneau (2000); Furlow (1997) in FNA3 (1997); Govaerts & Frodin (1998); Kubitzki, Rohwer, & Bittrich (1993); Whitcher & Wen (2001).

Corylus americana Walter. AMERICAN HAZELNUT, AMERICAN FILBERT. **Hab:** Rocky woodlands, mesic to rich forests and thickets. **Dist:** ME west to SK, south to GA, LA, and OK. **Phen:** Feb-Mar; Sep-Oct. **Syn:** = Ar, C, FNA3, Il, K1, K3, K4, Mi, NE, NY, Pa, RAB, S, Tn, Va, W, WV, Furlow (1990), Hardin (1971a); > *Corylus americana* var. *americana* – F, G, GrPl; > *Corylus americana* var. *indehiscens* E.J. Palmer & Steyermark – F, G, GrPl. NatureServe G5 (Secure).

Ostrya Scopoli 1760 (HOP-HORNBEAM, IRONWOOD)

A genus of 5-9 species, trees, of temperate regions of the Northern Hemisphere. References: Furlow (1997) in FNA3 (1997); Govaerts & Frodin (1998); Kubitzki, Rohwer, & Bittrich (1993).

Ostrya virginiana (P. Miller) K. Koch. AMERICAN HOP-HORNBEAM, IRONWOOD, LEVERWOOD. **Hab:** Mesic to dry forests, often rocky, especially over basic rocks, reaching high elevations. **Dist:** NS west to MB, south to c. peninsular FL, Panhandle FL, and TX. **Phen:** Mar-May; Aug-Oct. **Comm:** One of our heaviest and hardest woods. **Syn:** = Ar, C, FNA3, G, K3, K4, Mi, NE, NY, Pa, RAB, S, Tn, Va, W, WH3, WV, Furlow (1990), Hardin (1971a); = *Ostrya virginiana* var. *virginiana* – K1; > *Ostrya virginiana* var. *lasia* Fernald – F, GrPl, Il, Tx; > *Ostrya virginiana* var. *virginiana* – F, GrPl, Il. NatureServe G5T5 (Secure).

163. *CUCURBITACEAE* A.L. de Jussieu 1789 (GOURD FAMILY) [in CUCURBITALES]

A family of about 97-120 genera and 800-1000 species, of tropical and subtropical areas, with a few extending to temperate areas. References: Nesom (2011b); Nesom (2015b) in FNA6 (2015); Schaefer & Renner in Kubitzki (2011).

- 1 Ovaries and fruits muricate, tuberculate, or echinate; fruits 1-25 cm long at maturity. *Sicyos*
- 1 Ovaries and fruits smooth or pubescent, but not prickly; fruits 1-70 cm long at maturity.
 - 5 Leaves pinnately lobed, the divisions rounded; fruit surface green and white, the flesh red or pink; [tribe *Benincaseae*] *Citrullus*
 - 5 Leaves palmately lobed, the divisions angular and toothed; fruit surface red, green, white, black, orange, yellow, or blue, the flesh white, orange, yellow, tan, or green.
 - 6 Fruit < 3 cm long; tendrils present, simple; [native, mostly in moist forests or thickets].
 - 7 Fruit surface red at maturity; pedicel of pistillate flowers and fruits 1-3 mm long; [tribe *Cucurbiteae*] *Cayaponia*
 - 7 Fruit surface black or dark green at maturity; pedicel of pistillate flowers and fruits > 20 mm long; [tribe *Benincaseae*] *Melothria*
 - 6 Fruit > 5 cm long; tendrils absent or present (if present, forked); [introduced, mostly in gardens, fields, or disturbed places].
 - 8 Corolla white; [bottle gourd, ivy gourd]; [tribe *Benincaseae*] *Lagenaria*
 - 8 Corolla yellow; [cantaloupe, cucumber, luffa, squash, gourd, pumpkin].
 - 10 Corolla < 3 cm long; [cantaloupe, cucumber]; [tribe *Benincaseae*] *Cucumis*
 - 10 Corolla > 5 cm long; [luffa, squash, gourd, pumpkin] *Cucurbita*

Cayaponia Silva Manso 1836

A genus of about 75 species, herbaceous vines, of tropical, subtropical and warm-temperate America. References: Nesom (2015b) in FNA6 (2015); Schaefer & Renner in Kubitzki (2011).

Cayaponia quinqueloba (Rafinesque) Shinnars. FIVE-LOBE-CUCUMBER. **Hab:** Swamp forests, river banks, hammocks. **Dist:** E. SC south to GA and FL Panhandle, west to e. TX, north in the interior to w. TN. **Phen:** Jun-Nov. **Syn:** = Ar, FNA6, K1, K3, K4, NcTx, Tn, Tx, WH3; = *Cayaponia boykinii* (Torrey & A. Gray) Cogniaux – RAB, S; > *Cayaponia grandifolia* (Torrey & A. Gray) Small – GW2; > *Cayaponia quinqueloba* (Rafinesque) Shinnars – GW2. **NatureServe G4** (Apparently Secure).

*Citrullus* Schrader 1836 (WATERMELON)

A genus of 7 species, annual or perennial herbaceous vines, of Africa, Mediterranean Europe, and w. Asia. References: Chomicki & Renner (2015); Dane & Lang (2004); Nesom (2011b); Nesom (2015b) in FNA6 (2015); Paris (2015); Schaefer & Renner in Kubitzki (2011).

* ***Citrullus lanatus*** (Thunberg) J. Matsumura & Nakai. WATERMELON. **Hab:** Gardens, fields, trash heaps, commonly cultivated in home gardens and commercially, sometimes volunteering from seed the following year. **Dist:** Native of n. Africa. **Syn:** = Bah, Mi, NE, Chomicki & Renner (2015), but needing conservation with a new type; = *Citrullus lanatus* (Thunberg) Matsumura & Nakai ssp. *lanatus* – FNA6, NY, Nesom (2011b); = *Citrullus vulgaris* var. *vulgaris* – Tx; < *Citrullus citrullus* (Linnaeus) Karsten – S; < *Citrullus lanatus* (Thunberg) J. Matsumura & Nakai – IL, K4, Meso4.1, WH3; < *Citrullus lanatus* (Thunberg) Matsumura & Nakai var. *lanatus* – Ar, K1, K3, NcTx; < *Citrullus vulgaris* Schrader – F, G, RAB. **NatureServe GNRTNR** (Not Yet Ranked).

*Cucumis* Linnaeus 1753 (CANTELOUPE, MUSKMELON, CUCUMBER)

A genus of ca. 55 species, herbaceous vines, native of the Old World (but see discussion under *C. melo* var. *texanus*). Infrageneric classification follows Schaefer (2007). References: Decker-Walters et al (2002); Kirkbride (1993); Munger & Robinson (1991); Nesom (2015b) in FNA6 (2015); Schaefer & Renner in Kubitzki (2011); Schaefer (2007); Silberman et al (1999); Stepansky, Kovalski, & Perl-Treves (1999).

- 5 Fused portion of hypanthium or youngest fruits with appressed hairs; stem abundantly beset with retrorse prickles; fruit diameter 2.5-5 cm. ***Cucumis melo* var. *texanus***
- 5 Fused portion of hypanthium or youngest fruits with spreading hairs; stems smooth or nearly so; fruit diameter > 10 cm. ***Cucumis melo* var. *cantalupo***
- 6 Fruits with netted, warty, or scaly rind; ripe fruits with orange (rarely green) flesh, with aromatic flavor and musky odor; [cantaloupes, muskmelons, etc.] ***Cucumis melo* var. *inodorus***
- 6 Fruits with smooth or wrinkled rind; ripe fruits with white or green flesh, lacking musky odor; [honeydews, etc.]..... ***Cucumis melo* var. *inodorus***

* ***Cucumis melo* Linnaeus var. *cantalupo*** Seringe. CANTELOUPE, MUSKMELON. **Hab:** Gardens, fields, trash heaps, commonly cultivated in home gardens and commercially, sometimes volunteering from seed the following year. **Dist:** Native of Asia. **Phen:** May-Oct. **Syn:** = *Cucumis melo* ssp. *melo* var. *cantalupo* Seringe – FNA6; = *Cucumis melo* var. *cantalupensis* Naudin – Munger & Robinson (1991), Stepansky, Kovalski, & Perl-Treves (1999); < *Cucumis melo* Linnaeus – Ar, F, G, IL, K1, NcTx, RAB, S, WH3, WV, Schaefer (2007); < *Cucumis melo* ssp. *melo* – NY, Kirkbride (1993); < *Cucumis melo* var. *melo* – K4. **NatureServe GNRTNR** (Not Yet Ranked).

* ***Cucumis melo* Linnaeus var. *inodorus*** Jacquin. HONEYDEW, WINTER MELON. **Hab:** Gardens, fields, trash heaps, sometimes cultivated in our area. **Dist:** Native of Asia. **Syn:** = Munger & Robinson (1991), Stepansky, Kovalski, & Perl-Treves (1999); = *Cucumis melo* ssp. *melo* var. *inodorus* – FNA6; < *Cucumis melo* Linnaeus – Ar, Bah, F, G, K1, Mi, NcTx, NE, RAB, S, WH3, Schaefer (2007); < *Cucumis melo* ssp. *melo* – NY, Kirkbride (1993); < *Cucumis melo* var. *melo* – K4.

Cucumis melo* Linnaeus var. *texanus Naudin. GULF COAST MELON. **Hab:** Fields, roadsides, other disturbed areas; apparently evolved into a distinct variety in the southeastern United States from Asian stock introduced in the precolonial period. **Dist:** Panhandle FL south to peninsular FL, west through s. MS, s. TX, and Mexico. **Tax:** Decker-Walters et al. (2002) show that var. *texanus* is morphologically and molecularly distinct from the most closely related varieties, the Asian var. *chito* (C. Morren) Naudin and var. *dudaim* (Linnaeus) Naudin; they postulate that var. *texanus* was likely introduced from Asia in pre-Columbian times. **Syn:** = Decker-Walters et al (2002); = *Cucumis melo* ssp. *agrestis* (Naudin) Pangalo var. *texanus* – FNA6; < *Cucumis melo* Linnaeus – Ar, F, G, K1, NcTx, RAB, S, WH3, Schaefer (2007); < *Cucumis melo* ssp. *agrestis* (Naudin) Pangalo – Kirkbride (1993); < *Cucumis melo* Linnaeus var. *agrestis* Naudin – K4; < *Cucumis melo* var. *chito* – Munger & Robinson (1991), Stepansky, Kovalski, & Perl-Treves (1999); < *Cucumis melo* var. *melo* – Tx. **NatureServe GNRTNR** (Not Yet Ranked).

Cucurbita Linnaeus 1753 (SQUASH, ZUCCHINI, PUMPKIN, GOURD, VEGETABLE MARROW)

A genus of 14-22 species, annual or perennial herbaceous vines, of the New World tropics and subtropics. References: Castellanos-Morales et al (2018); Nesom (2011b); Nesom (2015b) in FNA6 (2015); Schaefer & Renner in Kubitzki (2011).

3 Stems and leaves variously pubescent, the hairs generally not pustulate-based.

..... *Cucurbita moschata*

3 Stems and leaves hispid with pustulate-based hairs.

5 Wild plants; fruit almost always bitter, solid ivory or green-and-white striped, usually not yellow or orange; rind smooth.

..... *Cucurbita melopepo* var. *texana*

5 Cultivated plants (or occurring as waifs and short-term naturalized population, usually in proximity to cultivation); fruit non-bitter (except for some ornamental gourds), variously colored, often at least partially yellow or orange; rind smooth, ribbed, or with warts.

..... *Cucurbita melopepo* var. *melopepo*

* *Cucurbita melopepo* Linnaeus var. *melopepo*. CROOKNECK SQUASH, STRAIGHTNECK SQUASH, SCALLOP SQUASH, PATTYPAN SQUASH, ACORN SQUASH, SPAGHETTI SQUASH, ORNAMENTAL GOURD. **Hab:** Gardens, fields, trash heaps; commonly cultivated in home gardens and commercially, rarely volunteering from seed the following year. **Dist:** Native of tropical America. **Phen:** May-Oct. **Syn:** = *Cucurbita melopepo* ssp. *melopepo* – K4; = *Cucurbita melopepo* ssp. *melopepo* var. *melopepo* – FNA6; = *Cucurbita melopepo* ssp. *texana* (Scheele) Nesom var. *melopepo* – Castellanos-Morales et al (2018), Nesom (2011b); = *Cucurbita pepo* Linnaeus var. *ovifera* (Linnaeus) Harz – Il, K2. **NatureServe** G4G5TNRQ (Not Yet Ranked).

163. CUCURBITACEAE

thickets. **Dist:** S. ME west to MN and se. ND, south to Panhandle FL and c. TX. **Phen:** May-Nov. **Syn:** = Ar, C, F, FNA6, G, GrPl, GW2, Il, K1, K3, K4, Mi, NcTx, NE, NY, Pa, RAB, S, Tn, Tx, Va, W, WH3, WV, Nesom (2011a). [NatureServe G5](#) (Secure).

168a. PARNASSIACEAE Martinov 1820 (GRASS-OF-PARNASSUS FAMILY) [in CELASTRALES]

A family of 2 genera and about 16 species, herbs, of largely north temperate and arctic areas. Numerous anomalous features separate *Parnassia* from the Saxifragaceae; affinities with the Droseraceae, Clusiaceae, Celastraceae, and other families have been historically suggested. It is now clear that its affinities lie with Celastraceae, but APG III's (2009) and APG IV's (2016) inclusion of it in Celastraceae seems premature; it is here retained as separate. Considering the uncertainties of its relationships, *Parnassia* is best treated as a family, the Parnassiaceae, as suggested by numerous workers as early as 1821, and increasingly accepted in recent decades. The very distant relationship of *Parnassia* to the Saxifragaceae (sensu stricto) has been strongly reaffirmed by molecular analyses (Morgan & Soltis 1993, Soltis et al. 2000, Savolainen et al. 2000). References: Ma, Ball, & Levin (2016) in FNA12 (2016); Simmons . [including LEPUROPETALACEAE] in Kubitzki et al (2004).

- 1 Plants diminutive, rosettes < 3 cm across; winter annual..... *Lepuropetalon*
 1 Plants larger, rosettes over 8 cm across; perennial from rhizomes..... *Parnassia*

Lepuropetalon Elliott 1817 (LEPUROPETALON)

A monotypic genus, of se. North America, Mexico, c. Chile, and Uruguay. Sometimes treated as part of a broad and polymorphic Saxifragaceae, *Lepuropetalon* has often been associated with *Parnassia* in the Parnassiaceae. Morgan & Soltis (1993) suggest a close relationship of *Lepuropetalon* and *Parnassia*, as well as the "distant relationship between both genera and the Saxifragoideae". The affinities of *Lepuropetalon* with *Parnassia* remain uncertain, however, as emphasized by Gastony & Soltis (1977) in their analysis of chromosomes and partially reiterated by Morgan & Soltis (1993). *Lepuropetalon* is here treated in the Parnassiaceae, as supported by molecular analyses (Soltis et al. 2000, Savolainen et al. 2000); treatment in a monotypic Lepuropetalaceae is perhaps equally warranted. References: Gastony & Soltis (1977); Saar (2016) in FNA12 (2016); Simmons in Kubitzki et al (2004); Spongberg (1972); Ward & Gholson (1987); Wilbur (1988b).

Lepuropetalon spathulatum Elliott. LEPUROPETALON, LITTLE-PEOPLE, PETITEPLANT. **Hab:** In moist open areas, such as seepage on granitic flatrocks, ditches, seasonally wet depressions. **Dist:** Se. NC and SC south to GA and FL Panhandle (Kunzer et al. 2009), west to e. TX and Mexico; also in Chile and Uruguay. **Phen:** Feb-Apr. **Comm:** As indicated by Ward & Gholson (1987), *Lepuropetalon* is more common than collections would indicate; the rosettes are 0.5-2 (-3) cm across, the greenish flowers are 2-3 mm across. It has been considered "the smallest terrestrial angiosperm" (Morgan & Soltis 1993). Its apparently greater abundance in the western portion of its range, where largely found by a few botanists "who have made determined efforts to establish its range" (Ward & Gholson), and in habitats such as granitic flatrocks, which have overall received close scrutiny, may be more a reflection of its diminutive size and early season of occurrence than of its real distribution and abundance. The recent increase in collections, mostly in disturbed or human-maintained habitats, also suggests a possible increase in abundance (and range?) from its original state. It should be more vigorously sought in the eastern part of our area. The presence of lines of red glandular dots on the leaves and sepals is a helpful diagnostic character. **Syn:** = Ar, FNA12, GW2, K1, K3, K4, NcTx, RAB, S, Tx, WH3. [NatureServe G4G5](#) (Apparently Secure).

Parnassia Linnaeus 1753 (GRASS-OF-PARNASSUS, PARNASSIA)

A genus of 15-70 species, herbs, primarily of arctic and north temperate areas. Our species (especially *Parnassia caroliniana*) are among the most southerly of the genus in distribution. *Parnassia* (all species) are among the most beautiful of our native plants. From a distance the white flowers are attractive but not extraordinary; when observed closely, though, the delicate tracery of the green veins on the waxy white petals is astonishing. References: Alexander (1934a); Alexander (1934b); Ball (2016) in FNA12 (2016); Gastony & Soltis (1977); GW2; Simmons in Kubitzki et al (2004); Spongberg (1972).

Identification Notes: Note that the five staminodia are (in our species) deeply three-lobed to the base, thus appearing as 15.

Parnassia grandifolia A.P. de Candolle. LIMSEEP PARNASSIA, BIGLEAF GRASS-OF-PARNASSUS. **Hab:** Fens, gravelly seepages, pineland seepage bogs and ecotones, primarily or solely over calcareous, mafic, or ultramafic rocks, in the outer Coastal Plain in seepage over marl on nearly vertical river bluffs on the Cape Fear River (NC) and in pineland seepage bogs. **Dist:** VA, WV, s. MO, and OK south to n. GA, Panhandle FL, s. MS (Sorrie & Leonard 1999), AR, and e. TX, primarily in the Appalachian and Ozarkian highlands. **Phen:** Aug-Nov (-Dec). **Comm:** The discovery of populations of this species in Brunswick and Columbus counties, NC, was remarkable. In the Panhandle of FL and the West Gulf Coastal Plain of LA and TX it also occurs in wet savannas and pitcherplant bogs (MacRoberts, MacRoberts, & Jackson 2004), in FL sometimes in close proximity to *P. caroliniana*; *Parnassia* in Coastal Plain savannas should not necessarily be assumed to be *P. caroliniana*. **Syn:** = Ar, C, F, FNA12, G, GW2, K1, K3, K4, RAB, S, Tn, Tx, Va, W, WH3, WV, Alexander (1934b). 168b. CELASTRACEAE R. Brown 1814 (BITTERSWEET FAMILY) [in CELASTRALES]

A family of about 100 genera and 1400 species, trees, shrubs, lianas, perennial and annual herbs, nearly cosmopolitan, especially in the tropics and subtropics. References: Brizicky (1964a); Ma, Ball, & Levin (2016) in FNA12 (2016); Simmons in Kubitzki et al (2004).

- 1 Lianas, climbing by adventitious roots, twining, or scrambling.
 - 2 Plants climbing by adventitious roots; sepals and petals 4; ovaries 4-carpellate (capsules 4-locular)..... *Euonymus*
 - 2 Plants climbing by twining or scrambling; sepals and petals 5; ovaries 3-carpellate (capsules 3-locular)..... *Celastrus*
- 1 Shrubs or trees, more or less erect and without climbing adaptations. *Euonymus*

***Celastrus* Linnaeus 1753 (BITTERSWEET)**

A genus of about 30 species, lianas, primarily in e. Asia, Malaysia, Oceania, Madagascar, and Central and South America. The one species native to e. North America is related to e. Asian species. The grammatical gender of the genus has been conserved as masculine (Brummitt 2005). References: Duncan (1969); Leicht-Young et al (2007); Ma & Levin (2016a) in FNA12 (2016); Simmons in Kubitzki et al (2004).

- 1 Flowers in 2-3-flowered axillary cymes; mature leaves mostly obovate, averaging 1.2-1.4 (-1.7)× as long as wide; expanding leaves folded (conduplicate); capsule yellow (contrasting with the seeds); pollen white *Celastrus orbiculatus*
- 1 Flowers in 6-many-flowered panicles terminal on leafy branches or branchlets; mature leaves mostly ovate-lanceolate to elliptic, averaging (1.8-) 2.0-2.6× as long as wide; expanding leaves rolled (involute); capsule orange (similar in color to the seeds); pollen yellow *Celastrus scandens*

* ***Celastrus orbiculatus* Thunberg. ORIENTAL BITTERSWEET. **Hab:**** Bottomland and riparian forests, mesic upland forests and bluffs, glade margins, disturbed areas, thickets, roadsides, forests. **Dist:** Native of Asia. *C. orbiculatus* is grown for its attractive fruits; it has become a noxious weed in much of our area. **Phen:** May-Jun; Aug-Sep. **Comm:** The first reports of its occurrence in our area appear to be in the 1960's; it is now much more common in most of our area than its native relative, *C. scandens*. **Syn:** = Ar, C, F, FNA12, GrPl, Il, K3, K4, Mi, NE, NY, Pa, RAB, Tn, Va, W, Duncan (1969); = *Celastrus orbiculata* – G, K1, orthographic variant. NatureServe GNR (Not Yet Ranked).

Celastrus scandens* Linnaeus. AMERICAN BITTERSWEET. **Hab:* Dry-mesic to mesic upland forests and woodlands, bluffs, riparian and bottomland forests, glade margins. **Dist:** QC west to MB and WY, south to w. SC, n. GA, AL, LA, and TX. **Phen:** May-Jun; Aug-Sep. **Syn:** = Ar, C, F, FNA12, G, GrPl, Il, K1, K3, K4, Mi, NcTx, NE, NY, Pa, RAB, S, Tn, Tx, Va, W, Duncan (1969). NatureServe G5 (Secure).

***Euonymus* Linnaeus 1753 (SPINDLE-TREE, EUONYMUS, STRAWBERRY-BUSH)**

A genus of ca. 129 species, of temperate and tropical areas, trees, shrubs, and lianas. The genus name was variously spelled '*Euonymus*' and '*Evonymus*' by Linnaeus. The spelling *Euonymus* has been nomenclaturally conserved. The genus is now considered to be grammatically masculine, and adjectival specific epithets therefore end in '-us'. References: Ma & Funston (2008); Ma & Levin (2016b) in FNA12 (2016); Simmons in Kubitzki et al (2004); Voss (1985).

- 1 Leaf undersurface with mostly erect hairs to ca. 0.2 mm long; petioles 8-20 mm long; flowers 4-merous; [native]; [section *Euonymus*] *Euonymus atropurpureus*
- 1 Leaf undersurface glabrous (or with some hairs on the midrib); petioles 1-33 mm long; flowers 4- or 5-merous; [introduced or native].
 - 2 Leaves evergreen; flowers 4-merous; [introduced species, rarely naturalized]; [section *Ilicifolii*].
 - 3 Leaves 2-5.5 cm long, 2-3.5 cm wide; capsule 5-6 mm in diameter; plant creeping *Euonymus fortunei*
 - 3 Leaves (3-) 5-10 (-12) cm long, (2-) 3-5 (-5.5) cm wide; capsule 6-9 (-12) mm in diameter; plant erect..... *Euonymus japonicus*
 - 2 Leaves deciduous; flowers 4- or 5-merous; [introduced or native].
 - 4 Petioles 5-33 mm long; flowers 4-merous; [introduced, rarely naturalized]; [section *Euonymus*]. *Euonymus europaeus*
 - 4 Petioles 1-5 mm long; flowers 4- or 5-merous; [native and introduced].
 - 6 Twigs and branches with 2-4 corky wings; flowers 4-merous; capsules smooth; [introduced, rarely naturalized]; [section *Melanocarya*]..... *Euonymus alatus*
 - 6 Twigs and small branches lacking corky wings, terete (or nearly so); flowers 5-merous; capsules muricate; [native species]; [section *Echinococcus*]. *Euonymus americanus*

(see introduction for more)

168b. CELASTRACEAE

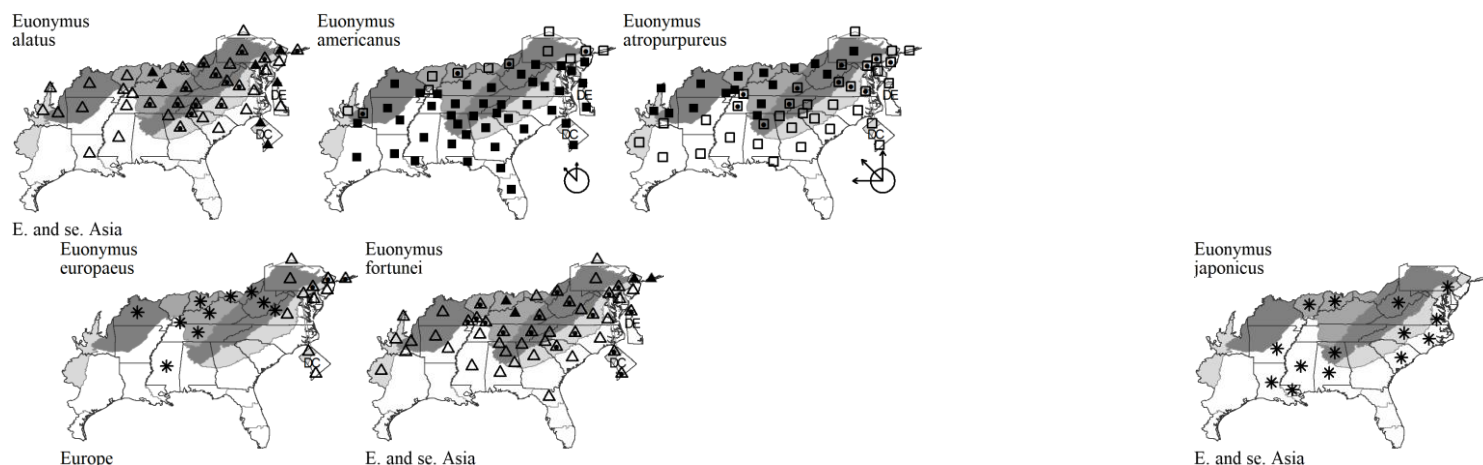

* **Euonymus alatus** (Thunberg) Siebold. WINGED EUONYMUS, BURNING BUSH. **Hab:** Suburban woodlands, becoming invasive in some areas. **Dist:** Native of e. Asia. First reported for NC (Jackson Co.) by Pittillo & Brown (1988), now widespread in the state. **Phen:** Apr-Jun; Sep-Oct. **ID Notes:** *Euonymus alatus* can easily be distinguished in winter condition from two native species that develop corky wings on the twigs. *Euonymus alatus* has opposite leaves (and therefore opposite branching), the wings are sometimes four in a particular stretch of twig (rather than two, or irregular), the wings are very 'geometric', with squared off, quadrate ends, and the smaller twigs are green and moderately fine. *Ulmus alata* has alternate leaves (and therefore alternate branches), usually 2 thinnish wings, irregular ends and margins of the wings, and fine smaller twigs that are greenish to tan or brown. *Liquidambar styraciflua* has alternate leaves (and therefore alternate branches), irregular corky outgrowths that often are not particularly wing-like, and greenish to bronze moderately thick twigs. **Syn:** = Ar, C, F, FNA12, G, Il, K3, K4, NE, NY, Pa, Tn, Va, W, Brizicky (1964a), Ma & Funston (2008); = *Euonymus alata* – K1, Mi, Voss (1985); > *Euonymus alatus* var. *alatus*; > *Euonymus alatus* var. *apterus* Regel. **NatureServe GNR** (Not Yet Ranked).

Euonymus americanus Linnaeus. STRAWBERRY-BUSH, HEART'S-A-BUSTIN' (-WITH-LOVE). **Hab:** Mesic to submesic forests. **Dist:** Se. NY west to s. OH and se. MO, south to n. peninsular FL and TX. **Phen:** May-Jun; Sep-Oct. **Tax:** A variety, var. *angustifolius* (Pursh) Alph. Wood, with narrowly lanceolate to linear leaves, has been named and occurs in our area; it is of uncertain status (Brizicky 1964) but is here considered a form. **Syn:** = Ar, C, F, FNA12, G, Il, K3, K4, NY, Pa, RAB, S, Tn, Tx, Va, W, WH3, WV; = *Euonymus americana* – K1; > *Euonymus americanus* var. *americanus*; > *Euonymus americanus* var. *angustifolius* (Pursh) Alph. Wood. **NatureServe G5** (Secure).

Euonymus atropurpureus Jacquin. AMERICAN WAHOO, BURNING BUSH. **Hab:** Bottomland forests, riverbanks, mostly on rich alluvial sediments, or on slopes over mafic or calcareous rocks. **Dist:** NY west to ND, south to Panhandle FL and TX. **Phen:** May-Jul; Aug-Oct. **Tax:** Two varieties are sometimes recognized: a widespread var. *atropurpureus* and var. *cheathamii* Lundell endemic to TX. **Syn:** = C, F, FNA12, G, GrPl, Il, K4, NY, Pa, RAB, S, Tn, Va, W, WH3, WV; = *Euonymus atropurpurea* – Mi, Voss (1985); > *Euonymus atropurpurea* var. *atropurpurea* – K1; > *Euonymus atropurpureus* var. *atropurpureus* – Ar, K3, NE, Tx; > *Euonymus atropurpureus* var. *cheathamii* Lundell – K3; > *Euonymus atropurpureus* var. *cheatumii* – Tx, orthographic variant; > *Euonymus atropurpurea* var. *atropurpurea* – NcTx, orthographic variant; > *Euonymus atropurpurea* var. *cheathamii* Lundell – NcTx, orthographic variant.

* **Euonymus europaeus** Linnaeus. EUROPEAN SPINDLE-TREE. **Hab:** Suburban woodlands, uncommonly cultivated, rarely naturalized. **Dist:** Native of Europe. **Phen:** May-Jun; Sep-Oct. **Syn:** = C, F, FNA12, G, Il, K3, K4, NE, NY, Pa, Va; = *Euonymus europaea* – K1, Mi, Voss (1985). **NatureServe GNR** (Not Yet Ranked).

* **Euonymus fortunei** (Turczaninow) Handel-Mazzetti. WINTERCREEPER, CHINESE SPINDLE-TREE, CLIMBING EUONYMUS. **Hab:** Bottomlands, swamps, upland suburban woodlands. **Dist:** Native of China. **Phen:** May-Jun; Oct-Dec. **Tax:** There is some confusion about the appropriate taxonomic treatment about various cultivated (and escaped) forms that have been attributed to this name. **Comm:** Sometimes climbing into the canopy. **Syn:** = F, FNA12, G, K4, Mi, NE, NY, Pa, Va, Ma & Funston (2008), Voss (1985); < *Elaeodendron fortunei* Turczaninow – K3; > *Euonymus fortunei* (Turczaninow) Handel-Mazzetti var. *radicans* (Siebold ex Miquel) Rehder – K1; > *Euonymus hederaceus* Champ. ex Benth – Il, K2, Tn; > *Euonymus kiautschovicus* Loesener – K1; > *Euonymus kiautschovicus* Loesener – Il.

* **Euonymus japonicus** Thunberg. JAPANESE SPINDLE-TREE. **Hab:** Disturbed areas, especially on barrier islands. **Dist:** Native of Japan. **Comm:** Especially widely planted on barrier islands and in other maritime situations because of its resistance to salt damage (Brown 1959). Reported for AR (Serviss et al. 2017a; Serviss et al. 2020). **Syn:** = C, FNA12, Il, K3, K4, Ma & Funston (2008); = *Euonymus japonica* – K1. **NatureServe GNR** (Not Yet Ranked).

171. OXALIDACEAE R. Brown 1818 (WOOD-SORREL FAMILY) [in OXALIDALES]

A family of 5-6 genera and 800 species, herbs, shrubs, vines, and small trees, nearly cosmopolitan (especially temperate). References: Cocucci in Kubitzki et al (2004); Nesom (2016a) in FNA12 (2016).

Oxalis Linnaeus 1753 (WOOD-SORREL, OXALIS)

A genus of about 700 species, herbs, shrubs, and vines, nearly cosmopolitan. References: Cocucci in Kubitzki et al (2004); Eiten (1963); Franck et al (2016); Horne, Barger, & Nesom (2013); Kelley & Vincent (2020); Lourteig (1979); Lourteig (1990); Nesom (2009b); Nesom (2009c); Nesom (2016a) in FNA12 (2016); Nesom, Spaulding, & Horne (2014); Robertson (1975); Ward (2004a).

3 Plant acaulescent; leaves basal; flowers white, pink, or purple.

10 Sepals conspicuously appressed-pubescent; leaflets with reddish-brown callosities mostly along the margins; [naturalized] *Oxalis articulata*

171. OXALIDACEAE

- 10 Sepals glabrous or sparsely pubescent; leaflets with reddish-brown callosities either scattered over the surface or only at the apical notch; [native or naturalized]
 11 Leaflets 25-45 mm long; leaflets with reddish-brown callosities scattered over the surface; [naturalized] *Oxalis debilis*
 11 Leaflets 8-15 mm long; leaflets with reddish-brown callosities only at the apical notch; [native] *Oxalis violacea*
- 3 Plant caulescent; leaves alternate; flowers yellow; [section *Corniculatae*].
 13 Stems evenly strigose from base to peduncles and pedicels.
 14 Flowers 1-3 (-8) in umbelliform cymes; flowers homostylous; petals 5-12 mm long, yellow, without red lines *Oxalis dillenii*
 14 Flowers (2-) 3-5 (-8) in umbelliform cyme; flowers distylous; petals (6-) 12-16 (-17) mm long, yellow with prominent red lines in the corolla throat *Oxalis texana*
- 13 Stems pilose to villous to nearly glabrous, rarely strigose and then only on peduncles or pedicels.
 15 Petals 9-20 (-23) mm long, red-lined in the throat (sometimes very faintly so).
 16 Corolla throats strongly red-lined within; petals 9-20 mm long; flowers 1 or (2-) 3-8 in umbelliform cymes above the level of the leaves; stems densely and pilose with stiffly spreading non-septate hairs; stoloniform rhizomes lignescent or ligneous and numerous on an individual plant
 17 Petals 9-15 mm long; plants caespitose or weakly colonial; pedicels strigose with short hairs that are curved towards pedicel apex *Oxalis colorea*
 17 Petals (13-) 15-20 (-23) mm long; plants strongly colonial; pedicels villous with long straightish hairs *Oxalis macrantha*
 16 Corolla throats yellow, very faintly to strongly red-lined within; petals 10-18 mm long; flowers 1 or 2-4 (-8) in regular or irregular cymes, above or within the level of the leaves; stems nearly glabrous to sparsely or densely pilose or villous with septate hairs or a mixture of septate and non-septate hairs; stoloniform rhizomes usually 1 or few, herbaceous or lignescent. *Oxalis grandis*
- 15 Petals 4-9 (-11) mm long, yellow, without red lines in the throat.
 19 Stems repent, rooting at most nodes; seeds brown, transverse ridges not white; stipules oblong with distinct flanges and free auricles *Oxalis corniculata*
 19 Stems erect, usually arising singly from the base, rarely decumbent, not or very rarely rooting at the nodes, from a short, thin, often herbaceous to slightly lignescent rhizome etc. ; seeds all brown or with white transverse ridges; stipules absent or so reduced to be barely evident.
 20 Stems (5-) 8-30 (-35) cm, sparsely pilose with non-septate hairs to almost completely glabrous, arising from a taproot, often producing lignescent stolons; flowers 1 or 2 (-3, rarely 4-5) in umbelliform cymes; capsules glabrous to sparsely puberulent, not villous *Oxalis florida*
 20 Stems 20-60 (-90) cm long, sparsely to very sparsely pilose with nonseptate hairs or a mixture of nonseptate and septate hairs or densely villous with septate hairs, arising singly from the base from a short herbaceous to lignescent rhizome; flowers usually (3-) 5-7 (-15) in regular (rarely irregular) cymes; capsules villous to puberulent and villous to glabrate *Oxalis stricta*

* *Oxalis articulata* Savigny. **Hab:** Roadsides, old gardens. **Dist:** Native of South America. **Syn:** = FNA12, K4, WH3, Kelley & Vincent (2020), Nesom (2009b); ? *Ionoaxalis martiana* (Zuccarini) Small – S, misapplied; > *Oxalis articulata* Savigny ssp. *rubra* (St. Hilaire) Lourteig – NcTx; > *Oxalis rubra* St. Hilaire – Ar, K1, RAB, Tx, Va, Robertson (1975).

Oxalis colorea (Small) Fedde. SMALL'S WOOD-SORREL. **Hab:** Longleaf pine sandhills, dry-mesic and mesic forests, thin soils around rock outcrops, disturbed areas. **Dist:** E. MD and sc. and w.VA west to MO, south to n. FL and e. LA. **Phen:** (Mar-) Apr-May (-Oct). **Syn:** = FNA12, K4; = *Xanthoxalis colorea* Small – S; ? *Oxalis priceae* Small ssp. *colorea* (Small) Eiten.

* *Oxalis corniculata* Linnaeus. CREEPING LADY'S-SORREL. **Hab:** Gardens, fields, disturbed areas, sometimes more natural areas including pinelands, dunes. **Dist:** Probably native of New World tropics and subtropics, possibly including the deeper South. Now nearly worldwide in distribution. **Phen:** Feb-Dec. **Syn:** = Bah, C, F, FNA12, GrPl, II, K1, K4, Mi, NcTx, NE, NY, Pa, RAB, Tn, Tx, Va, WV, Eiten (1963), Robertson (1975); = *Oxalis repens* Thunberg – G; < *Oxalis corniculata* Linnaeus – WH3; > *Oxalis corniculata* var. *atropurpurea* Planchon – Ward (2004a); > *Oxalis corniculata* var. *corniculata* – Ward (2004a); > *Xanthoxalis corniculata* (Linnaeus) Small – S; > *Xanthoxalis langloisii* Small – S.

* *Oxalis debilis* Kunth. **Hab:** Disturbed areas. **Dist:** Native of South America. **Phen:** Mar-Jun. **Syn:** = FNA12, K3, K4, WH3, Nesom (2009b); > *Oxalis corymbosa* A.P. de Candolle – Bah, Tx, Robertson (1975), Ward (2004a); > *Oxalis debilis* Kunth var. *corymbosa* (A.P. de Candolle) Lourteig – K1. 171. OXALIDACEAE

Oxalis grandis Small. GREAT YELLOW WOOD-SORREL. **Hab:** Rich moist forests, rocky bluffs. **Dist:** PA, OH, and IN, south to SC, GA, AL, MS. **Phen:** May-Aug. **Syn:** = C, F, FNA12, G, K1, K3, K4, Pa, RAB, Tn, Va, W, Eiten (1963), Robertson (1975); = *Xanthoxalis grandis* (Small) Small – S. NatureServe G4G5 (Apparently Secure).

Oxalis macrantha (Trelease) Small. SADIE PRICE'S YELLOW WOOD-SORREL. **Hab:** Rich woodlands. **Dist:** KY and TN south to GA, Panhandle FL, AL, MS, and se. LA; disjunct in c. NC. **Comm:** *O. macrantha* predates *O. priceae* and thus is the name to use. **Syn:** = FNA12, K4, WH3; = *Oxalis priceae* – Tn; = *Oxalis priceae* Small ssp. *priceae* – K1, Eiten (1963), Robertson (1975); = *Oxalis recurva* Elliott var. *macrantha* (Trelease) Wiegand – F; = *Xanthoxalis macrantha* (Trelease) Small – S; < *Oxalis recurva* – G; > *Xanthoxalis hirsuticaulis* (Small) Small – S; > *Xanthoxalis priceae* Small – S.

Oxalis stricta Linnaeus. COMMON YELLOW WOOD-SORREL. **Hab:** Disturbed areas, also in a variety of natural habitats. **Dist:** Widespread in North America, now widespread nearly worldwide. **Phen:** May-Oct. **Syn:** = Ar, C, FNA12, Il, K1, K3, K4, Mi, NE, NY, Pa, RAB, Tn, Tx, Va, W, WV, Eiten (1963), Robertson (1975), Ward (2004a); = *Oxalis europaea* – G; < *Oxalis corniculata* Linnaeus – WH3; > *Oxalis europaea* var. *bushii* (Small) Wiegand – F; > *Oxalis europaea* Jord. var. *europaea* – F; < *Oxalis stricta* Linnaeus – NcTx; > *Xanthoxalis bushii* Small – S; > *Xanthoxalis cymosa* (Small) Small – S; > *Xanthoxalis rufa* Small – S; > *Xanthoxalis stricta* (Linnaeus) Small – S.

Oxalis texana (Small) Fedde. TEXAS WOOD-SORREL. **Hab:** Glades, woodlands, forests. **Dist:** Panhandle FL and AL west to TX. **Phen:** Mar-May (-Jun). **Syn:** = Ar, FNA12, K4, Nesom (2009b); = *Oxalis lyonii* Pursh – Lourteig (1979); = *Oxalis priceae* Small ssp. *texana* (Small) Eiten – K1, Tx, Eiten (1963), Robertson (1975); = *Oxalis recurva* Elliott var. *texana* (Small) Wiegand. NatureServe G3G5TNR (Not Yet Ranked).

Oxalis violacea Linnaeus. VIOLET WOOD-SORREL. **Hab:** Dry to moist forests. **Dist:** MA, VT, MI, SD, and CO south to FL, TX, and AZ. **Phen:** Mid Feb-May (-Jul). **Syn:** < *Ionoxalis violacea* (Linnaeus) Small – S; < *Oxalis violacea* Linnaeus – Ar, C, FNA12, G, GrPl, Il, K1, K3, K4, Mi, NcTx, NE, NY, Pa, RAB, Tn, Tx, Va, W, WH3, Nesom (2009b), Robertson (1975), Ward (2004a); > *Oxalis violacea* var. *trichophora* Fassett – F, WV; > *Oxalis violacea* var. *violacea* – F, WV; < *Sassia violacea* (Linnaeus) Holub.

185. PODOSTEMACEAE Richard ex Kunth 1816 (RIVERWEED FAMILY) [in MALPIGHIALES]

A family of about 47-49 genera and 280 species, aquatic herbs, of tropical, subtropical, and rarely temperate regions of the New World and Old World. References: Cook & Rutishauser in Kubitzki, Bayer, & Stevens (2007); Graham & Wood (1975); Philbrick & Crow (2015) in FNA6 (2015).

Podostemum Michaux 1803 (RIVERWEED)

A genus of about 7-17 species, reduced aquatic herbs, of tropical to temperate America. References: Cook & Rutishauser in Kubitzki, Bayer, & Stevens (2007); Graham & Wood (1975); Philbrick & Crow (1983); Philbrick & Crow (2015) in FNA6 (2015).

Identification Notes: *Podostemum* is a curious plant, seeming more like an alga than a vascular plant in color, texture, mode of attachment to substrate (by a fleshy disk), and irregular thalloid branching.

Podostemum ceratophyllum Michaux. THREADFOOT, RIVERWEED, RIFFLEWEED. **Hab:** Attached to rocks and dams in rapidly or slowly flowing water. **Dist:** NS, ME, and QC south to sw. GA, s. AL, s. MS, se. LA (Florida parishes), AR, and w. TN; disjunct in the Ozark-Ouachita Highlands of w. AR and e. OK; Dominican Republic; Honduras. **Phen:** May-Jul. **Comm:** Fehrmann, Philbrick, & Halliburton (2012) demonstrate very low genetic diversity in the populations north of the glacial maximum, in the Ozark-Ouachita Highlands, and in Central America, and high genetic diversity in the portion of the unglaciated southeast east of the Mississippi River. **Syn:** = Ar, C, F, FNA6, G, K1, K3, K4, NE, NY, Pa, RAB, Tn, Va, W, WV, Graham & Wood (1975); = *Podostemon ceratophyllum* – GW2, Tx, orthographic variant; > *Podostemon abrotanoides* Nuttall – S; > *Podostemon ceratophyllum* – S, orthographic variant. NatureServe G5 (Secure).

186. HYPERICACEAE A.L. de Jussieu 1789 (ST. JOHN'S-WORT FAMILY) [in MALPIGHIALES]

A family of 7-9 genera and 480-560 species, herbs, shrubs, and trees, nearly cosmopolitan. It appears from molecular analysis that recognition of the Hypericaceae is (after all) warranted. *Hypericum* is in a clade with *Podostemum* and *Bonnetia*, sister to a clade including Clusiaceae s.s. (Savolainen et al. 2000), and unless the morphologically very different Podostemaceae is to be included in a broad Clusiaceae, Hypericaceae and Podostemaceae must be recognized. References: Adams (1973); Godfrey (1988); Robson (2015e) in FNA6 (2015); Stevens in Kubitzki, Bayer, & Stevens (2007); Wood & Adams (1976).

- 1 Petals yellow; stamens fascicled or not, if fascicled then not into 3 fascicles of 3 stamens each; staminodia (hypogynous glands) lacking; perianth 4-5-merous.....*Hypericum*
 1 Petals pale pink; stamens fascicled, in 3 fascicles of 3 stamens each; staminodia (hypogynous glands) present, alternating with the fascicles of stamens; perianth 5-merous.....*Triadenum*

Hypericum Linnaeus 1753 (ST. JOHN'S-WORT)

A genus of 370-420 species, trees, shrubs, and herbs, primarily temperate. *Hypericum* in our area is a large, complex, and interesting genus, with a number of unresolved questions remaining. The species treated in Key B have often been treated in the segregate genus *Ascyrum*; evidence from a variety of disciplines now suggests that they should be included in *Hypericum* (Adams & Robson 1961; Calie, Schilling, & Webb 1983; Robson 1996; Nürk et al. 2013). *Triadenum* is almost basal in (or to) *Hypericum*, and its inclusion in *Hypericum* has also been recently promoted (e.g. Nürk et al. 2013), but its retention at generic rank is suggested by its morphological distinction and position as a basal clade. References: Adams & Robson (1961); Adams (1957); Adams (1962); Adams (1973); Allison (2011); Calie, Schilling, & Webb (1983); Cooperrider (1989); Culwell (1970); Godfrey (1988); Meseguer et al (2015); Meseguer, Aldasoro, & Sanmartín (2013); Nürk et al (2013); Robson & Adams (1968); Robson (1985, 1990, 2001, 2002, 2006); Robson (1996); Robson (2015a) in FNA6 (2015); Sorrie (2012); Stevens in Kubitzki, Bayer, & Stevens (2007); Weakley et al (2011); Webb (1980).

Identification Notes: "Longest leaves" should be sought at branch nodes.

- 1 Petals pale pink; stamens fascicled, in 3 fascicles of 3 stamens each; staminodia (hypogynous glands) present, alternating with the fascicles of stamens; perianth 5-merous..... **Triadenum**
- 1 Petals yellow; stamens fascicled or not, if fascicled then not into 3 fascicles of 3 stamens each; staminodia (hypogynous glands) lacking; perianth 4-5-merous.
 - 2 Leaves with an articulation at the very base, this appearing as a narrow line, groove, or abrupt change of color and texture which extends across the petiole; shrubs; [section *Myriandra*].
 - 3 Leaves needle-like, 0.5-1.5 (-2) mm wide, the margins essentially parallel (*H. galioides* keyed here and below); [subsection *Centrosperma*]..... **Key A**
 - 3 Leaves, at least the largest on the plant, not needle-like, wider than 2 mm, the margins not parallel, the widest point often beyond the middle.
 - 4 Petals 4; sepals 4 (rarely 2); plant 5-100 cm tall; leaves 2-40 mm long; foliage bluish-green when fresh; [subsection *Ascyrum*] **Key B**
 - 4 Petals 5; sepals 5; plant 50-250 cm tall; leaves (10-) 20-70 mm long; foliage green when fresh; [subsections *Centrosperma* and *Brathydium*]..... **Key C**
 - 2 Leaves without an articulation at the very base, the petiole merging gradually into the stem with no break, groove, or abrupt change in color or texture; herb, decumbent shrub, or shrub.
 - 5 Leaves ascending or appressed, 1-nerved, < 1 mm wide; inflorescence either a compound raceme or a dichasial cyme; annual or perennial herbs; [section *Brathys*] **Key D**
 - 5 Leaves spreading or ascending, generally multi-nerved, > 1 mm wide; inflorescence a dichasial cyme; herbs or shrubs.
 - 9 Capsule 3 (-4) locular; stamens connate at the base into 3 or 5 fascicles; leaves with black glandular dots as well as translucent glandular dots when backlit (except in *H. perforatum*); sepals and/or petals marked with black glandular dots or lines; perennial herbs; [section *Hypericum*] **Key E**
 - 9 Capsule 1-locular; stamens separate or connate at the base, but not grouped into fascicles; leaves with translucent glandular dots, without black glandular dots (when backlit); sepals and petals with translucent glandular lines or dots only, not also marked with black glandular dots or lines.
 - 10 Shrubs, decumbent shrubs, or suffrutescent herbs; [section *Myriandra*, subsections *Brathydium*, *Pseudobrathydium*, and *Suturosperma*] **Key F**
 - 10 Herbs; [section *Trigynobrathys* and section *Myriandra* subsection *Suturosperma*]..... **Key G**

Key A - shrubby St. John's-worts with needle-like leaves and flowers with 5 petals and 5 sepals [section *Myriandra*, subsection *Centrosperma*]

- 1 Longest leaves 4-16 mm long.
 - 2 Upper leaf surface convex, merging gradually with revolute margins; leaves oblanceolate to linear-oblanceolate ("oblinear"); [east and west of the Mississippi River in the Coastal Plain]..... **Hypericum galioides**
 - 2 Upper leaf surface plane, abruptly angled to the revolute portion; leaves linear; [east of the Mississippi in the Coastal Plain].
 - 3 Capsules 3-4.5 (-6) mm long; longest leaves 7-16 mm long; corollas 13-17 mm in diameter; seeds reddish-amber or brown, the alveoli not in distinct longitudinal rows, the seed lacking longitudinal ridges except for the two marginal sutures; primary branches with two ridged or winged angles running the length of the internodes, extending from the leaf midribs (but not the margins) at the base of the paired leaves; leaf surface glossy; [of alfisols and ultisols of wet pine savannas, flatwoods, and seepage bogs] **Hypericum brachyphyllum**
 - 3 Capsules 6-9 mm long; longest leaves 4-10 (-11); corollas 13-15 mm in diameter; seeds dark red to black, the alveoli in distinct longitudinal rows, with raised ridges often evident between the rows; primary branches with six ridged or winged angles running the length of the internodes, extending from the midribs and margins at the base of the paired leaves; leaf surface dull; [of seasonally dry spodosol pine flatwoods and interdune flats and hollows] **Hypericum tenuifolium**
- 1 Longest leaves 13-30 mm long.
 - 6 Undersurface of most leaves easily visible (exposed) on both sides of the midrib, the veins usually obvious on the undersurface; leaves narrowly oblanceolate to linear-oblanceolate ("oblinear"), 1.5-5 (-7) mm wide; inflorescence elongate (3-7 nodes) **Hypericum galioides**
 - 6 Undersurface of most leaves not easily visible except for the midrib (leaf margins nearly touching the midrib for its entire length), if the undersurface visible then no veins visible; leaves linear, needle-like, 0.5-1.5 mm wide; inflorescence elongate or short. **Hypericum fasciculatum**

Key B - shrubby St. John's-worts with 4 petals and 4 (rarely 2) sepals [section *Myriandra*, subsection *Ascyrum*]

- 1 Styles and carpels 3 (rarely 4); leaves (5-) 7-20 mm wide, rounded, subcordate, or cordate-clasping at the base; plant an erect shrub. **Hypericum crux-andreae**
- 1 Styles and carpels 2 (3 in *H. microsepalum*); leaves 1-7 mm wide, mostly cuneate (or if rounded the leaves < 8 mm long and 3 mm wide); erect or decumbent shrub.
 - 5 Pedicels 6-13 mm long, soon reflexed; subtending bractlets located near the last pair of leaves; decumbent shrub, to 2 dm tall **Hypericum suffruticosum**
 - 5 Pedicels 1-5 mm long, erect; subtending bractlets located midway between the base of the flower and the last pair of leaves; erect or decumbent shrub, mostly 1-15 dm tall.
 - 6 Erect shrub, usually with a single stem, freely branched well above ground level (or from ground level if injured, as by fire, but then the multiple branches still erect rather than decumbent), to 1 m or more tall; leaves usually variable in size and shape, widest near the middle..... **Hypericum hypericoides**
 - 6 Decumbent, matted shrub, with several prostrate stems arising from a primary rootstock near ground level, each with numerous erect branchlets, rarely over 3 dm tall; leaves usually relatively uniform in size and shape, widest above the middle..... **Hypericum stragulum**

Key C - shrubby St. John's-worts with broader leaves (mostly lanceolate or oblanceolate) and flowers with 5 petals and 5 sepals

- 1 Leaves cordate-clasping at the base, ovate, averaging about 2× as long as wide; [of s. SC southward]; shrub wandlike or branched, becoming corky-thickened below; [Coastal Plain, se. SC south to s. FL, west to s. MS]; [section *Myriandra*, subsection *Brathydium*].....*Hypericum myrtifolium*
- 1 Leaves cuneate at the base, oblanceolate, oblong, elliptic, or narrowly elliptic, 2.5-10× as long as wide; shrub prolifically bushy-branched when well-developed, with thin bark; [collectively widespread]; [section *Myriandra*, subsection *Centrosperma*].
- 2 Leaves mostly narrowly oblanceolate, the larger 2-3 cm long, 2-5 (-7) mm wide, mostly 5-10× as long as wide; seeds 0.4-0.8 mm long, dark brown*Hypericum galioides*
- 2 Leaves mostly oblong, elliptic, narrowly elliptic, or broadly oblanceolate, the larger (2-) 3-7 cm long, 1-15 mm wide, mostly 2.5-7.5× as long as wide; seeds 0.8-1.5 mm long, amber to medium or dark brown.
- 3 Flowers solitary, terminal (or in 3-flowered terminal cymes); petals 10-20 mm long; sepals 7-15 mm long; shrubs to 1 m tall.....*Hypericum frondosum*
- 3 Flowers (1-) 3-many in terminal cymes; petals 5-10 mm long; sepals 1.5-8 mm long; shrubs to 3 m tall.
- 4 Flowers (1-) 3-7 per inflorescence; capsules (6-) 7-14 mm long; larger leaves (4-) 7-14 mm wide.....*Hypericum prolificum*
- 4 Flowers 7-many per inflorescence; capsules (3-) 4.5-7 mm long; larger leaves 1-10 (-14) mm wide.
.....*Hypericum lobocarpum*

Key D - herbaceous St. John's-worts with leaves ascending or appressed, 1-nerved, < 1 mm wide and with a diffuse, racemose or dichasial inflorescence

- 2 Leaves linear-subulate, (5-) 8-20 mm long; capsules 1-1.75× as long as the sepals; seeds coarsely rugose-areolate; stamens 10-22.....*Hypericum drummondii*
- 2 Leaves scale-like, 1-5 mm long; capsules ca. 2-3× as long as the sepals; seeds minutely and inconspicuously reticulate; stamens 5-10*Hypericum gentianoides*

Key E - herbaceous St. John's-worts with broad leaves, 3 (-4) locular capsules, stamens connate at base into 3 or 5 fascicles, leaves with black dots as well as translucent glands (except in *H. perforatum*), and sepals and/or petals marked with black dots or lines

- 1 Smaller stems strongly wing-angled; seeds 1.0-1.3 mm long; leaves of the main stem (8-) 11-20 (-26) mm long, those of the lateral branches typically much smaller; leaves punctate primarily with translucent glands; [alien, usually in disturbed habitats]; [section *Hypericum*].....*Hypericum perforatum*
- 1 Smaller stems not wing-angled; seeds 0.6-1.1 mm long; leaves of the main stem (11-) 21-48 (-64) mm long, those of the lateral branches nearly to quite as large; leaves punctate with black glands; [native, in a variety of habitats]; [section *Graveolentia*].
- 3 Sepals 3-6 mm long; styles (2.5-) 5.4-7.4 (-9.0) mm long; petals (6.0-) 9.2-12.2 (-14.0) mm long; leaf apices acute.....*Hypericum pseudomaculatum*
- 3 Sepals 1.5-4.0 mm long; styles (1.0-) 1.4-2.4 (-3.0) mm long; petals (3.0-) 4.3-5.9 (-9.0) mm long; leaf apices obtuse to slightly retuse*Hypericum punctatum*

Key F - shrubby and subshrubby St. John's-worts

- 2 Leaves 5-15× as long as wide; stamens 120-200 or 45-85; plants 1.5-6 dm tall.
.....*Hypericum sphaerocarpum*
- 2 Leaves 2-5× as long as wide; stamens 30-95; plants 4-20 dm tall; [section *Myriandra*, subsection *Suturosperma*].
- 4 Larger leaves 4-10 mm wide, 3-5× as long as wide; axillary leaf fascicles present in main leaf axils; seeds pale brown, faintly reticulate, 0.4-0.5 mm long*Hypericum cistifolium*
- 4 Larger leaves 10-30 mm wide, 1.5-3× as long as wide; axillary leaf fascicles absent; seeds dark brown, strongly reticulate, 1.5-2 mm long.
- 5 Flowers in simple 3-flowered cymes or in compound cymes with up to 8 flowers; sepals 3 mm long, oblong, obtuse apically; capsules ovoid, 8-10 mm long (excluding the styles) and 5-7 mm broad; seeds 1.8-2.0 mm long, cylindric, sometimes slightly falcate, dull brown when mature.....*Hypericum apocynifolium*
- 5 Flowers usually in many-flowered cymes terminating branches; sepals 1.5-2.0 mm long, usually triangular-acute; capsules ovoid to subglobose, 4-5 mm long (excluding the styles) and 4-5 mm broad; seeds 1.5-1.8 mm long, usually falcate-cylindric, dark purplish-brown and lustrous when mature*Hypericum nudiflorum*

Key G - herbaceous St. John's-worts with broad leaves, 1-locular capsules, stamens separate or connate at base, but not grouped into fascicles, leaves with translucent dots, without black dots, sepals and petals with translucent lines or dots only, not marked with black dots or lines

- 1 Stems and leaves pubescent; [section *Trigynobrathys*].....*Hypericum setosum*
- 1 Stems and leaves glabrous.
- 4 Styles 2-4 mm long; stamens (35-) 50-80; petals orange-yellow or burnt yellow.
.....*Hypericum virgatum*
- 4 Styles 0.5-1.5 mm long; stamens 5-22; petals bright golden-yellow.
- 10 Leaves lanceolate to linear, 6-30 mm long, 0.5-6 mm wide, the leaf base attenuate to cuneate
.....*Hypericum canadense*
- 10 Leaves ovate to elliptic, 3-35 mm long, 2-15 mm wide, the leaf base rounded to cordate-clasping.
- 12 Sepals broadest near the base; inflorescence with few or no normally sized leaves, these only low in the inflorescence, giving the inflorescence a naked appearance.
.....*Hypericum gymnanthum*
- 12 Sepals broadest near the middle; inflorescence with many normally sized leaves and leaflike bracts, giving the inflorescence a leafy appearance; [collectively widespread].

Hypericum drummondii (Greville & Hooker) Torrey & A. Gray. NITS-AND-LICE, DRUMMOND'S ST. JOHN'S-WORT. **Hab:** Dry woodlands, woodland borders, fields. **Dist:** MD west to OH, IL, and se. KS, south to Panhandle FL and c. TX. **Phen:** Jul-Sep. **Syn:** = Ar, C, F, FNA6, G, GrPl, GW2, IL, K1, K3, K4, Mo2, NcTx, Pa, RAB, Tn, Tx, Va, W, WH3, WV, Adams (1973), Robson (1985, 1990, 2001, 2002, 2006); = *Sarothra drummondii* Greville & Hooker – S. **NatureServe G5** (Secure).

Hypericum fasciculatum Lamarck. PEELBARK ST. JOHN'S-WORT. **Hab:** Wet pine savannas, beaver ponds, upland depression ponds. **Dist:** E. NC south to s. FL, west to s. MS and e. LA. **Phen:** May-Sep. **Syn:** = Ar, FNA6, GW2, K1, K3, K4, RAB, WH3, Adams (1962), Adams (1973), Godfrey (1988), Robson (1996), Sorrie (2012); < *Hypericum fasciculatum* Lamarck – S.

Hypericum frondosum Michaux. GOLDEN ST. JOHN'S-WORT, CEDAR GLADE ST. JOHN'S-WORT. **Hab:** Rock outcrops and rocky woodlands; also in dry disturbed areas. **Dist:** S. IN and KY south to GA, AL, and e. MS; W. LA and e. TX. **Phen:** Late May-Aug. **Syn:** = C, F, FNA6, G, K1, K3, K4, NE, NY, Tn, Tx, Va, W, WH3, Adams (1962), Adams (1973), Godfrey (1988), Robson (1996); > *Hypericum aureum* Bartram – S; > *Hypericum splendens* Small – S. **NatureServe G4** (Apparently Secure).

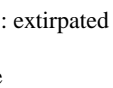

Hypericum galioides Lamarck. **Hab:** Wet pine savannas, wet pine flatwoods, pools, edges of bottomlands. **Dist:** E. NC south to c. peninsular FL, west to s. AR and se. TX. **Phen:** Jun-Aug. **Syn:** = FNA6, GW2, K1, K3, K4, RAB, Tx, WH3, Adams (1962), Adams (1973), Godfrey (1988), Robson (1996), Sorrie (2012); > *Hypericum ambiguum* Elliott – S; > *Hypericum galioides* Lamarck – S. **NatureServe G5** (Secure).

Hypericum gentianoides (Linnaeus) Britton, Sterns, & Poggenburg. PINEWEED, ORANGE-GRASS, ORANGEWEED. **Hab:** Fields, rock outcrops, woodland borders, eroding areas, pond margins, pine flatwoods. **Dist:** ME and ON west to MN, south to s. FL and TX. **Phen:** Jul-Oct. **Syn:** = Ar, C, F, FNA6, G, IL, K1, K3, K4, Mo2, NcTx, NE, NY, Pa, RAB, Tn, Tx, Va, W, WH3, WV, Adams (1973), Robson (1985, 1990, 2001, 2002, 2006); = *Sarothra gentianoides* Linnaeus – S. **NatureServe G5** (Secure).

Hypericum gymnanthum Engelmann & A. Gray. CLASPING-LEAF ST. JOHN'S-WORT. **Hab:** Pine savannas, wet pine flatwoods, sinkhole ponds (Augusta and Rockingham counties, VA), other wet to moist habitats. **Dist:** S. NJ south to ne. FL, Panhandle FL, west to c. TX, and scattered inland in PA, WV, sc. TN, OH, IN, IL, MO, and e. KS; also disjunct in Guatemala (introduced?). **Phen:** Jun-Sep. **Comm:** Added to the flora of KY in 2013

186. HYPERICACEAE

by Martina Hines (Littlefield 2014). **Syn:** = Ar, C, F, FNA6, G, GW2, Il, K1, K3, K4, Mo2, NcTx, Pa, RAB, S, Tn, Tx, Va, WH3, Adams (1973), Robson (1985, 1990, 2001, 2002, 2006). **NatureServe G4** (Apparently Secure).

Hypericum hypericoides (Linnaeus) Crantz. ST. ANDREW'S CROSS. **Hab:** Dry forests and woodlands. **Dist:** NJ, w. VA, c. KY, se. MO, and c. OK, south to s. FL and e. TX; West Indies; Mexico south to n. Central America. **Phen:** May-Aug. **Tax:** Very variable and probably warranting division into at least varieties. Coastal Plain (especially sandhill) plants are smaller- and narrower-leaved. **Syn:** = Bah, C, GW2, RAB, Tn, Va, W, WH3, Adams (1962), Adams (1973), Godfrey (1988); = *Ascyrum hypericoides* Linnaeus – Il; = *Hypericum hypericoides* ssp. *hypericoides* – Ar, FNA6, K1, K3, K4, Mo2, NcTx, Robson (1996); > *Ascyrum hypericoides* Linnaeus – S; > *Ascyrum hypericoides* Linnaeus var. *hypericoides* – F, G, Tx; > *Ascyrum hypericoides* Linnaeus var. *oblongifolium* (Spach) Fernald – F, G, Tx; > *Ascyrum linifolium* Spach – S. **NatureServe G5T5** (Secure).

Hypericum lobocarpum Gattinger. FIVE-LOBE ST. JOHN'S-WORT. **Hab:** Mesic prairies, pine flatwoods, stream banks, river scour; also roadsides and ditches through these habitats. **Dist:** C. KY, c. TN (Chester, Wofford, & Kral 1997) and s. MS west to s. IL, se. OK, and e. TX. **Phen:** Late May-Sep. **Comm:** Credited to SC by Robson (1996), based on specimens debated and dismissed by Adams (1973). The basis for attribution of *H. lobocarpum* to "Blue Ridge, N.C." by Small (1933) is unknown. **Syn:** = Ar, C, FNA6, Il, K1, K3, Mo2, S, Tn, Adams (1962), Adams (1973), Robson (1996); = *Hypericum densiflorum* var. *lobocarpum* (Gattinger) Svenson – F, G, Tx; < *Hypericum densiflorum* Pursh – GW2.

Hypericum mutilum Linnaeus var. *latisepalum* Fernald. SOUTHERN DWARF ST. JOHN'S-WORT. **Hab:** Marshes and other wet habitats. **Dist:** Se. SC south to s. FL, west to TX. Fernald (1950) considers this taxon to be north to NJ. **Phen:** Jun-Oct. **Comm:** Hybrids with *H. canadense* have been called *H. ×dissimulatum* E.P. Bicknell (pro sp.). **Syn:** = F, Tx; = *Hypericum mutilum* ssp. *latisepalum* (Fernald) N. Robson – FNA6, K4, Robson (1985, 1990, 2001, 2002, 2006); < *Hypericum mutilum* – G, GW2, K1, K3, NcTx, RAB, S, W, WH3, Adams (1973).

Hypericum mutilum Linnaeus var. *mutilum*. COMMON DWARF ST. JOHN'S-WORT. **Hab:** Bogs, fens, marshes, shores, other wet habitats. **Dist:** NL (Newfoundland) and QC west to MB, south to s. FL and c. TX; scattered (probably as an adventive) farther west in North America, in Central and South America, and Europe. **Phen:** Jun-Oct. **Tax:** Hybrids with *H. canadense* have been called *H. ×dissimulatum* E.P. Bicknell (pro sp.). **Syn:** = F, Tx, Va; = *Hypericum mutilum* ssp. *mutilum* – FNA6, K4, Mo2, NY, Robson (1985, 1990, 2001, 2002, 2006); < *Hypericum mutilum* – Ar, C, G, GrPl, GW2, Il, K1, K3, Mi, NcTx, NE, Pa, RAB, S, Tn, W, WH3, WV, Adams (1973). **NatureServe G5T5** (Secure).

Hypericum myrtifolium Lamarck. MYRTLE-LEAF ST. JOHN'S-WORT. **Hab:** Ponds. **Dist:** Se. SC south to s. FL, west to se. MS, a Southeastern Coastal Plain endemic. **Comm:** Small (1933) reports this species from SC; this distribution is now documented by a specimen from Jasper Co., SC (P. McMillan, pers. comm.). **Syn:** = FNA6, GW2, K1, K3, K4, S, WH3, Adams (1962), Adams (1973), Godfrey (1988), Robson (1996). **NatureServe G4G5** (Apparently Secure).

Hypericum nudiflorum Michaux ex Willdenow. **Hab:** Streambanks, moist forests, swamps. **Dist:** Se. VA south to Panhandle FL, west to e. TX, s. AR, and se. OK; disjunct in Cumberland Plateau of TN. **Phen:** Jun-Jul. **Syn:** = C, F, FNA6, G, K4, RAB, S, Tn, Tx, Va, W, WH3, Adams (1962), Godfrey (1988), Robson (1996); < *Hypericum nudiflorum* Michaux ex Willdenow – GW2, K1, K3, Adams (1973).

* ***Hypericum perforatum*** Linnaeus. EUROPEAN ST. JOHN'S-WORT, KLAMATH-WEED. **Hab:** Fields, pastures, roadsides, woodland borders. **Dist:** Native of Europe. See Duncan (1985) for documentation for GA. **Phen:** Jun-Sep. **Syn:** = Ar, C, F, G, GrPl, Il, K1, K3, K4, Mi, Mo2, NcTx, Pa, RAB, S, Tn, Va, W, WV, Adams (1973); = *Hypericum perforatum* ssp. *perforatum* – FNA6, NE, NY, Robson (1985, 1990, 2001, 2002, 2006). **NatureServe GNR** (Not Yet Ranked).

Hypericum prolificum Linnaeus. SHRUBBY ST. JOHN'S-WORT. **Hab:** Bogs, seepages, dry rocky forests, rock outcrops, riverside prairies. **Dist:** NY west to s. MI and MN, south to GA, LA, and e. TX. **Phen:** Jun-Oct. **Syn:** = Ar, C, FNA6, G, Il, K1, K3, K4, Mi, Mo2, NE, NY, Pa, RAB, S, Tn, Tx, Va, W, WH3, WV, Adams (1962), Adams (1973), Robson (1996); = *Hypericum spathulatum* (Spach) Steudel – F. **NatureServe G5** (Secure).

Hypericum pseudomaculatum Bush. LARGE SPOTTED ST. JOHN'S-WORT. **Hab:** Wet, moist, or dry forests and fields. **Dist:** SC south to Panhandle FL, west to TX, north in the interior to e. TN (?), c. IL, s. MO, and c. OK. **Phen:** Jun-Sep. **Comm:** {records east of the Ozarks need to be studied more carefully}. **Syn:** = Ar, C, FNA6, G, Il, K1, K3, K4, Mo2, NcTx, RAB, S, Tx, WH3, Adams (1973), Robson (1985, 1990, 2001, 2002, 2006); = *Hypericum punctatum* Lamarck var. *pseudomaculatum* (Bush) Fernald – F; < *Hypericum punctatum* Lamarck – GrPl.

Hypericum punctatum Lamarck. SPOTTED ST. JOHN'S-WORT. **Hab:** Fields, woodland borders. **Dist:** QC west to MN, south to c. peninsular FL and e. TX. **Phen:** Jun-Sep. **Syn:** = Ar, C, FNA6, G, Il, K1, K3, K4, Mi, Mo2, NcTx, NE, NY, Pa, RAB, Tn, Tx, Va, W, WH3, WV, Adams (1973), Robson (1985, 1990, 2001, 2002, 2006); = *Hypericum punctatum* var. *punctatum* – F; < *Hypericum punctatum* Lamarck – GrPl; > *Hypericum punctatum* Lamarck – S; > *Hypericum subpetiolatum* E.P. Bicknell ex Small – S.

Hypericum setosum Linnaeus. HAIRY ST. JOHN'S-WORT. **Hab:** Pine savannas, wet pine flatwoods, boggy areas, adjacent ditches, fireflow lines, and scrapes. **Dist:** Se. VA south to c. peninsular FL, west to se. TX. **Phen:** May-Sep. **Syn:** = C, F, FNA6, G, GW2, K1, K3, K4, RAB, S, Tx, Va, WH3, Adams (1973), Robson (1985, 1990, 2001, 2002, 2006). **NatureServe G4G5** (Apparently Secure).

Hypericum sphaerocarpum Michaux. BARRENS ST. JOHN'S-WORT, ROUNDFRUIT ST. JOHN'S-WORT. **Hab:** Limestone glades and barrens, prairies. **Dist:** C. OH, s. MI, s. WI, IA, and se. NE south through KY, e. and c. TN (Chester, Wofford, & Kral 1997), to nw. GA (GAHP 2003), c. AL, c. MS, LA, and ne. TX; also reported for sw. PA, where considered adventive (Rhoads & Klein 1993). **Phen:** Jun-Sep. **Syn:** = Ar, C, F, FNA6, G, GrPl, K1, K3, K4, Mi, Mo2, NeTx, Pa, Tn, Tx, Adams (1962), Adams (1973), Robson (1996); > *Hypericum sphaerocarpon* var. *sphaerocarpon* – Il; > *Hypericum sphaerocarpum* var. *turgidum* (Small) Svenson – Il; > *Hypericum turgidum* Small – S.

Hypericum stragulum W.P. Adams & Robson. LOW ST. JOHN'S-WORT, STRAGGLING ST. JOHN'S-WORT. **Hab:** Dry rocky or sandy woodlands. **Dist:** MA (Nantucket Island), NY (Long Island), west to s. PA, s. OH, s. IN, s. IL, c. MO, se. KS, and c. OK, south to ne. NC, c. SC, c. GA, n. AL, n. MS, n. LA, and c. TX. **Phen:** May-Aug. **Syn:** = C, NE, NY, Pa, Tn, Va, W, Adams (1962), Adams (1973); = *Ascyrum hypericoides* Linnaeus var. *multicaule* (Michaux ex Willdenow) Fernald – F, G, GrPl, Tx, WV; = *Ascyrum multicaule* Michaux ex Willdenow – Il; = *Hypericum hypericoides* (Linnaeus) Crantz ssp. *multicaule* (Michaux ex Willdenow) Robson – Ar, FNA6, K1, K3, Mo2, NeTx, Robson (1996); = *Hypericum stragulum* – RAB, misspelling.

Hypericum suffruticosum W.P. Adams & Robson. PINELAND ST. JOHN'S-WORT. **Hab:** Pine savannas and flatwoods. **Dist:** Se. NC south to c. peninsular FL, west to se. LA. **Phen:** Apr-Jun. **Syn:** = FNA6, K1, K3, K4, RAB, WH3, Adams (1962), Adams (1973), Godfrey (1988), Robson (1996); = *Ascyrum pumilum* Michaux – S. **NatureServe G4G5** (Apparently Secure).

Hypericum tenuifolium Pursh. SANDHILL ST. JOHN'S-WORT. **Hab:** Pine flatwoods, pine savannas, longleaf pine sandhills. **Dist:** Se. NC south to s. peninsular FL; Panhandle FL and se. AL. **Phen:** Jun-Sep (-Dec). **Tax:** Robson (1996) indicated that the older name *H. tenuifolium* Pursh has now been adequately shown to apply to this taxon. **Syn:** = FNA6, K3, K4, WH3, Robson (1996), Sorrie (2012); = *Hypericum reductum* (Svenson) W.P. Adams – GW2, K1, RAB, Adams (1962), Adams (1973), Godfrey (1988); < *Hypericum aspalathoides* Willdenow – S. **NatureServe G5** (Secure).

Hypericum virgatum Lamarck. STRICT ST. JOHN'S-WORT. **Hab:** Hardpan woodlands, rock outcrops, woodland borders, glades and barrens (especially over mafic or ultramafic rocks). **Dist:** MD west to s. OH, s. IN, and s. IL, south to c. NC, c. SC, sw. GA, Panhandle FL, s. MS, and se. LA. **Phen:** Late Jun-Sep. **Tax:** Though treated by most recent authors as a variety of *H. denticulatum*, *H. virgatum* is better considered as a distinct species. Webb (1980) recognized *H. harperi* as a separate species (it had previously been considered a part of *H. virgatum*), and continued to recognize this taxon as a variety of *H. denticulatum*. However, based on the nature of the punctate glands, size of seeds, inland distribution, etc., it appears that *H. virgatum* is more distantly related to *H. denticulatum* and *H. harperi* than they are to one another; recognition at the species level is warranted for *H. virgatum*. As pointed out by Webb, *H. denticulatum* is primarily tetraploid ($n = 24$), while *H. virgatum* and *H. harperi* are (as far as is known) strictly diploid. Additionally, the aberrant populations from granitic outcrops in the Brushy Mountains of Alexander and Wilkes counties, NC referred by Webb (1980) to this taxon are distinct, and more closely allied to *H. denticulatum* and *H. harperi*; see *Hypericum radfordiorum* for additional discussion. **Syn:** = Ar, FNA6, K1, K3, K4, Tn, Va, Allison (2011); = *Hypericum denticulatum* ssp. *acutifolium* (Elliott) N. Robson – Robson (1985, 1990, 2001, 2002, 2006); < *Hypericum acutifolium* Elliott – S, (also see *H. harperi*); < *Hypericum denticulatum* Walter – GW2, Il, WH3; < *Hypericum denticulatum* Walter var. *acutifolium* (Elliott) Blake – C, F, G, RAB, W, Adams (1973), (also see *H. harperi*); > *Hypericum denticulatum* var. *recognitum* Fernald & Schubert – F, RAB, WV.

Triadenum Rafinesque 1836 [1837] (MARSH ST. JOHN'S-WORT)

A genus of about 10 species, perennial herbs, of e. North America and e. Asia. Sometimes merged into *Hypericum*, *Triadenum* is one of a few basal clades that seem better separated at generic rank from *Hypericum*. References: Robson (2015d) in FNA6 (2015).

- 1 Leaves narrowed to the cuneate or broadly cuneate (rarely truncate) base.
 - 2 Lower leaves sessile; sepals 5-7 mm long, acute (to obtuse); leaves lacking translucent or dark glands or punctae; styles 0.5-1.5 mm long (best seen in fruit).....*Triadenum tubulosum*
 - 2 Lower leaves petiolate; sepals 3-5 mm long, obtuse; leaves with translucent glands and dark punctae; styles 1.5-3 mm long (best seen in fruit).....*Triadenum walteri*
- 1 Leaves clasping, cordate, or subcordate at the base.
 -*Triadenum virginicum*

Triadenum tubulosum (Walter) Gleason. SOUTHERN MARSH ST. JOHN'S-WORT. **Hab:** Bogs, peaty wetlands, drawdown sloughs along rivers, drawdown shorelines along man-made reservoirs. **Dist:** Se. VA south to Panhandle FL, west to LA, and north in the interior to se. and c. TN, s. IL

191. ELATINACEAE Dumortier 1829 (WATERWORT FAMILY) [in MALPIGHIALES]

A family of 2 genera and about 35 species, herbs. References: Kubitzki (2014); Tucker (1986); Tucker (2016b) in FNA12 (2016).

Elatine Linnaeus 1753 (WATERWORT)

A genus of about 10 species, aquatic, tropical and temperate, especially North America and Eurasia. Changing taxonomic concepts and under-collection of members of this genus in our area make the treatment here particularly provisional. Distribution and habitat information is uncertain until more collections are made and existing collections reviewed and re-annotated. References: Kubitzki (2014); Razifard, Tucker, & Les (2016) in FNA12 (2016); Tucker (1986).

* **Elatine triandra** Schkuhr. THREE-STAMENED WATERWORT. **Hab:** Shores, pools. **Dist:** Apparently native of e. and se. Asia. **Phen:** Jun-Sep. **Syn:** = FNA12, K4, NE, NY, Tx.

197. CHRYSOBALANACEAE R. Brown 1818 (COCO-PLUM FAMILY) [in MALPIGHIALES]

A family of about 18 genera and 530 species, trees and shrubs, of tropical and subtropical areas, especially tropical America. References: Bardon et al (2016); Prance in Kubitzki (2014); Prance & Sothers (2003); Prance (1970); Whetstone & Nixon (2016) in FNA12 (2016).

Geobalanus Small 1913

A monotypic genus, a shrub, endemic to the se. United States. Bardon et al. (2016) show with robust molecular sampling that "*Licania michauxii*" is sister to a complex group consisting of *Couepia*, *Gaulettia*, *Afrolicania*, *Hirtella*, and 3 additional clades of *Licania*. It seems best to acknowledge the evolutionarily isolated status of this species (estimated to have diverged from the larger clade in the Oligocene about 28 million years BP; Bardon et al. 2016) by placing it in the monotypic genus *Geobalanus*, as done by Small (1913b, 1933). References: Bardon et al (2016); Prance in Kubitzki (2014); Prance & Sothers (2003); Prance (1970); Prance (1972); S2; Small (1913b); Whetstone & Nixon (2016) in FNA12 (2016).

Geobalanus oblongifolius (Michaux) Small. GOPHER-APPLE, GROUND-OAK. **Hab:** Longleaf pine sandhills, dry pine flatwoods, pine rocklands. **Dist:** Se. SC south to s. FL, west to e. LA (Florida parishes), abundant and ubiquitous in dry sandy habitats in the southern part of its range. **Phen:** May-Jun; Sep-Oct. **Tax:** The two taxa recognized by Small (1933) await additional study. *G. pallidus* of s. FL pine rocklands and other pine flatwoods in s. and c. peninsular FL is alleged to differ in its white tomentose lower leaf surfaces, pubescent ovary, and larger and more spherical fruits. **Comm:** A rare upright shrub form (to over 15 dm tall) has been found in Brevard County, FL, suggesting that *G. oblongifolius* evolved from a taller and more upright ancestor (Ward & Taylor 1999). **Syn:** = *Chrysobalanus oblongifolius* Michaux – RAB, S2; = *Licania michauxii* Prance – FNA12, K1, K3, WH3, Prance & Sothers (2003), Prance (1970), Prance (1972); > *Geobalanus oblongifolius* (Michaux) Small – S, Small (1913b); > *Geobalanus pallidus* Small – S, Small (1913b). NatureServe G4G5 (Apparently Secure).

200. *VIOLACEAE* Batsch 1802 (VIOLET FAMILY) [in MALPIGHIALES]

A family of about 31 genera and 1100 species, herbs, shrubs, lianas, and trees, cosmopolitan in distribution, but especially diverse in the tropics. References: Ballard () (in prep); Ballard, Burwell, & Lockhart (2020) in Weakley et al (2020); Ballard et al. (1994); Little & McKinney (2015a) in FNA6 (2015); McKinney & Russell (2002); Paula-Souza & Ballard (2014); Wahlert et al (2014).

- 1 Plant acaulescent or caulescent; leaf blades of many species about as broad as long or broader, base cordate; peduncle not articulated; bottom petal spurred at base, blade distinctly shorter than lateral and upper petals *Viola*
- 1 Plant caulescent; leaf blades much longer than broad, base narrowly cuneate; peduncle/pedicle articulated; bottom petal saccate at base, blade slightly to greatly exerted beyond lateral and upper petals. *Cubelium*

Cubelium Rafinesque ex Britton & A. Brown 1897 (GREEN-VIOLET)

A monotypic genus, a perennial herb, native to eastern North America. "Recent comprehensive phylogenetic investigations of the Violaceae family demonstrated that broadly circumscribed *Hybanthus* was extensively polyphyletic, and that the sole trait of a bottom petal which was saccate at base failed to delineate natural evolutionary groups (Feng 2005; Tokuyoka 2008; Wahlert et al. 2014). The majority of New World hybanthoids formed a well supported clade and were subsequently segregated into the resurrected genus *Pombalia* on the basis of differences in floral and seed features and anatomical traits (Paula-Souza and Ballard 2014). Our temperate eastern North American native hybanthoid now belongs to the resurrected monotypic genus *Cubelium*, with the genus and species first validly published by Britton and Brown (1897). It is sister to the very small genus *Hybanthus* sensu stricto from Mesoamerica and the West Indies, that consists of three species of shrubs and treelets. Our Eastern Green Violet differs from *Hybanthus* sensu stricto in herbaceous habit, highly reduced cymose inflorescence, and several unique floral, fruit, seed and anatomical features." (Ballard 2020). References: Ballard (2020); Ballard () (in prep); Ballard, Burwell, & Lockhart (2020) in Weakley et al (2020); Ballard, Paula-Souza, & Wahlert in Kubitzki (2014); Little (2015) in FNA6 (2015); McKinney & Russell (2002); Paula-Souza & Ballard (2014); Wahlert et al (2014).

Cubelium concolor (T.F. Forster) Rafinesque ex Britton & A. Brown. GREEN-VIOLET. **Hab:** Very nutrient-rich and mesic forests, especially over calcareous substrates such as limestone and dolomite, sometimes extending upslope into dry-mesic or even dry forests and woodlands when the soils are very basic. **Dist:** VT and s. ON west to MI and KS, south to SC, GA, Panhandle FL, s. AL, ne. MS, and AR. **Phen:** Cleistogamous flowers: Apr-early May; late May-Jun. Chasmogamous flowers: Late May-Jun; Aug-Oct. **Syn:** = K4, S, Ballard () (in prep); = *Hybanthus concolor* (T.F. Forster) Sprengel – Ar, C, F, FL2, FNA6, G, GrPl, IL, K1, K3, Mi, NE, NY, Pa, RAB, Tn, Va, W, WH3, WV, McKinney & Russell (2002). NatureServe G5 (Secure).

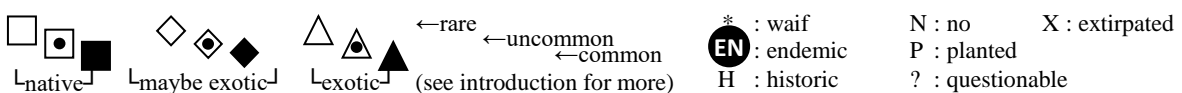

Viola Linnaeus 1753 (VIOLET, JOHNNY-JUMP-UP, PANSY)

Contributed by Harvey E. Ballard, Jr., Bruce A. Sorrie, and Alan S. Weakley

A genus of about 525 species, herbs (rarely subshrubs, shrubs, or treelets), of temperate regions of the Old and New Worlds. References: Ballard & Wujek (1994); Ballard (1992a); Ballard (1994); Ballard () (in prep); Ballard et al. (1994); Ballard, Sytsma, & Kowal (1999); Gil-Ad (1997); Gil-ad (1998); Haines (2001); Little & McKinney (2015b) in FNA6 (2015); McKinney & Russell (2002); McKinney (1992); Russell (1955); Russell (1965).

Viola has presented numerous problems in taxonomy, distribution, and identification. Particularly troublesome are the so-called “acaulescent blue violets”, including *V. sororia*, *V. sagittata*, *V. palmata*, *V. septemloba*, etc. They may be difficult to identify due to morphological overlap, or trying to key plants without mature leaves; in some instances hybridization may be suspect, or inadequate morphological characterization of the diversity found in nature and the herbarium continues (new taxa are being found on an annual basis). Leaf maturity is an important feature to recognize – the earliest 1-2 leaves produced in most of these taxa are generally ovate-cordate in outline and may not display characteristic lobing, toothing, or pubescence until more mature leaves are produced, 1-2 weeks later. Specimens thus collected early in the flowering period can present the botanist with a perplexing series of plants that do not key cleanly. A second troublesome group contains the small white violets, including *V. blanda*, *V. incognita*, and *V. minuscula*. These taxa have been dealt with in various ways, but resist a wholly satisfactory treatment, due to apparent hybridization (Russell 1954, 1955). However, recent reviews of these 3 species in the Southeast show that *V. blanda* and *V. minuscula* are quite distinct, with *V. incognita* less so (but this may be due to paucity of specimens from the area). A third difficult group contains *V. appalachiensis*, *V. conspersa/labradorica*, and *V. walteri*. They have been treated recently by Ballard (1992, 1994) and McKinney & Russell (2002). Despite the problems present in the genus, the great majority of plants encountered in the field may be successfully keyed out, particularly by botanists working within an area of several counties. Violet species are usually quite faithful to one or a few plant community types, so once learned these habitats can be valuable indicators as to which species to expect. Botanists working in larger regions (state, floristic province), however, must be aware of increased morphological variation and potential hybridization. All species possess brownish or reddish nectar guide striae in the corolla throat; these are ignored in the key. Hairs of the corolla throat and on leaf surfaces are important key characters; several plants should be inspected with a 10× lens before deciding the character state. De novo hybrids can be frequent in *Viola*, but they do not reproduce by the chasmogamous flowers, as reported in several publications by Ezra Brainerd. Their general intermediacy and their proximity to both parents makes hybrids relatively easy to diagnose and to infer their parentage, once one becomes familiar with species in the local area. Hybrids between species of caulescent blue and white rostrate violets, and between species of acaulescent white species, are always sterile F1s and do not produce viable seeds from cleistogamous flowers. However, most hybrids between species of acaulescent blue violets are unusual in being at least subfertile through cleistogamous seeds.

Key to Map
Symbology:

Cleistogamous capsules of a few hybrids abort or contain only abortive ovules, while those of most hybrids develop normally but produce a lower proportion of viable seeds (containing some abortive ovules) than the parental species; and very few hybrids (e.g., *V. fimbriatula* × *V. sagittata*) show no reduction in viable seed output relative to the parents. Nearly all acaulescent blue violet species (including the new species and some “variants” presented here) differ in size, shape and color pattern of the mature seeds of naturally dehiscent capsules—best collected by enclosing developing capsules in a small mesh bag and allowing the capsules to open of their own accord. Brainerd demonstrated that seeds (and their germinated progeny) of F1 and later-generation acaulescent blue violet hybrids recombine morphological traits of the parental species within each cleistogamous capsule. Thus, it is relatively easy to infer hybrid status from a cleistogamous capsule of a suspected hybrid by noting the presence of diverse seed morphologies within it, and even to interpret the parentage when one is acquainted with seeds of other local species.

Identification Notes: Leaf length should be measured down the midrib to an imaginary line connecting the very bottom of the basal lobes (in a leaf blade with a cordate or truncate base), or to the end of blade tissue (on a blade with a rounded or cuneate base).

- 1 Plant caulescent (producing aerial stems bearing leaves and flowers at above-ground nodes).
 - 2 Corolla yellow, or white with a yellow center (sometimes fading or drying to lavender), ventral surface of petals commonly pink- or purple- to brown-tinged; stipules entire or erose..... **Key A**
 - 2 Corolla wholly cream-colored, or cream with a yellow center, or pale blue, violet to purple, or multicolored (violet to purple with orange or yellow); stipules fringed or deeply lobed..... **Key B**
- 1 Plant acaulescent (with leaves and flowers/fruits arising separately from the rootstock) at spring flowering (*V. rotundifolia* is acaulescent during spring flowering and is included here, but it produces a stolon-like prostrate stem in summer with 0-1 leaf and a cyme with 1-3 capsules).
 - 4 Plant producing stolons (stolons absent in *V. renifolia*); corolla violet, or white with greenish-white throat, mostly < 1 cm long in profile (> 1 cm, in *V. odorata* with white or purple corolla)..... **Key C**
 - 4 Plant not producing stolons; corolla violet to purple (lower three or all five petals blue in *V. pedata*, white with grayish-violet eyespot around throat in *V. communis* [*V. priceana*], whitish in *V. floridana* [“peninsular Florida” variant], white in rare albinos of many species), > 1 cm long in profile
 - 5 At least the largest leaf blades notched, incised, coarsely toothed, lobed or dissected, or bearing linear marginal processes..... **Key D**
 - 5 All leaf blades undivided, margins merely crenate or serrate (pectinately serrate in *V. pectinata*; occasional *V. edulis* in early chasmogamous flower without lobed leaf blades will key to *V. langloisii* but has ovate-triangular sepals with shorter broader auricles < 2 mm long). **Key E**

Key A - Caulescent violets with yellow or white flowers, and entire or erose stipules

- 3 Leaves as broad as long or broader than long. *Viola pubescens*
- 3 Leaves distinctly longer than broad.
 - 5 Leaf blades hastate, base subcordate to cordate; upper surface of leaf blades in life usually (but not always) variegated, with the main surface gray-green or silvery and the veins a contrasting darker green..... *Viola hastata*
 - 5 Leaf blades narrowly ovate or lance-triangular to rhombic-lanceolate, base cuneate to broadly rounded or truncate; leaf blade surfaces uniformly green. *Viola tenuipes*

Key B - Caulescent violets with purple, pale blue, cream, or multicolored flowers, and fringed or lobed stipules

- 1 Corolla strongly frontally flattened in life; flower 'throat' yellow; spur short, up to 3 mm long; stipules deeply pinnately lobed with few to many lateral segments, the terminal lobe resembling the leaf blades; leaf blades linear-lanceolate to elliptical, base cuneate to truncate; plants annual or biennial, without thickish rootstock; [of weedy habitats].
 - 2 Petals shorter than the sepals or scarcely surpassing them by 1-2 mm, cream-white (slightly yellowish); sepals nearly or fully concealing capsule *Viola arvensis*
 - 2 Petals well surpassing sepals, pale blue to violet (infrequently cream-white) or multicolored; sepals neither surpassing nor concealing capsule.
 - 3 Petals uniformly pale blue or cream-white, concolorous distally; terminal lobe of stipules with 0-3 crenations on each margin; quadrate stems recurved-puberulent or -hispidulous on face directly above a leaf node but essentially glabrous on the other faces; leaves all cauline..... *Viola rafinesquei*
 - 3 Petals variously colored, commonly with the lower three petals cream-white and upper two purple-black; terminal lobe of stipule with 4 or more crenations on each side; quadrate stems recurved-puberulent on the angles; leaves cauline and commonly also basal. *Viola tricolor*
- 1 Corolla not strongly frontally flattened in life; flower 'throat' white; stipules subentire to irregularly lacerate or lacinate but not deeply lobed with leaf-like terminal lobe; leaf blades ovate to reniform, base cordate; plants perennial, with thickish rootstock; [mainly of natural habitats].
 - 5 Current year's stems ascending at chasmogamous flowering time, persistent through winter to become prostrate and root at the nodes, generating the following year's plants at their tips (plants thus mat-forming). *Viola walteri*
 - 5 Stems ascending to erect at chasmogamous flowering time through fruiting, deciduous and not rooting at nodes (plants thus solitary). *Viola striata*

Key C - Acaulescent violets with stolons and white flowers (flowers commonly purple in *V. odorata*)

- 3 Leaf blades ovate-lanceolate to ovate-triangular, 1.5–2× as long as broad, base broadly rounded to subcordate, not or slightly decurrent onto petiole *Viola primulifolia*
- 3 Leaf blades lanceolate to linear-lanceolate in early flower, narrowly lanceolate to linear in fruit, 3–15× as long as broad, base cuneate and somewhat decurrent onto petiole. *Viola vittata*

Key D - Acaulescent violets lacking stolons, with lobed leaves, and blue, violet, or purple flowers (white in rare albinos, white with heavy blue-gray eyespot in *V. communis* [*V. priceana*], whitish with purple eyespot in *V. floridana* ["peninsular Florida" variant])

- 1 All petals glabrous within; corolla concolorous blue or lower three petals blue and upper pair purple-black; stipules long-adnate to petiole; rhizome erect, barrel-like; cleistogamous flowers absent.
..... *Viola pedata* var. *pedata*
- 1 Lateral petals bearded within, sometimes the spurred petal also; corolla concolorous except for expanded white area from the throat in a few species; stipules free; rhizome horizontal or ascending, sometimes branching, not barrel-like; cleistogamous flowers produced.
4 Plant homophyllous, all blades lobed or dissected (plants with largest leaf blades shallowly lobed are frequent de novo hybrids between species producing deeply divided leaves and *V. sororia* and other species with unlobed leaf blades; they will not key readily and must be inferred by association with the parent species).
..... *Viola subsinuata* var. *subsinuata*
- 4 Plant heterophyllous, producing leaf blades with lobes, coarse teeth or incisions during chasmogamous flowering and cleistogamous fruiting, and undivided leaf blades in very early spring and late autumn (often retaining one or more undivided blades).
15 Largest leaf blades distinctly longer than broad (blade length:width ratio > 1.3).
..... *Viola sagittata*
- 15 Largest leaf blades slightly longer than broad to broader than long (blade length:width ratio < 1.3).
19 Foliage glabrate, puberulent or hirsute (occasionally essentially glabrous in *V. stoneana*); calyx eciliate or ciliate; lowest sepals various; auricles short and rounded and not elongating in fruit (prominent and weakly elongating in fruit in *V. stoneana*); cleistogamous capsule finely to heavily purple-spotted or -blotched, on initially prostrate peduncle arching upward just before dehiscence (peduncle suberect in *V. stoneana*).
20 Largest lobed leaf blades biternately divided, the terminal primary division with lateral lobes.
..... *Viola palmata* var. 3 ["Red Hills *palmata*" variant]
- 20 Largest lobed leaf blades pedately divided, the terminal primary division lacking lateral lobes
..... *Viola palmata* var. *palmata*
- 19 Foliage strictly or essentially glabrous; calyx eciliate; lowest sepals acute or acuminate; auricles short and not elongating in fruit, or prominent and elongating in fruit; cleistogamous capsule on erect or suberect peduncle (prostrate or arching upward in *V. edulis* "Gulf Coastal Plain" and *V. egglesonii*).
28 Largest leaf blades moderately to deeply (3-) 5-7 (-9)-lobed, lobes elliptical, lobes divergent on blades with 5 or more lobes, lowest lobe downward-pointing; blade margins entire or subentire; spurred petal densely bearded; cleistogamous capsule unspotted, on tall erect peduncle surpassing some petioles; seeds (1.5-) 1.9-2.5 × 1.4-1.6 mm, brownish-black, unspotted; [dry to seasonally moist sand of frequently burned long-leaf pine savannas].....
..... *Viola septemloba*
- 28 Largest leaf blades shallowly to deeply 3- to 7-lobed, lobes linear or angulate, elliptical, ovate or rhombic-ovate, lobes ascending to spreading on blades with 5 or more lobes, lacking a distinct downward-pointing lobe; blade margins incurved-serrate; spurred petal glabrous within (sparsely bearded in *V. viarum*); cleistogamous capsule unspotted or finely to heavily spotted or blotched with red or purple, on ascending to erect peduncle surpassing some petioles or on prostrate peduncle much shorter than petioles; seeds various; [bottomland sites in diverse substrates along rivers and streams or swamps].
..... *Viola species 5* ["Gulf Coastal Plain *edulis*"]

Key E - Acaulescent violets lacking stolons, with unlobed leaves

- 1 At least some petioles prominently winged; lowest sepals linear-lanceolate, acuminate (ovate-triangular, acute to obtuse in *V. villosa*); auricles prominent, elongating in fruit, erose; cleistogamous capsule unspotted, on declined or erect peduncle
..... *Viola villosa*
- 1 Petioles not prominently winged; lowest sepals lanceolate to (more commonly) ovate-lanceolate, oblong or ovate, acuminate to rounded; auricles inconspicuous and remaining short and rounded, or prominent and elongating in fruit and often erose; cleistogamous capsule unspotted or spotted, on prostrate, declined or erect peduncle.
7 Leaves spreading to prostrate on the substrate in life; upper leaf blade surface silvery- or gray-green with contrasting dark green or red-purple veins, lower blade surface purple-tinged; foliage glabrous except for conspicuous stiff ascending or spreading hairs uniformly distributed over upper surface of leaf blade; calyx eciliate; lowest sepals oblong to ovate, obtuse to rounded; spurred pet densely bearded; cleistogamous capsule purple-spotted, on initially prostrate peduncle shorter than petioles; seeds 1.5-2.1 × 1.1-1.4 mm, light brown, commonly with slightly darker streaks and spots..... *Viola hirsutula*
- 7 Leaves held above the substrate (prostrate in *V. villosa*, at least outer leaves prostrate especially in fruit in *V. fimbriatula*); upper surface of leaf blades uniformly green, lower green or purple tinged; foliage glabrous or variously pubescent, if hairs confined to upper surface of leaf blade, then these very small, scattered and (sub)appressed.
9 Plant in chasmogamous flower.
10 Largest leaf blades approx. as broad as long to broader than long (length:width ratio < 1.2), broadly ovate or orbicular to deltate or reniform (one largest leaf blade often longer than broad in *V. floridana*, *V. latiuscula*, *V. septentrionalis*, these are keyed here).
15 Lowest sepals oblong to ovate, obtuse to rounded; auricles not prominent, short and rounded or truncate.
..... *Viola sororia* var. *sororia*
- 15 Lowest sepals linear-lanceolate to ovate-triangular, acuminate; auricles prominent, narrowly linear to trapezoidal.
18 Corolla violet with contrasting dark purple eyespot around throat; lowest sepals linear-lanceolate; lateral petal beards very short, exposing throat in life, hairs strongly clavate to reniform..... *Viola cucullata*
- 18 Corolla violet to deep purple without contrasting eyespot (white with contrasting purple-gray eyespot around throat in *V. communis* [*V. priceana*]); lowest sepals lance- to ovate-triangular; lateral petal beards long, obscuring throat in life, hairs filiform or slightly clavate.
..... *Viola floridana* var. 2 ["rosacea" variant]
- 10 Largest leaf blades distinctly longer than broad (length:width ratio > 1.2).
22 Spurred petal densely bearded within; foliage glabrous or sparsely to moderately hirtellous [naturally occurring in open sites]
..... *Viola sagittata*
- 22 Spurred petal glabrous within; foliage strictly glabrous or upper surface of leaf blades with small to minute scattered subappressed hairs; [naturally occurring in forested sites, *V. cucullata* also in marshes and meadows].
25 Calyx ciliolate; lowest sepals oblong to ovate-lanceolate, obtuse to rounded; auricles short and rounded..... *Viola missouriensis*
- 25 Calyx eciliate; lowest sepals linear-lanceolate to ovate-triangular, acuminate; auricles prominent to elongate.
26 Corolla violet with contrasting dark purple "eyespot" around throat; lowest sepals linear-lanceolate; lateral petal beards very short, with strongly clavate to reniform hairs; [widely distributed over e. North America, infrequent on Atlantic Coastal Plain]..... *Viola cucullata*

- 26 Corolla violet lacking contrasting "eyespot" around throat but with flush of dark purple at base of lateral pet; lowest sepals lance- to ovate-triangular; lateral petal beards long, with slightly clavate hairs.

..... *Viola langloisii*

- 9 Plant in cleistogamous fruit.

28 Largest leaf blades substantially longer than broad (length:width ratio > 1.2), lance-triangular to sagittate *Viola sagittata*

- 28 Largest leaf blades about as long as broad to broader than long (length:width ratio < 1.2), ovate or deltate-triangular to reniform.

- 29 Foliage (at least petioles and/or lower surface of leaf blades) hirsute; calyx ciliate.

..... *Viola sororia* var. *sororia*

- 29 Foliage strictly glabrous or upper surface of leaf blades with small to minute scattered subappressed hairs.

- 31 Capsule unspotted.

- 32 Peduncle declined.

..... *Viola langloisii*

- 32 Peduncle erect, or initially prostrate and coiled then elongating to become sinuous-erect.

..... *Viola cucullata*

- 31 Capsule finely spotted, or heavily purple-spotted or blotched.

- 36 Lowest sepals oblong- to ovate-lanceolate or ovate, obtuse to rounded at apex.

..... *Viola missouriensis*

- 36 Lowest sepals linear-lanceolate to ovate-triangular, acuminate from middle or base (narrowly rounded to acute in *V. latiuscula*).

..... *Viola floridana* var. 2 ["*rosacea*" variant]

* ***Viola arvensis*** Murray. EUROPEAN FIELD PANSY. **Hab:** Roadsides, fields, other disturbed habitats. **Dist:** Native of Europe, widely introduced. **Phen:** Mar-Jul. **Syn:** = C, F, FNA6, G, GrPl, Il, K1, K3, K4, Mi, NE, Pa, RAB, S, Tn, Va, W, WV, Ballard () (in prep), McKinney & Russell (2002). NatureServe GNR (Not Yet Ranked).

Viola cucullata Aiton. MARSH BLUE VIOLET, BOG VIOLET. **Hab:** Bogs, seeps, margins of spring branches. **Dist:** NL (Newfoundland) west to MN, south to SC, GA, AL, MS, and MO. **Phen:** Apr-Jun. **Syn:** = C, FNA6, G, GW2, Il, K1, K2, K4, NE, Pa, RAB, S, Tn, Va, W, WV, Ballard () (in prep), Gil-ad (1998), Haines (2001), McKinney & Russell (2002); > *Viola cucullata* Aiton - WV; > *Viola cucullata* var. *cucullata* - F; > *Viola obliqua* Hill.

Viola floridana Brainerd var. 2 ["*rosacea*" variant]. MISSISSIPPI BLUE VIOLET. **Hab:** Loamy soils in mesic forests, floodplain borders. **Dist:** S. MS and s. LA. **Phen:** Jan-Mar. **Tax:** Russell (1965) mapped *Viola floridana* with a bimodal distribution, in the e. Gulf states and the w. Gulf region. However, he and others dismissed *V. rosacea* Brainerd (which differs in certain foliage and floral features), which may be more widespread westward than Brainerd's few collections and may represent much of the "western" portion of the range reported for *V. floridana*. The morphological variability and geographic range of this collective taxon are presently under study, and preliminary field and herbarium studies indicate there may be two taxa lurking under *Viola floridana* sensu stricto. **Syn:** < *Viola floridana*; < *Viola sororia* Willdenow - K4.

Viola hastata Michaux. SPEARLEAF VIOLET, SILVERLEAF VIOLET, HALBERD-LEAF VIOLET, HALBERD-LEAVED YELLOW VIOLET. **Hab:** Acidic coves, dry-mesic oak forests, bluff forests, bases of rock ledges. **Dist:** PA and OH south to GA, Panhandle FL, and AL. **Phen:** Late Mar-May. **Syn:** = C, F, FNA6, G, K1, K2, K4, Pa, RAB, S, Tn, Va, W, WV, Ballard () (in prep), McKinney & Russell (2002). NatureServe G5 (Secure).

Viola hirsutula Brainerd. WOOD VIOLET, SOUTHERN WOODLAND VIOLET. **Hab:** Bottomlands, moist slopes, dry forests and clearings. **Dist:** CT, NY, PA, OH, and s. IN, south to Panhandle FL, AL, and MS. **Phen:** Feb-Apr. **Comm:** Leaves usually mottled around the veins with silver-gray or purple, and also often purple beneath. **Syn:** = F, FNA6, G, K1, K3, K4, NE, Pa, RAB, S, Tn, Va, W, WV, Ballard () (in prep), Haines (2001), McKinney & Russell (2002); < *Viola villosa* Walter - C.

Viola langloisii Greene. LANGLOIS'S VIOLET. **Hab:** Alluvial sand and silt of floodplains and bottomlands in close proximity to the flooding zone, along streams and rivers emptying into the Gulf Coast. **Dist:** MS to se. OK, south along the w. FL panhandle and to se. coastal TX. **Phen:** (Jan) Feb-Mar. **Tax:** Sometimes synonymized with *V. affinis* or *V. sororia* or confused with *Viola missouriensis* but expressing distinctly different leaf, flower and fruit morphologies. Nearly a Gulf Coastal Plain endemic and quite uniform across its range. Disjunct populations resembling *Viola langloisii* along the se. lower Atlantic Coastal Plain have been segregated as *Viola species 3*. **Syn:** = F, K1, K3, S, Tx; < *Viola missouriensis* Greene - FNA6, K4.

Viola missouriensis Greene. MISSOURI VIOLET. **Hab:** Sandy soils of bottomland forests along streams, rivers and lakeshores. **Dist:** W. Midwest, Great Plains and Lower Midwest, c. IN to MN, s. to w. MS, e. TX. **Phen:** Apr-Jun (Oct-Nov); May-Jul (chasm.), Jun-Sep (cleist.). **Tax:** A distinctive species when leaf, flower and fruit characters are observed. Arguments by Gil-ad (1995, 1997) and others for conspecificity between this and *V. langloisii* Greene ignore the several distinctions between the two. Russell (1965) argued that the present species intergrades imperceptibly into *V. affinis* to the east and *V. langloisii* to the south, but field and herbarium studies contradict this, and all taxa maintain their morphological integrity in the narrow zones of geographic overlap. **Syn:** = F, G, Il, K1, K3, NeTx, Tx, Ballard () (in prep), Gil-ad (1998); = *Viola sororia* Willdenow var. *missouriensis* (Greene) L.E. McKinney - Ar, McKinney & Russell (2002); < *Viola missouriensis* Greene - FNA6, K4, Tn; < *Viola sororia* Willdenow - C.

Viola palmata Linnaeus var. 3 ["*Red Hills palmata*" variant]. RED HILLS VIOLET. **Hab:** Drier to dry sandy, sandy loam in dry oak and oak-pine woods and dry to dry-mesic savannas and closed forests, on slopes and bluffs. **Dist:** Coastal Plain, w. GA sc. AL, LA, and s. AR. **Phen:** (Feb-) Mar-Apr. **Syn:** < *Viola palmata* Linnaeus - K4.

Viola palmata Linnaeus var. *palmata*. SOUTHERN THREE-LOBED VIOLET, WOOD VIOLET. **Hab:** Drier to dry sandy, sandy loam in dry oak and oak-pine woods and dry to dry-mesic savannas and closed forests, on slopes and bluffs. **Dist:** ME west to WI, south to FL, AL, MS, LA, and TX. Widespread at lower elevations of Piedmont and Coastal Plain in southeastern U.S. and Lower Midwest. **Phen:** (Feb-) Mar-Apr. **Tax:** Nomenclature and typification have been problematic, but recent reexamination of the type of *V. palmata* unambiguously refers *V. palmata* sensu stricto to the

common Piedmont and upper Coastal Plain with deeply dissected leaf blades; var. *dilatata* Elliott is rendered a synonym of var. *palmata*, and the widespread northern taxon previously treated as var. *palmata* must use the earliest available name var. *triloba*. Infrequent specimens identified as the latter from the main range of southeastern var. *palmata* are probable local hybrids involving *Viola sororia*. *V. palmata* in the broad sense is a polymorphic complex of potentially distinct evolutionary taxa diverging in foliage, flower and seed characters and requiring further study ("pseudo-stoneana", "avipes", "glabrate palmata" and "Red Hills"). While most variants are pedately dissected and occur at lower elevations, the rare and sporadic c. Appalachian "avipes" and "pseudo-stoneana" are distinctive in producing biternate leaf blades. Taxonomists have synonymized the Lower Midwest *V. falcata* under the present variety, but differences in leaf morphology, modal habitat and seeds suggest that the two may represent different evolutionary taxa. For reasons separating *V. stoneana* House, see that species. **Syn:** = Ballard () (in prep); = *Viola palmata* Linnaeus – Ar, NcTx, NE, Pa, Tn, Va, Haines (2001), McKinney & Russell (2002); < *Viola* × *palmata* Linnaeus (pro sp.) – K1; < *Viola palmata* Linnaeus – WH3; > *Viola palmata* Linnaeus – F, G, S, W; < *Viola palmata* Linnaeus var. *palmata* – C, FNA6, Il; > *Viola palmata* Linnaeus var. *palmata* – K3, RAB, Tx, WV; ? *Viola triloba* Schweinitz – S; > *Viola triloba* Schweinitz var. *triloba* – F, G.

***Viola sagittata* Aiton. ARROWHEAD VIOLET. **Hab:** Dry to moist forests and woodlands. **Dist:** MA west to MN, south to GA and e. TX. **Phen:** Apr. **Syn:** = GrPl, S, Tx, W, WV, Gil-ad (1998); = *Viola sagittata* Aiton var. *sagittata* – FNA6, K1, K3, K4, NE, Pa, Tn, Va, Ballard () (in prep), Haines (2001), McKinney & Russell (2002); ? *Viola emarginata* – S; > *Viola emarginata* var. *acutiloba* Brainerd – F, G, RAB; > *Viola emarginata* (Nuttall) Leconte var. *emarginata* – F, G, RAB; < *Viola sagittata* Aiton – Ar, C, Il, NcTx.**

***Viola septemloba* Leconte. SOUTHERN COASTAL VIOLET. **Hab:** Longleaf pine sandhills, other sandy pinelands and secondary habitats derived from them. **Dist:** Se. VA south to s. FL, west to LA, mainly on the Coastal Plain. **Phen:** Late Mar-early May. **Syn:** = F, FNA6, G, GW2, K1, K3, K4, S, W, Ballard () (in prep), Gil-ad (1998); < *Viola palmata* Linnaeus – WH3; < *Viola palmata* Linnaeus var. *palmata* – C; ? *Viola septemloba* Leconte – Tx; < *Viola septemloba* Leconte – RAB; ? *Viola septemloba* ssp. *septemloba* – McKinney & Russell (2002).**

Viola sororia* Willdenow var. *sororia*. COMMON BLUE VIOLET. **Hab:** Loam or clay soils in dry-mesic to wet-mesic forests, higher ground and terraces or borders of bottomlands, and lawns and other anthropogenically modified sites formerly with native vegetation. **Dist:** NL (Newfoundland) west to MB, south to s. FL and TX. **Phen:** Feb-May. **Tax:** A heterogeneous complex of morphologically divergent but inadequately understood essentially glabrous taxa ("glabrous", "hirsutula-like") plus densely hirsute *V. sororia* sensu stricto; and two other uncertain taxa (*Viola domestica* E. P. Bicknell and *V. pratincola* Greene). The taxa share broad obtuse to rounded sepals and generally broad leaf blades, as well as a glabrous spurred petal, but they typically grow separately over the extensive zone of sympatry, occupy distinctly different microsites and maintain their distinctions when growing in the local area. Distinctions and geographic distributions are presently being interpreted. **Syn:** = Ar, McKinney & Russell (2002); = *Viola sororia* Willdenow – GrPl, K3, NcTx, NE, Va, W, Ballard () (in prep), Gil-ad (1998); > *Viola palmata* var. *sororia* (Willdenow) Pollard – RAB; > *Viola papilionacea

200. VIOLACEAE

Pursh – F, RAB, S, WV, misapplied; > *Viola papilionacea* var. *papilionacea* – G, misapplied; > *Viola papilionacea* var. *priceana* (Pollard) Alexander – G, misapplied; > *Viola priceana* Pollard – S; < *Viola sororia* Willdenow – C, FNA6, K4, Tn, Tx, WH3, Haines (2001); > *Viola sororia* Willdenow – F, G, Il, K1, Pa, S.

***Viola species 5* ["Gulf Coastal Plain *edulis*"].** **Hab:** Moist loamy soils of floodplains, swamps and hammocks. **Dist:** Confirmed in FL, s. GA and s. AL; the range of this recently detected new species is currently being reinterpreted and is probably broader than presented here. **Phen:** (Jan) Feb-Mar. **Tax:** The *Viola edulis* complex consists of multiple distinct evolutionary species presently under study, the present taxon being one of them. **Syn:** < *Viola edulis* Spach; < *Viola palmata* var. *heterophylla* – K4.

***Viola striata* Aiton.** CREAM VIOLET, PALE VIOLET. **Hab:** Mesic forests and woodlands, disturbed areas. **Dist:** MA west to WI, south to GA, AR, and e. OK. **Phen:** Mar-Jun. **Syn:** = Ar, C, F, FNA6, G, GW2, Il, K1, K3, K4, NE, Pa, RAB, S, Tn, Va, W, WV, Ballard () (in prep), Ballard (1992a), Haines (2001), McKinney & Russell (2002). **NatureServe G5** (Secure).

***Viola subsinuata* Greene var. *subsinuata*.** WAVY-LEAVED VIOLET. **Hab:** Rich, dry-mesic and dry upland forests, probably associated with mafic rocks. **Dist:** VT and c. PA south to NC, ne. AL, ne. MS and e. KY; slightly disjunct in e. OH (if these are not de novo hybrids involving *V. baxteri*) and in northern Piedmont from CT south to NJ. **Phen:** Apr-May; Apr-Jun (chasm.), May-Aug (cleist.). **Tax:** Formerly broadly delimited as highly polymorphic, but recent studies have shown this to be group of loosely morphologically similar homophyllous cut-leaved taxa, from which *Viola baxteri*, *Viola species 1*, and *Viola species 4* have now been segregated. Potentially distinct taxa under study are the "Chapel Hill" and *Viola subsinuata* sensu stricto as presented in the key. Brainerd's sole collection of a seemingly homophyllous cut-leaved violet from an unspecified location in FL is anomalous and well out of Appalachian/Western Allegheny Plateau distribution of the entire group. Populations outside the n. and c. Appalachian region require further study and may yield additional taxonomic diversity requiring recognition. **Comm:** ×. **Syn:** =; = *Viola subsinuata* Greene – FNA6, Il, NE, Pa, Tn, Va, Ballard () (in prep), Haines (2001), McKinney & Russell (2002); < *Viola* × *subsinuata* Greene, pro – K4; > *Viola palmata* var. *dilatata* Elliott – Ballard () (in prep); < *Viola palmata* Linnaeus var. *palmata* – C; > *Viola subsinuata* Greene – Ballard () (in prep); ? *Viola triloba* Schweinitz var. *dilatata* (Elliott) Brainerd – F, G, Il, K1.

***Viola tenuipes* Pollard.** SOUTHERN WEDGE-LEAF VIOLET. **Hab:** Rich dry to dry-mesic forests. **Dist:** Sw. NC and c. TN south to c. SC, w. GA, FL Panhandle, and c. and nw. AL. **Phen:** Feb-Mar. **Tax:** Resurrected from obscurity, preliminary study has demonstrated that this is distinct in a number of leaf features from the more northern *V. glaberrima*, occupies somewhat drier microsites, has a nearly allopatric distribution, and virtually never grows near the latter in the very small zone of sympatry. It is maintained as a distinct species here. **Syn:** < *Viola tripartita* Elliott – K4.

* ***Viola tricolor* Linnaeus.** PANSY, JOHNNY-JUMP-UP. **Hab:** Lawns, garden borders, railroad rights-of-way, commonly cultivated. **Dist:** Native of Europe. **Phen:** Mar-Jun (and sporadically later). **Syn:** = Ar, C, F, G, Il, K1, K3, K4, NE, Pa, RAB, WH3, Ballard () (in prep), Haines (2001); > *Viola tricolor* var. *tricolor* – FNA6. **NatureServe GNR** (Not Yet Ranked).

***Viola villosa* Walter.** SOUTHERN WOOLLY VIOLET. **Hab:** Pocosin ecotones, other sites with moist soils. **Dist:** MD south to n. peninsular FL, west to TX and OK. Reported for VA by Kartesz (1999), on the basis of Massey (1961); report requiring additional documentation. **Phen:** (Late Dec-) Feb-early Apr. **Syn:** = Ar, F, FNA6, G, K1, K3, K4, NcTx, RAB, S, Tx, WH3, Gil-ad (1998), McKinney & Russell (2002); < *Viola villosa* Walter – C.

***Viola vittata* Greene.** SOUTHERN WATER VIOLET, STRAP-LEAVED VIOLET. **Hab:** Depression ponds, Carolina bays, other wetlands lacking flowing water. **Dist:** Se. VA south to FL, west to e. TX; nw. IN and ne. IL. **Phen:** Jan-Dec. **Tax:** Although this taxon has long been subsumed under *V. lanceolata* as a subspecies or variety, it differs in several features of foliage and summer fruiting habit, and is confined to the se. Atlantic and Gulf Coastal Plains. The two maintain their morphological distinctions in the narrow zone of sympatry in the Carolinas and grow in different microsites there. They are maintained as distinct evolutionary species. **Syn:** = G, S, Ballard () (in prep); = *Viola lanceolata* ssp. *vittata* (Greene) Russell – GW2, Il, K1, K3, K4, Tx; = *Viola lanceolata* Linnaeus var. *vittata* (Greene) Weatherby & Griscom – C, F, Va, Haines (2001); < *Viola lanceolata* Linnaeus – Ar, FNA6, RAB, Tn, W, WH3, McKinney & Russell (2002).

***Viola walteri* House.** WALTER'S VIOLET, PROSTRATE BLUE VIOLET. **Hab:** Nutrient-rich woodlands and forests, dolomite bluffs and ledges especially on mafic or calcareous rocks to the north, sandy or rocky and often acidic soils in dry or dry-mesic forests southward. **Dist:** Sc. PA, ne. WV, and w. VA west to sc. OH and AR, south to n. peninsular FL and e. TX. **Phen:** (Late Jan-) Mar-May. **Syn:** = Ar, F, G, K1, K4, RAB, S, Tn, Tx, W, WH3, Ballard (1992a); = *Viola walteri* House var. *walteri* – FNA6, K3, Va, McKinney & Russell (2002). **NatureServe G4G5** (Apparently Secure).

202a. PASSIFLORACEAE A.L. de Jussieu ex Roussel 1806 (PASSIFLOWER FAMILY) [in MALPIGHIALES]

A family of about 27 genera and 935 species, vines, shrubs, trees, and herbs, of tropical and warm temperate regions, especially America and Africa. Here circumscribed to exclude Turneraceae, counter the recommendation of Angiosperm Phylogeny Group (2009); see comments under

Turneraceae. References: Arbo in Kubitzki, Bayer, & Stevens (2007); Feuillet & MacDougal in Kubitzki, Bayer, & Stevens (2007); Goldman & MacDougal (2015) in FNA6 (2015); Tokuoka (2012).

Passiflora Linnaeus 1753 (PASSIONFLOWER)

A genus of about 525 species, vines, shrubs, and trees, largely of tropical America, with a few species in warm temperate America and Asia.

References: WI; Feuillet & MacDougal in Kubitzki, Bayer, & Stevens (2007); Goldman & MacDougal (2015) in FNA6 (2015); Killip (1938); Porter-Utley (2014); Ulmer & MacDougal (2004); Vanderplank (2000); Vanderplank (2013).

Identification Notes: *Passiflora* flowers are structurally striking. There are 5 sepals and either 0 or 5 petals; a corona of numerous linear structures is present, arranged in 1-several series. The ovary, 3 styles, and 5 stamens are basally adnate and elevated on an androgynophore. Most species have glands on the leaves which function as extrafloral nectaries; these can be seen as paired glands on the leaf petiole (in all our species except *P. lutea*), and some species also have laminar glands on the leaf blade, near the margin.

7 Leaf margins entire; ripe fruits blue, purple, or black, 5-15 mm long; perianth segments 3-16 mm long; floral bracts (subtending the calyx) 0-3 mm long, setaceous to subulate. *Passiflora lutea*

7 Leaf margins serrate, at least on the lateral leaf lobes near the petiole junction; ripe fruits green, yellow, yellow-orange, or red, 30-60 mm long; perianth segments 18-40 mm long; floral bracts (subtending the calyx) 3-30 mm long, ovate, sometimes pinnatifid-lobed. *Passiflora incarnata*

Passiflora incarnata Linnaeus. MAYPOPS, PURPLE PASSIONFLOWER, PASIONARIA. **Hab:** Roadsides, fencerows, thickets, fields. **Dist:** S. NJ, DE, MD, sw. PA, OH, and OK, south to s. FL and s. TX. **Phen:** May-Jul (-later); Jul-Oct. **Comm:** Certainly one of our most interesting and beautiful flowers. **Syn:** = Ar, C, F, FNA6, G, GrPl, Il, K3, K4, NcTx, RAB, S, Tn, Tx, Va, W, WH3, WV, Ulmer & MacDougal (2004); >< *Passiflora edulis* Sims, misapplied.

Passiflora lutea Linnaeus. YELLOW PASSIONFLOWER, LITTLE PASSIONFLOWER. **Hab:** Woodlands, forests, thickets, maritime forests. **Dist:** DE, PA, OH, IN, IL, MO, and e. KS, south to c. peninsular FL, s. AL, s. MS, s. LA, and s. TX. **Phen:** May-Sep; Aug-Oct. **Tax:** Sometimes divided into two varieties, the more eastern var. *lutea* (west to WV and AL) with pilose calyx, petioles, and stems, and more western var. *glabriflora* Fernald (east to WV and AL) with glabrous calyx, petioles, and stems; it is not clear that this is anything more than a minor polymorphism. **Syn:** = Ar, FNA6, K1, K3, K4, NcTx, Pa, RAB, S, Tn, Va, W, WH3, Killip (1938), Ulmer & MacDougal (2004); > *Passiflora lutea* var. *glabriflora* – C, F, G, GrPl, Il, Tx, WV; > *Passiflora lutea* var. *lutea* – C, F, G, Tx, WV.

204. SALICACEAE Mirbel 1815 (WILLOW FAMILY) [in MALPIGHIALES]

Alan S. Weakley and Mac H. Alford

A family of 55 genera and about 1010 species (as circumscribed to include much of the Flacourtiaceae), trees, shrubs, and subshrubs, nearly cosmopolitan. References: Argus, Eckenwalder, & Kiger (2010) in FNA7 (2010); Li et al (2019b); Samarakoon & Alford (2019); Sleumer (1954); Sleumer (1975); Sleumer (1980); Yang & Zmarzty (2007).

4 Leaf blades 0.8-2 (-3)× as long as wide; stamens 5-80; buds covered by several, overlapping scales; flowering catkins arching or drooping.....*Populus*
4 Leaf blades (2-) 3-30× as long as wide; stamens 1-9; buds covered by a single scale; flowering catkins usually erect or ascending*Salix*

Populus Linnaeus 1753 (POPLAR, ASPEN, COTTONWOOD)

A genus of about 35 species, trees, largely north temperate. References: Eckenwalder (1977); Eckenwalder (1984); Eckenwalder (1996); Eckenwalder (2010) in FNA7 (2010); Hamzeh & Dayanandan (2004).

- 1 Winter buds not viscid; stamens 5-20.
2 Stamens 12-20; scales of the catkins deeply fimbriate; petioles terete; [section *Leucoides*]..... *Populus heterophylla*
2 Stamens 5-12; scales of the catkins dentate or with only 3-7 linear-triangular lobes; petioles strongly flattened laterally (90 degrees to the plane of the leaf blade), especially near the junction with the blade; [section *Populus*].
..... *Populus alba*
1 Winter buds viscid (sticky and shiny as if recently varnished); stamens (15-) 20-80.
8 Stigmas 3-4; stamens (30-) 40-80; [native tree, common]
..... *Populus deltoides* ssp. *deltoides*
8 Stigmas 2-3; stamens (15-) 20-30; [alien trees, rare out of cultivation].

Populus nigra

* ***Populus alba*** Linnaeus. SILVER POPLAR, WHITE POPLAR. **Hab:** Disturbed areas, roadsides, forest edges, suburban woodlands. **Dist:** Native of Europe. **Phen:** Mar-May. **Syn:** = Ar, C, F, FI2, FNA7, G, GrPl, K1, K3, K4, Mi, NcTx, NE, NY, Pa, RAB, S, Tn, Tx, Va, W, WH3, WV. NatureServe G5 (Secure).

Populus deltoides Bartram ex Marshall ssp. *deltoides*. EASTERN COTTONWOOD. **Hab:** Riverbanks, bottomland forests (not found along blackwater streams), river bars, rarely weedy in upland situations. **Dist:** QC west to MN, south to n. peninsular FL, Panhandle FL, and TX. **Phen:** Mar-Apr. **Syn:** = FNA7, K1, K3, K4, Mi, NcTx, NY, Eckenwalder (1977); = *Populus balsamifera* Linnaeus – S, misapplied; = *Populus deltoides* – Tx; = *Populus deltoides* var. *deltoides* – C, GW2, NE, Va; > *Populus balsamifera* Linnaeus var. *virginiana* (Fougeroux) Sargent; < *Populus deltoides* – FI2, G, Il, Pa, RAB, Tn, W, WH3, WV; > *Populus deltoides* var. *deltoides* – F; > *Populus deltoides* var. *missouriensis* (A. Henry) A. Henry – F.

Populus heterophylla Linnaeus. SWAMP COTTONWOOD. **Hab:** Blackwater and brownwater swamp forests, tidal swamp forests, depression ponds, interdune ponds. **Dist:** CT west to MI, south to Panhandle FL and LA, scattered and irregular in distribution, absent from the Appalachians. **Phen:** Mar-Apr. **Syn:** = Ar, C, FNA7, G, GW2, K1, K3, K4, Mi, NE, NY, Pa, RAB, S, Tn, Va, WH3. NatureServe G5 (Secure).

* ***Populus nigra*** Linnaeus. BLACK POPLAR, LOMBARDY POPLAR. **Hab:** Disturbed suburban areas. **Dist:** Native of s. Europe. Cultivated in various forms, especially the columnar ‘Lombardy Poplar’; short-lived and weakly spreading to disturbed areas in the vicinity of plantings, especially by root sprouts (Diamond 2013). **Phen:** Mar-May; May-Jun. **Syn:** = C, F, FNA7, G, GrPl, K1, K3, K4, Mi, NcTx, NE, NY, Pa, Tx; > *Populus italica* (Du Roi) Moench – S; > *Populus nigra* var. *italica* Du Roi – WV.

*Salix* Linnaeus 1753 (WILLOW)

A genus of about 400 species, trees, shrubs, and subshrubs, mostly north temperate and boreal. References: Argus (1986); Argus (1997); Argus (2010) in FNA7 (2010); Belyaeva (2009); Chen et al (2010); Dorn (1995); Dorn (1998).

- 2 Bud apex sharp-pointed; bud scale margin free and overlapping; leaf blades 2.5-16× as long as wide; [subgenus *Protitea*].
 - 4 Leaves glaucous beneath; pistils borne on stipes averaging 2 mm long (range 1-5 mm); stipules usually prominent and persistent, to 15 mm long; leaf blades (4-) avg. 7.5 (-13)× as long as wide..... *Salix caroliniana*
 - 4 Leaves not (or thinly) glaucous beneath; pistils borne on stipes averaging 1 mm long (range 0.5-1.5 mm); stipules usually small and caducous, to 12 mm long; leaf blades (4-) avg. 9 (-16)× as long as wide..... *Salix nigra*
- 2 Bud apex blunt; bud scale margin fused; leaf blades 2-30× as long as wide.
 - 6 Leaves green or pale green beneath.
 - 7 Leaves linear, (7-) 11-19 (-30)× as long as wide; leaf margin distinctly glandular-denticulate; stomates present on the upper leaf surface; pistils pubescent to glabrescent; stamens 2, the staminate floral bracts tawny, the aments on leafy branches; [subgenus *Longifoliae*, section *Longifoliae*]..... *Salix interior*
 - 7 Leaves lanceolate or elliptic-lanceolate, 2-6× as long as wide; leaf margin serrate; stomates usually absent on the upper leaf surface; pistils glabrous; stamens 3, or if 2 (*S. eriocephala*), the staminate floral bracts dark brown, the aments sessile with a few leafy bracts.
 - *Salix eriocephala*
 - 6 Leaves glaucous beneath.
 - 10 Leaf margin entire or crenate (to slightly and irregularly serrate); [subgenus *Vetrix*, section *Cinerella*].
 - 13 Leaves stipulate; leaf blades (5-) avg. 7 (-13) cm long, (12-) avg. 17 (-35) mm wide; staminate aments 1-2 cm long; pistillate aments 2-3.5 cm long..... *Salix humilis*
 - 13 Leaves exstipulate; leaf blades (2.5-) avg. 4 (-5) cm long, (5-) avg. 7 (-10) mm wide; staminate aments 0.5-1.1 cm long; pistillate aments 1-2 cm long..... *Salix occidentalis*
 - 10 Leaf margin serrulate or serrate.
 - 16 Shrubs to 6 m tall; leaves lacking stomates on the upper surface; [native to our area]; [subgenus *Vetrix*].
 - *Salix eriocephala*
 - 16 Trees; leaves with stomates on the upper surface; [introduced in our area]; [subgenus *Salix*].
 - 19 Leaves long-sericeous beneath; branches ascending (rarely pendulous); leaves narrowly lanceolate, with length/width ratio of 5-6.5; petioles 3-6 mm long; petioles 3-6 mm long, sericeous; flowering branchlets 1-1.5 cm long; [section *Salix*]..... *Salix alba*
 - 19 Leaves glabrate beneath; branches normally pendulous; leaves very narrowly lanceolate, with length/width ratio of 6.5-13; petioles 7-12 mm long; petioles 7-12 mm long, tomentose; flowering branchlets ca. 0.3 cm long; [section *Subalbae*].
 - 20 Branches yellowish, yellow-green, or yellow-brown..... *Salix ×sepulcralis*
 - 20 Branches yellow-brown to red-brown, or gray-brown.
 - 21 Pistillate catkins on branchlets that are (0-) 2-4 mm long; ovary beak abruptly tapered to styles; anthers 0.4-0.5 mm long..... *Salix babylonica*
 - 21 Pistillate catkins on branchlets that are 3-14 mm long; ovary beak gradually tapered to styles; anthers 0.5-0.8 mm long.
 - *Salix ×sepulcralis*

* ***Salix alba*** Linnaeus. EUROPEAN WHITE WILLOW. **Hab:** Disturbed bottomlands, other moist to wet disturbed areas. **Dist:** Native of Eurasia. **Phen:** Mar-May. **Syn:** = Ar, C, F, FNA7, G, K1, K3, Mi, NE, NY, Pa, RAB, S, Tn, Va, W, Argus (1986); > *Salix alba* var. *alba* – GrPl, Il; > *Salix alba* var. *caerulea* (J.E. Smith) J.E. Smith – Il; > *Salix alba* var. *vitellina* (Linnaeus) Stokes – GrPl, Il.

(see introduction for more)

* **Salix babylonica** Linnaeus. **WEeping Willow**. **Hab:** Disturbed bottomlands, streambanks, roadsides, impoundments, other disturbed areas. **Dist:** Native of Asia. Note that many trees identified as *S. babylonica* may actually be one of two commonly cultivated hybrids, *S. × pendulina* and *S. × sepulchralis*, with *S. babylonica* as one parent. **Phen:** Mar-Apr. **Syn:** = Ar, C, F, Fl2, FNA7, G, Il, K1, NcTx, RAB, Va, W, WH3, WV, Argus (1986); > *Salix babylonica* Linnaeus – K3, K4; < *Salix babylonica* – Pa; > *Salix matsudana* Koidzumi – K4, Mi.

Salix caroliniana Michaux. **CAROLINA Willow**, **COASTAL PLAIN Willow**. **Hab:** Riverbanks, sandbars, interdune ponds, canal banks, other wet sites. **Dist:** Widespread in the Southeast, *S. caroliniana* has a peculiar range, with three main centers of distribution, the Coastal Plain from VA south to s. FL and west to s. AL and the FL Panhandle, the Interior Low Plateau of KY, TN, and n. AL, and an area of MO, AR, e. KS, and e. OK centered on the Ozark-Ouachita Highlands. **Phen:** Mar-May; May-Jun. **Syn:** = Ar, C, F, Fl2, FNA7, G, GrPl, GW2, Il, K1, K3, K4, NcTx, Pa, RAB, Tx, Va, WH3, WV, Argus (1986); > *Salix amphibia* Small – S; > *Salix harbisonii* Sargent; > *Salix longipes* Shuttleworth ex Andersson – S. **NatureServe G5** (Secure).

Salix eriocephala Michaux. **HEART-LEAVED Willow**, **DIAMOND Willow**, **MISSOURI Willow**. **Hab:** Streambanks, riverbanks, calcareous fens and marshes, river-scour prairies, impoundments, and other disturbed wet areas. **Dist:** NL (Newfoundland) west to SK, south to w. FL, AR, s. KS, and ne. CO. **Phen:** Apr-early May; May-early Jun. **Syn:** = Ar, C, Fl2, FNA7, GrPl, Il, K1, K3, K4, Mi, NY, Pa, W, WH3, Argus (1986); = *Salix cordata* Michaux – S, misapplied; = *Salix eriocephala* ssp. *eriocephala* var. *eriocephala* – NE, Dorn (1995); > *Salix rigida* – WV; > *Salix rigida* var. *angustata* (Pursh) Fernald – F; > *Salix rigida* Muhlenberg var. *rigida* – F, G; > *Salix rigida* var. *vestita* (Andersson) Ball – G.

Salix humilis Marshall. **UPLAND Willow**, **PRAIRIE Willow**. **Hab:** Upland areas, often in open or semi-open sites, in barrens, fens, rocky woodlands, and grassy balds over mafic rocks (such as amphibolite) up to at least 1800m elevation, also in powerline rights-of-way, woodland borders, and other miscellaneous habitats. **Dist:** NL (Newfoundland) and MB, south to Panhandle FL and ne. TX. **Phen:** Mar-May; . **Syn:** = C, Fl2, G, NE, S, WH3; = *Salix humilis* var. *humilis* – Ar, FNA7, GrPl, K1, K3, K4, Mi, NY, Pa, W, Argus (1986); < *Salix humilis* Marshall – GW2, RAB; > *Salix humilis* var. *humilis* – F, Il, WV; > *Salix humilis* var. *hyporhysa* Fernald – F, Il, WV; > *Salix humilis* var. *rigidiuscula* (Andersson) B.L. Robinson – Tx.

Salix interior Rowlee. **SANDBAR Willow**. **Hab:** Sandbars, riverbanks, creekbanks, flood scours. **Dist:** NB west to BC, south to n. DE, n. VA, TN, MS, LA, TX, and NM. **Phen:** Mar-mid May; Jun-Aug. **Tax:** Sometimes interpreted as *S. exigua* var. *sericans* (Nees) Dorn (Nesom 2002). **Syn:** = Ar, FNA7, GW2, Il, K1, K3, K4, S, WV; = *Salix exigua* ssp. *interior* (Rowlee) Cronquist – GrPl, Argus (1986), Dorn (1998); = *Salix exigua* Nuttall var. *sericans* (Nees) Dorn; < *Salix exigua* – NcTx, W; > *Salix exigua* ssp. *interior* (Rowlee) Cronquist var. *angustissima* (Andersson) Reveal & Broome – C, Pa; > *Salix interior* var. *angustissima* – Tx; > *Salix interior* Rowlee var. *interior* – F, G; > *Salix interior* var. *pedicellata* (Andersson) Ball – Tx.

Salix nigra Marshall. **BLACK Willow**. **Hab:** Riverbanks, sandbars, bottomland forests, floodplain pools, tidal swamps, impoundments, ditches, other moist areas. **Dist:** NB, MN, NE, and CO, south to ne. FL, Panhandle FL, LA, and TX. **Phen:** Mar-May; May-Jun. **Syn:** = Ar, F, Fl2, FNA7, G, GW2, Il, K1, K3, K4, Mi, NE, NY, Pa, RAB, Va, W, WH3, WV, Argus (1986); > *Salix marginata* Wimmers ex Andersson – S; < *Salix nigra* Marshall – GrPl; > *Salix nigra* Marshall – S; > *Salix nigra* var. *lindheimeri* Schneider – Tx; > *Salix nigra* var. *nigra* – C, Tx. **NatureServe G5** (Secure).

Salix occidentalis Walter. **DWARF UPLAND Willow**, **DWARF PRAIRIE Willow**. **Hab:** Barrens, glades, rocky or hardpan woodlands, prairies, powerline rights-of-way, rarely in depression ponds, especially over mafic (such as amphibolite), ultramafic (such as olivine), or calcareous rocks. **Dist:** This species is less widespread than the related *S. humilis*, with a distribution centered in the central Appalachians: ME to ND, south to GA, LA, and OK. **Phen:** Mar-May; Apr-early Jun. **Syn:** = C, NE, Va; = *Salix humilis* var. *microphylla* (Andersson) Fernald – F, GrPl, Il, W, Argus (1986); = *Salix humilis* var. *tristis* (Aiton) Griggs – Ar, FNA7, K1, K3, K4, Mi, NY, Pa; = *Salix tristis* Aiton – G, S, WV; < *Salix humilis* Marshall – GW2, RAB.

* **Salix ×sepulchralis** Simonkai. **WEeping Willow**. **Hab:** Disturbed areas; a hybrid introduced from Europe. **Phen:** Mar-Apr. **Syn:** = FNA7, Il, K1, K3, NE; = *Salix alba* × *babylonica* – NY; = *Salix alba* × *fragilis*; < *Salix babylonica* – Pa, Tn.

207. EUPHORBIACEAE A.L. de Jussieu 1789 (SPURGE FAMILY) [in MALPIGHIALES]

A family of about 220 genera and 6500 species, trees, shrubs, vines, and herbs, nearly cosmopolitan in distribution. Molecular systematics suggests that various units traditionally included in the Euphorbiaceae should be segregated (Soltis et al. 2000; Chase et al. 2002); see Phyllanthaceae and Putranjivaceae. References: Govaerts, Frodin, & Radcliffe-Smith (2000); Levin & Gillespie (2016) in FNA12 (2016); Webster (1994); Webster (2014) in Kubitzki (2014).

2 Shrub or tree (woody).

3 Leaves entire.

4 Hairs of vegetative parts of the plant (especially the leaf undersurface) present and either 2-branched, stellate, or modified into lepidote scales (use 10× or more magnification); [subfamily Crotonoideae]. **Croton**

207. EUPHORBIACEAE

- 4 Hairs of vegetative parts of the plant (especially the leaf undersurface) absent or unbranched (simple) (use 10× or more magnification).
- 5 Flowers enclosed in a cyathium; plant with copious white latex; [subfamily Euphorbioideae]..... *Euphorbia*
- 5 Flowers not enclosed in a cyathium; plant either with or without white latex (the sap clear to whitish or absent).
- 6 Leaf blades 1-1.5× as long as wide; [alien trees]..... *Triadica sebifera*
- 6 Leaf blades 1.5-5× as long as wide; native or alien shrubs or, rarely, small trees..... *Ditrysinia fruticosa*
- 3 Leaves crenate, serrate, and/or palmately lobed.
- 13 Petals absent; inflorescence a panicle; leaf lobe margins serrate; [subfamily Acalyphoideae]..... *Ricinus communis*
- 13 Petals present; inflorescence a cyme or dichasium; leaf lobe margins entire or serrate; [subfamily Crotonoideae]..... *Vernicia fordii*
- 2 Herb.
- 19 Leaves palmately deeply divided into 3-many lobes.
- 21 Leaves peltate; plant glabrous; stamens 100-1000; [subfamily Acalyphoideae]..... *Ricinus communis*
- 21 Leaves cordate to truncate or rounded at base; plant glabrous, stellate, or with conspicuous stinging trichomes; stamens 8-15; [subfamily Crotonoideae].
- 22 Plant with stinging trichomes; stamens connate..... *Cnidoscopus*
- 22 Plant lacking stinging trichomes; stamens separate..... *Manihot*
- 19 Leaves generally not lobed, entire or serrate (rarely pinnately lobed in *Euphorbia*).
- 24 Plants hairy with stellate hairs and/or scales; [subfamily Crotonoideae]..... *Croton*
- 24 Plants glabrous or hairy with simple or 2-branched hairs.
- 26 Flowers enclosed in a cyathium; plant with copious white latex; [subfamily Euphorbioideae]..... *Euphorbia*
- 26 Flowers not enclosed in a cyathium; plant with or without white latex.
- 27 Flowers in terminal spikes; stout perennial with several to many stems arising from a subterranean crown [subfamily Euphorbioideae]..... *Stillingia*
- 27 Flowers strictly axillary or both axillary and terminal, in small clusters, racemes, or spikes; finer perennial or annual, not typically with > 1 stem arising from a subterranean crown; [subfamily Acalyphoideae]
- 29 Pistillate flowers subtended by a conspicuous leafy bract..... *Acalypha*
- 29 Pistillate flowers lacking a leafy bract.
- 30 Plant lacking stinging trichomes; styles deeply multifid; [wetland habitats]..... *Caperonia*
- 30 Plant with stinging trichomes; styles undivided; [upland habitats]..... *Tragia*

Acalypha Linnaeus 1753 (COPPERLEAF, THREE-SEEDED MERCURY)

A genus of about 430-462 species, shrubs, herbs, and trees, of primarily tropical and subtropical regions (rarely warm temperate). References: Govaerts, Frodin, & Radcliffe-Smith (2000); Levin (1999a); Levin (1999b); Levin (2016d) in FNA12 (2016); Webster (2014) in Kubitzki (2014).

Key based in large part on Levin in FNA (2016).

- 3 Bracts of pistillate flowers either with linear tips or lobes longer than the broad basal portion, or the entire bract linear.
- 6 Leaves cordate at base; fruit tuberculate, but not pubescent..... *Acalypha ostryifolia*
- 6 Leaves rounded to widely cuneate at base; fruit pubescent with pustular-based trichomes..... *Acalypha setosa*
- 3 Bracts of the pistillate flowers with deltate or lanceolate tips or lobes.
- 13 Leaves 3-6× as long as wide, the largest < 2 cm wide; pistillate bracts with sessile glands; pistillate bract lobes making up 10-25% of the overall bract length..... *Acalypha gracilens*
- 13 Leaves 1.5-2.8× as long as wide, the largest > 2 cm wide; pistillate bracts lacking sessile glands; pistillate bract lobes making up 25-75% of the overall bract length.
- 15 Lower surfaces of pistillate bracts hirsute and sometimes also stipitate-glandular; stems hirsute; pistillate bracts (9-) 10-14 (16)-lobed..... *Acalypha virginica*
- 15 Lower surfaces of pistillate bracts sparsely pubescent (sometimes stipitate-glandular); stems with only short, incurved hairs; pistillate bracts (5-) 7-9 (-11)-lobed..... *Acalypha rhomboidea*

Acalypha gracilens A. Gray. SHORTSTALK COPPERLEAF, SLENDER COPPERLEAF. **Hab:** Woodlands, disturbed ground. **Dist:** ME west to WI, south to FL and TX. **Phen:** Late Jun-Nov. **Tax:** The related *A. monococca* (Engelmann ex A. Gray) Lillian W. Miller & Gandhi is of broadly Ozarkian distribution and warrants specific status (Levin 1999a, 1999b). Var. *fraseri* is generally more southern and is considered to differ in having more elongate staminate spikes, to 3-4 cm long (vs. 0.5-1.5 cm long). It may have merit, but was not recognized by Levin (1999a, 1999b). **Syn:** = Ar, FNA12, K1, K3, K4, Mi, NcTx, NE, NY, Pa, RAB, S, Tn, Va, W, WH3, Levin (1999b); = *Acalypha gracilens* ssp. *gracilens*; = *Acalypha virginica* Linnaeus var. *gracilens* (A. Gray) Müller of Aargau – Govaerts, Frodin, & Radcliffe-Smith (2000); > *Acalypha virginica* A. Gray var. *delzii* L. Miller – Tx; > *Acalypha gracilens* var. *fraseri* (Müller of Aargau) Weatherby – C, F, G, Il; > *Acalypha gracilens* var. *gracilens* – C, F, G, Il, Tx. [NatureServe G5](#) (Secure).

Acalypha ostryifolia Riddell ex J.M. Coulter. ROUGH-POD COPPERLEAF, HOP-HORNBEAM COPPERLEAF. **Hab:** Dry, sandy soil of woodlands, disturbed ground, ditches. **Dist:** NJ west to IN and NE, south to FL, TX, Mexico; West Indies. **Phen:** Late Jun-Nov. **Syn:** = Ar, Bah, FNA12, Il, K1, K3, K4, NcTx, Tn, Va, W, WH3, Govaerts, Frodin, & Radcliffe-Smith (2000); = *Acalypha ostryaefolia* – C, F, G, GrPl, RAB, S, Tx, orthographic variant. [NatureServe G5](#) (Secure).

Acalypha rhomboidea Rafinesque. RHOMBIC COPPERLEAF. **Hab:** Woodlands, disturbed ground. **Dist:** NS and ME west to ND, south to Panhandle FL and e. TX. **Phen:** Late Jun-Nov. **Syn:** = Ar, C, FNA12, G, GrPl, GW2, Il, K1, K3, K4, Mi, NcTx, NE, NY, Pa, RAB, S, Tn, Tx, Va, W, WH3, Levin (1999b); = *Acalypha rhomboidea* var. *rhomboidea* – F; = *Acalypha virginica* Linnaeus var. *rhomboidea* (Rafinesque) Cooperrider – Govaerts, Frodin, & Radcliffe-Smith (2000). [NatureServe G5](#) (Secure).

* *Acalypha setosa* A. Richard. CUBAN COPPERLEAF. **Hab:** Disturbed ground. **Dist:** Native of West Indies, Mexico, Central America, and n. South America. **Phen:** Jun-Nov. **Syn:** = Bah, FNA12, K1, K3, K4, RAB, S, WH3, Govaerts, Frodin, & Radcliffe-Smith (2000). NatureServe GNR (Not Yet Ranked).

Acalypha virginica Linnaeus. VIRGINIA COPPERLEAF. **Hab:** Woodlands and disturbed ground. **Dist:** ME west to IN, IL, MO, and KS, south to c. GA and TX. **Phen:** Late Jun-Nov. **Syn:** = Ar, C, F, FNA12, G, GrPl, GW2, Il, K1, K3, K4, Mi, NeTx, NE, NY, Pa, RAB, S, Tn, Tx, Va, W, Levin (1999b); = *Acalypha virginica* Linnaeus var. *virginica* – Govaerts, Frodin, & Radcliffe-Smith (2000). NatureServe G5 (Secure).

Caperonia A. Saint-Hilaire 1826 (CAPERONIA)

A genus of about 34-40 species, annual and perennial herbs, mainly neotropical but also in Africa. References: Gillespie (2016b) in FNA12 (2016); Govaerts, Frodin, & Radcliffe-Smith (2000); Webster (2014) in Kubitzki (2014).

* *Caperonia palustris* (Linnaeus) A. Saint-Hilaire. SACATRAPO, TEXAS-WEED. **Hab:** Wet disturbed areas, a weed in rice fields. **Dist:** Native of the Neotropics. **Phen:** Jul-Nov. **Comm:** {add references Z}. **Syn:** = Ar, FNA12, K3, K4, Tx, WH3; < *Caperonia castaneaefolia* – S, orthographic variant. NatureServe GNR (Not Yet Ranked).

Cnidoscolus Pohl 1827 (SPURGE-NETTLE)

A genus of 50-75 species, perennial herbs, shrubs, and trees, of America (especially the tropics). References: Govaerts, Frodin, & Radcliffe-Smith (2000); Levin (2016e) in FNA12 (2016); Maya-Lastra & Steinmann (2018); McVaugh (1944); Webster (2014) in Kubitzki (2014).

Cnidoscolus stimulosus (Michaux) Engelman & A. Gray. SPURGE-NETTLE, TREAD-SOFTLY, FINGER-ROT, BULL-NETTLE. **Hab:** Longleaf pine sandhills, dry sandy woodlands, other dry sandy soils. **Dist:** Se. VA south to s. FL, west to e. LA, mostly on the Coastal Plain, but farther inland southward. **Phen:** Late Mar-Aug; May-Sep. **Tax:** Substantial variation in leaf shape, habitat and likely other characters suggest that several taxa may be currently subsumed here. **Comm:** Beset with stinging trichomes. Our species is allied to *C. urens* of Mexico, Central America, and n. South America, and is sometimes treated as a variety of it. **Syn:** = C, F, FNA12, G, K1, K4, RAB, Va, W, WH3, Maya-Lastra & Steinmann (2018), McVaugh (1944); = *Bivonea stimulosus* (Michaux) Rafinesque – S; = *Cnidoscolus urens* (Linnaeus) Arthur var. *stimulosus* (Michaux) Govaerts – K3, Govaerts, Frodin, & Radcliffe-Smith (2000). NatureServe G5 (Secure).

Croton Linnaeus 1753 (CROTON, DOVEWEED, RUSHFOIL)

A genus of about 1250 species, herbs, shrubs, and (rarely) trees, of nearly cosmopolitan distribution (primarily tropical and warm-temperate). Webster (1992, 1993a) considered the 2 taxa traditionally treated as *Crotonopsis* to be closely related to sections within *Croton*, such as section *Gynamblosis*; his reasoning has been supported by molecular phylogenetic studies and all recent floristic treatments and is followed here. The subgenera and sections shown in the key follow van Ee, Riina, & Berry (2011). References: Govaerts, Frodin, & Radcliffe-Smith (2000); van Ee & Berry (2009); van Ee & Berry (2010); van Ee & Berry (2016) in FNA12 (2016); van Ee, Berry, & Ginzburg (2011); van Ee, Riina, & Berry (2011); Ward (2012a); Webster (1992); Webster (1993a); Webster (2014) in Kubitzki (2014).

- 3 Leaves with coarsely serrate or crenate margins; 1-2 cup-shaped glands present near the junction of the petiole and the leaf blade; [subgenus *Geiseleria*; section *Geiseleria*].
- 3 Leaves with entire margins; glands absent at the junction of the petiole and the leaf blade.
- 8 Lower leaf surface densely lepidote or stellate-lepidote, silvery.
- 9 Inflorescences unisexual (rarely bisexual); staminate petals 0; leaf blades 1-1.4× as long as wide; petioles 10-40 mm long; plant a fleshy shrub; [of coastal dunes]; [subgenus *Geiseleria*; section *Drepadenium*].
- 9 Inflorescences bisexual; staminate petals 5; leaf blades 2-20× as long as wide; petioles 1-10 (-20) mm long; plants annual or perennial herbs.
- 11 Inflorescences 1-4 cm long, with 3-6 pistillate flowers arranged loosely toward the base; staminate flowers usually > 1 mm in diameter; stellate-lepidote trichomes of the fruit numerous, with radii much longer than the fused portion and often ascending (giving the fruit a fuzzy appearance when viewed under magnification); stellate trichomes of the upper leaf surface sparse, the radii not overlapping the radii of nearby stellae, the radii 5-8 per trichome; leaves 1-3 mm wide.
- 11 Inflorescences usually < 1 cm long, with 1-2 pistillate flowers crowded at the base (appearing sessile in the axil of the subtending leaf); staminate flowers usually < 1 mm in diameter; stellate-lepidote trichomes of the fruit sparse, with radii fused for all or most of their lengths, appressed; stellate trichomes of the upper leaf surface denser, the radii usually overlapping the radii of nearby stellae, the radii often only 1-3 per trichome (as viewed near the midvein); leaves 1.5-4 (-15) mm wide.
- 8 Lower leaf surface stellate-pubescent, not silvery.
- 17 Lower leaf surfaces appearing brown-dotted, because some of the stellate hairs have dark brown centers; terminal style segments 4; ovaries 2-locular, only 1 fertile.

Croton glandulosus var. *septentrionalis*

Croton punctatus

Croton michauxii

Croton willdenowii

Croton monanthogynus

- 17 Lower leaf surfaces not brown-dotted (none of the stellate hairs with brown centers); terminal style segments 6-18 (-24); ovaries 3 locular, all 3 usually fertile.
 19 Staminate flowers with sepals and petals 0.8-1.0 mm long; styles 2-3 mm long.

..... *Croton capitatus*

- 19 Staminate flowers with sepals and petals 1.0-2.0 mm long; styles 3-4 mm long.

..... *Croton lindheimeri*

Croton capitatus Michaux. WOOLLY CROTON, HOGWORT, CAPITATE CROTON, GOATWEED. **Hab:** Glades, prairies, woodlands, fields, disturbed areas. **Dist:** Native of sc. United States, the exact limits of the original native distribution unclear, perhaps something like IL west to NE, south to AL, TX, and TAM. **Phen:** Jul-Oct. **Syn:** = Ar, F, FNA12, IL, K3, K4, NY, S, Tn, Va, van Ee & Berry (2010); = *Croton capitatus* Michaux var. *capitatus* – C, G, GrPl, K1, Mo2, NcTx, NE, Tx; < *Croton capitatus* Michaux – Pa, RAB, W, WH3. NatureServe G5T5? (Secure).

Croton glandulosus Linnaeus var. *septentrionalis* Müller of Aargau. DOVEWEED, TOOTH-LEAVED CROTON, SAND CROTON, NORTHERN CROTON. **Hab:** Fields, roadsides, disturbed areas. **Dist:** *C. glandulosus* is widespread in tropical and subtropical America; var. *septentrionalis* is the northernmost variety, distributed from PA west to MN, south to FL, TX, and ne. Mexico (its exact pre-Columbian range is speculative because of its weedy nature). See discussion by Atha, Hewitt, & Wang (2020) for discussion of northern records. **Phen:** May-Nov. **Tax:** Probably warranting species rank. **Syn:** = FNA12, GrPl, K4, NcTx, Tn, Tx, Va, van Ee, Berry, & Ginzburg (2011); < *Croton glandulosus* – Mi, Pa, WV; > *Croton glandulosus* var. *angustifolius* – K1, K3, S; < *Croton glandulosus* var. *glandulosus* – WH3; ? *Croton glandulosus* Linnaeus var. *septentrionalis* Müller of Aargau – C, F, G, IL, RAB, W; > *Croton glandulosus* Linnaeus var. *septentrionalis* Müller of Aargau – K1, K3, S; > *Croton glandulosus* var. *simpsonii* – K1, S.

Croton lindheimeri (Engelmann & A. Gray) Alph. Wood. GOATWEED, LINDHEIMER'S CROTON. **Hab:** Disturbed areas. **Dist:** SC, IN, MO, e. KS, and south to c. peninsular FL, s. TX and Mexico (the adventive vs. native range somewhat unclear). **Phen:** May-Dec. **Syn:** = FNA12, K3, K4, Tn, van Ee & Berry (2010); = *Croton capitatus* Michaux var. *lindheimeri* (Engelmann & A. Gray) Müller of Aargau – GrPl, K1, Mo2, NcTx, Tx; = *Croton engelmannii* Ferguson – S; < *Croton capitatus* Michaux – WH3. NatureServe G5TNR (Not Yet Ranked).

Croton michauxii G.L. Webster. SAND RUSHFOIL, MICHAUX'S CROTON, NARROWLEAF RUSHFOIL. **Hab:** Longleaf pine sandhills, disturbed sandy soils. **Dist:** Se. NC and SC south to s. FL, west to TX, north in the interior to MO, IL, and IA. Fernald (1950) alleges that this species extends as far north as VA, but the documentation is unknown to me. **Phen:** Jun-Oct. **Syn:** = Ar, K1, K4, NcTx, Tn, WH3, Webster (1992); = *Croton michauxii* G.L. Webster var. *michauxii* – FNA12, K3, van Ee & Berry (2009); = *Crotonopsis linearis* Michaux – C, F, G, IL, RAB, S, Tx.

Croton monanthogynus Michaux. PRAIRIE-TEA, ONE-SEED CROTON. **Hab:** Limestone outcrops, blackland prairies, disturbed dry soil. **Dist:** Sw. VA, OH, IN, IA, NE, and CO, south to nw. GA, FL, TX, and Mexico; adventive as a weed at scattered locations east of the Blue Ridge. **Phen:** Jun-Oct. **Syn:** = Ar, C, F, FNA12, G, GrPl, IL, K1, K3, K4, Mi, NcTx, RAB, S, Tx, Va, W, WV, van Ee & Berry (2010). NatureServe G5 (Secure).

Croton punctatus Jacquin. SILVERLEAF CROTON, BEACH-TEA, GULF CROTON, HIERBA DE JABALI. **Hab:** Beach dunes, coastal grasslands, usually with *Uniola paniculata* and/or *Spartina patens*. **Dist:** NC (Dare County) south to s. FL, west to TX, and south through e. Mexico into Central and n. South America; West Indies. **Phen:** (Jan-) Late May-Nov (-Dec). **Syn:** = FNA12, K1, K3, K4, RAB, S, Tx, WH3. NatureServe G5 (Secure).

Croton willdenowii G.L. Webster. GLADE RUSHFOIL, OUTCROP RUSHFOIL, BROADLEAF RUSHFOIL, WILDENOW'S CROTON. **Hab:** Granitic flatrocks, diabase barrens, calcareous barrens, thin soils around other rock outcrops, open woodlands, disturbed sandy soil. **Dist:** CT, se. PA (Rhoads & Block 2007), IL, and se. KS, south to ne. FL, Panhandle FL, and TX. **Phen:** Jun-Oct. **Tax:** Van Ee & Berry (2009) argued that this taxon is only varietally distinct from *Croton michauxii* (see synonymy). **Syn:** = Ar, K1, K4, Tn, Va, WH3, Webster (1992); = *Croton michauxii* G.L. Webster var. *elliptica* (Willdenow) van Ee & P.E. Berry – FNA12, K3, van Ee & Berry (2009); = *Crotonopsis elliptica* Willdenow – C, F, G, GrPl, IL, NE, Pa, RAB, S, Tx, W. NatureServe G5 (Secure).

Ditrysinia Rafinesque 1825 (SEBASTIAN-BUSH)

A monotypic genus, a shrub, of the Southeastern United States Coastal Plain. References: Govaerts, Frodin, & Radcliffe-Smith (2000); Webster (2014) in Kubitzki (2014); Wurdack (2016d) in FNA12 (2016).

Ditrysinia fruticosa (W. Bartram) Govaerts & Frodin. SEBASTIAN-BUSH. **Hab:** Swamp forests, other wet to moist, mostly shaded, habitats. **Dist:** Se. NC south to c. peninsular FL, west to e. TX and sw. AR. **Phen:** Apr-Jun; Jul-Oct. **Syn:** = Ar, FNA12, K3, K4, Govaerts, Frodin, & Radcliffe-Smith (2000); = *Sebastiania ligustrina* – S, orthographic variant; = *Sebastiania fruticosa* (W. Bartram) Fernald – GW2, K1, Tx, WH3; = *Sebastiania ligustrina* (Michaux) Müller of Aargau – RAB. NatureServe G5 (Secure).

Euphorbia Linnaeus 1753 (SPURGE)

A genus of over 2000 species, herbs, shrubs, and trees, nearly cosmopolitan in distribution. Infrageneric classification follows Yang et al. (2012), Dorsey et al. (2013), Riina et al. (2013), and Horn et al. (2012). It is debatable whether the very broad circumscription of *Euphorbia* used here (and following nearly all recent experts) is really the most serviceable. References: Berry et al (2016) in FNA12 (2016); Bradley & Sadle (2021) in Weakley et al (2021); Bridges & Orzell (2002); Burch (1966); Cacho, Monteverde-Suárez, & McIntyre (2019); Dorsey et al (2013); Dressler (1957); Govaerts, Frodin, & Radcliffe-Smith (2000); Horn et al (2012); Huft (1979); Mayfield (2013a); Park (1998); Riina et al (2013); Smith & Krings (2018); Webster (2014) in Kubitzki (2014); Yang et al (2012); Zimmermann, Ritz, & Hellwig (2010).

Unkeyed taxa: *Euphorbia hypericifolia*, *Euphorbia ophthalmica*, *Euphorbia tirucalli*

- 3 Leaves strictly opposite, oblique or inequilateral at base; branches prostrate (less usually erect); [subgenus *Chamaesyce*; section *Anisophyllum*] **Key A**
- 3 Leaves alternate or opposite, not oblique or asymmetric at base; branches usually erect.
- 4 Bracteal leaves lobed or toothed (rarely linear), usually marked with red or white at the base or purple-spotted; glands of the cyathia usually 1 (rarely more), bilabiate, lacking petaloid appendages; [subgenus *Chamaesyce*; section *Poinsettia*] **Key B**
- 4 Bracteal leaves entire, not marked with red (white-margined in *E. marginata*); glands of the cyathia 4-5, flattish, not bilabiate, with or without petaloid appendages.
- 5 Glands of the cyathia 5 (or 7-10 on the central cyathium in *E. pubentissima*), with petaloid appendages 0.1-5.0 mm long (measured along a radius), these white, maroon, red, pink, or green; stipules present, glandlike, often minute; [subgenus *Chamaesyce*; section *Alectorocotnum*] **Key C**
- 5 Glands of the cyathia 4 (except 5 in *E. purpurea*), oval, reniform, or crescent-shaped, lacking petaloid appendages (the glands themselves yellowish or green); stipules absent or vestigial
- 6 Ovary and capsule subtended by a calyx-like structure; seeds without caruncles; involucre gland appendages absent; [subgenus *Euphorbia*; section *Nummulariopsis*] *Euphorbia inundata* var. *inundata*
- 6 Ovary and capsule not subtended by a calyx-like structure; seeds with caruncles; involucre gland appendages hornlike or absent; [subgenus *Esula*] **Key E**

Key A - subgenus *Chamaesyce*, section *Anisophyllum*, subsection *Hypericifoliae* {add to Key A: *E. blodgettii*, *E. hypericifolia*, *E. mesembrianthemifolia*, *E. ophthalmica*, *E. serpyllifolia* var. *serpyllifolia*}

- 1 Young stems and leaves glabrous; leaves either entire or serrulate, at least at the apex (use 10× magnification).
- 2 Leaves serrulate, at least at the apex (use 10× magnification); seeds with 2-4 transverse ridges. *Euphorbia hyssopifolia*
- 2 Leaves absolutely entire; seeds smooth.
- 4 Stipules united into a triangular scale-like structure (this often lobed or fringed), thus appearing as 2 stipules at each node..... *Euphorbia serpens*
- 4 Stipules separate, lacerate, appearing as 4 stipules at each node.
- 5 Mature seeds 1.0-1.2 (-1.4) mm long, angled; leaves either 1.5-2× or 4-5× as long as wide, not fleshy; [inland sandhills or coastal dunes]. *Euphorbia cordifolia*
- 5 Mature seeds (1.3-) 1.5-2.6 mm long, rounded; leaves 2-3 (-5)× as long as wide, often somewhat fleshy; [of barrier island dunes and other sandy coastal habitats]. *Euphorbia bombensis*
- 1 Young stems and leaves pubescent (at least in lines along the stems); leaves serrulate, at least at the apex (use 10× magnification).
- 8 Ovary and capsule glabrous.
- 9 Seeds 0.8-1.0 mm long, light gray, the faces with 2-3 (-4) horizontal, low, blunt ridges, sometimes connected by 1-2 cross ridges; stems glabrous when young (uncommonly puberulent along 1 side of the branchlets); capsule 1.5-2.0 mm long..... *Euphorbia hyssopifolia*
- 9 Seeds 1.0-1.3 mm long, dark gray, faces without ridges, though irregularly and finely wrinkled; stems puberulent when young on 1 side only; capsule 2.0-2.5 mm long. *Euphorbia nutans*
- 8 Ovary and capsule pubescent.
- 11 Stems with 2 types of trichomes, the longer 3-5 mm long; cyathia in axillary and terminal cymes, at least some of the peduncles > 10 mm long *Euphorbia hirta*
- 11 Stems with 1 type of trichome, these < 2 mm long; cyathia solitary or several in axils, the peduncles < 5 mm long.
- 12 Capsules spreading-villous, especially or solely on the angles; styles 0.2-0.3 mm long, bifid nearly to the base; seeds sharply quadrangular-angled, the faces with 3-4 transverse ridges..... *Euphorbia prostrata*
- 12 Capsules minutely appressed-puberulent, on the entire surface (though sometimes primarily on the lower portion); styles 0.3-0.7 mm long, bifid only in the upper half or third; seeds quadrangular but not angled, the faces with inconspicuous transverse ridges or nearly smooth.
- 13 Involucre cleft on 1 side half its length; leaves mostly obovate, 1.5-2× as long as wide; styles 0.5-0.7 mm long, filiform; seed faces nearly smooth; adventitious roots formed at middle nodes along the stem *Euphorbia humistrata*
- 13 Involucre cleft on 1 side a fourth to a third its length; leaves mostly oblong, 2-3× as long as wide; styles 0.3-0.4 mm long, clavate; seed faces transversely ridged; adventitious roots not formed..... *Euphorbia maculata*

Key B - subgenus *Chamaesyce*, section *Poinsettia*

- 1 Principal stem leaves opposite, dentate, neither lobed nor linear; plant pubescent. *Euphorbia dentata*
- 1 Principal stem leaves alternate, either lobed or linear; plant usually glabrous.
- 3 Cyathial gland with a circular opening; bracteal leaves wholly green or green and paler at base (sometimes purple-spotted); seeds angular, with a small caruncle and pronounced longitudinal dorsal ridge, but lacking a distinct transverse tubercular ridge near the middle..... *Euphorbia heterophylla*
- 3 Cyathial gland 2-lipped, the opening elliptical and elongate; bracteal leaves wholly green, purple, white, pink, or red, or green or purplish towards the tip and white, pink, or red at the base; seeds cylindrical, lacking both a caruncle and longitudinal dorsal ridge, but with a distinct transverse tubercular ridge near the middle. *Euphorbia cyathophora*

Key C - subgenus *Chamaesyce*, section *Alectoroctonum* {add to Key C: *E. graminea*}

- 1 Upper stem leaves and/or dichasial bracts with white margins or entirely white; [alien, cultivated and rarely persisting or a waif] *Euphorbia marginata*
- 1 Upper stem leaves and bracteal leaves entirely green, obovate, elliptic, narrowly elliptic, or oblanceolate; [native].
- 5 Petioles 5-11 mm long; leaves with ciliate margins; cyathia across the appendages ca. 2.5 mm; nodes 7-11 below the umbels; [shady, mesic hardwood forest over limestone or in sand over limestone] *Euphorbia species 4*
- 5 Petioles 0-3 (-10) mm long; leaves without ciliate margins; cyathia across the appendages (3.5-) 4-8 (-11) mm; nodes 20-75 nodes below the umbels; [habitats various, generally open, drier, and acidic, e.g., pine woods, sandhills, sandstone, ruderal sites]
- 6 Plants (2-) 4-9 (-1.3) dm tall; aerial stems multiple, (1-) 3-10 stems from a crown, each (1.2-) 2.5-5 (-7) mm in diameter at the base; leaves ascending, leathery, sessile; primary bracts smaller than stem leaves; petaloid appendages oblong or spatulate, 2.5-4.4 mm long; seeds 2.6-3.2 mm long; [NH and MA west to s. ON, MI, WI, MN, and NE, south to se. VA, c. NC, n. GA, s. AL, and e. TX] *Euphorbia corollata*
- 6 Plants 35-65 cm tall; aerial stems 1 (-3) from a crown, each 1.0-2.2 mm in diameter at the base; leaves usually reflexed, thin, petiolate or subpetiolate; primary bracts similar to stem leaves in size; petaloid appendages orbicular or oval, 0.9-2.2 mm long; seeds 1.8-2.3 mm long; [c. MD, VA, and c. and sw. TN, south to Panhandle FL and s. MS] *Euphorbia pubentissima*

Key E - subgenus *Esula*

- 1 Principal stem leaves finely serrulate (especially toward the apex); [subgenus *Esula*, section *Helioscopia*].
- 2 Ovary and capsule smooth. *Euphorbia helioscopia*
- 2 Ovary and capsule verrucose-roughened. *Euphorbia spathulata*
- 1 Principal stem leaves entire.
- 5 Stem leaves linear to narrowly oblong, averaging ca. 10× as long as wide; [subgenus *Esula*, section *Esula*].
- *Euphorbia cyparissias*
- 5 Stem leaves oblanceolate, obovate, elliptic, or oblong, 1-10 cm long, 5-30 mm wide, averaging 1-5× as long as wide.
- *Euphorbia commutata*

Euphorbia bombensis Jacquin. SOUTHERN SEASIDE SPURGE, DIXIE SANDMAT. **Hab:** Open sands of dunes, dune blowouts and overwashes, often growing with perennial grasses such as *Uniola paniculata*, but preferring open sands with little competition, sometimes mixed with the more common *E. polygonifolia*. Johnson (1992) contrasted the habitat of this species with that of the closely similar *E. polygonifolia*; *E. bombensis* preferring areas behind the foredune, while *E. polygonifolia* preferring the pioneer situation on the upper beach and foredune front. **Dist:** E. VA south to s. FL along the Atlantic, from s. FL to TX and Mexico along the Gulf of Mexico, and south into n. South America. **Phen:** Jun-Oct. **Syn:** = FNA12, K3, K4, Va, Govaerts, Frodin, & Radcliffe-Smith (2000); = *Chamaesyce bombensis* (Jacquin) Dugand – K1, WH3; = *Euphorbia ammannioides* Kunth – C, F, G, RAB, Tx; > *Chamaesyce ingallsii* Small – S. **NatureServe G4G5** (Apparently Secure).

Euphorbia commutata Engelm ex A. Gray. WOODLAND SPURGE, TINTED SPURGE. **Hab:** Rich forests and rock outcrops, over calcareous or mafic rocks. **Dist:** PA west to s. ON and MN, south to ne. and Panhandle FL and ne. TX. **Phen:** Mar-Jul. **Tax:** The southern var. *erecta* J.B.S. Norton may be worthy of recognition; we have both it and the typic var. *commutata* in our area. Var. *erecta* (ranging north to VA, KY, and MO) has all the cauline leaves oblanceolate and with petioles 5-12 mm long; var. *commutata* has leaves varying from oblanceolate to obovate or ovate, the upper leaves usually broad and sessile. **Syn:** = Ar, F, FNA12, IL, K1, K3, K4, Mi, Pa, RAB, Tn, Va, W, WH3, WV, Govaerts, Frodin, & Radcliffe-Smith (2000), Mayfield (2013a); > *Euphorbia commutata* var. *commutata* – C, G; > *Euphorbia commutata* var. *erecta* J.B.S. Norton – C, G; > *Galarhoeus austrinus* – S; > *Galarhoeus commutatus* (Engelmann) Small – S. **NatureServe G5** (Secure).

Euphorbia cordifolia Elliott. HEARTLEAF SANDMAT. **Hab:** Open sands of very dry longleaf pine sandhills, Florida scrub, other dry, open habitats. **Dist:** Se. NC south to c. peninsular FL and west to se. OK (Singhurst, Buthod, & Holmes 2012) and s. TX. **Phen:** Jul-Oct. **Syn:** = Ar, FNA12, K3, K4, RAB, Tx, Govaerts, Frodin, & Radcliffe-Smith (2000); = *Chamaesyce cordifolia* (Elliott) Small – K1, NcTx, S, WH3. **NatureServe G5** (Secure).

Euphorbia corollata Linnaeus. EASTERN FLOWERING SPURGE. **Hab:** Woodlands and forests. **Dist:** NH and MA west to s. ON, MI, WI, MN, and NE, south to se. VA, c. NC, n. GA, s. AL, and e. TX (some of the northern distribution may be by expansion northwards in disturbed areas). **Phen:** Jun-Sep. **Tax:** Huft (1979) considered *E. marilandica* a sporadic growth form of *E. corollata*. **Syn:** = Ar, FNA12, GrPl, K1, K3, K4, Mi, NcTx, NE, NY, Pa, Tn, Tx, Va, WV, Huft (1979), Park (1998); = *Euphorbia corollata* Linnaeus var. *corollata* – RAB; = *Tithymalopsis corollata* (Linnaeus) Klotzsch – S; > < *Euphorbia corollata* Linnaeus – G, W; < *Euphorbia corollata* Linnaeus var. *corollata* – Govaerts, Frodin, & Radcliffe-Smith (2000); > *Euphorbia corollata* Linnaeus var. *corollata* – C, F, IL; > *Euphorbia corollata* var. *mollis* Millspaugh – F, IL; > *Euphorbia marilandica* Greene – C, F, G.

Euphorbia *Euphorbia* Murray. PAINTED LEAF, FIRE-ON-THE-MOUNTAIN. **Hab:** Bottomland forests, dunes, streambanks, disturbed habitats. **Dist:** E. VA, KS, and CA south into the New World tropics, the original range obscure. **Phen:** May-Oct. **Syn:** = Bah, C, FNA12, GrPl, K1, K3, K4, NcTx, Tn, Tx, Va, Govaerts, Frodin, & Radcliffe-Smith (2000); = *Euphorbia heterophylla* Linnaeus – G, misapplied; = *Poinsettia cyathophora* (Murray) Klotzsch & Garcke – WH3, Burch (1966); > *Euphorbia heterophylla* var. *graminifolia* Engelm – F, RAB; > *Euphorbia heterophylla* Linnaeus var. *heterophylla* – F, RAB, misapplied; > *Poinsettia cyathophora* (Murray) Klotzsch & Garcke – S; > *Poinsettia cyathophora* var. *cyathophora* – IL; > *Poinsettia cyathophora* var. *graminifolia* (Michaux) Mohlenbrock – IL; > *Poinsettia heterophylla* (Linnaeus) Klotzsch & Garcke ex Klotzsch – S, misapplied.

207. EUPHORBIACEAE

* *Euphorbia cyparissias* Linnaeus. CYPRESS SPURGE, GRAVEYARD SPURGE. **Hab:** Roadbanks, graveyards, waste places. **Dist:** Native of Europe. **Phen:** Mar-May (occasionally later). **Comm:** Rarely producing seeds, so a relatively "well-behaved weed", tending to spread only vegetatively from plantings. **Syn:** = Ar, C, F, G, GrPl, Il, K1, K3, K4, Mi, NE, NY, Pa, RAB, Tn, Va, W, WV, Govaerts, Frodin, & Radcliffe-Smith (2000); = *Galarhoeus cyparissias* (Linnaeus) Small ex Rydberg – S; = *Tithymalus cyparissias* (Linnaeus) Lamarck. **NatureServe G5** (Secure).

Euphorbia dentata Michaux. PAINTED LEAF, WILD POINSETTIA, TOOTHED SPURGE. **Hab:** Bottomland forests, disturbed areas, hedgerows, thickets, railroad cinders. **Dist:** Native of sc. North America. The native distribution obscured by spread since, but apparently OH west to CO, south to LA, TX, NM, AZ, and Mexico. **Phen:** Jul-Oct. **Syn:** = Ar, C, F, FNA12, G, GrPl, Mi, NcTx, NE, Pa, RAB, Tn, Tx, Va, W, WV, Govaerts, Frodin, & Radcliffe-Smith (2000); = *Poinsettia dentata* (Michaux) Klotzsch & Garcke – S, WH3, Burch (1966); ? *Euphorbia dentata* var. *dentata* – K1, K3; > *Euphorbia dentata* var. *dentata* – K4; > *Euphorbia dentata* var. *lasiocarpa* Boissier – K4; > *Poinsettia dentata* var. *cuphosperma* (Engelmann) Mohlenbrock – Il; > *Poinsettia dentata* var. *dentata* – Il.

* *Euphorbia helioscopia* Linnaeus. WARTWEED, MADWOMAN'S-MILK, SUN SPURGE, SUMMER SPURGE. **Hab:** Disturbed areas, roadsides, cultivated ground. **Dist:** Native of Europe. **Phen:** Late Mar-Jun. **Syn:** = C, F, FNA12, G, Il, K1, K3, K4, Mi, NE, NY, Pa, RAB, Tn, Tx, Va; = *Galarhoeus helioscopia* (Linnaeus) Haworth – S; > *Euphorbia helioscopia* ssp. *helioscopia* – Govaerts, Frodin, & Radcliffe-Smith (2000). **NatureServe G5** (Secure).

Euphorbia heterophylla Linnaeus. FIDDLER'S SPURGE, MEXICAN FIREPLANT, CATALINA, JACOB'S-LADDER. **Hab:** Disturbed areas. **Dist:** VA, NC, SC, GA, TX, and NM south through Mexico, Central America, and South America; some of the distribution is likely by introduction. **Phen:** Jan-Dec. **Syn:** = Bah, FNA12, K1, K3, K4, Tx, Govaerts, Frodin, & Radcliffe-Smith (2000), Smith & Krings (2018); = *Poinsettia heterophylla* (Linnaeus) Klotzsch & Garcke ex Klotzsch – WH3, Burch (1966); > *Poinsettia geniculata* Ortega – S; > *Poinsettia heterophylla* (Linnaeus) Klotzsch & Garcke ex Klotzsch – S.

* *Euphorbia hirta* Linnaeus. PILLPOD SANDMAT. **Hab:** Fields, disturbed ground, waste areas, in and around greenhouses, perhaps only adventive in the northern part of our area. **Dist:** E. NC, c. SC, south to s. FL, west to TX, and south into Central and South America, the pre-Columbian distribution obscure. Reported for Goldsboro, NC and Abbeville, Abbeville County, SC (C.N. Horn, pers.comm. 2008). **Phen:** (Jan-) Jun-Oct (-Dec). **Syn:** = Ar, Bah, C, FNA12, G, K3, K4, Mi, NY, RAB, Tx, Govaerts, Frodin, & Radcliffe-Smith (2000); = *Chamaesyce hirta* (Linnaeus) Millspaugh – K1, NcTx, S, WH3. **NatureServe G5** (Secure).

Euphorbia humistrata Engelman. SPREADING SANDMAT. **Hab:** Floodplain forests, exposed river shores, rocky riverside gravel bars, disturbed areas, some of the easternmost occurrences apparently adventive from farther west. **Dist:** OH, IL, MO, and e. KS south to Panhandle FL and e. TX; scattered eastward, apparently as an adventive. **Phen:** Apr-Oct. **Syn:** = Ar, C, F, FNA12, G, GrPl, K3, Tn, Va, WV, Govaerts, Frodin, & Radcliffe-Smith (2000); = *Chamaesyce humistrata* (Engelmann) Small – GW2, Il, K1, S, WH3. **NatureServe G4G5** (Apparently Secure).

Euphorbia hypericifolia Linnaeus. **Hab:** Disturbed upland areas. **Dist:** FL west to TX, south into Mexico, Central America, South America; West Indies. Reported for SC (Kartesz 1999), FL, GA, LA (Q). The boundary between native and adventive distribution is uncertain. **Syn:** = Bah, FNA12, K3, K4, Tx, Govaerts, Frodin, & Radcliffe-Smith (2000); = *Chamaesyce hypericifolia* (Linnaeus) Millspaugh – K1, NcTx, S, WH3. **NatureServe G5** (Secure).

Euphorbia hyssopifolia Linnaeus. HYSSOPELEAF SANDMAT. **Hab:** Disturbed ground. **Dist:** SC south to s. FL, west to LA; also in w. TX, s. NM, and n. Mexico, and south to s. South America. **Phen:** May-Oct. **Comm:** Its status in our area has been muddled by confusion with *E. nutans*. **Syn:** = Bah, FNA12, K3, K4, NY, Tx, Govaerts, Frodin, & Radcliffe-Smith (2000); = *Chamaesyce hyssopifolia* (Linnaeus) Small – GW2, K1, WH3.

Euphorbia inundata Torrey ex Chapman var. *inundata*. FLATWOOD SPURGE. **Hab:** Wet pine flatwoods, savannas, seepage slopes. **Dist:** Ne. FL and se. GA (Bridges & Orzell 2002); Panhandle FL west to s. MS. **Comm:** {not yet keyed; subgenus *Euphorbia*, section *Nummulariopsis*}. **Syn:** = K3, K4, WH3, Bridges & Orzell (2002); < *Euphorbia inundata* – K1, Govaerts, Frodin, & Radcliffe-Smith (2000); < *Galarhoeus inundatus* (Torrey ex Chapman) Small – S. **NatureServe G4G5TNR** (Not Yet Ranked).

Euphorbia maculata Linnaeus. MILK-PURSLANE, SPOTTED SPURGE, SPOTTED SANDMAT. **Hab:** Gardens, fields, disturbed places, crevices in pavement or sidewalks. **Dist:** QC west to ND, south to s. FL and TX; introduced in various places worldwide. **Phen:** Jan-Dec. **Syn:** = Ar, Bah, C, FNA12, G, GrPl, K3, Mi, NE, NY, Pa, Tn, Tx, Va, W, Govaerts, Frodin, & Radcliffe-Smith (2000); = *Chamaesyce maculata* (Linnaeus) Small – GW2, Il, K1, NcTx, S, WH3; < *Euphorbia maculata* Linnaeus – K4; > *Euphorbia supina* Rafinesque – F, RAB, WV. **NatureServe G5?** (Secure).

Euphorbia marginata Pursh. SNOW-ON-THE-MOUNTAIN. **Hab:** Upland sites (prairies, woodlands) over calcareous substrates; eastwards on roadsides and in disturbed areas. **Dist:** MN and MT south through the Great Plains to MO, TX, and NM. **Phen:** Jun-Nov. **Syn:** = Ar, C, F, FNA12, G, GrPl, Il, K1, K3, K4, Mi, NcTx, NE, NY, Pa, RAB, Tn, Tx, Va, WH3, WV, Govaerts, Frodin, & Radcliffe-Smith (2000); = *Agaloma marginata* (Pursh) A. & D. Löve; = *Lepadena marginata* (Pursh) Nieuwland – S. **NatureServe G5** (Secure).

Euphorbia nutans Lagasca y Segura. EYEBANE, UPRIGHT SPOTTED SPURGE. **Hab:** Fields, gardens, waste places, disturbed ground. **Dist:** NH west to MI and ND, south to Panhandle FL and TX; introduced in various places worldwide. **Phen:** May-Oct. **ID Notes:** The leaves tend to fold late in the day. **Syn:** = Ar, C, FNA12, GrPl, K3, K4, Mi, NE, NY, Pa, Tn, Tx, Va, W, Govaerts, Frodin, & Radcliffe-Smith (2000); = *Chamaesyce hyssopifolia* (Linnaeus)

207. EUPHORBIACEAE

Small – S, misapplied; = *Chamaesyce nutans* (Lagasca y Segura) Small – GW2, IL, K1, NcTx, WH3; = *Euphorbia maculata* Linnaeus – F, RAB, WV, misapplied; = *Euphorbia preslii* Gussone – G.

Euphorbia ophthalmica Persoon. FLORIDA HAMMOCK SANDMAT. **Hab:** Roadsides, flowerbeds, other disturbed areas, hammocks. **Dist:** GA and PA (Kartesz 1999), widespread in FL (WH), but not in North America (Q). **Phen:** Jan-Dec. **Comm:** See Barger et al. (2012) for discussion of AL occurrences. {not yet keyed}. **Syn:** = Bah, FNA12, K3, K4, Govaerts, Frodin, & Radcliffe-Smith (2000); = *Chamaesyce ophthalmica* (Persoon) Burch – K1, WH3; ? *Chamaesyce gemella* (Lagasca y Segura) Small. **NatureServe G5** (Secure).

* ***Euphorbia prostrata*** Aiton. PROSTRATE SANDMAT. **Hab:** Crevices of pavement or sidewalks, disturbed places. **Dist:** Probably native of tropical America and only naturalized in our area, but possibly native in the southern parts of the Southeastern United States. **Phen:** Jan-Dec. **Syn:** = Ar, Bah, C, FNA12, GrPl, K3, K4, Mi, NE, Tn, Tx, Va, Govaerts, Frodin, & Radcliffe-Smith (2000); = *Chamaesyce prostrata* (Aiton) Small – IL, K1, NcTx, S, WH3; = *Euphorbia chamaesyce* Linnaeus – F, G, RAB, misapplied. **NatureServe G5** (Secure).

Euphorbia pubentissima Michaux. SOUTHEASTERN FLOWERING SPURGE. **Hab:** Dry woodlands, sandbars, cobblebars, rock outcrops, longleaf pine sandhills. **Dist:** C. MD, VA, and c. and sw. TN, south to Panhandle FL and s. MS. **Phen:** Apr-Sep. **Syn:** = IL, K1, K3, K4, Tn, Va, WH3, Huft (1979), Park (1998); = *Agaloma pubentissima* (Michaux) D.B. Ward; = *Euphorbia corollata* var. *paniculata* Boissier – C, F, Govaerts, Frodin, & Radcliffe-Smith (2000); > *Euphorbia apocynifolia* Small – F; < *Euphorbia corollata* Linnaeus – G, W; >< *Euphorbia corollata* Linnaeus var. *corollata* – RAB, in part; > *Euphorbia corollata* Linnaeus var. *zinniflora* (Small) H.E. Euphorbia serpens (Kunth) Small. HIERBA DE LA GOLONDRINA, ROUNDLEAF SANDMAT. **Hab:** Dry sandy hammocks, disturbed uplands. **Dist:** OH, IN, IA, ND, and MT south to TN, LA, TX, NM, AZ, and Mexico. Allegedly in se. PA as a waif (Rhoads & Klein 1993). **Phen:** (Jan-) Jul-Oct (-Dec). **Syn:** = Ar, C, F, FNA12, G, K3, K4, NE, NY, Pa, Tn, Tx, Govaerts, Frodin, & Radcliffe-Smith (2000); = *Chamaesyce serpens* (Kunth) Small – GrPl, IL, K1, NcTx, S, WH3. **NatureServe G5** (Secure).

Euphorbia spathulata Lamarck. PRAIRIE SPURGE, WARTY SPURGE. **Hab:** Rocky woodlands, prairies, disturbed areas. **Dist:** MN and WA south to w. VA, AL, LA, TX, and Mexico. **Phen:** Mar-Jun. -Jun. **Syn:** = Ar, C, GrPl, IL, Mi, NcTx, Tn, Tx, Va, W, WH3; > *Euphorbia dictyosperma* Fischer & Meyer – F, G; < *Euphorbia spathulata* Lamarck – FNA12, GrPl, K1, K3, K4, Govaerts, Frodin, & Radcliffe-Smith (2000); > *Galarhoeus arkansanus* (Engelmann & A. Gray) Small ex Rydberg – S. **NatureServe G5** (Secure).

Euphorbia species 4. **Hab:** Calcareous forests. **Dist:** S. SC south to Panhandle FL, west to s. MS. **Tax:** Under study by Mac Alford and Richard Carter. Possibly the same as or related to the type of *E. apocynifolia*. **Syn:** *Euphorbia species 4*.

* ***Euphorbia tirucalli*** Linnaeus. PENCIL TREE. **Hab:** Disturbed areas, spread from horticultural use. **Dist:** Native of sub-Saharan Africa. **Phen:** Jan-Dec. **Syn:** = Bah, K3, K4, WH3. **NatureServe GNR** (Not Yet Ranked).

***Manihot* P. Miller 1754 (CASSAVA)**

A genus of about 100 species, trees, shrubs, and herbs, of tropical and subtropical America. References: Govaerts, Frodin, & Radcliffe-Smith (2000); Hayden (2016a) in FNA12 (2016); Webster (2014) in Kubitzki (2014).

* ***Manihot grahamii*** Hooker. HARDY TAPIOCA, GRAHAM'S CASSAVA. **Hab:** Suburban forests, vacant lots, other disturbed areas, uncommonly grown as an ornamental, rarely naturalizing. **Dist:** Native of tropical America. Introduced in sw. GA (Jones & Coile 1988; Carter, Baker, & Morris 2009), FL Panhandle, peninsular FL, west to LA and TX (Aplaca 2012). **Phen:** Apr-Aug; Jun-Sep. **Syn:** = Ar, FNA12, K3, K4, WH3, Govaerts, Frodin, & Radcliffe-Smith (2000). **NatureServe G5** (Secure).

Ricinus Linnaeus 1753 (CASTOR-BEAN)

A monotypic genus, a shrub or tree, native to w. Africa, now pantropical. References: Gillespie (2016a) in FNA12 (2016); Govaerts, Frodin, & Radcliffe-Smith (2000); Webster (2014) in Kubitzki (2014).

* ***Ricinus communis*** Linnaeus. CASTOR-BEAN, CASTOR-OIL PLANT, PALMA CHRISTI. **Hab:** Waste places, gardens. **Dist:** Native of ne. Africa. **Phen:** Jul-Oct (-May). **Comm:** The seeds are dangerously poisonous, formerly the source of an oil used as a purgative and machine lubricant. In FL and farther south in the tropics, *R. communis* is a small to medium tree. **Syn:** = Ar, Bah, C, F, FNA12, G, Il, K1, K3, K4, Mi, NcTx, NE, NY, Pa, RAB, S, Tn, Tx, WH3, Govaerts, Frodin, & Radcliffe-Smith (2000). NatureServe GNR (Not Yet Ranked).

*Stillingia* Garden ex Linnaeus 1767 (QUEEN'S-DELIGHT, TOOTHLEAF)

Contributed by James W. Horn and Alan S. Weakley

A genus of about 33 species, herbs, shrubs, and small trees, of tropical to subtropical regions of America, Madagascar, and se. Asia. References: Govaerts, Frodin, & Radcliffe-Smith (2000); Huft (2016b) in FNA12 (2016); Rogers (1951); Webster (2014) in Kubitzki (2014).

Stillingia sylvatica Garden ex Linnaeus. QUEEN'S-DELIGHT. **Hab:** Longleaf pine sandhills, dryish Coastal Plain woodlands, other dry woodlands. **Dist:** Se. VA south to s. FL, west to s. TX, s. NM, and Mexico (COA, MIC, TAM), north in the interior to KS and se. CO. **Phen:** Apr-Jul (-Aug); May-Sep. **Tax:** *S. sylvatica* may contain an additional entity distributed in peninsular FL and s. GA, designated by Small (1933) as *S. spathulata*. *S. spathulata* putatively differs structurally from *S. sylvatica* in having smaller capsules, shorter seeds, and in having many individuals in a population with oblanceolate (common) to truly spatulate (infrequent) leaf blades. Nevertheless, individuals with narrowly elliptical leaves are present in most *S. spathulata* populations. The two entities occupy similar niches throughout their respective ranges, and are not genetically isolated. **Syn:** = Ar, C, G, GrPl, RAB, Tx; = *Stillingia sylvatica* ssp. *sylvatica* – K1, K3, Va, Govaerts, Frodin, & Radcliffe-Smith (2000), Rogers (1951); = *Stillingia sylvatica* var. *sylvatica* – F; > *Stillingia spathulata* (Müller of Aargau) Small – S; < *Stillingia sylvatica* Garden ex Linnaeus – FNA12, K4, WH3; > *Stillingia sylvatica* Garden ex Linnaeus – S. NatureServe G5T5 (Secure).

*Tragia* Linnaeus 1753 (NOSEBURN)

A genus of about 170 species, herbs and shrubs, of tropical to warm temperate regions of the Old and New Worlds. Molecular and morphological studies suggest that section *Leptobotrys* (*T. smallii* and *T. urens*) should be accorded generic rank (Cardinal-McTeague & Gillespie 2016; Urtecho in FNA 2016). References: Cardinal-McTeague & Gillespie (2016); Govaerts, Frodin, & Radcliffe-Smith (2000); Miller & Webster (1967); Urtecho (2016) in FNA12 (2016); Webster (2014) in Kubitzki (2014).

- 1 Leaf bases cuneate to rounded; stamens 2; [section *Leptobotrys*].
 - 2 Leaf blades usually 1.5-3× as long as wide, broadest near the base (except narrower forms with margins relatively parallel through the middle part of the blade); leaf margins serrate to crenate, usually through the length of the blade..... *Tragia smallii*
 - 2 Leaf blades usually 4-20× as long as wide, broadest at the middle or towards the apex; leaf margins entire or with a few, irregular teeth or undulations, these almost exclusively near the leaf blade apex..... *Tragia urens*
- 1 Leaf bases cordate, subcordate, or truncate; stamens 3-6 (-10); [section *Tragia*].
 - 3 Larger leaf blades on a plant > 5 cm wide and > 8 cm long, deeply cordate at the base; capsules 11-13 mm wide; stamens 3; petioles 15-85 mm long..... *Tragia cordata*
 - 3 Larger leaf blades on a plant < 3.5 cm wide and < 8 cm long, cuneate, rounded, truncate, or shallowly cordate at the base; capsules 4-11 mm wide; stamens 3-6 (-10); petioles 0-38 (-41) mm long.
 - 5 Pedicels of the staminate flowers 0.7-1 mm long, the lower persistent part 0.3-0.6 mm long (shorter than the subtending bract); sepals of the pistillate flowers 1.8-5.0 mm long; staminate flowers 15-80 per raceme, clustered towards the tip; [largely west of the Mississippi River, rarely disjunct eastwards]..... *Tragia betonicifolia*
 - 5 Pedicels of the staminate flowers 1.5-2 mm long, the lower persistent part 1-1.8 mm long (longer than the subtending bract); sepals of the pistillate flowers 1.3-2.3 mm long; staminate flowers 11-40 per raceme, evenly distributed along the raceme axis; [widespread in our region]..... *Tragia urticifolia*

Tragia betonicifolia Nuttall. BETONY NOSEBURN. **Hab:** Glades and dry bluffs, prairies, dry, sandy woodlands. **Dist:** MO and KS south to w. LA and TX; disjunct eastward in KY, TN, and possibly AL (and apparently introduced in VA). **Phen:** May-Sep. **Syn:** = Ar, FNA12, GrPl, K3, K4, NcTx, Tn, Tx, Govaerts, Frodin, & Radcliffe-Smith (2000), Miller & Webster (1967); = *Tragia urticifolia* Michaux var. *texana* Shinnars.

Tragia cordata Michaux. HEARTLEAF NOSEBURN. **Hab:** Rocky calcareous woodlands, calcareous prairies. **Dist:** C. KY, s. IN to s. MO, south through c. TN, rarely to e. TN (Meigs County, in the Ridge and Valley Province) (Chester, Wofford, & Kral 1997), n. AL (Jackson Co.) (D. Spaulding, pers. comm.) to sc. and sw. GA, Panhandle FL, and e. TX. **Phen:** Jul-Sep. **Syn:** = Ar, C, FNA12, Il, K3, K4, Tn, Tx, WH3, Govaerts, Frodin, & Radcliffe-Smith (2000), Miller & Webster (1967); = *Tragia macrocarpa* Willdenow – S. NatureServe G4 (Apparently Secure).

Tragia smallii Shinnars. GULF COAST NOSEBURN. **Hab:** Longleaf pine sandhills, other dry woodlands. **Dist:** Sw. GA south to c. peninsular FL, west to e. TX and sw. AR. Reports of *T. betonicifolia* from GA are based on misapplication of that name to material representing *T. smallii*. **Phen:** May-Sep. **Syn:** = FNA12, K3, K4, Tx, WH3, Govaerts, Frodin, & Radcliffe-Smith (2000), Miller & Webster (1967); = *Tragia betonicaefolia* Nuttall – S, misapplied; = *Tragia betonicifolia* Nuttall, misapplied.

Tragia urens Linnaeus. SOUTHEASTERN NOSEBURN, WAVYLEAF NOSEBURN, SANDHILL NOSEBURN. **Hab:** Longleaf pine sandhills, sandy woodlands, pine rocklands, other dry woodlands. **Dist:** Se. VA south to s. FL and west to TX, mostly on the Coastal Plain, but ranging into the Piedmont and Mountains in NC, SC, GA, and AL. **Phen:** May-Oct. **Tax:** *Tragia urens* is variable in (at least) leaf form, and may represent a complex including *Tragia smallii*; the group needs additional study, as well as resolution about generic placement. **Syn:** = C, F, FNA12, G, K3, K4, RAB, S, Va, W, WH3, Govaerts, Frodin, & Radcliffe-Smith (2000), Miller & Webster (1967); = *Tragia linearifolia* Elliott – S. NatureServe G5 (Secure).

Tragia urticifolia Michaux. NETTLELEAF NOSEBURN. **Hab:** Dry woodlands and rock outcrops, particularly over mafic or calcareous rocks. **Dist:** Sc. VA west to n. AR, south to wc. peninsular FL, Panhandle FL, and c. TX. **Phen:** May-Oct. **Syn:** = Ar, F, FNA12, G, K3, K4, NcTx, RAB, Tx, Va, W, WH3, Govaerts, Frodin, & Radcliffe-Smith (2000), Miller & Webster (1967); = *Tragia urticaefolia* – S, orthographic variant. NatureServe G5 (Secure).

Triadica Loureiro 1790 (CHINESE TALLOW-TREE)

A genus of 3 species, native to tropical and subtropical Asia. The most recent monographers of *Sapium* and related genera (Kruijt 1996; Esser 2002) place our naturalized species in the genus *Triadica*, native to Asia; *Sapium* (excluding *Triadica*) is a genus of 21 species restricted to the neotropics. This conclusion is corroborated by molecular phylogenetic analysis (Wurdack, Hoffmann, & Chase 2005). References: Buthod, Hoagland, & Arbour (2019); DeBerry & Hunter (2018); Esser (2002); Govaerts, Frodin, & Radcliffe-Smith (2000); Kruijt (1996); Vogt et al (2021); Webster (2014) in Kubitzki (2014); Wurdack (2016a) in FNA12 (2016).

Identification Notes: With *Euphorbia* and *Cnidioscolus*, one of our few Euphorbiaceous genera with milky sap.

* **Triadica sebifera** (Linnaeus) Small. CHINESE TALLOW-TREE, POPCORN TREE. **Hab:** Marsh edges, swamps, riverbanks, shell deposits, upland forests, disturbed areas. *Triadica sebifera* has become a serious invasive weed from se. NC south and west to se. TX (Vogt et al. 2021). Reported for King and Queen County, VA (DeBerry & Hunter 2018), and McCurtain County, OK (Buthod, Hoagland, & Arbour 2019) showing its continued spread. **Dist:** Native of e. Asia. **Phen:** May-Jun; Aug-Nov. **Syn:** = Ar, FNA12, K1, K3, K4, S, Esser (2002), Govaerts, Frodin, & Radcliffe-Smith (2000), Kruijt (1996); = *Sapium sebiferum* (Linnaeus) Roxburgh – GW2, NcTx, RAB, Tx, WH3. NatureServe GNR (Not Yet Ranked).

Vernicia Loureiro 1790 (TUNG-OIL TREE)

A genus of 3-4 species, trees, native of se. Asia. References: Gillespie (2016c) in FNA12 (2016); Govaerts, Frodin, & Radcliffe-Smith (2000); Stuppy et al (1999); Webster (2014) in Kubitzki (2014).

* **Vernicia fordii** (Hemsley) Airy Shaw. TUNG-OIL TREE, TUNG TREE. **Hab:** Planted for the oil and for ornament, now extensively naturalized in moist to dry upland forests, bottomland forests, and disturbed areas. **Dist:** Native of c. and w. China. Naturalized on the Gulf Coastal Plain from former plantations; planted and showing a tendency to naturalize in the Coastal Plain of NC (Mount Olive, Wayne Co.; A.J. Bullard, pers. comm.). **Phen:** Mar-Apr; Apr-Aug. **Syn:** = Ar, FNA12, K3, K4, Govaerts, Frodin, & Radcliffe-Smith (2000), Stuppy et al (1999); = *Aleurites fordii* Hemsley – WH3. NatureServe GNR (Not Yet Ranked).

208. LINACEAE A.P. de Candolle 1818 (FLAX FAMILY) [in MALPIGHIALES]

A family of about 10-14 genera and 250-350 species, herbs, trees, vines, and shrubs, cosmopolitan. References: Dressler, Reppinger, & Bayer in Kubitzki (2014); McDill & Simpson (2011); McDill et al (2009); Morin (2006) in FNA12 (2016); Robertson (1971); Schneider et al (2016).

Linum Linnaeus 1753 (FLAX)

A genus of about 180 species, herbs, of temperate and subtropical areas. The traditional separation of *Linum*, its component sections, and related genera (*Sclerolinum*, *Hesperolinum*, *Cliococca*) appears to need reworking (McDill et al. 2009; McDill & Simpson 2011; Schneider et al. 2016). *Linum* could encompass the related genera into an ever more heterogeneous *Linum sensu lato*, or sections of *Linum* could be elevated to generic rank (some sections have been previously accorded such rank). References: Bradley & Weakley (2020) in Weakley et al (2020); Dressler, Reppinger, & Bayer in Kubitzki (2014); Morin (2006) in FNA12 (2016); Rogers (1963); Rogers (1984).

1 Petals blue, red, or pink (rarely white); capsule 5-10 mm long; [section *Linum*].

1 Petals predominantly light to dark yellow (sometimes also with other coloration, including orange, copper, salmon, brown, and red bands or blotches); capsules 1-4 mm long; [section *Linopsis*].

- 6 Outer sepals entire (very rarely sparsely glandular-toothed), the inner sepals entire or sparsely to conspicuously glandular-toothed; leaves without red or brown stipular glands flanking the attachment to the stem.
- 7 Fruit as long as broad or longer, its apex acute, apiculate, or obtuse, (2-) 2.2-3.2 (-3.3) mm long; leaves mostly 1.3-4.3 mm wide.
- 10 Fruit 3.4-3.8 mm long, 3.2-3.4 mm in diameter..... *Linum macrocarpum*
- 10 Fruit (2.0-) 2.3-3.2 (-3.3) mm long, 1.7-3.1 mm in diameter.
- 11 Fruit ovoid, (2.8-) 3.0-3.2 (-3.3) mm long, 2.5-3.1 mm in diameter, the apex minutely apiculate, the exposed portions yellow; seeds 2.1-2.4 mm long; anthers averaging 1.2 mm long..... *Linum floridanum* var. *chrysocarpum*
- 11 Fruit pyriform, (2.0-) 2.3-2.8 (-3.0) mm long, 1.7-2.6 mm in diameter, the apex rounded, the exposed portions purple; seeds (1.6-) 1.7-2.0 (2.1) mm long; anthers averaging 0.8 mm long..... *Linum floridanum* var. *floridanum*
- 7 Fruit broader than long, its apex depressed, flattened, or broadly rounded, (1.3-) 1.5-2.1 (-2.3) mm long; leaves mostly 1.9-9.3 mm wide.
- 12 Margins of the inner sepals with conspicuous stalked glands; mature fruits of dried specimens usually adhering to the plant..... *Linum curtissii*
- 12 Margins of the inner sepals glandless, or with a few inconspicuous, sessile glands; mature fruits of dried specimens usually shattering and falling freely.
- 14 Inflorescence panicle, the lower inflorescence branches not elongate, their tips not nearly reaching the tips of the upper inflorescence branches; branchlets striate-ridged; leaves mostly opposite (usually to beyond the midpoint from the base of the plant to the first inflorescence branch) *Linum striatum*
- 14 Inflorescence corymbose, some (at least) of the lower branches of the inflorescence elongate, their tips nearly equaling the tips of the upper inflorescence branches; branchlets terete or nearly so; leaves mostly alternate (usually the opposite leaves of the lower stem not extending beyond the midpoint from the base of the plant to the first inflorescence branch)..... *Linum virginianum*
- 6 Inner and outer sepals all very conspicuously glandular-toothed; leaves with 2 red or brown stipular glands flanking the attachment to the stem (these absent or obscure in *L. smallii* and *L. rigidum* var. *rigidum* – but check leaves on the upper and lower stem).
- *Linum sulcatum*

Linum curtissii Small. TEXAS YELLOW FLAX. **Hab:** Woodlands, other dry to moist places. **Dist:** S. ME, MI, and n. IL south to s. FL and TX; West Indies. **Phen:** Mar-Aug. **Syn:** = *Linum medium* ssp. *texanum* (Planchon) A. Haines – NE; = *Linum medium* (Planchon) Britton var. *texanum* (Planchon) Fernald – Ar, Bah, C, F, FNA12, GrPl, GW2, Il, K1, K3, K4, Mi, NcTx, NY, Tn, Tx, Va, W, WH3, WV, Rogers (1963), Rogers (1984); < *Cathartolimum medium* (Planchon) Small – S; < *Linum medium* (Planchon) Britton – G; > *Linum medium* var. *medium* – Pa; > *Linum medium* (Planchon) Britton var. *texanum* (Planchon) Fernald – Pa; < *Linum virginianum* var. *medium* Planchon – RAB.

Linum floridanum (Planchon) Trelease var. *chrysocarpum* C.M. Rogers. YELLOW-FRUITED YELLOW FLAX. **Hab:** Wet savannas. **Dist:** Se. NC south to s. FL and west to s. MS. **Phen:** Jun-Oct. **Tax:** Probably warranting species rank. **Syn:** = FNA12, K1, K3, K4, Rogers (1963), Rogers (1984); < *Cathartolimum floridanum* (Planchon) Small – S; < *Linum floridanum* – GW2, WH3; < *Linum virginianum* var. *floridanum* Planchon – RAB. NatureServe G5?T3? (Vulnerable).

Linum floridanum (Planchon) Trelease var. *floridanum*. FLORIDA YELLOW FLAX. **Hab:** Pine savannas, sandhill seeps. **Dist:** E. MD south to s. FL and west to LA and e. TX, essentially limited to the Coastal Plain; West Indies (Jamaica). **Phen:** Jun-Oct. **Syn:** = FNA12, K1, K3, K4, Rogers (1963), Rogers (1984); < *Cathartolimum floridanum* (Planchon) Small – S; > *Cathartolimum macrosepalum* Small – S; < *Linum floridanum* – C, F, G, GW2, Il, WH3; < *Linum virginianum* var. *floridanum* Planchon – RAB, (also see *L. floridanum* var. *chrysocarpum* and *L. intercursum*). NatureServe G5?T5? (Secure).

Linum macrocarpum C.M. Rogers. SPRING HILL FLAX. **Hab:** Pitcher plant bogs, wet savannas. **Dist:** FL Panhandle west through s. AL and s. MS to se. LA. **Phen:** May-Jul. **Syn:** = FNA12, K1, K3, K4, WH3, Rogers (1963), Rogers (1984). NatureServe G2 (Imperiled).

Linum striatum Walter. RIDGESTEM YELLOW FLAX. **Hab:** Bogs, seepages, other wet places, often growing in *Sphagnum*. **Dist:** MA, PA, MI, and IL south to Panhandle FL, LA, and e. TX. **Phen:** May-Oct. **Syn:** = Ar, C, FNA12, G, GW2, Il, K1, K3, K4, Mi, NcTx, NE, NY, Pa, RAB, Tn, Tx, Va, W, WH3, Rogers (1963), Rogers (1984); = *Cathartolimum striatum* (Walter) Small – S; > *Linum striatum* var. *striatum* – F.

Linum sulcatum Riddell. GROOVED YELLOW FLAX. **Hab:** Prairies; eastwards in dry rocky woodlands, barrens, and blackland prairies over calcareous, mafic, or ultramafic rocks (and sometimes also weedy in adjacent disturbed areas). **Dist:** Primarily a species of the Great Plains of WI, MN, and s. ON, s. MB, WI, MN, and ND, to LA and TX, *L. sulcatum* occurs farther east (to MA, VA, NC, and AL) as a rare disjunct on glades or barrens over rocks such as limestone or diabase. **Phen:** May-Oct. **Syn:** = Ar, C, F, FNA12, G, GrPl, Il, Mi, NcTx, NY, Pa, RAB, Tn, Tx, Va, W, WV; = *Cathartolimum sulcatum* (Riddell) Small – S; = *Linum sulcatum* Riddell var. *sulcatum* – K1, K3, K4, NE, Rogers (1963), Rogers (1984); = *Mesynium sulcatum* (Riddell) A. & D. Löve. NatureServe G5T5 (Secure).

* *Linum usitatissimum* Linnaeus. COMMON FLAX, CULTIVATED FLAX, LINAZA. **Hab:** Roadsides, other disturbed places, not long persisting after agricultural use. **Dist:** Native of Europe. **Phen:** Apr-Sep. **Comm:** This is the flax of commerce, used for its fiber for at least the last 25,000 years (the source of flax/linen), seeds, and the oil expressed from its seeds (linseed oil). **Syn:** = Ar, C, F, FNA12, G, GrPl, Il, K1, K3, K4, Mi, NcTx, NE, NY, Pa, RAB, S, Tx, Va, WH3, WV, Rogers (1984). NatureServe GNR (Not Yet Ranked).

Linum virginianum Linnaeus. VIRGINIA YELLOW FLAX. **Hab:** Dry or moist places. **Dist:** MA, NY, ON, MI, and IL south to SC, GA, AL, and MO. **Phen:** Jun-Oct. **Syn:** = C, F, FNA12, G, GW2, Il, K1, K3, K4, Mi, NE, NY, Pa, Tn, Va, W, WV, Rogers (1963), Rogers (1984); = *Cathartolimum virginianum* (Linnaeus) Reichenbach – S; = *Linum virginianum* var. *virginianum* – RAB. NatureServe G4G5 (Apparently Secure).

208. LINACEAE

211. PHYLLANTHACEAE Martinov 1820 (LEAF-FLOWER FAMILY) [in MALPIGHIALES]

A family of about 60 genera and 2000 species, trees, shrubs, and herbs, mainly tropical and warm temperate. References: Chase et al (2002); Levin (2016f) in FNA12 (2016); Webster (1994); Webster (2014) in Kubitzki (2014).

- 3 Plant with "normal" arrangement of branches and leaves (leaves uniformly distributed on the stem and branches, alternate and either distichous or spirally arranged, the ultimate branches not deciduous, flowers produced on ultimate and penultimate orders of branches)..... *Phyllanthus*
- 3 Plant with "phyllanthoid" arrangement of branches, leaves, and flowers (leaves lacking on the main stem, the penultimate order of branches with scales arranged spirally, the ultimate (final) order of branches deciduous, bearing normal leaves alternately and distichously, flowers produced only on the ultimate, deciduous branches), the ultimate branches and their distichous small leaves resembling the rachis and leaflets of a once-pinnate compound leaf.
 - 5 Fruiting pedicels 0.5 mm long; seeds with 12-15 transverse ridges and sometimes 1-3 pits; male flowers borne toward the tip of the branchlets, female flowers toward the base..... *Emblia urinaria*
 - 5 Fruiting pedicels > 0.5 mm long; seeds either longitudinally ribbed or striate, or verrucose; female flowers borne toward the tip of the branchlets, male flowers toward the base..... *Moeroris*

Emblia Gaertner 1790

A genus of about 45 species, herbs (our introduced species), shrubs, and trees, native of tropical and subtropical Asia and Australia. Previously included in *Phyllanthus*; see Bouman et al. (2021, 2022). References: Bouman et al (2021); Bouman et al (2022).

Identification Notes: Our one alien species can be an aggressive weed in disturbed soils. The distichous leaves arrayed along the horizontal ultimate stems are very easily mistaken for the leaflets of a pinnately compound leaf. The leaves have a distinctive dark green color, typically grading to paler green near the pale green stem.

* *Emblia urinaria* (Linnaeus) R.W. Bouman. CHAMBER BITTER, GRIPEWEED. **Hab:** Gardens, roadsides, and other disturbed ground, apparently preferring nitrogen-rich or fertilized soils. **Dist:** Native of tropical South and Southeast Asia, now widespread in the tropics and subtropics of both hemispheres. This species appeared in the 1940s to 1960s in FL, GA, AL, LA, TX, and NC, and in the 1970s in TN (Kral (1981). Reported for MO by Freeman & Morse (2019). **Phen:** (Jan-) Mar-Nov (-Dec). **Tax:** Ssp. *nudicarpus* Rossignol & Haicour is e. Asian and not known to be introduced in our area; it is likely specifically distinct. **Syn:** =; = *Phyllanthus urinaria* Linnaeus ssp. *urinaria* – Ar, FNA12, NY, Govaerts, Frodin, & Radcliffe-Smith (2000), Rossignol, Rossignol, & Haicour (1987); < *Emblia urinaria* (Linnaeus) R.W. Bouman – Bouman et al (2022); < *Phyllanthus urinaria* – Fl2, GW2, IL, K1, K3, K4, NcTx, Tx, WH3, Webster (1970). NatureServe GNR (Not Yet Ranked).

Moeroris Rafinesque 1838

A genus of 200 or more species, herbs (ours), shrubs, and trees, of the Americas and Africa. Previously included in *Phyllanthus*; see Bouman et al. (2021, 2022). The subgenera shown in the key are those of Bouman et al. (2022). References: Bouman et al (2021); Bouman et al (2022).

- 1 Stamens 5, filaments free; fruiting pedicels capillary, 3-7 mm long, flexuous and pendent in fruit; seeds densely papillose; [subgenus *Tenellanthus*]..... *Moeroris tenella*
- 1 Stamens 3, filaments connate into a column 0.1-0.15 mm long; fruiting pedicels thicker and often also shorter, spreading in fruit; seeds variously ribbed or striate..... *Moeroris fraterna*

* *Moeroris fraterna* (G.L. Webster) R.W. Bouman. **Hab:** Disturbed areas. **Dist:** Native of India and Pakistan. Introduced in SC (Kartesz 1999, 2010). S. FL, MS, LA. Reported for GA (Zomlefer et al. 2018). **Phen:** Jan-Dec. **Syn:** = Bouman et al (2022); = *Phyllanthus fraternus* G.L. Webster – Fl2, FNA12, K1, K3, K4, WH3, Govaerts, Frodin, & Radcliffe-Smith (2000), Webster (1970). NatureServe GNR (Not Yet Ranked).

* *Moeroris tenella* (Roxburgh) R.W. Bouman. MASCARENE ISLAND LEAF-FLOWER. **Hab:** Disturbed areas, especially in and around greenhouses. **Dist:** Native of the Mascarene Islands. This species appeared in FL in the 1920s, s. GA in the 1940s, SC in the 1950s, NC in the 1960s, and TN in the 1970s (Kral 1981). Reported from a single collection from VA, as a "contaminant in a container plant" (Virginia Botanical Associates 2007). **Syn:** = Bouman et al (2022); = *Phyllanthus tenellus* Roxburgh – Ar, Bah, Fl2, FNA12, GW2, IL, K1, K3, K4, NcTx, Tn, WH3, Webster (1970); > *Phyllanthus amarus* Schumacher – RAB, misapplied (misidentified); ? *Phyllanthus lathyroides* Kunth – S, misapplied; > *Phyllanthus niruri* Linnaeus – RAB, misapplied (misidentified); > *Phyllanthus tenellus* var. *tenellus* – Govaerts, Frodin, & Radcliffe-Smith (2000).

211. PHYLLANTHACEAE

Moeroris
fraternaMoeroris
tenella

E. and se. Asia

E. and se. Asia

Phyllanthus Linnaeus 1753 (LEAF-FLOWER)

A genus of 800-900 species, trees, shrubs, and herbs, of tropical, subtropical and warm temperate regions of the Old and New Worlds. *Phyllanthus*, as recently treated very broadly was heterogeneous, paraphyletic with respect to other genera, and needed either to be divided or expanded even further. Bouman et al. (2021) stated "Based on the recognizability of the monophyletic groups, redefining them as genera (which was once the case) is the best option, as, in spite of the many name changes, it provides a better reflection of the evolutionary history of *Phyllanthus* s.l. and will in the future improve identifications greatly. Instead of one giant genus, where identification is difficult and evolution is only depicted by the various subgenera, it is more sensible and worthwhile to recognize separate genera that highlight the morphological variation within the tribes. Additionally, patterns of floral convergence can be discussed in the light of separate lineages, highlighting the complex diversity of tribe Phyllanthae." Bouman et al. (2022) implemented the taxonomic changes. The subgenera and sections shown in the key are those of Bouman et al. (2022). References: Bouman et al (2021); Bouman et al (2022); Govaerts, Frodin, & Radcliffe-Smith (2000); Levin (2016c) in FNA12 (2016); Levin, Wilder, & McCollom (2018); Rossignol, Rossignol, & Haicour (1987); Webster (1970); Webster (2014) in Kubitzki (2014).

- 2 Plant with "normal" arrangement of branches and leaves (leaves uniformly distributed on the stem and branches, alternate and either distichous or spirally arranged, the ultimate branches not deciduous, flowers produced on ultimate and penultimate orders of branches).....*Phyllanthus carolinensis*
- 2 Plant with "phyllanthoid" arrangement of branches, leaves, and flowers (leaves lacking on the main stem, the penultimate order of branches with scales arranged spirally, the ultimate order of branches deciduous, bearing normal leaves alternately and distichously, flowers produced only on the ultimate, deciduous branches), the ultimate branches and their distichous small leaves resembling the rachis and leaflets of a once-pinnate compound leaf.
 - 8 Stamens 5, filaments free; fruiting pedicels capillary, 3-7 mm long, flexuous and pendent in fruit; seeds densely papillose; [subgenus *Kirganelia*].....*Moeroris tenella*
 - 8 Stamens 3, filaments connate into a column 0.1-0.15 mm long; fruiting pedicels thicker and often also shorter, spreading in fruit; seeds variously ribbed or striate.
 - 9 Fruiting pedicels 0.5 mm long; seeds with 12-15 transverse ridges and sometimes 1-3 pits; male flowers borne toward the tip of the branchlets, female flowers toward the base; [section *Urinaria*].....*Emblia urinaria*
 - 9 Fruiting pedicels > 0.5 mm long; seeds either longitudinally ribbed or striate, or verrucose; female flowers borne toward the tip of the branchlets, male flowers toward the base; [section *Phyllanthus*].....*Moeroris*

Phyllanthus carolinensis Walter. CAROLINA LEAF-FLOWER. **Hab:** Roadsides, moist woodlands, forests, and fields, often in seasonally wet, muddy places. **Dist:** PA and IL south to c. peninsular FL and TX, and south to Argentina and Paraguay, the original range not clear, and perhaps introduced in part of the area. **Phen:** Jun-Nov. **Syn:** = *S*; = *Phyllanthus carolinensis* ssp. *carolinensis* – Ar, FNA12, K1, K3, K4, Tx, Va, Govaerts, Frodin, & Radcliffe-Smith (2000), Webster (1970); = *Phyllanthus carolinensis* var. *carolinensis* – C, WH2; < *Phyllanthus carolinensis* – GW2, orthographic error; < *Phyllanthus carolinensis* Walter – F, G, GrPl, IL, NcTx, Pa, RAB, W, WV3, Bouman et al (2022). Geranium Linnaeus 1753 (GERANIUM, CRANE'S-BILL)

A genus of about 350-430 species, mainly perennial herbs, also annuals and dwarf shrubs, mainly temperate. House plants called 'geranium' are members of the genus *Pelargonium*. References: Aedo (2012); Aedo (2017); Aedo, Aldasoro, & Navarro (1998); Albers & Van der Walt in Kubitzki, Bayer, & Stevens (2007); Yeo (1984).

- 1 Perennial, from a stout rhizome; [subgenus *Geranium*]. *Geranium maculatum*
- 1 Annual, from a taproot.
 - 8 Sepals blunt or acute, or terminating in a minute callus tip (mucro) < 0.3 mm long; [subgenus *Robertium*, section *Batrachioidea*]. *Geranium molle*
 - 8 Sepals awned or subulate, the subulate awn 0.7-3 mm long.
 - 11 Mature pedicels < 1.5× as long as the calyx.
 - 12 Mericarps with spreading hairs about 0.5 mm long, these often gland-tipped; [subgenus *Geranium*, section *Dissecta*]. *Geranium dissectum*
 - 12 Mericarps with long appressed hairs about 1 mm long, these not gland-tipped; [subgenus *Geranium*, section *Geranium*]. *Geranium carolinianum*
 - 11 Mature pedicels > 2× as long as the calyx; [subgenus *Geranium*, section *Geranium*]. *Geranium columbinum*

Geranium carolinianum Linnaeus. CAROLINA CRANE'S-BILL. **Hab:** Fields, roadsides, lawns, pastures, gardens, disturbed areas. **Dist:** MA, MI, WY, and BC south to FL, CA, and n. Mexico (and introduced in various places in the Old and New World). **Phen:** Mar-Jun (and sometimes later). **Tax:** Varieties are sometimes recognized, with two in our area: var. *carolinianum*, with the inflorescence diffusely corymbiform (because of long upper internodes), mostly 4-12-flowered, and pubescence of the stem mostly < 0.5 mm long, and var. *confertiflorum*, with the inflorescence a compact corymb (because of notably short upper internodes), mostly 5-25-flowered, and pubescence of the stem mostly > 0.75 mm long. **Syn:** = Bah, Il, K3, K4, Mi, NcTx, NE, NY, Pa, RAB, S, Tn, Tx, Va, W, WH3, WV, Aedo (2012); > *Geranium carolinianum* var. *carolinianum* – Ar, C, F, G, GrPl, K1; > *Geranium carolinianum* var. *confertiflorum* – C, F, G, GrPl, K1.

* ***Geranium columbinum*** Linnaeus. LONG-STALK CRANE'S-BILL. **Hab:** Roadsides, pastures, disturbed areas. **Dist:** Native of Europe. **Phen:** Apr-Jul. **Syn:** = Ar, C, F, G, K1, K3, K4, Mi, NE, NY, Pa, RAB, S, Tn, Va, W, WV, Aedo (2012). **NatureServe GNR** (Not Yet Ranked).

* ***Geranium dissectum*** Linnaeus. CUTLEAF CRANE'S-BILL. **Hab:** Roadsides, pastures, disturbed areas. **Dist:** Native of Europe, c. Asia, n. Africa. **Phen:** Apr-Aug. **Syn:** = Ar, C, F, G, K1, K3, K4, NcTx, NE, NY, Pa, RAB, S, Tn, Tx, Va, W, WV, Aedo (2012). **NatureServe GNR** (Not Yet Ranked).

Geranium maculatum Linnaeus. WILD GERANIUM. **Hab:** Cove forests, bottomland forests, other mesic, base-rich forests. **Dist:** ME west to MB, south to SC, GA, FL Panhandle (Gadsden County) (Kunzer et al. 2009) and ne. OK. **Phen:** Apr-Jun (and rarely later). **Comm:** Sometimes cultivated. **Syn:** = Ar, C, F, G, GrPl, K1, K3, K4, Mi, NE, NY, Pa, RAB, S, Tn, Va, W, WH3, WV, Aedo (2012). **NatureServe G5** (Secure).

* ***Geranium molle*** Linnaeus. DOVE'S-FOOT CRANE'S-BILL. **Hab:** Roadsides, pastures, disturbed areas. **Dist:** Native of Europe and w. Asia. Reported for MS (Majure et al. 2011). **Phen:** Apr-Aug. **Syn:** = Ar, C, F, G, Il, K1, K3, K4, Mi, NE, NY, Pa, RAB, S, Tn, Va, W, WV, Aedo (2012). **NatureServe GNR** (Not Yet Ranked).

215. LYTHRACEAE J. Saint-Hilaire 1805 (LOOSESTRIFE FAMILY) [in MYRTALES]

A family of about 27-35 genera and about 600 species, herbs, shrubs, and trees, primarily tropical (a few warm temperate). References: Graham (1975); Graham in Kubitzki, Bayer, & Stevens (2007). Keys adapted, in large part, from Z. [including PUNICACEAE and TRAPACEAE].

- 1 Plant woody or suffrutescent, a shrub or a small tree 1-10 m tall; petals present, showy, 8-20 mm long.
 - 2 Aquatic shrubs with arching suffrutescent or woody stems; leaves opposite or whorled; [native] *Decodon*
 - 2 Terrestrial shrubs or small trees with erect woody stems; leaves alternate to subopposite; [aliens cultivated and sometimes persistent].
 - 3 Flowers in many-flowered terminal or axillary cymose panicles; fruit a loculicidal capsule. *Lagerstroemia*
 - 3 Flowers solitary or several in terminal or axillary clusters; fruit a leathery berry (pomegranate). *Punica*
- 1 Plant not woody, an herb 0.1-1.2 m tall; petals absent or present, inconspicuous or showy, 1-10 mm long.
 - 5 Stems pubescent.
 - 6 Floral tube (hypanthium) swollen obliquely at its base; capsule dehiscing longitudinally along the upper surface. *Cuphea*
 - 6 Floral tube (hypanthium) symmetrical; capsule dehiscing septicidally at the apex *Lythrum*
 - 5 Stems glabrous.
 - 7 Floral tube cylindric to turbinate, about 2× as long as wide. *Lythrum*
 - 7 Floral tube campanulate to globose, about 1× long as wide.
 - 8 Flowers or fruits (1-) 3-10 in the leaf axils (at least some axils with 2 or more flowers or fruits on a given plant). *Ammannia*
 - 8 Flowers or fruits solitary in the leaf axils (never > 1 per axil).
 - 9 Capsule indehiscent; petals 0; sepals 4, broadly triangular, lacking intersepaly appendages; seeds spatulate or oblanceolate, about 1 mm long, minutely granular on one face and smooth on the other *Didiplis*

Key to Map
Symbology:

* : waif
EN : endemic
H : historic

N : no X : extirpated
P : planted
? : questionable

- 9 Capsule dehiscing septicidally; petals 4; sepals 4 (-6), triangular, with intersepaly appendages of size about equal to the calyx lobes; seeds hemispheric, about 0.3 mm long, the surface very finely reticulate..... *Rotala*

Ammannia Linnaeus 1753 (TOOTHCUP)

A genus of about 80 species, herbs, cosmopolitan. The circumscription of the genus here includes *Nesaea* and *Hionanthera*, following Graham, Diazgranados, & Barber (2011) and Graham (2007). References: Graham in Kubitzki, Bayer, & Stevens (2007); Graham (1975); Graham (1985); Graham (2021b) in FNA10 (2021).

- 2 Style included (when in fruit), thick, 0.5-1.0 mm long (much shorter than the ovary); calyx lobes obtuse, often with the apices minutely mucronate; petals 0, 1, or 4, pale pink to white, to 1 mm long and 1 mm wide..... *Ammannia latifolia*
- 2 Style exerted (when in fruit), filiform, 1.5-3.0 mm long (equal to or longer than the ovary); calyx lobes triangular, with acute apices; petals 4 (-5), deep rose-purple or pale lavender, ca. 2-3 mm long and 2-3 mm wide.
- 4 Peduncles slender; cymes (3-) 7-15-flowered; capsules (1.0-) 1.5-2.5 (-3.5) mm in diameter..... *Ammannia auriculata*
- 4 Peduncles stout; cymes (1-) 3-7 (-15)-flowered; capsules 3.5-5) mm in diameter..... *Ammannia coccinea*

* *Ammannia auriculata* Willdenow. EARED REDSTEM. **Hab:** Swamps, ditches, other wetlands. **Dist:** MS, LA, SD, NM, and AZ, south to TX, Mexico, Central America, and n. South America. Perhaps only native in the Old World. **Phen:** May-Jul (-Oct). **Syn:** = FNA10, GrPl, GW2, Il, K3, K4, Meso4.1, NcTx, Tx, Graham (1975), Graham (1985). **NatureServe G5** (Secure).

Ammannia coccinea Rottbøll. SCARLET TOOTHCUP. **Hab:** Marshes, ditches, exposed muddy river shores and banks, wet pine flatwoods, other wet places. **Dist:** NJ, OH, IN, IL, IA, and SD south to s. FL and TX; disjunct in CA; south through Mexico and Central America to n. South America; West Indies. **Phen:** Jul-Oct. **Syn:** = Ar, Bah, C, Fl4, FNA10, GrPl, Il, K1, K3, K4, Meso4.1, NcTx, NY, Pa, RAB, Tn, Tx, Va, W, WH3, Graham (1985); < *Ammannia coccinea* Rottbøll – F, GW2, S, Graham (1975); > *Ammannia coccinea* ssp. *purpurea* (Lamarck) Koehne – G.

Ammannia latifolia Linnaeus. PINK REDSTEM. **Hab:** Brackish to fresh tidal marshes, wet places, ditches. **Dist:** NJ south to s. FL and west to TX (mostly on the Coastal Plain), and also in the West Indies, Yucatan, Central America, and South America. **Phen:** Jul-Sep. **Tax:** All plants in North America north of Florida have flowers with petals; most plants from FL south through the West Indies into Central and South America have flowers without petals. Graham (1985) considered these forms; additional study is warranted. The name *A. koehnei* Britton is available for the petaliferous North American plant should its recognition prove warranted. **Syn:** = C, Fl4, FNA10, GW2, K1, K3, K4, Meso4.1, NcTx, Va, W, WH3, Graham (1975), Graham (1985); > *Ammannia koehnei* Britton – S; > *Ammannia latifolia* Linnaeus – S; > *Ammannia teres* Rafinesque – G, RAB, Tx; > *Ammannia teres* var. *exauriculata* (Fernald) Fernald – F; > *Ammannia teres* var. *teres* – F. **NatureServe G5** (Secure).

Cuphea P. Browne 1756 (WAXWEED)

A genus of about 260 species, herbs, of America, primarily tropical and subtropical. References: Graham in Kubitzki, Bayer, & Stevens (2007); Graham (1975); Graham (2021c) in FNA10 (2021).

- 2 Floral tube 4-6 mm long, glabrous inside; stamens much shorter than the floral tube; petioles 0-2 mm long..... *Cuphea carthagenensis*
- 2 Floral tube 5.5-12 mm long, villous or finely puberulent inside; stamens equal to or exceeding the floral tube; petioles 0-15 (-20) mm long..... *Cuphea viscosissima*

* *Cuphea carthagenensis* (Jacquin) J.F. Macbride. COLOMBIAN WAXWEED. **Hab:** Marshes, ditches, floodplain forests, wet hammocks, other wet places. **Dist:** Native of South America; the northern boundary of the native distribution is unclear. **Phen:** Jun-Sep. **Syn:** = Ar, Fl4, FNA10, GW2, K1, K3, K4, Meso4.1, WH3, Graham (1975); = *Cuphea carthagensis* – RAB, Tx, misspelling; = *Parsonia balsamona* (Chamisso & Schlechtendal) Standley – S. **NatureServe G5?** (Secure).

Cuphea viscosissima Jacquin. CLAMMY CUPHEA, BLUE WAXWEED. **Hab:** Dry or wet places, especially over mafic or calcareous rocks. **Dist:** NH west to IA and KS, south to c. GA, LA, and e. OK. **Phen:** Jul-Oct. **Syn:** = Ar, C, FNA10, GrPl, GW2, K1, K3, K4, NE, NY, Pa, RAB, Tn, Tx, Va, W, WV, Graham (1975); = *Cuphea petiolata* (Linnaeus) Koehne – F, G; = *Parsonia petiolata* (Linnaeus) Rusby – S.

Decodon J.F. Gmelin 1791 (WATER-OLEANDER, WATER-WILLOW)

A monotypic genus, a weak shrub, endemic to e. North America (more widespread in the fossil record). References: Graham in Kubitzki, Bayer, & Stevens (2007); Graham (1975); Graham (2021d) in FNA10 (2021).

Decodon verticillatus (Linnaeus) Elliott. WATER-OLEANDER, WATER-WILLOW, SWAMP LOOSESTRIFE, PEATWEED. **Hab:** Natural lakes, limesink ponds, peatlands, peaty swamps. **Dist:** NS, ON, and MN south to c. peninsular FL and e. TX. **Phen:** Jul-Sep. **ID Notes:** The lower stems are spongy in texture. **Syn:** = Ar, Fl4, FNA10, GW2, K1, K3, K4, Mi, NE, NY, Pa, RAB, S, Tn, Tx, Va, W, WH3, WV, Graham (1975); > *Decodon verticillatus* var. *laevigatus* Torrey & Gray – C, F, G, Il; > *Decodon verticillatus* var. *verticillatus* – C, F, G, Il.

*Didiplis* Rafinesque 1833 (WATER-PURSLANE)

A monotypic genus, an herb, endemic to e. North America. *Didiplis diandra* is more closely related to *Rotala* than to *Peplis* (Morris 2007). References: Graham in Kubitzki, Bayer, & Stevens (2007); Graham (1975); Graham (2021e) in FNA10 (2021).

Identification Notes: See Horn (2011) for discussion of the submersed and emerged leaf forms of *Didiplis*, and how to distinguish them from superficially similar species.

Didiplis diandra (Nuttall ex A.P. de Candolle) Alph. Wood. WATER-PURSLANE. **Hab:** Stagnant water of pools, streams, and old beaverponds. **Dist:** Se. VA, IN, and WI south to NC, SC, MS, LA, and e. TX; disjunct in c. peninsular FL (Wunderlin, Hansen, & Franck 2017). Recently found in se. PA, where considered likely to be an accidental introduction (S. Grund, pers.comm., 2019). **Phen:** Apr-Oct. **Syn:** = Ar, C, Fl4, FNA10, G, GrPl, GW2, Il, K1, K3, K4, S, Tn, Va, WH3, Graham (1975); = *Peplis diandra* Nuttall ex A.P. de Candolle – F, RAB, Tx. NatureServe G5 (Secure).

*Lagerstroemia* Linnaeus 1759 (CRAPE-MYRTLE)

A genus of 53-56 species, trees and shrubs, of tropical se. Asia and Australia. References: Graham in Kubitzki, Bayer, & Stevens (2007); Graham (1975); Graham (2021f) in FNA10 (2021).

* ***Lagerstroemia indica*** Linnaeus. CRAPE-MYRTLE. **Hab:** Commonly cultivated, persistent around old plantings, spreading to roadsides, old fields, suburban woodlands, and natural areas. **Dist:** Native of Asia. Reported as escaping in DC (Steury 2011). **Phen:** Jun-Sep. **Syn:** = Ar, C, Fl4, FNA10, Il, K1, K3, K4, Meso4.1, NcTx, S, Tx, WH3, Graham (1975). NatureServe GNR (Not Yet Ranked).

Lythrum Linnaeus 1753 (LOOSESTRIFE)

A genus of about 36 species, annual and perennial herbs, cosmopolitan. References: Graham in Kubitzki, Bayer, & Stevens (2007); Graham (1975); Graham (2021g) in FNA10 (2021); Haines (2010).

- 1 Flowers numerous in terminal spike-like thyrses; stamens usually 12; leaves opposite or whorled on the lower stem. *Lythrum salicaria*
- 1 Flowers solitary or paired in axils; stamens usually (4-) 6; leaves either opposite throughout, or opposite to subopposite below and alternate above.
 - 3 Leaves opposite throughout, mostly shorter than to about as long as the internodes, 1-6 mm wide *Lythrum lineare*
 - 3 Leaves opposite or sub-opposite on the lower stem, alternate above
 - 8 Leaves ovate to lanceolate, widest at a point 1/6 to 1/2 of the way from the base to the apex, the base rounded to subcordate; stems mostly slender, to 8 dm tall; bracteoles mostly at the base of the pedicel. *Lythrum alatum*
 - 8 Leaves lanceolate to linear-lanceolate, widest at a point 1/3 to 2/3 of the way from the base to the apex, the base cuneate, often narrowly so; stems stout, to 13 dm tall; bracteoles mostly on the upper pedicel, immediately below the floral tube *Lythrum lanceolatum*

Lythrum alatum Pursh. NORTHERN WINGED LOOSESTRIFE. **Hab:** Calcareous meadows, marl fens, and disturbed wet calcareous places. **Dist:** ME, NY, MI, and ND south to sc. VA, e. TN, nw. GA, n. AL, n. AR, ne. OK, and CO; allegedly disjunct in Citrus County (Graham 1975; Wunderlin, Hansen, & Franck 2017). **Phen:** Jun-Sep. **Tax:** See discussion in Graham (1975) about unresolved issues of typification and southern records of *L. alatum* (as here treated). **Syn:** = F, Il, Mi, Pa, S, Va, W, WV; = *Lythrum alatum* ssp. *alatum* – NE, Haines (2010); = *Lythrum alatum* var. *alatum* – Ar, C, Fl4, FNA10, G, GrPl, GW2, K1, K3, K4, NY, Tn, WH3, Graham (1975); > *Lythrum dacotanum* Nieuwland – Tx. NatureServe G5T5 (Secure).

Lythrum lanceolatum Elliott. SOUTHERN WINGED LOOSESTRIFE. **Hab:** Pine flatwoods, blackland prairies, coastal prairies, marshes, swamps, other moist to wet places, ditches. **Dist:** Se. VA, se. NC, SC, GA, AL, MS, n. AR, s. MO, and OK south to s. FL, s. TX, VER, CHP; West Indies. **Phen:** May-Sep. **Tax:** Although Graham (1975) argues that *L. lanceolatum* should be reduced to a variety of *L. alatum*, her evidence can also be interpreted (and is here) as warranting specific status. **Syn:** = F, RAB, S, Tx, Va; = *Lythrum alatum* ssp. *lanceolatum* (Elliott) A. Haines – Haines (2010); = *Lythrum alatum* Pursh var. *lanceolatum* (Elliott) Torrey & A. Gray ex Rothrock – Ar, C, Fl4, FNA10, G, GrPl, GW2, K1, K3, K4, Meso4.1, NcTx, Tn, WH3, Graham (1975). NatureServe G5T5 (Secure).

215. LYTHRACEAE

Lythrum lineare Linnaeus. NARROWLEAF LOOSESTRIFE, WAND LOOSESTRIFE, SALTMARSH LOOSESTRIFE. **Hab:** Nearly fresh, brackish, and saline marshes. **Dist:** NJ south to s. FL and west to TX. **Phen:** Jul-Oct. **Syn:** = C, F, FI4, FNA10, G, GW2, K1, K3, K4, NE, NY, RAB, S, Va, WH3, Graham (1975). NatureServe G5 (Secure).

* **Lythrum salicaria** Linnaeus. PURPLE LOOSESTRIFE. **Hab:** Swamps, marshes, other wet places. **Dist:** Native of Eurasia. An extremely noxious weed in the ne. United States, aggressively colonizing and coming to dominate a wide variety of freshwater wetlands, sometimes to the near exclusion of native vegetation. **Phen:** Jun-Sep. **Syn:** = Ar, C, FNA10, G, GrPl, IL, K1, K3, K4, Mi, NcTx, NE, NY, Pa, RAB, Tn, Va, W, WV, Graham (1975); > *Lythrum salicaria* var. *gracilior* Turczaninow – F; > *Lythrum salicaria* var. *salicaria* – F; > *Lythrum salicaria* var. *tomentosum* (P. Miller) A.P. de Candolle – F. NatureServe G5 (Secure).

Punica Linnaeus 1753 (POMEGRANATE)

A genus of 2 species, trees, of Mediterranean Europe and w. Asia. Sometimes treated in the monogeneric family Punicaceae; here included in Lythraceae, following Angiosperm Phylogeny Group (2003, 2009); *Punica* is deeply embedded phylogenetically in Lythraceae (Graham, Diazgranados, & Barber 2011). References: Graham in Kubitzki, Bayer, & Stevens (2007); Graham (2021h) in FNA10 (2021); Zohary & Hopf (1994).

* **Punica granatum** Linnaeus. POMEGRANATE. **Hab:** Suburban areas, cultivated and at least persistent. **Dist:** Native of Mediterranean Europe. Reported as cultivated on Hatteras Island (Dare County, NC) (Brown 1959). **Comm:** This species has been cultivated in the Old World for at least five millennia. **Syn:** = Bah, FNA10, K1, K3, K4, Meso4.1, S. NatureServe GNR (Not Yet Ranked).

Rotala Linnaeus 1771 (TOOTH CUP)

A genus of about 50 species, wetland herbs, of temperate to tropical areas, closely related to *Didiplis*. References: Graham in Kubitzki, Bayer, & Stevens (2007); Graham (1975); Graham (2021i) in FNA10 (2021).

Rotala ramosior (Linnaeus) Koehne. TOOTH CUP. **Hab:** Marshes, ditches, exposed drawdown muds and silts. **Dist:** VT, NY, ON, MI, WI, MN, SD, MT, and BC, south to s. FL, TX, AZ, CA, and south through Mexico to Central America and South America; West Indies. **Phen:** Jun-Oct. **Syn:** = Ar, C, FI4, GrPl, GW2, IL, K1, K3, K4, Meso4.1, Mi, NcTx, NE, NY, Pa, RAB, S, Tn, Va, W, WH3, Graham (1975); > *Rotala ramosior* var. *interior* Fernald & Griscom – F, G, Tx; > *Rotala ramosior* var. *ramosior* – F, G, Tx. NatureServe G5 (Secure).

216. ONAGRACEAE A.L. de Jussieu 1789 (EVENING-PRIMROSE FAMILY) [in MYRTALES]

A family of about 22 genera and 664 species, herbs, shrubs, and rarely trees, cosmopolitan (especially of temperate and subtropical America). References: Crisci et al (1990); Munz (1965); Wagner & Hoch (2021) in FNA10 (2021); Wagner, Hoch, & Raven (2007).

- 1 Flowers 2-merous, the petals white; fruits with uncinat trichomes; leaves opposite, decussate, borne spreading at right angles to the stem, mostly ovate, on petioles mostly 0.5-8 cm long; [subfamily *Onagroideae*; tribe *Circaeae*]..... **Circaea**
- 1 Flowers (3-) 4 (-7)-merous, the petals yellow, pink, or white (or absent); fruits lacking uncinat trichomes; leaves alternate (rarely opposite), not decussate, usually ascending or appressed (rarely spreading at right angles to the stem), mostly lanceolate, mostly sessile or subsessile.
- 2 Fruit indehiscent; seeds 1-6 per capsule, 1.5-3.5 mm long; [subfamily *Onagroideae*; tribe *Onagreae*]..... **Oenothera**
- 2 Fruit dehiscent; seeds (10-) 50-many per capsule, 0.3-2 mm long.
- 5 Calyx tube not extended beyond the summit of the ovary; sepals persistent on the capsule (rarely deciduous); stamens 4, 8, or 10-14; petals yellow or absent; [primarily of wetlands]; [subfamily *Ludwigioideae*]..... **Ludwigia**
- 5 Calyx tube extended beyond the summit of the ovary; sepals deciduous; stamens 8; petals yellow (rarely pink or white); [primarily of uplands]; [subfamily *Onagroideae*; tribe *Onagreae*]..... **Oenothera**

Circaea Linnaeus 1753 (ENCHANTER'S-NIGHTSHADE)

A genus of 8 species (14 taxa), herbs, of temperate and boreal regions of the Northern Hemisphere. References: Averett & Boufford (1985); Boufford (1983 [1982]); Boufford (2005); Boufford (2021b) in FNA10 (2021); Munz (1965); Skvortsov (1979); Wagner, Hoch, & Raven (2007); Xie et al (2009).

Identification Notes: Sometimes confused in vegetative condition with *Phryma*; the leaf teeth are quite different.

Circaea canadensis (Linnaeus) Hill. CANADA ENCHANTER'S-NIGHTSHADE. **Hab:** Mesic, nutrient-rich forests.

Dist: NS and NB west to se. MB and ND, south to e. NC, c. SC, s. GA, LA, OK, and NE. **Phen:** Jun-Aug. **Tax:** The systematics of this taxon has been controversial, and treatments have changed over the years. Most recently, Xie et al. (2009) support species status for *C. canadensis*, a conclusion followed here. Previously, Boufford (2005) treated the complex as two species, *C. canadensis* and *C. lutetiana*, the former with two subspecies, ssp. *canadensis* of eastern North America and ssp. *quadrisulcata* of Asia. Before that, Boufford (1983) treated the complex as a circumboreal complex of three subspecies of *C. lutetiana*, including the North American ssp. *canadensis* (Linnaeus) Ascherson & Magnus, the primarily Asian ssp. *quadrisulcata* (Maximowicz) Ascherson & Magnus, and the European ssp. *lutetiana*. Other authors have preferred varietal status for the three entities, full species status, no formal status at all (*C. lutetiana* as a polymorphic complex), or associating the more similar pair (North American and Asian) as two subspecies separate from the European at specific rank. Boufford (1983) and Averett & Boufford (1985) show convincingly that separate taxonomic status for the three entities is warranted, and that ssp. *canadensis* is more closely related to ssp. *quadrisulcata*. The question of the appropriate taxonomic level remains. Boufford (1983) states that "although subspp. *canadensis* and *quadrisulcata* are placed in *C. lutetiana*, this might not ultimately prove to be the best treatment". Later, flavonoid data showed strong differences between the three taxa, stronger than the differences between many of the other species in the genus (Averett & Boufford 1985). Morphologic differences between the three taxa are fairly subtle but appear to be consistent. The complicated synonymy is perhaps an example of a too-zealous attempt to have nomenclature reflect subtleties of relationship and evolutionary divergence, our understanding of which is unclear and changeable. **Syn:** = K3, K4, NY, Xie et al (2009); = *Circaea canadensis* ssp. *canadensis* – Ar, Mi, NE, Pa, Va, Boufford (2005), Wagner, Hoch, & Raven (2007); = *Circaea latifolia* Hill – S; = *Circaea lutetiana* Linnaeus ssp. *canadensis* (Linnaeus) Ascherson & Magnus – FNA10, GrPl, Il, K1, RAB, Tn, W, Boufford (1983 [1982]), Munz (1965); = *Circaea lutetiana* var. *canadensis* Linnaeus – C; = *Circaea quadrisulcata* ssp. *canadensis* (Linnaeus) Löve & Löve; = *Circaea quadrisulcata* (Maximowicz) Franchet & Savatier var. *canadensis* (Linnaeus) Hara – G, Tx, WV; > *Circaea canadensis* var. *canadensis* – F; > *Circaea canadensis* var. *virginiana* Fernald – F. NatureServe G5T5 (Secure).

Ludwigia Linnaeus 1753 (SEEDBOX, WATER-PRIMROSE, WATER-PURSLANE)

A genus of about 82 species, herbs and shrubs, cosmopolitan. References: Duke (1955); Eyde (1977); Eyde (1978); Eyde (1981); Harper (1904a); Hoch (2021a) in FNA10 (2021); Munz (1938, 1944); Munz (1965); Nesom & Kartesz (2000); Peng & Tobe (1987); Peng (1984); Peng (1986); Peng (1988); Peng (1989); Raven & Tai (1979); Raven (1963); Wagner, Hoch, & Raven (2007); Ward (2012a); Zardini, Gu, & Raven (1991).

Identification Notes: Many natural hybrids are known. Hybrids are generally recognizable from their intermediate morphology and usual association with their two parents. However some hybrids resemble one parent much more than the other, and some hybrids are found in populations independent (and even disjunct) from one or both parents. Allopolyploidy may have had a major role in the evolution of this genus, especially section *Microcarpum*, which has a majority of polyploid species.

- 1 Leaves opposite; plants creeping (rooting at the nodes); [section *Isnardia*]..... **Key A**
- 1 Leaves alternate; plants erect or ascending (not rooting at the nodes), or creeping (rooting at the nodes).
- 2 Stamens 8-14; sepals 4-7; petals 4-7; [of various habits, including annual and perennial herbs and shrubs, variously erect, ascending, creeping, or forming floating mats]..... **Key B**
- 2 Stamens 4; sepals 4; petals 0-4; [perennial herbs, with erect ascending flowering stems]..... **Key C**

Key A - *Ludwigia* with opposite leaves (section *Isnardia*)

- 4 Petals 0; floral tubes and capsules with 4 longitudinal dark green bands; bractlets (borne at or near the base of the floral tube) absent or 0-1 mm long..... *Ludwigia palustris*
- 4 Petals 4; floral tubes and capsules lacking green banding; bractlets (borne at or near the base of the floral tube) present, 2-4 mm long..... *Ludwigia repens*

Key B - *Ludwigia* with alternate leaves, 8-14 stamens, 4-7 sepals, and 4-7 petals (sections *Pterocaulon*, *Macrocarpon*, *Seminuda*, and *Jussiaea*)

- 1 Sepals 4 (or rarely 5); stamens 8 (or rarely 10); seeds in 2-several vertical series in each locule, free of endocarp tissue; annual or perennial herbs or a woody shrub below.
- 2 Capsule obconic, gradually broadening from base to apex, weakly angled; young stems and both surfaces of leaves shaggy-pubescent with tawny hairs; [section *Myrtocarpus*]..... *Ludwigia peruviana*
- 2 Capsule narrowly cylindrical, nearly isodiametric, or, if obconic, sharply 4-angled and usually winged on the angles; young stems and both surfaces of leaves glabrous, sparsely short-pubescent, or sparsely villous.
- 3 Internodes of the stem not winged, weakly angled, usually villous or strigillose at least proximally (sometimes inconspicuous); capsules nearly terete, narrowly cylindrical, 1.7-5.0 cm long, often curved.
- 4 Petals (1.5-) 3-5 cm long; sepals ca. 10 mm wide at base..... *Ludwigia bonariensis*
- 4 Petals 1-2 cm long; sepals 3-5 mm wide at base..... *Ludwigia octovalvis*
- 3 Internodes of the stem sharply 4-angled or 4-winged, glabrous; capsule sharply 4-angled, obconic, often winged on the angles, 1-2 cm long (rarely longer in *L. longifolia*); [section *Pterocaulon*].
- 6 Leaves sessile; petals 1-2 cm long; sepals 7-12 mm long; stems strongly 4-winged (from decurrent leaf bases)..... *Ludwigia decurrens*
- 6 Leaves petiolate, petioles 0.2-2.2 cm; petals 0.4-0.5 cm long; sepals 3-6 mm long; stems sharply 4-angled but usually not winged..... *Ludwigia erecta*
- 1 Sepals 5 (-7); stamens 10 (-14); seeds in 1 vertical series in each locule, loosely embraced or embedded in endocarp tissue.
- 7 Stems erect; floral tube much longer than the pedicel; seeds loosely embraced by a corky, horseshoe-shaped segment of endocarp; [section *Seminudae*]..... *Ludwigia leptocarpa*
- 7 Stems (at least the lower portions) decumbent, creeping, or floating in mats (the flowering stems more-or-less erect in *L. grandiflora* and *L. hexapetala*); floral tube much shorter than the pedicel; seeds embedded in the woody endocarp; [section *Jussiaea*].

N : no X : extirpated
P : planted
? : questionable

- 8 Flowering stems more-or-less erect; emergent leaves chartaceous, light to medium green, dull, mostly lanceolate or oblanceolate, petioles 0.1-2 (-2.5) cm; stems, sepals, ovaries, and emergent leaves (at least along veins) villous, hairs often viscid; bracteoles obovate, 1-1.8 mm long.
- 9 Sepals (6-) 8-11 (-14) mm long; emergent leaves 5-8.5 cm long, 7-11 mm wide, mostly linear-lanceolate, usually widest below the middle; petals (1.2-) 1.6-2.0 (-2.6) cm long; style 4.7-6.7 (-8.2) mm long; stems densely villous *Ludwigia grandiflora*
- 9 Sepals (8-) 12-19 mm long; emergent leaves 5.5-13 cm long, 9-18 mm wide, mostly oblanceolate, usually widest above the middle; petals (1.5-) 2.0-2.9 (-3) cm long; style (5.8-) 6-10 mm long; stems sparsely to densely villous (rarely glabrous) *Ludwigia hexapetala*
- 8 Flowering stems decumbent, floating, or creeping; stem and leaves glabrous or glabrescent; petals mostly 1-1.5 cm long; anthers 1-1.7 mm long.
- 10 Stems glabrous; emergent leaves with petioles 0.6-6 cm, blades (2-) 4-10 cm, eglandular-mucronate, alternate; stamens subequal, anthers all 1.2-1.4 mm, stigmas well-exserted at anthesis; pedicels 3.5-9 cm, ovaries 14-20 mm; seeds 16-18 per locule; [widespread] *Ludwigia peploides* var. *glabrescens*
- 10 Stems glabrous or sparsely to densely villous; emergent leaves with petioles 0.3-2.8 cm, blades (0.4-) 0.8-6 (-9.5) cm, often glandular-mucronate, alternate or fascicled; stamens unequal, filaments of 2 different lengths and anthers of 2 different sizes, 0.5-2.2 mm, surrounding the stigmas at anthesis; pedicels 0.7-3.8 cm, ovaries 6-14 mm; seeds 7-15 per locule; [s. MS westward and southward] *Ludwigia peploides* var. *peploides*

Key C - *Ludwigia* with alternate leaves, 4 stamens, 4 sepals, and 0-4 petals (sections *Ludwigia* and *Microcarpum*)

- 1 Pedicels 2-15 mm long; capsules subglobose to spheric or cubic, about as long as wide, box-like, 4-angled, dehiscence by an apical pore (later sometimes also irregularly loculicidal); petals present, 4-15 mm long, persistent or caducous; roots fascicled, fusiform, tuberous; plants lacking basal, stoloniform shoots; [section *Ludwigia*].
- 2 Leaves cuneate at base; pedicels 2-5 mm long; nectary discs at base of style flattish, inconspicuous; [widespread in our area, in a wide variety of habitats] *Ludwigia alternifolia*
- 2 Leaves rounded or truncate at base; pedicels 4-15 mm long; nectary discs at base of style domed, prominent; [nearly restricted to the Coastal Plain, primarily of pinelands].
- 3 Styles 6-10 mm long; plants glabrous, glabrescent, or pubescent with very short hairs; sepals strongly reflexed in fruit *Ludwigia virgata*
- 3 Styles 1.5-3 mm long; plants glabrescent or pubescent with short to long, spreading to shaggy hairs; sepals strongly reflexed, spreading, or ascending in fruit.
- 4 Sepals narrowly deltoid, broadest at or near the base, 3-4× as long as wide, ascending or spreading in fruit; plants glabrescent to hirtellous with long spreading hairs *Ludwigia hirtella*
- 4 Sepals ovate, broadest near the middle, ca. 2× as long as wide, strongly reflexed in fruit; plants pubescent with relatively short, appressed to spreading hairs *Ludwigia maritima*
- 1 Pedicels 0-1 (-5) mm long; capsules subglobose, obconic, or obpyramidal, about as long as wide or longer than wide, circular to quadrangular in cross-section, dehiscence irregularly loculicidal; petals absent or present, if present (*L. linearis*, *L. linifolia*) then 0-6 mm long and caducous; roots fibrous or rhizomatous; plants frequently with basal, stoloniform shoots; [section *Isnardia*].
- 5 Capsules cylindrical, narrowly obconical, or narrowly obpyramidal, at least 2.5-5× as long as broad; petals present or absent.
- 6 Primary leaves of the flowering stems narrowly elliptical, 6-12 (-20) mm wide; petals absent. *Ludwigia glandulosa*
- 6 Primary leaves of the flowering stems linear, 1.5-5 mm wide; petals present.
- 8 Sepals (3.3-) 4-7 mm long; lateral and marginal veins obscure on lower leaf surface; seeds reddish brown; capsules cylindric, parallel-sided through most of their length, not grooved; anthers 0.5-1.1 mm long *Ludwigia linifolia*
- 8 Sepals 2.3-5 (-5.6) mm long; lateral and marginal veins distinct on lower leaf surface; seeds yellowish; capsules elongate obpyramidal, tapering through most or all of their length, with a shallow longitudinal groove on each face; anthers 1.1-2 mm long.
- 9 Sepals 2.3-4 mm long, acuminate, the surfaces densely and minutely papillose, the papillae 0.02-0.05 mm long and appressed; capsules 5-8.5 (-10) mm long, 2-4 (-5) mm in diameter; pedicels 0-0.4 mm long; seed surface cells elongate parallel to the seed length (as seen at 20× or more); anthers 1.1-1.6 mm long *Ludwigia linearis* var. *linearis*
- 9 Sepals 3-5 (-5.6) mm long, elongate-acuminate to cuspidate, the surfaces densely minutely strigillose, the hairs 0.06-0.10 mm long and appressed to ascending; capsules 5-10 (-12) mm long, 3-5.5 mm in diameter; pedicels 0-3.5 (-5) mm long; seed surface cells elongate transverse to the seed length, or irregular (as seen at 20× or more); anthers (1.1-) 1.3-2 mm long *Ludwigia linearis* var. *puberula*
- 5 Capsules subglobose, obovoid, or broadly obpyramidal, 1-1.5 × as long as broad; petals absent.
- 11 Plants densely pubescent throughout.
- 12 Sepal apex elongate-acuminate or subcuspidate, reflexed; pubescence of stems and leaves hirtellous (the hairs spreading); seed surface cells suborbicular (as seen at 20× or more); anthers 0.6-0.9 (-1.3 mm long; style 1-2 mm long *Ludwigia pilosa*
- 12 Sepal apex acuminate, ascending; pubescence of stems and leaves strigillose (the hairs appressed) or hirtellous (the hairs spreading); seed surface cells elongate; anthers 0.3-0.8 mm long; style 0.25-1 (-1.25) mm long. *Ludwigia sphaerocarpa*
- 11 Plants glabrous or subglabrous throughout.
- 14 Primary leaves of the flowering stems 4-17 mm long, 1.5-10 mm wide, mostly obovate-spatulate and 1.5-3× as long as wide; capsules 1-1.5 (-2) mm long, containing 10-20 dark reddish-brown seeds; plants typically 1-4 dm tall; nectary disc nearly flat on ovary apex *Ludwigia microcarpa*
- 14 Primary leaves of the flowering stems (18-) 30-110 mm long, 2-10 (-20) mm wide, mostly elliptic, lanceolate, oblanceolate, or linear and 4-20× as long as wide; capsules 1.8-2.7 mm long, containing 40-500 light brown, yellowish, or tan seeds; plants typically 3-10 dm tall; nectary disc distinctly raised on ovary apex.
- 15 Capsules obpyramidal, the corners narrowly winged with wings 0.3-0.9 mm wide. *Ludwigia alata*
- 15 Capsules oblong-ovoid or subglobose, the corners not winged.
- 17 Cauline leaves lanceolate, oblong-elliptic to narrowly so, 30-110 mm long, usually about 10 × as long as wide; capsules dehiscing by irregular rupture of the outer walls; stolons present; [collectively widespread] *Ludwigia sphaerocarpa*
- 17 Cauline leaves obovate-spatulate to oblanceolate, 16-30 mm long, usually < 5× as long as wide; capsules dehiscing by 4 longitudinally lenticular slits on the wall opposite the locules; stolons not common; [FL and MS] *Ludwigia simpsonii*

***Ludwigia alata* Elliott.** WINGED SEEDBOX. **Hab:** Interdune ponds, freshwater to slightly brackish (oligohaline) marshes, cypress swamps. **Dist:** Se. VA south to s. FL, west to se. LA; disjunct in Jamaica, where apparently introduced. **Phen:** Jun-Oct. **Tax:** This species is a hexaploid (n = 24).

216. ONAGRACEAE

One third of the genome of *L. alata* is apparently derived from *L. microcarpa* or its ancestor (Peng 1988). **Syn:** = C, F, FI4, FNA10, G, K1, K3, K4, RAB, S, Va, WH3, WI, Peng (1989), Wagner, Hoch, & Raven (2007); < *Ludwigia alata* Elliott – GW2.

Ludwigia alternifolia Linnaeus. ALTERNATE-LEAVED SEEDBOX. **Hab:** Freshwater tidal marshes, ditches, other marshes, open wet places, disturbed wet places. **Dist:** MA west to s. ON, s. MI, IA, and KS, south to n. FL and e. TX. **Phen:** May-Oct. **Syn:** = Ar, FI4, FNA10, G, GrPl, GW2, K1, K3, K4, Mi, NcTx, NE, NY, Pa, RAB, S, Tn, Tx, Va, W, WH3, Wagner, Hoch, & Raven (2007); > *Ludwigia alternifolia* var. *alternifolia* – C, F, Il, WV; > *Ludwigia alternifolia* var. *linearifolia* Britton – WV; > *Ludwigia alternifolia* var. *pubescens* E.J. Palmer & Steyermark – C, F, Il.

* ***Ludwigia bonariensis*** (M. Micheli) Hara. **Hab:** Freshwater tidal marshes and adjacent disturbed areas. **Dist:** Apparently native of tropical America. Locally abundant in disturbed edges of freshwater tidal marshes near Wilmington, NC, perhaps introduced on ship's ballast. **Phen:** Jun-Sep. **Comm:** Material from Wilmington apparently has larger flowers than material of *L. bonariensis* elsewhere; its source and appropriate taxonomic treatment remain uncertain and need further study. First reported for SC by Leonard (1971b). **Syn:** = FI4, FNA10, GW2, K1, K3, K4, RAB, WH3, Wagner, Hoch, & Raven (2007); = *Jussiaea neglecta* Small – S. **NatureServe GNR** (Not Yet Ranked).

Ludwigia decurrens Walter. WINGSTEM WATER-PRIMROSE. **Hab:** Swamp forests, marshes, ditches. **Dist:** MD, w. VA, WV, s. IN, s. IL, and MO, south to s. FL and TX; West Indies; Mexico, Central America and South America; Africa and Asia. **Phen:** Jun-Oct. **Syn:** = Ar, C, FNA10, GW2, Il, K1, K3, K4, Meso4.1, NcTx, Pa, RAB, Tn, Tx, Va, W, WH3, WI, Wagner, Hoch, & Raven (2007); = *Jussiaea decurrens* (Walter) A.P. de Candolle – F, G, S, WV. **NatureServe G5** (Secure).

Ludwigia erecta (Linnaeus) H. Hara. YERBA DE JICOTEA. **Hab:** Marshes, swamps, pineland ponds. **Dist:** FL; West Indies; tropical America; tropical Africa and Madagascar. Also in Coastal Plain of MS and e. TX, probably by introduction. **Syn:** = Bah, FI4, FNA10, GW2, K1, K3, K4, Meso4.1, WH3, WI; = *Jussiaea erecta* Linnaeus – S. **NatureServe G5** (Secure).

Neotropics

Ludwigia glandulosa Walter. SMALL-FLOWERED SEEDBOX. **Hab:** Low forests, marshes, ditches. **Dist:** E. MD south to n. FL, west to e. TX, north in the interior to c. TN, w. KY, s. IN, s. IL, se. MO, c. AR, and se. OK, primarily on the Southeastern Coastal Plain. **Phen:** Jun-Sep. **Tax:** A related species, treated by Peng as *L. glandulosa* ssp. *brachycarpa* (Torrey & A. Gray) Peng, ranges from sw. LA north and west to s. OK and c. TX. This species is tetraploid ($n = 16$). **Syn:** = Va; = *Ludwigia glandulosa* ssp. *glandulosa* – FNA10, K1, K3, Peng (1989), Wagner, Hoch, & Raven (2007); < *Ludwigia glandulosa* Walter – C, F, G, GrPl, GW2, Il, NcTx, RAB, S, Tn, Tx, WH3. **NatureServe G5T5** (Secure).

* ***Ludwigia grandiflora*** (Michaux) Zardini, H.Y. Gu, & Raven. SHOWY WATER-PRIMROSE. **Hab:** Ponds, lakes, sluggish waters of ditches or streams. **Dist:** Se. SC south to FL, west to TX; disjunct in MO, Guatemala, and in s. South America. **Phen:** May-Sep. **Tax:** This taxon is hexaploid ($n = 24$). See Zardini, Gu, and Raven (1991) and Nesom & Kartesz (2000) for additional information. **Syn:** = FNA10, Meso4.1, WI, Wagner, Hoch, & Raven (2007), Zardini, Gu, & Raven (1991); = *Jussiaea michauxiana* Fernald – F; = *Ludwigia grandiflora* (Michaux) Greuter & Burdet ssp. *grandiflora* – K3, K4, Nesom & Kartesz (2000); = *Ludwigia grandiflora* var. *grandiflora* – Ward (2012a); < *Ludwigia grandiflora* (Michaux) Zardini, H.Y. Gu, & Raven – FI4, WH3; < *Ludwigia uruguayensis* (Cambessedes) Hara – C, GW2, K1, RAB, Tx. **NatureServe GUTNR** (Not Yet Ranked).

* ***Ludwigia hexapetala*** (Hooker & Arnott) Zardini, H.Y. Gu, & Raven. COMMON WATER-PRIMROSE. **Hab:** Ponds, lakes, sluggish waters of ditches or streams. **Dist:** NC south to FL, west to OK and TX; also in CA, Europe, South America, Mexico; also introduced farther north in North America. **Phen:** May-Sep. **Comm:** This taxon is decaploid ($n = 40$). See Zardini, Gu, and Raven (1991) and Nesom & Kartesz (2000) for additional information. Reported for DE and MD (Longbottom, Naczi, & Knapp 2016). **Syn:** = FNA10, Meso4.1, NY, Wagner, Hoch, & Raven (2007), Zardini, Gu, & Raven (1991); = *Ludwigia grandiflora* (Michaux) Greuter & Burdet ssp. *hexapetala* (Hooker & Arnott) Nesom & Kartesz – Ar, K3, K4, Tn, Va, Nesom & Kartesz (2000); = *Ludwigia grandiflora* var. *hexapetala* (Hooker & Arnott) D.B. Ward – Ward (2012a); < *Jussiaea uruguayensis* Cambessedes – F, G, WV; < *Ludwigia grandiflora* (Michaux) Zardini, H.Y. Gu, & Raven – FI4, WH3; < *Ludwigia uruguayensis* (Cambessedes) Hara – C, GW2, K1, Pa, RAB, W. **NatureServe GUTNR** (Not Yet Ranked).

Ludwigia hirtella Rafinesque. RAFINESQUE'S SEEDBOX, SPINDLEROOT, HAIRY SEEDBOX. **Hab:** Pine savannas, rarely inland in boggy seepage in barrens and oak flatwoods. **Dist:** S. NJ south to Panhandle FL, west to e. TX, north in the interior to KY, c. TN, AR, and se. OK. **Phen:** Jun-Sep. **Syn:** = Ar, C, F, FI4, FNA10, G, GW2, K1, K3, K4, RAB, S, Tn, Tx, Va, W, WH3, Wagner, Hoch, & Raven (2007). **NatureServe G5** (Secure).

Ludwigia leptocarpa (Nuttall) Hara. WATER-WILLOW. **Hab:** Riverbanks, marshes, swamps, and ditches, often on logs or tree bases in deep swamps. **Dist:** VA south to c. peninsular FL, west to e. TX, north in the interior along the Mississippi and Ohio rivers to se. MO, s. IL, and w. WV; and in tropical America. **Phen:** Jun-Oct. **Tax:** Morphologically variable and of different ploidies (tetraploid and hexaploid) (Hoch 2021). **Syn:** = Ar, C, FI4, FNA10, GW2, Il, K1, K3, K4, Meso4.1, NcTx, RAB, Tn, Tx, Va, W, WH3, Wagner, Hoch, & Raven (2007); = *Jussiaea leptocarpa* Nuttall – F, G, S, WV; > *Ludwigia leptocarpa* ssp. *leptocarpa* – WI. **NatureServe G5** (Secure).

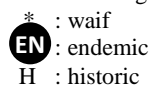

South America

Neotropics

Ludwigia linearis Walter var. *linearis*. EASTERN NARROWLEAF SEEDBOX. **Hab:** Pine savannas, swamps, marshes. **Dist:** Var. *linearis* ranges from s. NJ south to c. peninsular FL, west to se. LA, extending inland to the Cumberland Plateau of nc. AL and c. TN. **Phen:** Jun-Sep. **Tax:** Var. *linearis* is here interpreted to be equivalent to Peng's subglabrous morph. Peng (1989) declined to recognize infraspecific taxa in *L. linearis*, but his

X : extirpated

P : planted

? : questionable

discussion makes clear that two distinctive entities are present, as characterized by orientation of seed surface cells and characters of leaves, bracteoles, pedicels, sepals, stigmas, and styles (see key). The orientation of seed surface cells, recognized as a distinctive character in other difficult species pairs (such as *L. alata* and *L. lanceolata*) is the most reliable character separating the 2 varieties. This species is diploid ($n = 8$). **Syn:** < *Ludwigia linearis* – C, F, FI4, FNA10, G, GW2, K1, K3, K4, RAB, S, Tn, Va, W, WH3, Peng (1989), Wagner, Hoch, & Raven (2007).

Ludwigia linearis Walter var. *puberula* Engelm. & A. Gray. WESTERN NARROWLEAF SEEDBOX. **Hab:** Pine savannas, prairies, interdunal swales, ditches. **Dist:** Var. *puberula* ranges primarily from c. AL west to c. AR and e. MO, south to e. TX, with intergradational material extending as far north and east as n. FL and e. NC. **Phen:** Jun-Sep. **Tax:** Var. *puberula* is here interpreted to include Peng's intermediate morph, densely strigillose morph, and completely glabrous morph (Peng 1989). As pointed out by Peng (1989), the glabrous morph is exactly like the densely strigillose morph except for the absence of pubescence. They often grow together, have essentially the same distribution, and may differ only at a single allele. Peng's intermediate morph is heterogeneous; some likely being truly intermediate between (and possibly hybrid derivatives of) the two varieties here recognized, while others clearly belong to var. *puberula* (based on surface cell orientation and floral characteristics) and merely have an amount of pubescence intermediate between the densely strigillose and completely glabrous morphs. **Syn:** < *Ludwigia linearis* – Ar, C, F, FI4, FNA10, G, GW2, K1, K3, K4, NcTx, RAB, S, Tx, W, WH3, Peng (1989), Wagner, Hoch, & Raven (2007).

Ludwigia linifolia Poir. FLAXLEAF SEEDBOX. **Hab:** Limesink ponds (dolines) and *Taxodium ascendens* savannas. **Dist:** Nc. NC south to s. FL, west to s. MS; disjunct in Mexico (TAB). **Phen:** Jun-Sep. **Tax:** This species is diploid ($n = 8$). **Syn:** = FI4, FNA10, GW2, K1, K3, K4, Meso4.1, RAB, S, WH3, Peng (1989), Wagner, Hoch, & Raven (2007). **NatureServe G4** (Apparently Secure).

Ludwigia maritima R.M. Harper. HARPER'S SEEDBOX. **Hab:** Pine savannas, pine flatwoods, bogs. **Dist:** E. NC south to s. peninsular FL, west to e. LA. **Phen:** Jun-Sep. **Syn:** = FI4, FNA10, GW2, K1, K3, K4, RAB, S, WH3, Wagner, Hoch, & Raven (2007); < *Ludwigia virgata* Michaux, misapplied in part before 1904.

Ludwigia microcarpa Michaux. SMALL-FRUITED SEEDBOX. **Hab:** In circumneutral or alkaline soils of moist places, over calcareous rock, mafic rock, shell hash, or brackish sands, such as in maritime wet grasslands, savannas and adjacent ditches over coquina limestone ('marl'), and wet clay flats over diabase, often in roadside ditches, and inland in calcareous fens and wet calcareous glades. **Dist:** Ne. NC south to s. FL, west to se. TX (Brown & Marcus 1998); disjunct inland on calcareous or mafic rocks in nc. NC, nc. SC, n. GA, n. AL, c. and e. TN, sc. MO, and nc. AR; also in the Bahamas, Cuba, and Jamaica. **Phen:** Jul-Oct. **Tax:** This species is diploid ($n = 8$). **Syn:** = Ar, Bah, F, FI4, FNA10, GW2, K1, K3, K4, RAB, S, Tn, W, WH3, Peng (1989), Wagner, Hoch, & Raven (2007). **NatureServe G5** (Secure).

Ludwigia octovalvis (Jacquin) Raven. MEXICAN PRIMROSE-WILLOW. **Hab:** Marshes, disturbed areas. **Dist:** Se. NC south to s. FL, west to TX; and widespread in tropical America; Old World tropics and subtropics. **Phen:** May-Sep. **Syn:** = Ar, Bah, FI4, FNA10, GW2, K3, K4, Meso4.1, NcTx, Tx, WH3, Wagner, Hoch, & Raven (2007); > *Jussiaea angustifolia* Lamarck – S; > *Jussiaea scabra* Willdenow – S; > *Ludwigia octovalvis* ssp. *octovalvis* – K1; > *Ludwigia octovalvis* ssp. *sessiliflora* (M. Micheli) Raven – K1.

Ludwigia palustris (Linnaeus) Elliott. COMMON WATER-PURSLANE. **Hab:** In a wide range of natural and altered moist to wet disturbed areas. **Dist:** Widespread in North America, West Indies, Central America, South America, Central Eurasia, Africa, and Asia. **Phen:** May-Nov. **Syn:** = Ar, C, FNA10, GrPl, GW2, K1, K3, K4, Meso4.1, Mi, NcTx, NE, NY, Pa, RAB, Tn, Tx, Va, W, WH3, Wagner, Hoch, & Raven (2007); = *Isnardia palustris* Linnaeus – S; > *Ludwigia palustris* var. *americana* (A.P. de Candolle) Fernald & Griscom – F, G, Il, WV; > *Ludwigia palustris* var. *nana* Fernald & Griscom – F.

Ludwigia peploides (Kunth) Raven var. *glabrescens* (Kuntze) Shinners. FLOATING PRIMROSE-WILLOW. **Hab:** Pools, ditches, disturbed places. **Dist:** PA, VA and NC south and west to FL and AZ; Venezuela. Doubtfully native in the eastern parts of our area. **Phen:** May-Oct. **Syn:** = C, Il, RAB, Va; = *Jussiaea repens* – G, misapplied; = *Jussiaea repens* Linnaeus var. *glabrescens* Kuntze – F, misapplied; = *Ludwigia peploides* ssp. *glabrescens* (Kuntze) Raven – Ar, FI4, FNA10, K1, K3, K4, NY, Pa, Tn, WH3, Wagner, Hoch, & Raven (2007); > *Jussiaea diffusa* Forsskål – S; > *Jussiaea grandiflora* Michaux – S; > *Ludwigia peploides* – GrPl, NcTx, W; ? *Ludwigia peploides* ssp. *peploides* – GW2.

Ludwigia peploides (Kunth) Raven var. *peploides*. **Hab:** Canals, ditches, sluggish waters. **Dist:** TX, NM, AZ, and CA south to Mexico, Central America, South America; West Indies. **Syn:** = *Ludwigia peploides* ssp. *peploides* – FNA10, K3, K4, Meso4.1, Tx.

* **Ludwigia peruviana** (Linnaeus) Hara. PRIMROSE-WILLOW. **Hab:** Swamps, pondshores. **Dist:** Native of the Neotropics. In s. GA (Jones & Coile 1988). Reported for NC (Kartesz 1999). All or part of the Southeastern distribution is as an alien species. **Phen:** Jan-Dec. **Syn:** = FI4, FNA10, GW2, K1, K3, K4, Meso4.1, WH3, Wagner, Hoch, & Raven (2007); = *Jussiaea peruviana* Linnaeus – S. **NatureServe G5** (Secure).

Ludwigia pilosa Walter. HAIRY SEEDBOX. **Hab:** Swamps, ditches, other wet places. **Dist:** Se. VA south to n. FL, west to se. TX, restricted to the Coastal Plain except for disjunct occurrences inland in NC, VA, and n. AL. **Phen:** Jun-Oct. **Tax:** This species is tetraploid ($n = 16$). **Syn:** = Ar, FI4, FNA10, K1, K3, K4, Va, W, WH3, Peng (1989), Wagner, Hoch, & Raven (2007); < *Ludwigia pilosa* Walter – C, F, G, GW2, RAB, S, Tx.

Ludwigia repens J.R. Forster. CREEPING SEEDBOX. **Hab:** Ditches, pools, and streams. **Dist:** Se. VA south to s. FL, west to TX, CA, and n. Mexico, north in the interior to TN, MO, and OK; Bermuda; West Indies; Central and South America. **Phen:** Jun-Sep. **Comm:** Reveal et al. (2003) proposed the name *L. repens* for nomenclatural conservation with a conserved type; if this proposal had not been accepted, *L. natans* Elliott would have become the name of this species. **Syn:** = F14, FNA10, GrPl, GW2, K1, K3, K4, NcTx, RAB, Tx, WH3, Wagner, Hoch, & Raven (2007); = *Isnardia repens* – S; = *Ludwigia natans* Elliott – F, G. [NatureServe G5](#) (Secure).

Ludwigia simpsonii Chapman. SIMPSON'S SEEDBOX. **Hab:** Ponds, ditches. **Dist:** Ne. FL, Panhandle FL, s. MS (?) south to s. FL; West Indies (Bahamas, Cuba, Jamaica). **Phen:** Jan-Dec. **Syn:** = FNA10, WI, Peng (1989); < *Ludwigia curtissii* Chapman – Bah, F14, GW2, K1, K3, K4, WH3; > *Ludwigia simpsonii* Chapman – S; > *Ludwigia spathulifolia* Small – S.

Ludwigia sphaerocarpa Elliott. GLOBE-FRUITED SEEDBOX. **Hab:** Boggy areas, pools, ditches, river marshes, interdune swales, river and pondshores. **Dist:** E. MA south to n. FL, west to e. TX, primarily on the Coastal Plain, spottily distributed in that range, and also disjunct in w. NY, sc. TN, s. IN, and nw. IN and ne. IL. **Phen:** Jun-Sep. **Tax:** This species is tetraploid (n = 16). Peng (1989) considers it likely that *L. sphaerocarpa* is of allopolyploid origin, one or both of its parents now extinct. **Syn:** = C, F14, FNA10, GW2, K1, K3, K4, Mi, NE, NY, Pa, RAB, S, Tn, Va, WH3, Peng (1989), Wagner, Hoch, & Raven (2007); > *Ludwigia sphaerocarpa* var. *deamii* Fernald & Griscom – F, G, Il; > *Ludwigia sphaerocarpa* var. *jungens* Fernald & Griscom – F, G; > *Ludwigia sphaerocarpa* var. *macrocarpa* Fernald & Griscom – F, G; > *Ludwigia sphaerocarpa* var. *sphaerocarpa* – F, G. [NatureServe G5](#) (Secure).

Ludwigia virgata Michaux. SAVANNA SEEDBOX. **Hab:** Wet pine savannas and pine flatwoods. **Dist:** Se. VA south to s. peninsular FL, west to Panhandle FL and se. AL. **Phen:** Jun-Sep. **Syn:** = C, F, F14, FNA10, GW2, K1, K3, K4, RAB, S, Va, WH3, Wagner, Hoch, & Raven (2007).

Oenothera Linnaeus 1753 (EVENING-PRIMROSE)

Contributed by John Kees & Alan Weakley

A genus of about 145 or more species (188 or more taxa), herbs, of America (especially temperate regions). This treatment provisional, with further revision likely, especially in the *O. fruticosa* complex. References: Dietrich & Wagner (1988); Dietrich, Wagner, & Raven (1997); Munz (1965); Sorrie, LeBlond, & Weakley (2018b) in Weakley et al (2018b); Straley (1977); Towner & Raven (1970); Wagner (2014); Wagner (2021) in FNA10 (2021); Wagner, Hoch, & Raven (2007); Wagner, Hoch, & Zarucchi (2015); Wagner, Krakos, & Hoch (2013).

Identification Notes: The key requires flowering or fruiting material. Mature fruits can usually be found lower down on the inflorescence axis in flowering material. Frequent reference is made to different types of pubescence on plant surfaces; a hand lens is helpful. Some definitions – strigillose: covered in short, straight, stiffly incurved or appressed hairs; hirtellous: covered in short, soft, spreading hairs; glandular-puberulent: covered in tiny stalked glands (will be sticky to the touch); hirsute: covered in long, stiff hairs; villous: covered in long, flexible, sometimes shaggy hairs; pilose: covered in soft, straight, long hairs. The presence or absence of hairs with pustular (swollen, blister-like) bases is sometimes used to distinguish closely related species. Free sepal tips refer to the horn-like tips of the sepals that project at the apex of flower buds.

- 1 Flowers zygomorphic (except *O. curtiflora* and *O. glaucifolia*), white to pink; petals distinctly clawed, blades elliptic to narrowly obovate, rounded at apex; fruits indehiscent; seeds 1-6 (-8) per capsule, 1.5-3.5 mm long; [section *Gaura*] **Key A**
- 1 Flowers actinomorphic, yellow or white to pink; petals not notably clawed, elliptic to broadly obcordate; fruit dehiscent; seeds (10-) 50-many per capsule, 0.3-2 mm long.
- 2 Capsules lanceoloid to cylindric (roughly isodiametric or thickest below middle), nearly terete except for shallow grooves along valves, often curved or contorted; ovary essentially terete (note: buds may be 4-angled).
- 6 Stigmas peltate, disc-shaped or shallowly 4-lobed; leaves linear to narrowly lanceolate or oblanceolate, stiff, spinulose-serrate to subentire, less than 1 cm wide; plants perennials less than 6 dm tall, often suffrutescent, stems several to many, branching from near base (*O. capillifolia* var. *capillifolia* may be annual and single-stemmed); [MO, s. IL, TX, and OK westward, or disjunct in MS and AL in calcareous soils]; [section *Calylophus*] *Oenothera capillifolia* ssp. *capillifolia*
- 6 Stigmas deeply divided into 3-4 linear lobes; leaves narrowly to broadly lanceolate to oblanceolate, subentire to deeply sinuate-lobed, up to 6+ cm wide; plants annuals, biennials, or short-lived perennials, stems to 30 dm tall; [collectively widespread]; [section *Oenothera*]
- 7 Capsules lanceoloid, thickest below the middle, tapering to the apex; inflorescence spicate or racemose, dense; plants 3-30 dm tall, erect or ascending **Key C**
- 7 Capsules linear, nearly isodiametric, sometimes very slightly thickened distally; inflorescence lax, appearing to consist of solitary axillary flowers; plants to 4 dm tall, often decumbent; [subsection *Raimmania*]
- 8 Nonflowering portion of stems stiff, densely and uniformly strigillose, sometimes also sparsely villous; leaves thick, gray-green, densely strigillose, subentire, shallowly dentate, or occasionally lyrate; [coastal dunes and barrier islands] *Oenothera humifusa*
- 8 Nonflowering portion of stem not stiff, sparsely to moderately strigillose, often villous, sometimes densely so; leaves green (sometimes gray-green in *O. falfurriae* and *O. mexicana* of inland s. TX), sparsely to moderately strigillose and usually villous, mostly deeply sinuate-lobed or dentate; [sandy soils inland, often disturbed] *Oenothera laciniata*
- 2 Capsules clavate, ellipsoid, or oblong (thickest at or above the middle), strongly 4-8-ribbed or -winged (weakly in *O. linifolia*); ovary 4-angled or 4-winged.
- 13 Flowers pink or white.

N : no
P : planted
? : questionable
X : extirpated

- *Oenothera speciosa*
- 13 Flowers yellow, sometimes fading orange or reddish.
- 17 Leaves all basal, pinnatifid; [section *Lavauxia*, subsection *Lavauxia*]..... *Oenothera triloba*
- 17 Leaves all or partly cauline, entire or toothed.
- 20 Cauline leaves linear, < 1 mm wide; petals 3-5 (-7) mm long; floral bracts shorter than the ovaries they subtend; mature fruits ellipsoid-rhomboid, 4-6 mm long, bluntly angled; annual; [section *Peniophyllum*]..... *Oenothera linifolia*
- 20 Cauline leaves lanceolate to ovate, > 1 mm wide; petals 5-30 mm long; floral bracts longer than the ovaries they subtend; mature fruits clavate to oblong-elliptic, 3.5-20 mm long, mostly narrowly winged; perennial (*O. spachiana* annual); [section *Kneiffia*]..... **Key D**

Key A - section (or genus) *Gaura*

- 1 Pedicels 2-4 mm long; fruit with a slender stipe (0.5-) 2-10 mm long at maturity; clumped or mat-forming perennials from woody rhizomes or rootstocks [subsection *Stipogaura*].
- 5 Plants aggressively rhizomatous (also with a taproot), mat-forming; stems, leaves, and inflorescences glabrous or inconspicuously strigillose..... *Oenothera sinuosa*
- 5 Plants single-stemmed or caespitose, taprooted; plants glabrate to densely strigillose, sometimes also villous or glandular-puberulent..... *Oenothera filipes*
- 1 Pedicels 0-1 mm long; fruit sessile or with thick cylindric base 0.2-2.2 mm long; annuals or biennials (*O. hispida*, *O. suffrutescens*, and *O. lindheimeri* perennial).
- 7 Flowers small, with sepals 2-3.5 mm long, petals 1.5-3 mm long; anthers ellipsoid, ca. 1 mm long; inflorescences long, densely spicate, flexuous and conspicuously nodding apically (stiffening in fruit); [subsection *Schizocarya*]..... *Oenothera curtiflora*
- 7 Flowers larger, with sepals 2.5-12 mm long, petals 2.5-15 mm long; anthers linear, 1.5-6 mm long; inflorescences erect, not as above.
- 11 Plants perennial, branched from base; sepals spreading-villous, stems spreading-villous at least proximally, usually stipitate-glandular in inflorescence, not strigillose; flowers large, opening at sunrise, with petals 10-15 mm long, rhombic-obovate or broadly elliptic, sepals 9-17 mm long; [native in coastal prairies of sw. LA and e. TX, widely cultivated, sometimes naturalizing]..... *Oenothera lindheimeri*
- 11 Plants annual or biennial (rarely monocarpic perennial); sepals glabrous to strigillose (rarely short hirtellous), stem pubescence various, but often strigillose; flowers opening at sunset (except *O. demareei*), petals 3.5-15 mm long, often narrower, sepals 2.5-18 mm long.
- 12 Capsules narrowly (3-) 4-winged, furrowed between the wings; stems 1.5-6.5 (-12) dm, spreading-villous proximally, glabrate distally (rarely somewhat strigillose); [west of the Mississippi River, or disjunct in sw. MS]..... *Oenothera patriciae*
- 12 Capsules 3-4-angled; stems 5-40 dm (shorter in *G. triangulata*), villous, hirtellous, glandular-puberulent, and/or strigillose (see below); [collectively widespread].
- 14 Flowers small, often 3-merous or a mixture of 3-4-merous, with sepals 2.5-8 mm long, petals 3.5-8 mm long; fruits 3-4-angled; stems mostly branching from near the base, often from persistent rosettes, the inflorescence of relatively few, narrow, ±spicate branches; [acid sandy soils; TX and OK, or FL and outer coastal plain from NC to se. MS]..... *Oenothera simulans*
- 14 Flowers larger, 4-merous, with sepals 5-20 mm long, petals 6-17 mm long; fruits 4-angled; plants usually copiously branched at and above the middle, the inflorescence open and diffuse; [of a variety of substrates, often calcareous; widespread inland]
- 16 Stems and leaves conspicuously spreading-villous at least proximally, lacking strigillose hairs, and also glandular-puberulent in inflorescence (rarely glabrate); pollen 35-65% fertile; [Northeast and Upper Midwest south to n. AL and GA, absent from the Coastal Plain southward]..... *Oenothera gaura*
- 16 Stems and leaves densely and finely appressed-strigillose nearly throughout, sometimes also sparsely villous or short-hirtellous, glandular-puberulent or not in inflorescence; pollen 90-100% fertile; [mostly west of the MS river, eastward to AL, TN, KY]..... *Oenothera filiformis*

Key C - section *Oenothera*, subsections *Oenothera* and *Candela*

- 1 Petals rhombic-ovate to elliptic, widest near midlength, acute to broadly rounded; seeds ellipsoid, regularly pitted, borne ascending in locules; leaf margins deeply sinuate-lobed to subentire; [subsection *Candela*].
- 4 Pedicels, sepals, and capsules densely to sparsely appressed-strigillose, sometimes also with a few stipitate glands; mature flower buds not overtopping spike apex; free sepal tips 0.5-1.5 mm long; petals mostly bluntly acute to short-acuminate; [primarily of the Great Plains and Midwest, southwest to AK, IL, e. TX, and nw. LA]..... *Oenothera rhombipetala*
- 4 Pedicels, sepals, and capsules usually glandular-puberulent, spreading-villous, hirsute with pustulate-based hairs, or glabrate; mature flower buds overtopping spike apex; free sepal tips 1-6 mm long; petals mostly broadly rounded; [primarily southeastern, e. TX north to AK and east to AL]..... *Oenothera heterophylla* ssp. *orientalis*
- 1 Petals obcordate, widest near the apex, deeply to shallowly emarginate (rarely truncate); seeds prismatic and angled, irregularly pitted, borne horizontally in locules; leaf margins remotely dentate to subentire, or weakly sinuate-dentate near base; [subsection *Oenothera*].
- 7 Stigma well-elevated above the anthers at anthesis; petals (2.5-) 3-5 cm long; anthers 8-22 mm long; pollen 90-100% fertile (except *O. glazioviana*)..... *Oenothera grandiflora*
- 7 Stigma surrounded by or below the anthers at anthesis; petals 0.7-2.5(-3) cm long; anthers 3-10 mm long; pollen ca. 50% fertile.
- 16 Stems, leaves, ovaries, capsules, and corolla tubes sparsely to moderately strigillose and glandular puberulent, usually also with abundant spreading, pustular-based hairs; leaves green; sepals usually green or yellowish; [mostly east of the Mississippi River]..... *Oenothera biennis*
- 16 Stems, leaves, ovaries, capsules, and corolla tubes densely strigillose, appearing exclusively appressed-pubescent without magnification (also with some appressed or subappressed pustular-based hairs and rarely glandular-puberulent in the inflorescence); leaves grayish-green; sepals usually red-striped or flushed red; [mostly west of the Mississippi River, scattered eastward as an introduction]..... *Oenothera villosa* ssp. *villosa*

Key D - section *Kneiffia*

- 1 Plants taprooted annuals, 1-3 dm tall; leaves linear-spatulate or linear-oblongate, erect-ascending; flowers borne in leaf axils throughout upper 1/2 of plant..... *Oenothera spachiana*
- 1 Plants fibrous-rooted or rhizomatous perennials, 1-12 dm tall; leaves broader; flowers borne only in uppermost few nodes of branches.

- 2 Stems, leaves, and free sepal tips (but often not sepal bodies) coarsely pilose-hirsute with spreading, whitish hairs 1-3 mm long; free sepal tips 1-4 mm long, widely divergent; leaf blades mostly elliptic or elliptic-lanceolate, rugose..... *Oenothera pilosella*
- 2 Plants sparsely to densely strigillose, glandular, pilose, and/or villous pubescence, not pilose-hirsute (hairs mostly shorter or appressed); sepal tips various; leaf blades various.

..... *Oenothera fruticosa* var. 1

Oenothera biennis Linnaeus. COMMON EVENING-PRIMROSE. **Hab:** Fields, pastures, roadsides, disturbed areas. **Dist:** Ranging widely in e. North America and Europe, and scattered in w. North America. **Phen:** Jun-Sep (-Oct). **Syn:** = Ar, Fl4, FNA10, GrPl, Il, K1, K3, K4, Mi, NcTx, NE, NY, Pa, Tn, W, WH3, Dietrich, Wagner, & Raven (1997), Wagner, Hoch, & Raven (2007); = *Oenothera biennis* var. *biennis* - C; < *Oenothera biennis* Linnaeus - G, RAB, S, Va, WV; > *Oenothera biennis* ssp. *caeciarum* Munz - Munz (1965); > *Oenothera biennis* ssp. *centralis* Munz - Tx, Munz (1965); > *Oenothera biennis* var. *biennis* - F; > *Oenothera biennis* var. *pyncocarpa* (Atkinson & Bartlett) Wiegand - F.

Oenothera capillifolia Scheele ssp. *capillifolia*. **Hab:** Prairies and oak savannas, in sandy and rocky areas, especially calcareous. **Dist:** OK and NM south through s. LA and s. TX to Mexico; disjunct eastward in MS and AL. **Phen:** Mar-Sep. **Syn:** = FNA10, K4, Wagner, Krakos, & Hoch (2013); = *Calylophus berlandieri* ssp. *pinifolius* (Engelmann ex A. Gray) Towner - GrPl, K2, NcTx; = *Calylophus drummondianus* Spach ssp. *drummondianus* - Tx; = *Oenothera berlandieri* (Spach) Steudel ssp. *pinifolia* (Engelmann ex A. Gray) W.L. Wagner & Hoch - K3, Wagner, Hoch, & Raven (2007). **NatureServe G5T4T5** (Apparently Secure).

Oenothera curtiflora W.L. Wagner & Hoch. SMALL-FLOWERED GAURA, VELVETY GAURA, LIZARDTAIL GAURA. **Hab:** Sandy fields, disturbed areas, and clearings. **Dist:** IN and IL west to WA, south to MS, and Mexico; apparently introduced eastward to MA, TN, GA, and SC (the exact eastern edge of the native distribution uncertain). **Phen:** May-Jul. **Tax:** Kartesz's (1999) adoption of *Gaura mollis* as the name for this taxon has been rejected (Wagner & Hoch 2000; Brummitt 2001). **Syn:** = Fl4, FNA10, K3, K4, NE, Wagner, Hoch, & Raven (2007); = *Gaura mollis* James - K1; = *Gaura parviflora* Douglas ex Lehmann - Ar, F, G, GrPl, Il, NcTx, Q, RAB, S, Tx, WH3; > *Gaura parviflora* var. *lachnocarpa* Weatherby - Munz (1965); > *Gaura parviflora* var. *parviflora* - Munz (1965). **NatureServe G4G5** (Apparently Secure).

Oenothera filiformis (Small) W.L. Wagner & Hoch. LARGE-FLOWERED GAURA, BIENNIAL GAURA, TALL GAURA. **Hab:** Glades, prairies, woodlands, shell middens and calcareous hammocks, openings in bottomland forests, disturbed areas, especially over calcareous soils. **Dist:** MI, WI, MN, SD, and NE, south to AL, MS, LA, TX, and Mexico. **Phen:** Jun-Oct. **Syn:** = FNA10, K3, K4, Mi, NE, Wagner, Hoch, & Raven (2007); = *Gaura biennis* Linnaeus var. *pitcheri* Torrey & A. Gray - C, F, G, Munz (1965); = *Gaura filiformis* ssp. *filiformis* - Tx; = *Gaura longiflora* Spach - Ar, GrPl, Il, K1, NcTx, Tn, preoccupied name; > *Gaura filiformis* Small - S; > *Gaura longiflora* Spach - S. **NatureServe G4G5** (Apparently Secure).

Oenothera filipes (Spach) W. L. Wagner & Hoch. THREADSTALK GAURA. **Hab:** Longleaf pine sandhills, pine flatwoods, barrens, prairies, sandy fields, disturbed areas, and clearings. **Dist:** SC west to n. TN and s. IN, south to ne. FL and e. and w. LA. **Phen:** Apr-Jul. **Syn:** = Fl4, K3, K4, Wagner, Hoch, & Raven (2007); = *Gaura filipes* Spach - C, G, Il, K1, Q, RAB, Tn, W, WH3; = *Gaura michauxii* Spach - S; > *Gaura filipes* var. *filipes* - F, Munz (1965); > *Gaura filipes* var. *major* Torrey & A. Gray - F, Munz (1965). **NatureServe G5** (Secure).

***Oenothera fruticosa* var. 1.** GLANDULAR SUNDROPS. **Hab:** Calcareous barrens, post oak savannas and flatwoods, other dry to mesic, rocky or sandy woodlands. **Dist:** S. SC west to MS and north to IL and OH. **Phen:** May-Aug. **ID Notes:** This is the more western component of *O. fruticosa*, distinguished by predominantly glandular pubescence (also with sparse eglandular hairs intermixed) on capsules, floral tubes, and sepals.

Oenothera gaura W.L. Wagner & Hoch. BIENNIAL GAURA, NORTHEASTERN GAURA. **Hab:** Barrens, glades, woodlands, roadsides, streambanks, fields, disturbed areas. **Dist:** MA and NY west to WI, se. MN, and IA, south to sw. NC, c. GA (Jones & Coile 1988), sc. TN, and c. IL. **Phen:** Jun-Oct. **Syn:** = FNA10, K3, K4, Mi, NE, NY, Va, Wagner, Hoch, & Raven (2007); = *Gaura biennis* Linnaeus - Il, K1, Pa, Q, RAB, S, Tn, W, WV; > *Gaura biennis* var. *biennis* - C, F, G, Munz (1965). **NatureServe G5** (Secure).

Oenothera grandiflora L'Héritier ex Aiton. **Hab:** Woodlands, river-banks, disturbed areas. **Dist:** Apparently native to Panhandle FL, AL, and MS; scattered elsewhere as a horticultural plant. **Phen:** Jun-Oct. **Syn:** = F, Fl4, FNA10, K1, K3, K4, NE, Pa, S, Tn, WH3, Dietrich, Wagner, & Raven (1997), Munz (1965), Wagner, Hoch, & Raven (2007). **NatureServe G3G5** (Apparently Secure).

Oenothera heterophylla Spach ssp. *orientalis* W. Dietrich, Raven, & W.L. Wagner. ALABAMA EVENING-PRIMROSE. **Hab:** Sandy, open areas. **Dist:** Endemic to w. AL (Pickens and Sumter counties), sw. AR, and MS (Tombigbee barrens, J. Kees, pers.comm. 2021). **Phen:** May-Jul. **Syn:** = Ar, FNA10, K3, K4, Wagner, Hoch, & Raven (2007). **NatureServe G4TU** (Unrankable).

Oenothera humifusa Nuttall. SEABEACH EVENING-PRIMROSE, SPREADING EVENING-PRIMROSE. **Hab:** Coastal sand dunes. **Dist:** S. NJ south to s. FL, west to s. LA, along the coast. **Phen:** (Jan-) May-Oct (-Dec). **Syn:** = C, F, Fl4, FNA10, G, K1, K3, K4, RAB, Va, WH3, Dietrich & Wagner (1988), Munz (1965), Wagner, Hoch, & Raven (2007); > *Raimannia humifusa* (Nuttall) Rose - S; > *Raimannia mollissima* (Linnaeus) Sprague & Riley - S, misapplied. **NatureServe G5** (Secure).

Oenothera laciniata Hill. CUTLEAF EVENING-PRIMROSE. **Hab:** Disturbed areas. **Dist:** ME west to ND, south to s. FL and TX; also in CA. **Phen:** (Feb-) Apr-Sep (-Nov). **Syn:** = Ar, Fl4, FNA10, GrPl, Il, K1, K3, K4, Meso4.1, Mi, NcTx, NE, NY, Pa, Tn, Tx, Va, W, WH3, WV, Wagner, Hoch, & Raven (2007); = *Oenothera laciniata* ssp. *laciniata* – Munz (1965); = *Oenothera laciniata* var. *laciniata* – C, F, G, RAB; = *Raimannia laciniata* (Hill) Rose – S. NatureServe G5 (Secure).

Oenothera lindheimeri (Engelmann & A. Gray) W.L. Wagner & Hoch. LINDHEIMER'S BEEBLOSSOM. **Hab:** Coastal prairies; eastwards on roadsides and in other disturbed areas. **Dist:** W. LA and TX; scattered eastwards (perhaps only as introductions) in e. LA (the Florida parishes), s. MS, s. AL, and Panhandle FL. **Phen:** Late Apr-Jul (-Aug). **Syn:** = Fl4, FNA10, K3, K4, Wagner, Hoch, & Raven (2007); = *Gaura lindheimeri* Engelmann & A. Gray – K1, NcTx, Tx, WH3. NatureServe G3G5 (Apparently Secure).

Oenothera linifolia Nuttall. THREADLEAF SUNDROPS, FLAXLEAF SUNDROPS. **Hab:** Barrens, glades, dry openings, and fields. **Dist:** C. VA west to s. IL and se. KS, south to Panhandle FL and se. TX. Occurrences east of the Mississippi River may be mainly or entirely adventive. Belden et al. (2004) discuss the Virginia occurrence. **Phen:** May-Jul. **Syn:** = Ar, C, F, Fl4, FNA10, G, GrPl, Il, K1, K3, K4, NcTx, RAB, Tn, Tx, Va, W, WH3, Munz (1965), Straley (1977), Wagner, Hoch, & Raven (2007); = *Peniophyllum linifolium* (Nuttall) Pennell – S; > *Oenothera linifolia* Nuttall var. *glandulosa* Munz. NatureServe G5 (Secure).

Oenothera patriciae W.L. Wagner & Hoch. PLAINS GAURA. **Hab:** Sandy open areas. **Dist:** OK south through w. LA, e. TX, and c. TX; historically eastwards in MS, perhaps only as a waif. **Phen:** Mar-May (-Jun). **Syn:** = FNA10, K3, K4, Wagner, Hoch, & Raven (2007); = *Gaura brachycarpa* Small – K1, NcTx, Tx. NatureServe G4G5 (Apparently Secure).

Oenothera pilosella Rafinesque. MIDWESTERN EVENING-PRIMROSE. **Hab:** Fens, marshes, swamps, moist fields, disturbed areas. **Dist:** NH west to ON, south to s. VA, KY, n. AL, c. MS, and c. LA; widely cultivated, many occurrences eastward and southward likely represent introductions. **Phen:** May-Jul. **Comm:** *O. sessilis* (Pennell) Munz, treated by Straley (1977) as *O. pilosella* ssp. *sessilis* (Pennell) Straley, is best recognized as a species; it is restricted to West Gulf Coastal Plain. **Syn:** = F, FNA10, G, Il, K4, Mi, Pa, Tn, Va, WV, Munz (1965); = *Oenothera fruticosa* Linnaeus var. *hirsuta* Nuttall ex Torrey & A. Gray; = *Oenothera pilosella* ssp. *pilosella* – Ar, C, K1, K3, NE, NY, Straley (1977), Wagner, Hoch, & Raven (2007); > *Kneiffia pratensis* Small – S. NatureServe G5T5? (Secure).

Oenothera rhombipetala Nuttall ex Torrey & A. Gray. LONGSPIKE EVENING-PRIMROSE, SAND EVENING-PRIMROSE. **Hab:** Riverbanks, prairies, disturbed areas. **Dist:** MI, WI, MN, and ND south to w. LA, TX, and se. NM. **Phen:** May-Oct. **Syn:** = Ar, C, FNA10, G, GrPl, Il, K3, K4, Mi, NcTx, Tx, Wagner, Hoch, & Raven (2007).

Oenothera simulans (Small) W.L. Wagner & Hoch. SOUTHEASTERN GAURA, SOUTHERN BEE-BLOSSOM. **Hab:** Longleaf pine sandhills, other open woodlands, sandy fields, roadsides, primarily in the outer Coastal Plain. **Dist:** E. NC (Dare County) south to s. FL, west to e. TX, endemic to the Coastal Plain. **Phen:** May-Sep. **Syn:** = Fl4, FNA10, K3, K4, Wagner, Hoch, & Raven (2007); = *Gaura angustifolia* Michaux – Bah, K1, Q, RAB, S, WH3; > *Gaura angustifolia* var. *angustifolia* – Munz (1965). NatureServe G5 (Secure).

Oenothera sinuosa W.L. Wagner & Hoch. TEXAS GAURA. **Hab:** Sandy fields, disturbed areas, and clearings. **Dist:** Native of farther west. AR and OK south to s. TX, introduced eastward to SC and FL. **Phen:** Apr-Oct. **Syn:** = Fl4, FNA10, K3, K4, Wagner, Hoch, & Raven (2007); = *Gaura sinuata* Nuttall ex Seringe – Ar, GrPl, K1, NcTx, Q, RAB, Tx, WH3, Munz (1965). NatureServe G4G5 (Apparently Secure).

Oenothera spachiana Torrey & A. Gray. SPACH'S EVENING-PRIMROSE. **Hab:** Prairies, open woodlands, sandy areas. **Dist:** Sw. AR and OK south to w. LA and e. TX; disjunct eastwards in MS and AL. **Phen:** Apr-May. **Comm:** {not yet keyed}. **Syn:** = Ar, FNA10, K3, K4, NcTx, Tx, Wagner, Hoch, & Raven (2007). NatureServe G5 (Secure).

Oenothera speciosa Nuttall. WHITE EVENING-PRIMROSE, PINK-LADIES. **Hab:** Grasslands, prairies, glades, roadsides and fields, also cultivated as an ornamental. **Dist:** The original distribution obscured by subsequent cultivation and spread, but apparently something like IA and NE south to LA, TX, NM, and Mexico. **Phen:** (Feb-) Apr-Jul (-Oct). **Tax:** Substantial variation in ploidy ($n=7, 14, 21$), color (white, pink), and flower-opening time (morning, evening) is here included uncomfortably in one taxon. Great Plains Flora Association (1986) discussed "Most of our plants are diploid, with white flowers that open in the evening. In se. KS rare roadside colonies are tetraploid, with rose-purple flowers that open in the morning". **Syn:** = Ar, C, F, Fl4, FNA10, G, GrPl, Il, K1, K3, K4, NcTx, Pa, RAB, Tn, Tx, Va, W, WH3, Munz (1965), Wagner, Hoch, & Raven (2007); = *Hartmannia speciosa* (Nuttall) Small – S; > *Oenothera delessertiana* Steudel. NatureServe G5 (Secure).

Oenothera triloba Nuttall. STEMLESS EVENING-PRIMROSE. **Hab:** Limestone glades, blackbelt prairies, playas, floodplains; eastwards also in disturbed areas. **Dist:** MO and KS south through AR, OK, and e. NM to ne. LA, TX, and Mexico; also scattered east of the Mississippi River in both native and apparently introduced populations. **Phen:** (Feb-) Mar-Jun (-Jul). **Syn:** = Ar, C, F, FNA10, G, GrPl, H, Il, K1, K3, K4, NcTx, NY, Pa, Tn, Tx, Munz (1965), Wagner, Hoch, & Raven (2007); = *Lavauxia triloba* (Nuttall) Spach – S. NatureServe G4 (Apparently Secure).

216. ONAGRACEAE

Oenothera villosa Thunberg ssp. **villosa**. **Hab:** Prairies, eastwards naturalized in fields, roadsides, other disturbed areas. **Dist:** ON west to AB, south to AR and TX. **Phen:** Jun-Oct. **Syn:** = Ar, FNA10, GrPl, K1, K3, K4, NE, NY, Dietrich, Wagner, & Raven (1997), Wagner, Hoch, & Raven (2007); < *Oenothera biennis* Linnaeus – Va; ? *Oenothera biennis* var. *canescens* Torrey & A. Gray – C, F; ? *Oenothera strigosa* (Rydborg) Mackenzie & Bush – G; ? *Oenothera strigosa* (Rydborg) Mackenzie & Bush ssp. *canovirens* (Steele) Munz – Munz (1965); < *Oenothera villosa* – Il, Mi, Pa, Tn.

219. MELASTOMATACEAE A.L. de Jussieu 1789 (MELASTOME FAMILY) [in MYRTALES]

A family of about 150-200 genera and about 5000 species, trees, shrubs, vines, and herbs, of tropical, subtropical, and warm temperate areas.

References: Nesom (2012d) in FNA10 (2021).

Rhexia Linnaeus 1753 (MEADOW-BEAUTY)

Contributed by Richard J. LeBlond

A genus of about 13 species, herbs, of North America. *Rhexia* is the only genus of the Melastomataceae to occur in North America north of s. FL.

References: Bounds (1987); Kral & Bostick (1969); Nesom (2012a); Snyder (1996); Wurdack & Kral (1982).

Identification Notes: Measurements of the hypanthium are to the base of the calyx lobes.

- 1 Anthers 1-3.5 (-4) mm long, straight to slightly curved.
 - 3 Stem internodes with at least some hairs; leaves oblong, linear, or spatulate; petals yellow; [section *Luteorhexia*]..... *Rhexia lutea*
 - 3 Stem internodes glabrous; leaves ovate, suborbicular, or widely elliptic; petals lavender-rose to pink; [section *Brevianthera*]..... *Rhexia petiolata*
- 1 Anthers 5-11 mm long, distinctly curved.
 - 5 Stem nodes and internodes glabrous; stem and foliage blue-green; [section *Cymborhexia*]..... *Rhexia alifanus*
 - 5 Stem nodes and usually also the internodes hirsute; stem and foliage green; [section *Rhexia*].
 - 7 Leaves 1-5 (-8) mm wide, linear, linear-elliptic, narrowly oblong, or narrowly spatulate.
 - 9 Petals lavender-rose, (1-) 1.5-2.7 cm long; mature hypanthium 10-14 mm long, with glandular hairs; marginal nerves of leaf abaxial surface either absent or obscure and discontinuous; anthers 7-10 mm long..... *Rhexia cubensis*
 - 9 Petals white to pink (-rose-purple), (7-) 0.9-1.4 cm long; mature hypanthium 6-10 mm long, glabrous or sparsely glandular-hairy; marginal nerves of leaf abaxial surface prominent; anthers 5-8 mm long..... *Rhexia mariana* var. *exalbida*
 - 7 Leaves (5-) 7-20 (-35) mm wide, lanceolate, elliptic, or ovate.
 - 10 Four stem faces at mid-stem markedly unequal, one pair of opposite faces broader, convex, darker green, the narrower pair concave or flat, pale, the arrangement of broader and narrower faces alternating at each subsequent internode.
 - 11 Mature hypanthium 6-10 (-11) mm long, glandular-setose; petals 12-15 (-18) mm long, glabrous on the lower surface; anthers 5-8 mm long..... *Rhexia mariana* var. *mariana*
 - 11 Mature hypanthium (9-)10-15 (-20) mm long, glabrous or glabrate; petals (18-) 20-25 mm long, glandular-hairy on the lower surface (best seen in bud); anthers 8-11 mm long..... *Rhexia nashii*
 - 10 Four stem faces at mid-stem about equal, almost flat, the angles sharp or winged.
 - 12 Roots tuberous; stem angles at mid-stem conspicuously winged; hypanthium 7-10 mm long, the neck shorter than the body..... *Rhexia virginica*
 - 12 Roots not tuberous; stem angles sharp to narrowly winged; hypanthium 10-13 mm long, the neck as long as or longer than the body..... *Rhexia interior*

Alternate Key - based largely on vegetative characters

- 1 Stem internodes glabrous.
 - 2 Stem nodes as well as internodes glabrous, leaf margins entire or remotely low-toothed apically, glabrous..... *Rhexia alifanus*
 - 2 Stem nodes hirsute, leaf margins toothed, the teeth often tipped with hairs.
 - 3 Longest leaves 1.5 (-2) cm long, ovate or suborbicular..... *Rhexia petiolata*
 - 3 Longest leaves > 2 cm long, lanceolate, elliptic, or ovate..... *Rhexia virginica*
- 1 Stem internodes (and nodes) hirsute or glandular-hairy.
 - 7 Leaves lanceolate, elliptic, or ovate, broadest at or below the middle.
 - 8 Four stem faces at mid-stem markedly unequal, one pair of opposite faces broader, convex, darker green, the narrower pair concave or flat, pale.
 - 9 Mature hypanthium 6-10 mm long, glandular-hairy; petals 1.2-1.5 cm long, glabrous on the lower surface..... *Rhexia mariana* var. *mariana*
 - 9 Mature hypanthium 10-15 mm long, glabrous or glabrate; petals 2.0-2.5 cm long, glandular-hairy on lower surface (best seen in bud)..... *Rhexia nashii*

- 8 Four stem faces at mid-stem about equal, almost flat, the angles sharp or winged.
 10 Roots not rhizome-like; roots tuberiferous or spongy-thickened..... *Rhexia virginica*
 10 Some roots rhizome-like, with adventitious buds; roots not tuberiferous or spongy-thickened.
 *Rhexia interior*
 7 Leaves linear, narrowly elliptic, or broadest above the middle.
 12 Plant bushy-branched..... *Rhexia lutea*
 12 Plant simple below the cymose inflorescence.
 14 Mature hypanthium 10-14 mm long, with glandular hairs; petals lavender-rose, 1.5-2.0 cm long..... *Rhexia cubensis*
 14 Mature hypanthium 6-10 mm long, glabrous or sparsely glandular-hairy; petals white, 1.2-1.5 cm long..... *Rhexia mariana* var. *exalbida*

Rhexia alifanus Walter. SMOOTH MEADOW-BEAUTY. **Hab:** Pine flatwoods and savannas, pocosin borders, more able to tolerate merely moist soils than other *Rhexia* species. **Dist:** A Southeastern Coastal Plain species: e. NC south to n. peninsular FL and west to se. Texas (Singhurst, Mink, & Holmes 2010). **Phen:** May-Sep. **ID Notes:** Our tallest and showiest *Rhexia*: the unbranched (unless injured), wand-like stems, with strongly ascending, bluish-green, waxy-smooth, and generally entire leaves make this species unmistakable. **Syn:** = Fl4, FNA10, GW2, K1, K3, K4, RAB, S, WH3, Kral & Bostick (1969), Nesom (2012a); = *Rhexia glabella* Michaux. NatureServe G5? (Secure).

Rhexia cubensis Grisebach. WEST INDIAN MEADOW-BEAUTY. **Hab:** Limesink ponds (dolines). Drawdown zones of depression ponds such as Carolina bays or limesink ponds (dolines), Pond-cypress savannas and depression meadows; farther south (especially in FL) in wet pine flatwoods, dome swamps, hammock edges, pond and lake margins, pine savannas, ditches, and moist roadsides. **Dist:** Se. NC south to s. FL and west to sw. MS; also in the West Indies. **Phen:** Jun-Sep. **Syn:** = Fl4, FNA10, GW2, K1, K3, K4, RAB, S, WH3, Kral & Bostick (1969), Nesom (2012a). NatureServe G4G5 (Apparently Secure).

Rhexia interior Pennell. OZARK MEADOW-BEAUTY. **Hab:** Moist to wet areas, ditches, prairies. **Dist:** S. IN, s. IL, s. MO, and se. KS south to c. AL, c. MS, n. LA, and se. OK. **Phen:** Jun-Oct. **Syn:** = F, FNA10, G, Tx, Nesom (2012a); = *Rhexia mariana* Linnaeus var. *interior* (Pennell) Kral & Bostick – Ar, GrPl, GW2, K1, K3, K4, Tn, Kral & Bostick (1969); < *Rhexia interior* Pennell – C. NatureServe G5T4T5 (Apparently Secure).

Rhexia lutea Walter. YELLOW MEADOW-BEAUTY, GOLDEN MEADOW-BEAUTY. **Hab:** Wet pine flatwoods and savannas, seepage slopes, and bogs. **Dist:** A Southeastern Coastal Plain species: e. NC south to ne. FL and Panhandle FL, and west to se. TX. **Phen:** Apr-Jul (-Sep). **ID Notes:** The only yellow-flowered *Rhexia* and also our most bushy-branched species. **Syn:** = Fl4, FNA10, GW2, K1, K3, K4, RAB, S, Tx, WH3, Kral & Bostick (1969), Nesom (2012a). NatureServe G5 (Secure).

Rhexia mariana Linnaeus var. *exalbida* Michaux. WHITE MEADOW-BEAUTY. **Hab:** Wet pine flatwoods and savannas, wet meadows, ditches, and wet roadsides. **Dist:** NC south to FL and west to e. TX. **Phen:** Jun-Sep. **Tax:** Reported to merge into *R. mariana* var. *mariana* from FL westward, but var. *exalbida* appears quite distinct at species rank. **ID Notes:** The white flowers and linear leaves are diagnostic. **Syn:** = FNA10, RAB, Tx; = *Rhexia lanceolata* Walter – S; < *Rhexia mariana* – Fl4, WH3; < *Rhexia mariana* Linnaeus var. *mariana* – GW2, K1, K3, K4, Kral & Bostick (1969).

Rhexia mariana Linnaeus var. *mariana*. MARYLAND MEADOW-BEAUTY, DULL MEADOW-BEAUTY, PALE MEADOW-BEAUTY. **Hab:** Pine flatwoods, wet meadows, bog margins, ditches, wet roadsides, often weedy. **Dist:** E. MA south to s. FL, west to TX, and north to s. IN and IL. **Phen:** Early Mar-Oct. **Syn:** = Ar, FNA10, G, NcTx, NE, NY, RAB, Tn, Tx, Va, W; > *Rhexia delicatula* Small – S; < *Rhexia mariana* – Fl4, Il, Mi, Pa, WH3, WV; > *Rhexia mariana* – S; > *Rhexia mariana* var. *leiosperma* Fernald & Griscom – F; < *Rhexia mariana* Linnaeus var. *mariana* – F, GW2, K1, K3, K4, Kral & Bostick (1969).

Rhexia nashii Small. HAIRY MEADOW-BEAUTY, MAID MARIAN. **Hab:** Wet pine flatwoods and savannas; pond shores, bogs, marshes, ditches, wet roadsides. **Dist:** Primarily a Southeastern Coastal Plain species: e. VA south to s. FL and west to se. LA. **Phen:** May-Oct. **Syn:** = Fl4, FNA10, GW2, K1, K3, K4, S, Va, WH3, Kral & Bostick (1969), Nesom (2012a); = *Rhexia mariana* var. *purpurea* Michaux – F, G, RAB. NatureServe G5 (Secure).

Rhexia petiolata Walter. CILIATE MEADOW-BEAUTY, SHORT MEADOW-BEAUTY, FRINGED MEADOW-BEAUTY. **Hab:** Wet pine flatwoods and savannas, pocosin borders, and ditches. **Dist:** A Southeastern Coastal Plain endemic: se. VA south to s. FL and west to se. TX. **Phen:** May-Oct. **Comm:** The flowers are sessile, the petals ascending. **Syn:** = C, Fl4, FNA10, G, GW2, K1, K3, K4, RAB, Tx, Va, WH3, Kral & Bostick (1969), Nesom (2012a); = *Rhexia ciliosa* Michaux – F, S. NatureServe G5? (Secure).

Rhexia virginica Linnaeus. VIRGINIA MEADOW-BEAUTY, DEERGRASS, HANDSOME HARRY, WING-STEM MEADOW-BEAUTY. **Hab:** Wet pine flatwoods and savannas, pond shores, bogs, and ditches. **Dist:** E. Canada and WI south to ne. FL, Panhandle FL, and TX. **Phen:** May-Oct. **Syn:** = Ar, C, Fl4, FNA10, G, GW2, Il, K1, K3, Mi, NcTx, NE, NY, Pa, Tn, Tx, Va, W, WH3, WV, Kral & Bostick (1969), Nesom (2012a); = *Rhexia stricta* Pursh – S; > *Rhexia virginica* var. *purshii* (Sprengel) C.W. James – RAB; > *Rhexia virginica* var. *septemneria* (Walter) Pursh – F; > *Rhexia virginica* var. *virginica* – F, RAB. NatureServe G5 (Secure).

226. STAPHYLEACEAE Martinov 1820 (BLADDERNUT FAMILY) [in CROSSOSOMATALES]

A family of 2 genera and about 45 species, trees and shrubs, of mainly temperate Northern Hemisphere, especially e. Asia. References: Brouillet (2014) in FNA9 (2014); Simmons in Kubitzki, Bayer, & Stevens (2007); Spongberg (1971).

Staphylea Linnaeus 1753 (BLADDERNUT)

A genus of 23 species, trees and shrubs, mainly of temperate Eurasia and e. North America, but extending into Central and South America. References: Brouillet (2014) in FNA9 (2014); Simmons in Kubitzki, Bayer, & Stevens (2007).

Identification Notes: *Staphylea* is readily recognized as a shrub or small tree with opposite, trifoliate leaves with serrulate margins.

Staphylea trifolia Linnaeus. BLADDERNUT. **Hab:** Nutrient-rich bottomland forests, extending upslope over calcareous or mafic rocks. **Dist:** QC west to MN, south to sw. GA, Panhandle FL, n. AL, n. MS, and OK. **Phen:** Apr-May; Aug-Oct. **Syn:** = Ar, C, F, FL4, G, GrPl, GW2, Il, K1, K3, K4, Mi, NE, NY, Pa, RAB, S, Tn, Va, W, WH3, WV, Spongberg (1971). [NatureServe G5](#) (Secure).

239. ANACARDIACEAE R. Brown 1818 (CASHEW FAMILY) [in SAPINDALES]

A family of about 70-81 genera and about 800-875 species, trees, shrubs, lianas, and rarely herbs, of tropical, subtropical, and temperate regions. Our representatives are all classed in subfamily Anacardioidae (Pell et al. 2011). References: Barkley (1937); Pell et al. in Kubitzki (2011).

- 3 Leaves 3-foliolate.
 - 4 Terminal leaflet sessile; fruit red, glandular-pubescent; foliage and stems lacking contact poisons *Rhus*
 - 4 Terminal leaflet distinctly petiolulate; fruit white or greenish, glabrous or with scattered trichomes; foliage and stems containing contact poisons *Toxicodendron*
- 3 Leaves pinnately compound, with (3-) 5-41 leaflets (at least the larger and better-developed on a plant with 5 or more leaflets).
 - 5 Leaf rachis winged (with a flange of leaf tissue, often irregular in width and terminating at each leaflet attachment) *Rhus*
 - 5 Leaf rachis not winged.
 - 7 Inflorescence either a terminal panicle (the central axis stiff and upright) or of axillary or terminal clusters of short spikes *Rhus*
 - 7 Inflorescence of axillary or cauliflorous panicles, the central axis lax and often dangling.
 - 8 Leaves all or mostly even-pinnate (sometimes some leaves with an apparently terminal or obliquely subterminal leaflet) *Pistacia chinensis*
 - 8 Leaves odd-pinnate *Toxicodendron vernix*

Pistacia Linnaeus 1753 (PISTACHIO)

A genus of about 12 species, trees and shrubs, of tropical and temperate Asia, n. Africa. Mediterranean Europe, and s. North America and c. America. References: Pell et al. in Kubitzki (2011).

* ***Pistacia chinensis*** Bunge. CHINESE PISTACHIO. **Hab:** Uncommonly planted, but now naturalizing freely in suburban areas. **Dist:** Native of China, the Philippines, and Taiwan. Krings (2011) documents its occurrence in the Piedmont of NC (Wake County). Serviss & Serviss (2020) reported its naturalization in Arkadelphia, AR (Clark County). Reported for Marengo and Montgomery counties, AL (Diamond & Keener 2021). **Phen:** Mar-Apr. **Comm:** This species is a major new invasive species in the Southeast. **Syn:** = K1; = n/a – RAB; > *Pistacia chinensis* ssp. *subintegerrima* (Stewart) Rechinger f. – K3, K4. [NatureServe GNR](#) (Not Yet Ranked).

Rhus Linnaeus 1753 (SUMAC)

A genus of about 35 species, trees, shrubs, and lianas, temperate and subtropical, of Eurasia, Hawaii, North America, and n. Central America. The subgenera and sections follow Andrés-Hernández et al. (2014). There is some merit to the idea that *Rhus* should be split into two genera, *Rhus* s.s. and *Schmaltzia*. References: Andrés-Hernández et al (2014); Barkley (1937); Greene (1905); Hardin & Phillips (1985a); Miller, Young, & Wen (2001); Mitchell & Pell (2019) in Naczi & collaborators (2019); Pell et al. in Kubitzki (2011); Yi, Miller, & Wen (2007).

Identification Notes: Two hybrids have been documented to occur naturally in our area: *Rhus* × *borealis* Greene (*glabra* × *typhina*) and *Rhus* × *ashei* (Small) Greene (*glabra* × *michauxii*). They are intermediate between their parents. For instance, *R. ashei* has sparsely pubescent leaves and stems, slight winging of the rachis between the terminal leaflets, greater potential stature than *R. michauxii*, and leaflets with a length/width ratio of 2.5-3. Hardin & Phillips (1985b) discuss other natural and artificial hybrids in *Rhus*.

- 1 Leaves 3-foliolate; shrub to 4 m tall; inflorescence of small lateral and terminal clusters; pedicels < 1 mm long, with bracteoles; [subgenus *Lobadium*; section *Lobadium*].

Key to Map
Symbology:

* : waif
EN : endemic
H : historic

N : no
P : planted

X : extirpated

-*Rhus aromatica* var. *aromatica*
- 1 Leaves (3-) 5-31-foliolate; shrub or small tree, to 12 m tall; inflorescence either of dense, terminal panicles or small lateral and terminal clusters; pedicels 1.5-2.5 mm long, lacking bracteoles.
- 7 Rachis of the leaf winged between each pair of adjacent leaflets; stems and petioles puberulent; leaflets entire to remotely toothed.
-*Rhus copallinum* var. *copallinum*
- 7 Rachis of the leaf not winged between each pair of adjacent leaflets (sometimes winged between the last 1 or 2 pairs of leaflets on each side of the rachis); stems and petioles either densely villous or essentially glabrous; leaflets sharply and rather coarsely serrate.
- 11 Stems essentially glabrous; pubescence of the fruit short and blunt-tipped.....*Rhus glabra*
- 11 Stems densely long-pubescent; pubescence of the fruit long and pointed.....*Rhus typhina*

***Rhus aromatica* Aiton var. *aromatica*.** FRAGRANT SUMAC, SQUAWBUSH. **Hab:** Dry to dry-mesic upland forests and woodlands, glade margins, stream banks, bluffs, and pastures, eastwards primarily in rocky, rather dry, woodlands, usually over mafic rocks (such as gabbro or diabase) or calcareous rocks, less commonly in sandy soils. **Dist:** The species (if interpreted to include *Rhus trilobata* at varietal rank) ranges throughout much of temperate North America. Var. *aromatica* is the most eastern component of the complex, distributed from NH, ON, and MN south to Panhandle FL and TX. **Phen:** Late Feb-early May; late Apr-Jun. **ID Notes:** The foliage of *Rhus aromatica* bears some superficial resemblance to *Toxicodendron pubescens*. *Rhus aromatica* has sessile terminal leaflets, while *Toxicodendron* has a prominent petiolule. **Syn:** = Ar, GrPl, GrPl, K1, K3, Mo2, NE, NY, Pa, Va, WV; = *Rhus aromatica* – Barkley (1937); = *Rhus aromatica* ssp. *aromatica*; = *Schmaltzia crenata* (P. Miller) Greene – S; < *Rhus aromatica* – Fl4, Mi, RAB, Tn, W, WH3, Mitchell & Pell (2019) in Naczi & collaborators (2019); < *Rhus aromatica* Aiton var. *aromatica* – K4; > *Rhus aromatica* Aiton var. *aromatica* – C, F, G, Il; > *Rhus aromatica* var. *illinoensis* (Greene) Rehder – C, F, G, Il; > *Schmaltzia aromatica* (Aiton) Small – Greene (1905); > *Schmaltzia crenata* (P. Miller) Greene – Greene (1905); > *Schmaltzia illinoensis* Greene – Greene (1905). NatureServe G5T5 (Secure).

***Rhus copallinum* Linnaeus var. *copallinum*.** EASTERN WINGED SUMAC, EASTERN FLAMELEAF SUMAC. **Hab:** Longleaf pine sandhills, dry woodlands, maritime thickets (especially from VA northward), old fields, roadsides. **Dist:** S. NY south to s. FL, west to e. TX, mainly on the Coastal Plain and lower Piedmont. **Phen:** Jul-Sep; Aug-Oct. **Tax:** The recognition of two or more varieties is problematic (the variation in leaflet size, shape, and number clinal), yet the degree of variation makes a monolithic *Rhus copallinum* uncomfortable. **Comm:** The Linnaean epithet "*Copallinum*" (traditionally capitalized) is grammatically a noun in apposition rather than an adjective, and therefore does not change grammatical gender. **Syn:** = K1, NY, Va; = *Rhus copallina* var. *copallina* – F, orthographic variant; < *Rhus copallina* – Pa, RAB, Tx, W, orthographic variant; < *Rhus copallina* var. *copallina* – Mitchell & Pell (2019) in Naczi & collaborators (2019), orthographic variant; > *Rhus copallina* var. *copallina* – Barkley (1937), orthographic variant; > *Rhus copallina* var. *leucantha* (Jacquin) A.P. de Candolle – Barkley (1937), orthographic variant; < *Rhus copallinum* – Ar, C, Fl4, G, K3, K4, WH3; > *Rhus copallinum* – S; > *Rhus leucantha* Jacquin – S; > *Rhus obtusifolia* (Small) Small – S; > *Schmaltzia copallina* (Linnaeus) Small; > *Schmaltzia obtusifolia* Small. NatureServe G5T5 (Secure).

***Rhus glabra* Linnaeus.** SMOOTH SUMAC. **Hab:** Disturbed areas, clearings, roadsides, woodlands. **Dist:** ME west to BC, south to Panhandle FL, TX, CA, and beyond. **Phen:** Late May-Jul; Jun-Oct. **Syn:** = Ar, C, Fl4, G, GrPl, Il, K1, K3, K4, Mi, Mo2, NcTx, NE, NY, Pa, RAB, S, Tn, Tx, Va, W, WH3, WV, Naczi & collaborators (2019); > *Rhus glabra* var. *glabra* – F, Barkley (1937); > *Rhus glabra* var. *laciniata* Carrière – Barkley (1937). NatureServe G5 (Secure).

***Rhus typhina* Linnaeus.** STAGHORN SUMAC. **Hab:** Roadsides, old pastures, thickets, clearings, rock outcrops, barrens. **Dist:** NS and NB west to MN, south to n. GA, AL, MS, and KS. **Phen:** May-Jun; Jun-Sep. **Tax:** The apparently older epithet "*hirta*" was formally rejected in 1999 (see Gandhi 2016 for summary). **Comm:** The species, especially in its cut-leaved forms, forma *laciniata* (Wood) Rehder and forma *dissecta* Rehder, is very popular in Europe as a cultivated ornamental. **Syn:** = C, F, G, K1, K3, K4, Mi, Mo2, NY, Pa, RAB, Tn, Va, W, WV, Naczi & collaborators (2019); = *Rhus hirta* (Linnaeus) Sudworth – Il, NE, S; = *Schmaltzia hirta* (Linnaeus) Small; > *Rhus typhina* var. *laciniata* Alph. Wood – Barkley (1937); > *Rhus typhina* var. *typhina* – Barkley (1937). NatureServe G5 (Secure).

Toxicodendron P. Miller 1754 (POISON IVY, POISON OAK, POISON SUMAC)

A genus of about 10-15 species, trees and shrubs, primarily temperate, of North America, n. South America, Indonesia, and e. Asia. References: Gillis (1971); Greene (1905); Pell et al. in Kubitzki (2011).

- 1 Leaflets 7-13, entire; small tree.....*Toxicodendron vernix*
- 1 Leaflets 3, toothed, lobed, or entire; shrub or vine.
- 2 Fruits pubescent or papillose; leaflets entire, coarsely toothed, undulate, or round-lobed; lower surfaces of leaflets either velvety puberulent, sometimes becoming glabrate in age (*T. pubescens*) or glabrous (glabrescent or rarely pilose beneath) but with prominent tufts of tannish hairs present in the vein axils (*T. radicans* var. *radicans*).
- 3 Leaves sparsely pubescent (rarely pilose beneath), the apex and the lobes (if present) generally acute to acuminate; drupes papillose, scabrous or puberulent; plant a high-climbing vine or stoloniferous shrub; [of mesic, swampy, or dry habitats].....*Toxicodendron radicans* var. *radicans*
- 3 Leaves velvety puberulent (sometimes becoming glabrate in age), the apex and the lobes (if present) generally obtuse to broadly acute; drupes pubescent (becoming glabrate); plant a stoloniferous shrub; [of dry habitats, especially sandhills].....*Toxicodendron pubescens*
- 2 Fruits glabrous (or very sparsely pubescent); leaflets coarsely toothed or notched (rarely entire); lower surfaces of leaflets glabrous to pubescent, but without tufts of tannish hairs in the vein axils.
-*Toxicodendron radicans* var. *pubens*

Toxicodendron pubescens P. Miller. POISON OAK, SOUTHEASTERN POISON OAK. **Hab:** Longleaf pine sandhills, dry upland woodlands, around dry rock outcrops in the Piedmont and Mountains, barrens. **Dist:** Primarily Southeastern: s. NJ south to n. FL, west to e. TX, inland to WV, e. TN, c. TN, se. MO, and s. KS. **Phen:** Late Apr-May; Aug-Oct. **Tax:** The nomenclatural confusion may still not be resolved. **Syn:** = Ar, C, Fl4, Il, K1, K3, K4, Mo2, NcTx, Tn, Va, WH3, Naczi & collaborators (2019); = *Rhus toxicodendron* – F, G, RAB; = *Rhus toxicodendron* Linnaeus var. *toxicodendron* – Tx; = *Toxicodendron toxicarium* Gillis – GrPl, W, Gillis (1971); = *Toxicodendron toxicodendron* (Linnaeus) Britton – S; > *Rhus quercifolia* Michaux; > *Toxicodendron pubescens* P. Miller – Greene (1905); > *Toxicodendron quercifolium* (Michaux) Greene – Greene (1905). [NatureServe G5](#) (Secure).

Toxicodendron radicans (Linnaeus) Kuntze var. *pubens* (Engelmann ex S. Watson) Reveal. **Hab:** Xeric limestone woodlands, barrens, outcrops, and clearings. **Dist:** S. IL and MO south to se. LA and s. TX; disjunct eastward in c. KY, c. TN, and w. VA (Virginia Botanical Associates 2019). **Syn:** = Va; = *Toxicodendron radicans* ssp. *pubens* (Engelmann ex S. Watson) Gillis – GrPl, K1, K3, K4, Mo2, NcTx, Gillis (1971); < *Toxicodendron radicans* – Ar, GW2, Tn, W; < *Toxicodendron radicans* (Linnaeus) Kuntze var. *radicans* – Il, NeUS. [NatureServe G5T5](#) (Secure).

Toxicodendron radicans (Linnaeus) Kuntze var. *radicans*. EASTERN POISON IVY. **Hab:** In a wide range of habitats, including mesic forests, rock outcrops, swamp forests, brackish marshes, open areas, disturbed ground, usually in more mesic to hydric sites than *T. pubescens*, and particularly common in areas with fertile soils, such as bottomlands or over calcareous rocks or calcareous sands (as in maritime forests). **Dist:** NS south to s. FL (and the Bahamas), west to e. TX, inland to VT, c. PA, WV, KY, and AR. **Phen:** Late Apr-May; Aug-Oct. **Tax:** Var. *radicans* is the typical poison ivy of the Atlantic and Gulf Coastal Plain, rarely found west of the Appalachians. **Comm:** It is normally a vine, climbing by adventitious roots, and can attain diameters of 10 cm and climb to the crowns of forest trees. It can also resemble *T. pubescens* in habit, producing numerous meter-high upright stems from rhizomes. *T. radicans* var. *radicans* is ubiquitous in our area, absent only from the high mountains of NC. **Syn:** = C, Va; = *Toxicodendron radicans* ssp. *radicans* – K1, K3, K4, Mo2, NE, NY; < *Rhus radicans* Linnaeus – Bah, RAB; > *Rhus radicans* var. *radicans* – F, G, WV; < *Rhus radicans* var. *vulgaris* (Michaux) A.P. de Candolle – Tx; > *Rhus radicans* var. *vulgaris* (Michaux) A.P. de Candolle – WV; > *Rhus radicans* var. *vulgaris* (Michaux) A.P. de Candolle – F, G; < *Toxicodendron radicans* – Ar, Fl4, GW2, Mi, Pa, S, Tn, W, WH3; < *Toxicodendron radicans* (Linnaeus) Kuntze var. *radicans* – Il, NeUS. [NatureServe G5T5](#) (Secure).

Toxicodendron vernix (Linnaeus) Kuntze. POISON SUMAC, THUNDERWOOD. **Hab:** In peaty habitats, in the Coastal Plain frequent in streamhead pocosins and sandhill seepage bogs, in the mountains in bogs. **Dist:** NS west to MN, south to c. peninsular FL and TX. **Phen:** May-Jun; Aug-Sep. **Comm:** The leaf rachis and leaflet petiolules are usually a dark red or maroon color. The leaves turn a very attractive shade of orange-red in autumn. **Syn:** = C, Fl4, GW2, Il, K1, K3, K4, Mi, NcTx, NE, NY, Pa, S, Tn, Va, W, WH3, Naczi & collaborators (2019); = *Rhus vernix* Linnaeus – F, G, RAB, Tx, WV. [NatureServe G5](#) (Secure).

240a. ACERACEAE A.L. de Jussieu 1789 (MAPLE FAMILY) [in SAPINDALES]

A family of 2 genera and about 130 species, trees and shrubs of the northern hemisphere. The Aceraceae has traditionally been accorded family rank, but in recent decades usually included in Sapindaceae as an early-diverging subfamily and/or tribe, as by APG IV (2016) and Buerki et al. (2021). A counter-case for family rank was made by Buerki et al. (2010). Buerki et al (2021) meekly followed APG IV, stating "while there is strong justification for these familial delimitations... and the decision to recognize one or four families is a matter of preference, the Angiosperm Phylogeny Group (APG IV, 2016) adopted a single, broadly defined family, and the classification presented here is aligned with their interpretation." References: Acevedo-Rodríguez et al (2011) in Kubitzki (2011); Buerki et al (2010); Buerki et al (2021).

Acer Linnaeus 1753 (MAPLE)

A genus of about 111-126 species, trees and shrubs, primarily north temperate. References: Acevedo-Rodríguez et al (2011) in Kubitzki (2011); Desmarais (1952); Harris et al (2017); Murray (1970); Saeki et al (2011); Suh, Heo, & Park (2000); van Gelderen, de Jong, & Oterdoorn (1994).

Symbology:

* : waif
 EN : endemic
 H : historic

N : no X : extirpated
 P : planted
 ? : questionable

- 3 Leaves not toothed, or often with a few rounded, coarse, and irregular teeth on the principal lobes, these teeth 0-5 per principal lobe; sinuses between the principal leaf lobes generally broadly rounded, the sinus broader than deep.
- 7 Leaves green beneath, moderately to densely pubescent across the surface; leaf sinuses on either side of the terminal lobe shallow, the two sides of each sinus forming an angle of > 90 degrees (the terminal lobe typically broadly triangular); leaves sometimes planar, more usually with drooping lobe tips. *Acer leucoderme*
- 7 Leaves pale, grayish, silvery-gray, or strongly glaucous beneath, glabrous, pubescent on the veins, or pubescent across the surface; leaf sinuses on either side of the terminal lobe deep, the two sides of each sinus forming an angle of < 70 degrees (the terminal lobe typically with parallel margins, or even narrower toward the base than toward the tip); leaves usually planar, but sometimes with drooping lobe tips, especially in sun-exposed individuals. *Acer floridanum*
- 3 Leaves finely to coarsely toothed, the toothing often regular, the teeth 8-50 per principal lobe; sinuses between the principal leaf lobes generally sharp, forming a definite angle (or if rounded, then the sinus much deeper than broad).
- 11 Leaves deeply lobed, the two sinuses on either side of the central lobe deep and narrow, approaching the midrib, the terminal lobe thus narrower at its base than at its middle; flowers either with petals (*A. palmatum*) or without petals (*A. saccharinum*).
- 12 Leaves green beneath (or purple in many forms); main leaf lobes 5-9, these main lobes merely toothed or in some cultivars variously further divided; [small exotic tree, commonly planted and weakly naturalizing]; [section *Palmata*] *Acer palmatum*
- 12 Leaves silvery white beneath; main leaf lobes 3-5, these main lobes with coarse teeth and smaller lateral lobes; [large native tree (also extensively planted)]; [section *Rubra*] *Acer saccharinum*
- 11 Leaves shallowly lobed, the two sinuses on either side of the central lobe broadly wedge-shaped, not approaching the midrib, the terminal lobe thus broadest at its base and progressively (though often irregularly) narrowing toward the tip; flowers with petals.
- 18 Mature leaves densely white tomentose (feltly-pubescent) beneath; petioles usually with white tomentum; mature samaras 2.7-5 cm long *Acer rubrum* var. *drummondii*
- 18 Mature leaves glabrous to densely pubescent (but not white-tomentose) beneath; petioles usually glabrous; mature samaras 1.5-3 cm long.
- 19 Leaves (3-) 5 (-9)-lobed, the central lobe 4-8 cm long, the 2 upper lateral lobes 2-5 cm long; leaf base generally cordate (rarely rounded); leaves 7-18 cm wide; [widespread, in nearly all habitats] *Acer rubrum* var. *rubrum*
- 19 Leaves unlobed or 3 (-5)-lobed, the central lobe 1-5 cm long, the lateral lobes (if present) 0.5-2 (-3) cm long; leaf base broadly cuneate to rounded or subcordate; leaves 2-10 cm wide; [primarily of wetlands, especially in the Coastal Plain] *Acer rubrum* var. *trilobum*

Acer floridanum (Chapman) Pax. SOUTHERN SUGAR MAPLE, FLORIDA MAPLE. **Hab:** Bottomland forests, mesic slopes, especially common over mafic or calcareous rocks, but not at all limited to such situations. **Dist:** S. VA, w. KY, se. MO, e. OK, c. OK, and n. TX, south to c. peninsular FL and e. TX. **Phen:** Apr-May; Jun-Oct. **Comm:** It is widely planted in southern cities and towns as a street tree. Ward (2004b) discusses the reasons for accepting *A. floridanum* as the correct name for this species; the Michauxian name *A. barbatum* is associated with specimens that are demonstrably *A. saccharum*. **Syn:** = K3, K4, Va; = *Acer barbatum* Michaux – C, IL, K1, Tx, misapplied; = *Acer saccharum* ssp. *floridanum* (Chapman) Desmarais – FL4, Mo2, RAB, Tn, WH3, Desmarais (1952), Murray (1970); = *Acer saccharum* Marshall var. *floridanum* (Chapman) Small & A. Heller – Ar; = *Saccharodendron barbatum* (Michaux) Nieuwland, misapplied; = *Saccharodendron floridanum* (Chapman) Nieuwland – S; > *Acer barbatum* var. *barbatum* – F, G, misapplied; > *Acer barbatum* var. *longii* (Fernald) Fernald – F, G, misapplied. **NatureServe** G4G5 (Apparently Secure).

Acer leucoderme Small. CHALK MAPLE. **Hab:** Rocky slopes and bluffs, particularly over mafic or calcareous rock, on the Gulf Coast in floodplains. **Dist:** A species of se. North America, primarily of the Piedmont from NC to AL, less commonly in the Ridge and Valley of se. TN (Chester, Wofford, & Kral 1997), low Blue Ridge of w. NC and adjacent TN and GA, Coastal Plain of Panhandle FL, GA, AL, MS, LA, and se. TX, and in sw. AR and se. OK. **Phen:** Mar-Apr; May-Sep. **Comm:** The leaves, at least those on lower and inner branches, tend to dry a tawny color and remain on the tree until spring, reminiscent of beech. **Syn:** = K1, K3, K4, W; = *Acer saccharum* ssp. *leucoderme* (Small) Desmarais – FL4, RAB, WH3, Desmarais (1952), Murray (1970); = *Acer saccharum* Marshall var. *leucoderme* (Small) Sargent – Ar; = *Saccharodendron leucoderme* (Small) Nieuwland – S. **NatureServe** G5 (Secure).

Acer negundo Linnaeus var. *negundo*. EASTERN BOX ELDER, ASH-LEAVED MAPLE, RIVER MAPLE, ARCE, FRESNO DE GUAJUICO. **Hab:** Riverbanks, swamps, bottomlands, also upslope on calcareous substrates. **Dist:** The species ranges nearly across North America, including well into the arid west along rivers. Var. *negundo* occurs from NB west to MB, south to c. peninsular FL and TX. **Phen:** Mar-Apr; May-Oct. **ID Notes:** *Acer negundo* often grows on the banks of rivers, leaning out over the water at a 45° angle. The leaves can resemble poison ivy (*Toxicodendron radicans*), which has alternate leaves. The coarse toothing (approaching lobing) distinguishes it readily from any of our ashes (*Fraxinus*). **Syn:** = K3, NY, Tx, Va; < *Acer negundo* – FL4, GW2, Mi, Pa, RAB, Tn, W, WH3; < *Acer negundo* Linnaeus var. *negundo* – K4; > *Acer negundo* Linnaeus var. *negundo* – Ar, C, F, G, GrPl, IL, K1, K3, Mo2, NcTx, NE, Murray (1970); > *Acer negundo* Linnaeus var. *texanum* Pax – Ar, C, F, G, IL, K1, Mo2, NcTx, Murray (1970); > *Acer negundo* Linnaeus var. *violaceum* (Kirchner) Jaeger – F, G, GrPl, IL, K1, K3, NE, Murray (1970); < *Negundo negundo* (Linnaeus) Karsten – S; < *Rulac negundo* (Linnaeus) A.S. Hitchcock.

* ***Acer palmatum*** Thunberg. JAPANESE MAPLE. **Hab:** Suburban woodlands. **Dist:** Native of e. Asia. **Phen:** Apr-May; Aug-Sep. **Comm:** Frequently planted in its numerous cultivars. Intraspecific taxa are recognized in its native area. It is also reported as escaped in the DC area (Shetler & Orli 2000). **Syn:** = IL, K1, K3, K4, NE, NY, Pa, Murray (1970). **NatureServe** GNR (Not Yet Ranked).

Acer rubrum Linnaeus var. *drummondii* (Hooker & Arnott ex Nuttall) Sargent. DRUMMOND'S MAPLE, SWAMP RED MAPLE, DRUMMOND'S RED MAPLE. **Hab:** Swamps and floodplains, often in deeply flooded situations. **Dist:** *A. rubrum* var. *drummondii* is probably limited to the Mississippi River basin and its immediate tributaries; reports from more eastern areas likely represent pubescent extremes of *Acer rubrum* var. *trilobum*. **Phen:** Jan-Mar; Mar-Jun. **Comm:** Saeki et al. (2011) show some (chloroplast) gene exchange between *Acer rubrum* var. *drummondii* and *A. saccharinum*. Additional study of the *Acer rubrum* complex is needed. **Syn:** = Ar, F, G, K1, K3, K4, Mo2, Tx; = *Acer drummondii* Hooker & Arnott ex Nuttall – IL, Tn; = *Acer rubrum* ssp. *drummondii* (Nuttall) A.E. Murray – Murray (1970); = *Rufacer drummondii* (Hooker & Arnott ex Nuttall) Small – S; < *Acer rubrum* – C, GW2, NcTx, RAB, Va, WH3. **NatureServe** G5T5 (Secure).

3 Stamens about 1× as long as the petals, included or barely exerted beyond the corolla; petals markedly unequal in size; fruit smooth.

.....*Aesculus pavia* var. *pavia*

Aesculus glabra Willdenow var. *glabra*. OHIO BUCKEYE, CHALKY BUCKEYE. **Hab:** Mesic upland and riparian forests, bluffs, ravines, stream banks; usually over calcareous substrates. **Dist:** Largely midwestern, but ranges east to sw. PA, e. TN, and nw. GA (Jones & Coile 1988); it is also sometimes introduced eastward of its native distribution. It occurs in TN counties adjacent to VA. Reported as likely planted and weakly naturalizing in Shenandoah County, VA (Domangue & McMullen 2013). **Phen:** Apr-May. **Syn:** = Ar, C, F, G, K1, K3, K4, NY, Du, Harris, & Xiang (2020), Hardin (1957a), Hardin (1957b); = *Aesculus glabra* – Tx; < *Aesculus glabra* – Mi, NE, Pa, S, Tn, WV; > *Aesculus glabra* Willdenow var. *glabra* – Il; > *Aesculus glabra* Willdenow var. *leucodermis* Sargent – Il.

Aesculus pavia Linnaeus var. *pavia*. RED BUCKEY. **Hab:** Coastal Plain marl forests (wet, calcareous flats), hardwood bluffs, rich floodplains of brownwater and blackwater rivers, basic-mesic forests, shell hammocks and shell middens, calcium-rich sandy soils in maritime forests. **Dist:** Var. *pavia* ranges from se. NC south to c. peninsular FL and west to e. TX, extending north in the Mississippi Embayment to se. MO and s. IL, and in scattered occurrences off the Coastal Plain, as in sc. TN; also it is sometimes cultivated inland and persistent or slightly naturalizing. Fernald (1950) reports *A. pavia* from VA and WV, but there is likely taxonomic or nomenclatural confusion. **Phen:** Apr-early May; Jul-Aug. **Tax:** Var. *flavescens* (Sargent) Correll occurs in the Edwards Plateau of c. TX. **Syn:** = K1, K3, K4, NcTx, Tx, Hardin (1957a), Hardin (1957b); > *Aesculus discolor* Pursh – F; < *Aesculus pavia* – C, Fl4, G, Il, RAB, S, Tn, W, WH3, Du, Harris, & Xiang (2020); > *Aesculus pavia* – F. NatureServe G5T5 (Secure).

240c. SAPINDACEAE A.L. de Jussieu 1789 (SOAPBERRY FAMILY) [in SAPINDALES]

A family of about 133-141 genera and 1465-1900 species, trees, shrubs, vines, and herbs, primarily of tropical (rarely temperate) regions of the Old World and New World. APG III (2009), Acevedo-Rodríguez et al. (2011), APG IV (2016), Buerki et al. (2021), and others have recently included Hippocastanaceae and Aceraceae in the Sapindaceae; though Buerki et al. (2009, 2010) made a well-reasoned case for recognition of the segregate families Xanthocerataceae, Aceraceae, Hippocastanaceae, Sapindaceae, and as more diagnosable families with long traditional usage (except Xanthocerataceae). References: Acevedo-Rodríguez et al (2011) in Kubitzki (2011); Brizicky (1963); Buerki et al (2009); Buerki et al (2010); Buerki et al (2021).

- 1 Leaves opposite; leaves either palmately compound, or simple (and then palmately lobed and/or toothed), or pinnately compound.
- 2 Leaves either simple (and palmately lobed and/or toothed) or pinnately compound; flowers radially symmetrical; fruit a schizocarp of 2 samaroid mericarps; [family Aceraceae; or subfamily Hippocastanoideae, tribe Acereae] **Acer**
- 2 Leaves palmately compound; flowers bilaterally symmetrical; fruit a capsule, usually with single large “nut-like” seed; [family Hippocastanaceae; or subfamily Hippocastaoideae, tribe Hippocastaneae] **Aesculus**
- 1 Leaves alternate; leaves compound (if unifoliolate and thus appearing simple [*Dodonaea*], then unlobed and with entire margins) **Cardiospermum**
- 8 Fruits dehiscent, a capsule with papery, membranaceous, coriaceous, or woody valves. **Koelreuteria**
- 8 Fruits indehiscent, with a leathery exterior. **Koelreuteria**
- 12 xxxx
- 12 yyyy

Cardiospermum Linnaeus 1753 (BALLOON VINE)

A genus of about 14-15 species, vines, of tropical America. References: Acevedo-Rodríguez et al (2011) in Kubitzki (2011); Brizicky (1963).

Cardiospermum halicacabum Linnaeus. BALLOON VINE, HEARTSEED, LOVE-IN-A-PUFF. **Hab:** Thickets, riverbanks, cultivated or abandoned fields, other disturbed areas. **Dist:** Probably native in at least the southwestern part of our area, south through tropical America. Its native distribution is obscured by later cultivation and spread. André Michaux collected in the region of Illinois in the 1790s, an earlier period to assume that it was non-native.

Phen: (Jan-) Jun-Sep (-Dec). **Syn:** = Ar, Bah, F, Fl4, G, GrPl, Il, K1, K3, K4, Mi, NcTx, NE, NY, Pa, RAB, S, Tn, Tx, Va, WH3; = *Cardiospermum halicacabum* – C, orthographic error; = *Cardiospermum halicacabum* var. *halicacabum* – Brizicky (1963). NatureServe G5 (Secure).

Koelreuteria Laxmann 1772 (GOLDEN RAIN TREE)

A genus of 4 species, trees, of temperate China, Taiwan, and Japan. References: Acevedo-Rodríguez et al (2011) in Kubitzki (2011); Meyer (1976).

240c. SAPINDACEAE

- 1 Leaves pinnate (rarely bipinnate in part), the leaflets coarsely crenate to lobulate; capsule valves ovate, ca. 2 × as long as wide; capsules greenish to tawny when young, aging to dark brown..... *Koelreuteria paniculata*
- 1 Leaves bipinnate, the leaflets entire to shallowly serrate; capsule valves orbicular, 0.9-1.4 × as long as wide; capsules rose-purple when young, aging to tawny-brown..... *Koelreuteria henryi*

* *Koelreuteria henryi* Dümmer. FLAMEGOLD. **Hab:** Disturbed areas, roadsides. **Dist:** Native of Taiwan. **Tax:** This taxon appears to be distinct morphologically and geographically from *K. elegans*, and warrants recognition at the species level. Becoming popular horticulturally, and producing abundant seedlings near the planted specimens; potentially invasive, and becoming established in various areas in the Deep South. **Syn:** = *Koelreuteria elegans* (Seemann) A.C. Smith ssp. *formosana* (Hayata) F.G. Meyer – Fl4, K1, K3, K4, WH3, Meyer (1976). NatureServe GNRTNR (Not Yet Ranked).

* *Koelreuteria paniculata* Laxmann. GOLDEN RAIN TREE. **Hab:** Disturbed areas, roadsides, frequently cultivated as an ornamental tree, rarely escaped. **Dist:** Native of n. China. **Phen:** May-Aug; Sep-Oct. **Syn:** = Ar, C, F, G, Il, K1, K3, K4, NE, NY, Pa, RAB, Meyer (1976). NatureServe GNR (Not Yet Ranked).

*Sapindus* Linnaeus 1753 (SOAPBERRY)

A genus of about 10-13 species, trees, of tropical and warm temperate regions of the Old and New World. References: Acevedo-Rodríguez et al (2011) in Kubitzki (2011); Brizicky (1963); McNair & Andresen (2020).

Sapindus marginatus Willdenow. FLORIDA SOAPBERRY. **Hab:** Coastal marsh hammocks, shell middens. **Dist:** Se. SC and e. GA south to c. peninsular FL (Lee and Brevard counties), and on the Gulf Coast in s. MS. **Phen:** May-Jun. **Tax:** Although sometimes combined with the tropical *Sapindus saponaria*, I follow most Florida authors (Clewett 1985, Tomlinson 1986, Godfrey 1988, Nelson 1994, Nelson 1996) in maintaining it as distinct. *S. marginatus* is a species of n. FL, e. GA, and possibly SC and has wingless rachises, acuminate leaflets, and globose fruits; *S. saponaria* is a species of s. FL and tropical America and has winged rachises, rounded leaflet tips, and ovoid to globose fruits. **Comm:** Small (1933) reports this species from SC, based on collections by Mellichamp at Bluffton; there are no recent records. **Syn:** = K4, RAB, S, Brizicky (1963); < *Sapindus saponaria* – Fl4, WH3; < *Sapindus saponaria* Linnaeus var. *saponaria* – K1, K3.

241. RUTACEAE A.L. de Jussieu 1789 (CITRUS FAMILY) [in SAPINDALES]

A family of about 154-156 genera and 1800-2100 species, trees, shrubs, vines, and rarely herbs, cosmopolitan (but mainly tropical and subtropical). Subfamily classification follows Appelhans et al. (2021). References: Appelhans et al (2018); Appelhans et al (2021); Kubitzki, Kallunki, Durretto, & Wilson in Kubitzki (2011).

- 3 Leaves either simple, or unifoliate and appearing simple..... *Citrus*
- 3 Leaves pinnately or palmately compound (1-foliate leaves sometimes also present).
- 6 Leaves 1-pinnate, either odd-pinnate and (3-) 5-19-foliate or even-pinnate and (4-) 6-8 (-14)-foliate..... *Zanthoxylum*
- 6 Leaves palmately 3-foliate.
- 12 Branches armed with axillary spines; fruit a hesperidium; [subfamily Aurantioideae]..... *Citrus trifoliata*
- 12 Branches unarmed; fruit a drupe, few-seeded berry, or samara..... *Ptelea*

Citrus Linnaeus 1753

(Citrus, Orange, Grapefruit, Lemon, Lime, Citron, Pummelo, Kumquat, Trifoliate Orange). References: Araújo, Queiroz, & Machado (2003); Kubitzki (2011); Mabberley (1997); Nesom (2014a); Pfeil & Crisp (2008).

A genus of about 27-35 species, trees, of s. and se. Asia. Recent studies (followed here) provide compelling arguments in favor of a broad circumscription including *Poncirus* and *Fortunella*, based on DNA analyses and other considerations (Bayer et al. 2009; Araújo, Queiroz, & Machado 2003; Mabberley 1997). The recognition of *Poncirus* and other segregate genera would render *Citrus* paraphyletic because of the position of *Citrus medica* (the type species of *Citrus*) as basal to these genera and the rest of *Citrus*.

N : no X : extirpated
P : planted
? : questionable

241. RUTACEAE

Identification Notes: *Citrus* has simple to trifoliate, evergreen, coriaceous, acuminate, glossy green leaves, and the familiar spherical fruits. *Citrus ×limon* (Linnaeus) Burman f., Lemon, *C. ×paradisi* Macfadyen in Hooker (pro sp.), Grapefruit, and *C. ×sinensis* (Linnaeus) Osbeck, Orange, have been grown on the Outer Banks of North Carolina in Buxton, Dare County, NC (Brown 1959). They are apparently not naturalized there, being killed outright or severely damaged by occasional colder winters, and are not keyed or otherwise treated here.

* ***Citrus trifoliata*** Linnaeus. TRIFOLIATE ORANGE, HARDY ORANGE. **Hab:** Bottomland and riparian forests, mesic upland forests, stream banks, spring runs, fencerows, roadsides, becoming common especially in suburban areas. **Dist:** Native of temperate China. See Nesom (2014a) for a detailed discussion of various aspects of this species in the se. United States. **Phen:** Mar-Jun; Sep-Oct. **Tax:** *Citrus trifoliata* is often placed in a separate genus, *Poncirus*, but differs very little from *Citrus* morphologically, has been shown to be phylogenetically nested within *Citrus* (Araújo, Queiroz, & Machado 2003), and thus seems best included in *Citrus*. **Comm:** Planted in our area as an ornamental, as a "living fence", and also used as a grafting stock for citrus, *C. trifoliata* is a small tree or shrub that seems to be made up almost entirely of "thorns" (actually, stipular spines). The fruits closely resemble an orange, but are small (ca. 4 cm in diameter), densely pubescent, and sour. **Syn:** = Ar, K3, Tx, Va, Araújo, Queiroz, & Machado (2003), Nesom (2014a); = *Poncirus trifoliata* (Linnaeus) Rafinesque – F, Fl4, G, Il, K1, NcTx, Pa, RAB, S, Tn, WH3. **NatureServe GNR** (Not Yet Ranked).

Ptelea Linnaeus 1753 (HOP-TREE, WAFER-ASH, STINKING ASH)

A genus of 3-11 species, shrubs and small trees, of North America (south into Mexico). References: Bailey (1962); Bailey, Herlin, & Bailey (1970); Kubitzki (2011); Skornia, Yang, & Applequist (2015).

- 1 Lower leaf surface and petiole densely to moderately pubescent throughout, usually more or less villous. *Ptelea trifoliata* var. *mollis*
 1 Lower leaf surface and petiole glabrous to sparsely pubescent. *Ptelea trifoliata* var. *trifoliata*

Ptelea trifoliata Linnaeus var. *mollis* Torrey & A. Gray. HAIRY WAFER-ASH. **Hab:** Moist to dry forests, woodlands, and outcrops over calcareous or mafic substrates. **Phen:** Apr-Jun; Jun-Aug. **Syn:** = F, Il; = *Ptelea trifoliata* ssp. *trifoliata* var. *mollis* Torrey & A. Gray – C, K1, K3, NcTx, Tx, Bailey (1962), Skornia, Yang, & Applequist (2015); = *Ptelea trifoliata* var. *tomentosa* – S; < *Ptelea trifoliata* Linnaeus – Fl4, RAB, Va, WH3; < *Ptelea trifoliata* ssp. *trifoliata* – K4; > *Ptelea trifoliata* var. *deamiana* Nieuwland – G.

Ptelea trifoliata Linnaeus var. *trifoliata*. COMMON WAFER-ASH. **Hab:** Rocky hillsides, glades, and barrens, especially over calcareous or mafic rocks, prairies, prairie woodlands. **Dist:** NY west to WI, south to FL and TX. **Phen:** Apr-Jun; Jun-Aug. **Syn:** = F, G, Il, NY; > *Ptelea microcarpa* Small – S; > *Ptelea serrata* Small – S; < *Ptelea trifoliata* Linnaeus – Ar, Fl4, Mi, Pa, RAB, Tn, Va, WH3; < *Ptelea trifoliata* ssp. *trifoliata* – GrPl, K4; < *Ptelea trifoliata* ssp. *trifoliata* var. *trifoliata* – C, K1, K3, NE, Tx, Bailey (1962), Skornia, Yang, & Applequist (2015); > *Ptelea trifoliata* Linnaeus var. *trifoliata* – S.

Zanthoxylum Linnaeus 1753 (PRICKLY-ASH, TOOTHACHE TREE)

A genus of about 225-250 species, trees, of America, Africa, Asia, and Australia. References: Appelhans et al (2018); Kubitzki (2011); Porter (1976).

Zanthoxylum clava-herculis Linnaeus. SOUTHERN TOOTHACHE TREE, HERCULES'-CLUB, SEA-ASH, SOUTHERN PRICKLY-ASH, PEPPER-BARK, TICKLE-TONGUE. **Hab:** Maritime forests, dunes, shell middens, shell hammocks, maritime scrub, inland (in FL and GA) in hammocks. **Dist:** A Southeastern Coastal Plain endemic: se. VA south to s. FL and west to TX, AR, and OK. In the northern part of its distribution, it is restricted to the outer Coastal Plain, nearly entirely on barrier islands. **Phen:** Apr-May; Jun-Sep. **Comm:** Many of the common names come from the numbing effect on the mouth of chewing the leaf or twig, the flavor, smell, and effect being very similar to *Ctenium aromaticum*, Toothache Grass. **ID Notes:** The compound leaves are armed with stout prickles along the rachis. The twigs are also spiny. On the larger branches and trunks, the spines become elevated on conical, pyramidal, or cylindrical corky bases up to 5 cm long and 4 cm in diameter, giving the trunk a very peculiar appearance. Although normally a small tree, it can reach considerable size, up to about 60 cm DBH. **Syn:** = Ar, C, Fl4, G, K1, K3, K4, NcTx, RAB, S, Tx, Va, WH3, Porter (1976); = *Zanthoxylum clava-herculis* – F, orthographic variant. **NatureServe G4** (Apparently Secure).

242. SIMAROUBACEAE A.P. de Candolle 1811 (QUASSIA FAMILY) [in SAPINDALES]

A family of about 13-22 genera and 110-115 species, trees and shrubs of primarily tropical areas of the New World and Old World. The Leitneriaceae has been traditionally considered to be a monotypic family, endemic to se. North America; a variety of recent studies have suggested its

242. SIMAROUBACEAE

inclusion in the Simaroubaceae (Angiosperm Phylogeny Group 2009, 2016; Bogle in FNA 1997). References: APG (2009); APG (2016); Bogle (1997) in FNA3 (1997); Clayton in Kubitzki (2011).

- 1 Leaves odd-pinnately compound.

.....*Ailanthus altissima*

- 1 Leaves simple or unifoliate (appearing simple).

.....*Leitneria*

***Ailanthus* Desfontaines 1788 (TREE-OF-HEAVEN)**

A genus of 5 species, trees, native to Asia and Australia. References: Clayton in Kubitzki (2011); Hu (1979).

* ***Ailanthus altissima*** (P. Miller) Swingle. TREE-OF-HEAVEN, COPAL TREE, STINK-TREE. **Hab:** Roadsides, forests, disturbed areas, including cities, especially in moist, fertile soils. **Dist:** Native of e. Asia. In our area, this tree is now an aggressive and noxious weed, colonizing even undisturbed forests and outcompeting the native vegetation. **Phen:** Apr-Jun; Jul-Oct. **ID Notes:** *Ailanthus altissima* can be recognized vegetatively by its large pinnately compound leaves, very stout twigs (often over 1 cm thick), and the characteristic and unpleasant odor of the crushed foliage. **Syn:** = Ar, C, F, Fl4, G, GrPl, Il, K1, K3, K4, Mi, NcTx, NE, NY, Pa, RAB, S, Tn, Tx, Va, W, WH3. NatureServe GNR (Not Yet Ranked).

E. and se. Asia

***Leitneria* Chapman 1860 (CORKWOOD)**

As reinterpreted by Schrader & Graves (2011), a genus of 2 species, one with 2 subspecies, endemic to disjunct areas of se. North America. Yatskievych (2013) expressed skepticism that the three disjunct populations are reliably distinct based on the morphological characters presented by Schrader & Graves (2011); the combination of morphological characters, genetic differentiation, and disjunct isolation warrants taxonomic recognition of the three populations. Historically, the genus has sometimes been placed in its own family, Leitneriaceae. References: Bogle (1997) in FNA3 (1997); Channell & Wood (1962); Clayton in Kubitzki (2011); Schrader & Graves (2011).

EN

Leitneria pilosa J.A. Schrader & W.R. Graves *ssp. ozarkana* J.A. Schrader & W.R. Graves. MISSISSIPPI CORKWOOD. **Hab:** Bottomland hardwood forests, sand ponds, swamps, marshes, ditches. **Dist:** MO south to w. MS and se. AR. Possible occurrences in the e. Ozarks of AR and MO are uncertainly documented. **Phen:** Mar; May-Jun. **Syn:** = Schrader & Graves (2011); < *Leitneria floridana* Chapman – Ar, FNA3, GW2, K1, K3, K4, S.

243. MELIACEAE A.L. de Jussieu 1789 (MAHOGANY FAMILY) [in SAPINDALES]

A family of about 50 genera and 565-575 species, trees and shrubs, of tropical and subtropical areas. References: Mabberley in Kubitzki (2011).

***Melia* Linnaeus 1753 (CHINABERRY)**

A genus of 3 species, trees, of the Old World tropics. References: Mabberley in Kubitzki (2011); Miller (1990).

* ***Melia azedarach*** Linnaeus. CHINABERRY, CAROLINA MAHOGANY, UMBRELLA-TREE, PRIDE-OF-INDIA, WHITE CEDAR, PERSIAN LILAC. **Hab:** Disturbed areas, abandoned rural yards and fields; commonly cultivated in our area (mainly in the Coastal Plain) and commonly escaped. **Dist:** Native of se. Asia (Indomalesia). **Phen:** Apr-May; Sep-Oct. **Comm:** The fruits are sometimes used as beads; they are very poisonous if ingested. **Syn:** = Bah, C, F, Fl4, G, K1, K3, K4, NcTx, RAB, S, Tn, Tx, Va, WH3, Miller (1990). NatureServe GNR (Not Yet Ranked).

E. and se. Asia

247. MALVACEAE A.L. de Jussieu 1789 (MALLOW FAMILY) [in MALVALES]

A family of about 243 genera and 4000-4500 species, herbs, shrubs, and trees, of cosmopolitan distribution, but especially diverse in the tropics and subtropics. Malvaceae has always been difficult to circumscribe cleanly, relative to members of such families as Sterculiaceae and Tiliaceae. Molecular evidence now adds to morphologic evidence that traditional circumscriptions of these families are highly polyphyletic. Bayer et al. (1999) present a classification of an expanded Malvaceae, with 9 subfamilies recognized. This family includes several economically important species, including cotton (*Gossypium* spp.), cacao or chocolate (*Theobroma cacao* Linnaeus), and cola (*Cola acuminata* R. Brown). References: Bayer & Kubitzki in Kubitzki & Bayer (2003); Bayer et al (1999); Fryxell (1988); Hanes (2015) in FNA6 (2015).

- 1 Petals absent; carpels 5, whorled, each expanding into a stalked and papery structure which bears 1-4 pea-sized seeds along its margins; tree; leaves 10-40 cm wide, 3-5 lobed, the lobes acute, the margins entire; [subfamily *Sterculioideae*].....*Firmiana*
- 1 Petals present; carpels 1, 5, or many, united or separate, but not as above; tree, shrub, or herb; leaves < 15 cm wide, lobed or unlobed, but if lobed then also serrate.
- 2 Epicalyx of bracts (immediately subtending the calyx) absent.
- 3 Stamens 3 or 5; [subfamily *Byttnerioideae*].....*Melochia*

- 3 Stamens >10.

- 6 Stamens free.

- 7 Tree; fruit a woody drupe; [subfamily *Tilioideae*]..... *Tilia*
 7 Herb or shrub; fruit a capsule; [subfamily *Grewioideae*, tribe *Apeibeae*]..... *Corchorus*
- 6 Stamens united into a staminal column adnate to the corolla at its base; [subfamily *Malvoideae*; tribe *Malveae*].
 9 Seeds 2 or more per carpel *Abutilon*
 9 Seed 1 per carpel.
 10 Leaves palmately and deeply cleft (> 9/10s of the way to the midrib) into linear segments *Callirhoe*
 10 Leaves unlobed or lobed (if lobed, < 4/5's of the way to the midrib and the lobes broad).
 12 Corolla blue to purple; lateral walls of the carpels disintegrating at maturity of the fruit..... *Anoda*
 12 Corolla yellow or white; lateral walls of the carpels persistent *Sida*
- 2 Epicalyx of bracts (immediately subtending the calyx) present.
 14 Fruit a loculicidal capsule or fleshy and berry-like.
 15 Fruit fleshy and berry-like; [subfamily *Malvoideae*; tribe *Hibisceae*]..... *Malvaviscus*
 15 Fruit a loculicidal capsule.
 16 Calyx spathe-like, soon falling after anthesis; [subfamily *Malvoideae*; tribe *Hibisceae*]..... *Abelmoschus*
 16 Calyx radially symmetrical, 5-lobed.
 17 Style branches short, erect, the stigmas nearly sessile; epicalyx bracts 3, large, foliaceous, and incised; seeds bearing long white fibers; [subfamily *Malvoideae*; tribe *Gossypiae*]..... *Gossypium*
 17 Style branches elongate, spreading; epicalyx bracts 6-15, linear to lanceolate and untoothed; seeds sometimes pubescent but not with long white fibers; [subfamily *Malvoideae*; tribe *Hibisceae*].
 18 Locules of the fruit several-seeded; capsule longer than broad, the apex pointed or rounded; petals yellow, white, red, or pink (if pink, then > 4 cm long, or the plant a shrub)..... *Hibiscus*
 18 Locules of the fruit 1-seeded; capsule depressed-globose, indented at the apex; petals pink, 2-4 cm long *Kosteletzkya*
- 14 Fruit of radially disposed, 1- to several-seeded, dry carpels that split apart at maturity.
 19 Bracts of the epicalyx 5 or more. *Alcea*
 19 Bracts of the epicalyx 2-3; [subfamily *Malvoideae*; tribe *Malveae*].
 23 Ovules and seeds 2 or more per carpel. *Modiola*
 23 Ovules and seeds 1 per carpel.
 25 Leaf blades 1.5-8× as long as wide. *Callirhoe*
 25 Leaf blades orbicular, about as wide as long.
 27 Leaves deeply palmately cleft..... *Callirhoe*
 27 Leaves unlobed or shallowly lobed..... *Malva*

***Abelmoschus* Medikus 1787 (OKRA, GUMBO)**

A genus of about 15 species, herbs, of the Old World tropics. Perhaps better included in a broadly circumscribed *Hibiscus* (Pfeil & Crisp 2005). References: Bates (2015a) in FNA6 (2015); Bayer & Kubitzki in Kubitzki & Bayer (2003).

* ***Abelmoschus esculentus*** (Linnaeus) Moench. OKRA, GUMBO. **Hab:** Frequently cultivated in gardens, rarely persistent or self-seeding the year following. **Dist:** Native of Africa. Reported for AR (Serviss & Peck 2017). **Phen:** Jun-Sep. **Comm:** The young capsules are a famous component of southern cooking. **Syn:** = Bah, Fl4, FNA6, Il, K1, K3, K4, Mi, NcTx, NE, S, WH3; = *Hibiscus esculentus* Linnaeus – F; = n/a – RAB. NatureServe GNR (Not Yet Ranked).

***Abutilon* P. Miller 1754 (ABUTILON, INDIAN-MALLOW, INDIAN-HEMP)**

A genus of about 100-160 species, herbs, of tropical and warm temperate areas. References: Bayer & Kubitzki in Kubitzki & Bayer (2003); Fryxell & Hill (2015a) in FNA6 (2015); Fryxell (2002).

* ***Abutilon theophrasti*** Medikus. VELVETLEAF, PIE-MARKER, BUTTERPRINT, CHINA-JUTE. **Hab:** Crop fields, roadsides, disturbed areas. **Dist:** Native of s. Asia. **Phen:** Jun-Oct. **Syn:** = Ar, Bah, C, F, Fl4, FNA6, G, GrPl, K3, K4, Mi, NcTx, NE, NY, Tn, Tx, Va, W, WH3, WI, Fryxell (2002); = *Abutilon abutilon* (Linnaeus) Rusby – S; = *Abutilon theophrastii* – Il, Pa, RAB, orthographic variant. NatureServe GNR (Not Yet Ranked).

***Alcea* Linnaeus 1753 (HOLLYHOCK)**

A genus of about 50-60 species, warm temperate Eurasian (Mediterranean Europe to c. Asia). References: Bayer & Kubitzki in Kubitzki & Bayer (2003); Hill (2015a) in FNA6 (2015).

* ***Alcea rosea*** Linnaeus. HOLLYHOCK, AMAPOLA GRANDE. **Hab:** Roadsides, dumps, frequently cultivated, less commonly escaped or persistent. **Dist:** Native of Eurasia. Reported for AR (Serviss & Peck 2017). **Phen:** May-Sep. **Syn:** = FNA6, Il, K1, K3, K4, Mi, NcTx, NE, NY, Tn, Va; = *Althaea rosea* (Linnaeus) Cavanilles – C, F, G, GrPl, RAB, Tx. Anoda Cavanilles 1785 (ANODA)

A genus of about 24 species, herbs, of sw. North America, Central America, and South America. References: Bayer & Kubitzki in Kubitzki & Bayer (2003); Fryxell & Hill (2015b) in FNA6 (2015).

* ***Anoda cristata*** (Linnaeus) Schlechtendal. SPURRED ANODA, VIOLETA. **Hab:** Cultivated and fallow fields, other disturbed areas. **Dist:** Native of sw. United States, Mexico, and Central and South America. **Phen:** Jun-Oct. **Syn:** = Fl4, FNA6, G, Il, K1, K3, K4, NE, NY, RAB, Tn, Va, WH3; = *Anoda crista* – C, orthographic variant; > *Anoda cristata* var. *brachyanthera* (Reichenbach) Hochreutiner – F; > *Anoda cristata* var. *cristata* – F. [NatureServe G5](#) (Secure).

*Callirhoe* Nuttall 1821 (POPPY-MALLOW)

A genus of about 9 species, herbs, of North America. References: Bayer & Kubitzki in Kubitzki & Bayer (2003); Dorr (1990); Dorr (2015c) in FNA6 (2015).

- 4 Bractlets of the epicalyx linear, 0.1-1.7 mm wide; peduncles 1-flowered; calyx lobes lanceolate, 7-15.4 mm long; mericarps indehiscent; leaves cordate or ovate in outline, palmately deeply divided into 5-7 lobes..... ***Callirhoe papaver***
 4 Bractlets of the epicalyx obovate, 2.5-4.6 mm wide; peduncles several-flowered; calyx lobes deltoid, 2-5 (-6.5) mm long; mericarps dehiscent; leaves triangular, not lobed or only slightly so ***Callirhoe triangulata***

Callirhoe papaver (Cavanilles) A. Gray. WOODS POPPY-MALLOW. **Hab:** Longleaf pine woodlands, dry hammocks, glades, barrens, prairies, forest openings. **Dist:** N. peninsular FL, Panhandle FL, and sw. GA (Carter, Baker, & Morris 2009) west to e. TX and s. AR (Dorr 1990). **Phen:** May-Jul. **Syn:** = F, Fl4, FNA6, G, K1, K3, K4, Tx, WH3, Dorr (1990); = *Callirrhoë papaver* – S, orthographic variant. [NatureServe G5](#) (Secure).

Callirhoe triangulata (Leavenworth) A. Gray. SAND POPPY-MALLOW, CLUSTERED POPPY-MALLOW. **Hab:** Longleaf pine sandhills, sandy scrub, and other dry, open habitats. **Dist:** Sc. NC south to GA (and n. FL?), and west to ec. MS; also sw. WI and ne. IA south to s. IN, s. IL, and se. MO. **Phen:** Jul-Aug. **Syn:** = C, F, Fl4, FNA6, G, Il, K1, K3, K4, WH3, Dorr (1990); = *Callirrhoë triangulata* – S, orthographic variant. [NatureServe G3](#) (Vulnerable).

*Corchorus* Linnaeus 1753 (JUTE)

A genus of 40-100 species, shrubs and herbs, broadly tropical and subtropical in distribution. References: Bayer & Kubitzki in Kubitzki & Bayer (2003); Nesom (2015c) in FNA6 (2015).

* ***Corchorus aestuans*** Linnaeus. JUTE. **Hab:** Roadsides, other disturbed ground. **Dist:** Native of Asia. Reported for Thomas County, GA (Carter, Baker, & Morris 2009). **Phen:** Jan-Dec. **Syn:** = Bah, Fl4, FNA6, K3, WH3, WI; > *Corchorus acutangulus* Lamarck – S. [NatureServe GNR](#) (Not Yet Ranked).

*Firmiana* Marsili 1786 (CHINESE PARASOL-TREE, PHOENIX TREE)

A genus of about 12 species, trees, of Africa and Asia. References: Bayer & Kubitzki in Kubitzki & Bayer (2003); Brizicky (1966); Dorr (2015a) in FNA6 (2015); Whetstone (1983).

* ***Firmiana simplex*** (Linnaeus) W. Wight. CHINESE PARASOL-TREE, PHOENIX TREE. **Hab:** Planted and naturalized nearby. **Dist:** Native of se. Asia, probably China. **Phen:** May-Aug; Jun-Oct. **Syn:** = C, Fl4, FNA6, K1, K3, K4, NcTx, WH3, Brizicky (1966), Whetstone (1983); = *Firmiana platanifolia* (Linnaeus f.) Schott & Endlicher – RAB, S. [NatureServe GNR](#) (Not Yet Ranked).

*Gossypium* Linnaeus 1753 (COTTON)

A genus of about 40-50 species, herbs, shrubs, and trees, of warm temperate to tropical areas. References: Bayer & Kubitzki in Kubitzki & Bayer (2003); Fryxell & Hill (2015f) in FNA6 (2015); Fryxell (1969); Fryxell (1976); Fryxell (1979); Fryxell (1992); Wendel & Grover (2015).

Identification Notes: Agricultural cotton is now a complex set of cultivars, some involving cross-breeding between *Gossypium barbadense* and *Gossypium hirsutum*, and some plants may not be readily identifiable to species.

Gossypium hirsutum Linnaeus. UPLAND COTTON, SHORT-STAPLE COTTON. **Hab:** Coastal hammocks, rockland hammock edges, coastal rock barrens (in FL peninsula), disturbed areas, a frequently cultivated crop, especially in sandy soils of the Coastal Plain, rarely adventive or a waif where grown. **Dist:** Native of Central America, South America, the West Indies, and s. FL. **Phen:** Jul-Sep. **Tax:** Plants in the FL Keys have larger and creamy white to pinkish flowers and petals with a maroon blotch near the base, while those from mainland s. FL have smaller flowers and uniformly pale yellowish petals, perhaps reflecting different races (R. Hammer, pers.comm., 2019). Several varieties were invalidly named based on FL material (Fryxell (1976). **Comm:** Probably first domesticated in the Yucatan Peninsula. **Syn:** = Ar, C, FI4, FNA6, G, IL, K4, NcTx, NY, Tx, WH3, Fryxell (1969), Fryxell (1992); = *Gossypium herbaceum* Linnaeus – F, misapplied; > *Gossypium herbaceum* Linnaeus – S; > *Gossypium hirsutum* Linnaeus – S, misapplied; > *Gossypium hirsutum* var. *hirsutum* – K1, K3, NE. NatureServe G4G5T4T5 (Apparently Secure).

Hibiscus Linnaeus 1753 (HIBISCUS, ROSE-MALLOW)

A genus of about 200-300 species, trees, shrubs, and herbs, of tropical to warm temperate areas. References: Bayer & Kubitzki in Kubitzki & Bayer (2003); Blanchard (2008); Blanchard (2015a) in FNA6 (2015); Craven et al (2011); Murray, Craven, & de Lange (2008); Shiller (1960); Wise & Menzel (1971).

- 1 Woody shrub, the stems usually solitary from a creeping rhizome; [section *Hibiscus*] **Hibiscus syriacus**
- 1 Herb (sometimes robust and to as tall as 3.5 m), often several from ground level, from a crown or taproot.
 - 2 Annual from a taproot, to 0.5 m tall; calyx inflated at maturity; capsule 1.0-1.3 cm long; petals 1.5-3 (-4) cm long; leaves 2-6 cm long, deeply cleft; [section *Trionum*] **Hibiscus trionum**
 - 2 Perennial from a crown, usually 0.7-3.5 m tall; calyx not inflated at maturity; capsule 1.7-3.5 cm long; petals 4-14 cm long; leaves 4-25 cm long, deeply cleft, hastate-lobed, or not at all lobed or cleft.
 - 3 Leaves and stems harshly scabrous; calyx lobes each with an elongate purplish nectary on the back; [of pine savannas and dry sandy soils of maritime forest edges, from se. NC southward]; [section *Furcaria*] **Hibiscus aculeatus**
 - 3 Leaves and stems glabrous, softly pubescent, or slightly scabrous; calyx lobes lacking nectaries; [of marshes and swamps (sometimes cultivated in drier soils), collectively widespread in our area]; [section *Muenchhusia*].
 - 4 Stem glabrous; leaves glabrous; leaves either palmately 3-5-lobed, or prominently halberd-lobed at the base (uncommonly unlobed).
 - 5 Leaves either palmately 3-5-lobed; petals bright scarlet **Hibiscus coccineus**
 - 5 Leaves halberd-lobed at the base (uncommonly unlobed); petals pink or white with a purplish base **Hibiscus laevis**
 - 4 Stem pubescent at least when young; leaves pubescent on at least one surface; leaves unlobed or slightly lobed toward the tip (except *H. grandiflorus*).
 - 6 Staminal column 6.2-9.5 cm long, > 2/3 x as long as the petals; petals 8.5-14 cm long; [e. GA southward] **Hibiscus grandiflorus**
 - 6 Staminal column 1.2-5 cm long, < 1/2 x as long as the petals; petals 4-12 cm long; [widespread].
 - 7 Capsule glabrous and dark brown to black; bracts of involucre ciliate; upper leaf surface glabrous or nearly so **Hibiscus moscheutos**
 - 7 Capsule pubescent (the dark surface largely or completely obscured); bracts of the involucre usually ciliate; upper leaf surface usually moderately densely stellate-pubescent.
 - **Hibiscus lasiocarpus**

Hibiscus aculeatus Walter. SAVANNA HIBISCUS, COMFORT-ROOT. **Hab:** Pine savannas, swamp forests, dry sandy or loamy soils of maritime forest edges. **Dist:** Se. NC south to sc. peninsular FL, west to LA and extreme e. TX. **Phen:** Jun-Aug; Jul-Sep. **Syn:** = FI4, FNA6, GW2, K1, K3, K4, RAB, S, WH3. NatureServe G4G5 (Apparently Secure).

Hibiscus coccineus Walter. SCARLET HIBISCUS. **Hab:** Marshes, swamp forests, roadside swales, cultivated as an ornamental in yards, in much of our area presumably introduced from farther south, but sometimes appearing native. **Dist:** S. GA and s. AL south to s. FL, west to s. AL, and s. MS (a wider distribution is the result of naturalization from horticultural use). **Phen:** (Feb-) Apr-Aug. **Syn:** = Ar, FI4, FNA6, GW2, K1, K3, K4, S, Va, WH3. NatureServe G4? (Apparently Secure).

Hibiscus grandiflorus Michaux. LARGE-FLOWERED HIBISCUS, SWAMP HIBISCUS. **Hab:** Tidal marshes, swamps, lakeshores, wet pine flatwoods and savannas. **Dist:** E. GA (Chatham Co., adjacent to the SC border) (Jones & Coile 1988) and historically apparently in se. SC (Mellichamp 1889) south to s. FL, west to e. LA; w. Cuba. **Phen:** (May-) Jun-Aug (-Sep). **Syn:** = FI4, FNA6, GW2, K1, K3, K4, S, WH3, WI. NatureServe G4? (Apparently Secure).

Hibiscus laevis Allioni. SMOOTH ROSE-MALLOW, HALBERD-LEAVED MARSH-MALLOW, SHOWY HIBISCUS. **Hab:** Freshwater marshes, exposed riverbanks, sandbars. **Dist:** S. PA south to FL Panhandle, west to TX; north in the interior to around the Great Lakes. **Phen:** Jun-Aug (-Nov); Aug-Oct (-Dec). **Syn:** = Ar, C, FI4, FNA6, GrPl, IL, K1, K3, K4, Mi, NcTx, NY, Pa, Tn, Va, W, WH3; = *Hibiscus militaris* Cavanilles – F, G, GW2, RAB, S, Tx, WV.

Hibiscus lasiocarpus Cavanilles. WESTERN ROSE-MALLOW. **Hab:** Marshes, swamps. **Dist:** KY, IN, IL, MO, KS, and NM south to Panhandle FL (?), AL, MS, LA, and TX. **Phen:** Jul-Oct. **Syn:** = GrPl, Tx, Shiller (1960); < *Hibiscus lasiocarpus* Cavanilles – Ar, F, GW2, IL, S; < *Hibiscus lasiocarpus* – G, orthographic variant; < *Hibiscus moscheutos* Linnaeus – FI4, WH3; < *Hibiscus moscheutos* Linnaeus ssp. *lasiocarpus* (Cavanilles) O.J. Blanchard – FNA6, K1, K3, K4, NcTx, Blanchard (2008); < *Hibiscus moscheutos* ssp. *lasiocarpus* – Tn, orthographic variant; < *Hibiscus moscheutos* Linnaeus var. *occidentalis* Torrey – C.

Hibiscus moscheutos Linnaeus. EASTERN ROSE-MALLOW. **Hab:** Marshes, swamps, river sandbars. **Dist:** E. MA west to MI, south to c. peninsular FL and e. TX. **Phen:** Jun-Oct; Jul-Oct. **Syn:** = GrPl, IL, Mi, Pa, Tx, Va; = *Hibiscus moscheutos* Linnaeus ssp. *moscheutos* – FNA6, K1, K3, K4, NcTx, NE, NY, Tn, Blanchard (2008); = *Hibiscus moscheutos* var. *moscheutos* – C; > *Hibiscus incanus* Wendland f. – G, S, Shiller (1960); < *Hibiscus moscheutos*

247. MALVACEAE

Linnaeus – Fl4, WH3; > *Hibiscus moscheutos* Linnaeus – F, G, S, W; > *Hibiscus moscheutos* Linnaeus ssp. *incanus* (Wendland f.) H.E. Ahles – GW2, RAB; > *Hibiscus moscheutos* Linnaeus ssp. *moscheutos* – GW2, RAB, W; > *Hibiscus moscheutos* Linnaeus ssp. *palustris* (Linnaeus) R.T. Clausen – GW2, RAB, W; > *Hibiscus oculiroseus* Britton – S; > *Hibiscus palustris* Linnaeus – F, G.

* ***Hibiscus syriacus*** Linnaeus. ROSE-OF-SHARON, ALTHAEA. **Hab:** Escaped or persistent after cultivation, often spreading by rhizomes. **Dist:** Native of e. Asia. **Phen:** Jun-Sep; Aug-Oct. **Syn:** = Ar, C, F, FNA6, G, Il, K1, K3, K4, NcTx, NE, NY, Pa, RAB, S, Tn, Tx, Va, W, WV. NatureServe GNR (Not Yet Ranked).

* ***Hibiscus trionum*** Linnaeus. FLOWER-OF-AN-HOUR, VENICE MALLOW, BLADDER KETMIA. **Hab:** Fields, roadsides, railroad yards, disturbed areas. **Dist:** Native of Europe or Africa. Reported for Ware County, GA (Carter, Baker, & Morris 2009). **Phen:** Jun-Sep. **Tax:** There is substantial question about the taxonomic treatment of the *H. trionum* complex and the identity of the species (singular or plural) naturalized in e. North America (Craven et al. 2011; Murray, Craven, & de Lange 2008). **Syn:** = C, Fl4, FNA6, G, GrPl, Il, K1, K3, K4, NcTx, NE, NY, Pa, RAB, Tn, Tx, Va, W, WH3, WI, WV; = *Trionum trionum* (Linnaeus) Wooton & Standley – S. NatureServe GNR (Not Yet Ranked).

***Kosteletzkya* C. Presl 1835 (SEASHORE-MALLOW)**

A genus of about 15-30 species, herbs, of North America, sub-Saharan Africa, and Madagascar. Perhaps better included in a broadly circumscribed *Hibiscus* (Pfeil & Crisp 2005). References: Alexander (2010); Alexander, Hayek, & Weeks (2012); Bayer & Kubitzki in Kubitzki & Bayer (2003); Blanchard (2008); Blanchard (2015b) in FNA6 (2015); Weeks (2017b) in Weakley et al (2017).

Kosteletzkya pentacarpos (Linnaeus) Ledebour. SEASHORE-MALLOW, SALTmarsh-MALLOW, FEN-ROSE. **Hab:** Brackish to freshwater tidal marshes. **Dist:** NY (Long Island) south to s. FL, west to TX; West Indies (Cuba); also early introduced in Europe, Linnaeus's name based on its occurrence in Venice). **Phen:** Jul-Oct. **Tax:** Several varieties have often been recognized on the basis of length of hairs and of parts of the flower and inflorescence (see synonymy). While geographic trends are readily apparent, the recognition of infraspecific taxa is made problematic by the non-correlation of various characters. In recent studies, neither Blanchard (2008) nor Alexander (2010) recognize varieties in our flora area. *K. smilacifolia* A. Gray, of peninsular FL, appears to warrant specific status, as treated by Small (1933). It also appears that the supposedly "Eurasian" *K. pentacarpos* represents an early introduction of North American *Kosteletzkya* to the Old World (probably via ship's ballast) and is conspecific; *K. pentacarpos* (based on European material) has nomenclatural priority over *K. virginica* (Blanchard 2008). **Syn:** = Va, WI; = *Hibiscus pentacarpos* Linnaeus; = *Kosteletzkya virginica* (Linnaeus) C. Presl ex A. Gray – RAB, orthographic variant; = *Kosteletzkya pentacarpos* var. *pentacarpos* – K3, K4, NY, Alexander (2010), Weeks (2017b) in Weakley et al (2017); > *Kosteletzkya althaeifolia* (Chapman) Rusby – S; < *Kosteletzkya pentacarpos* (Linnaeus) Ledebour – Fl4, FNA6, WH3, Blanchard (2008); > *Kosteletzkya virginica* (Linnaeus) C. Presl ex A. Gray – GW2, K1, S; > *Kosteletzkya virginica* var. *althaeifolia* – Tx, orthographic variant; > *Kosteletzkya virginica* var. *althaeifolia* Chapman – F, G; > *Kosteletzkya virginica* var. *aquilonia* Fernald – C, F, G; > *Kosteletzkya virginica* var. *virginica* – C, F, G.

***Malva* Linnaeus 1753 (MALLOW)**

A genus of about 40 species, herbs, of temperate Eurasia and montane Africa. References: Bayer & Kubitzki in Kubitzki & Bayer (2003); Hill (2015d) in FNA6 (2015).

- 6 Petals 6-13 mm long, about 2× as long as the sepals; mature mericarps slightly roughened or obscurely reticulate..... ***Malva neglecta***
 6 Petals 3-6 mm long, about 1× as long as the sepals; mature mericarps strongly rugose-reticulate..... ***Malva pusilla***

* ***Malva neglecta*** Wallroth. COMMON MALLOW, CHEESES. **Hab:** Pastures, roadsides, barnyards. **Dist:** Native of Europe. **Phen:** Apr-Nov. **Syn:** = Ar, C, F, FNA6, G, GrPl, Il, K1, K3, K4, Mi, NcTx, NE, NY, Pa, RAB, Tn, Tx, Va, W, WV; = *Malva rotundifolia* Linnaeus – S, rejected because of uncertain application.

* ***Malva pusilla*** Smith. SMALL MALLOW, DWARF MALLOW, CHEESES. **Hab:** Pastures, roadsides, barnyards. **Dist:** Native of Europe. **Phen:** May-Sep. **Syn:** = FNA6, K3, K4, Mi, NY; = *Malva rotundifolia* Linnaeus – C, F, G, GrPl, Il, K1, NcTx, NE, Pa, Tx, rejected because of uncertain application.

247. MALVACEAE

*Malvaviscus* Fabricius 1759 (WAX-MALLOW)

A genus of 3-4 species, herbs, of tropical and subtropical areas. Perhaps better included in a broadly circumscribed *Hibiscus* (Pfeil & Crisp 2005). References: Bayer & Kubitzki in Kubitzki & Bayer (2003); Mendenhall & Fryxell (2015) in FNA6 (2015); Turner & Mendenhall (1993).

Malvaviscus drummondii Torrey & A. Gray. WAX-MALLOW, TURK'S-CAP MALLOW. **Hab:** Open areas, streambanks, disturbed areas. **Dist:** Native west of the Mississippi, in LA, s. AR, e. and c. TX south into n. Mexico. **Phen:** Jun-Oct. **Comm:** First reported for NC and SC by Leonard (1971b). Although Turner & Mendenhall (1993) cite Leonard's specimens as *M. arboreus* var. *arboreus*, they were correctly determined by Leonard as *M. drummondii*. Therefore the attribution of *M. arboreus* var. *arboreus* to NC by Kartesz (1999) is an error. **Syn:** = S; = *Hibiscus drummondii* (Torrey & A. Gray) M.J. Young; = *Malvaviscus arboreus* Dillenius ex Cavanilles var. *drummondii* (Torrey & A. Gray) Schery – Ar, Fl4, FNA6, K1, K3, K4, NcTx, Tx, WH3, Turner & Mendenhall (1993); < *Malvaviscus arboreus* Cavanilles – WI. [NatureServe GNRT4T5Q](#) (Apparently Secure).

*Melochia* Linnaeus 1753 (CHOCOLATE-WEED)

A genus of about 54 species, herbs and shrubs, of tropical regions, especially America. References: Bayer & Kubitzki in Kubitzki & Bayer (2003); Brizicky (1966); Goldberg (2015) in FNA6 (2015).

* *Melochia corchorifolia* Linnaeus. CHOCOLATE-WEED. **Hab:** Sandy fields, especially in low, wet places. **Dist:** Native of the Old World tropics. **Phen:** Aug-Oct. **Syn:** = Ar, Fl4, FNA6, GW2, Il, K1, K3, K4, NY, RAB, S, Tx, WH3, Z, Brizicky (1966); = *Riedlea corchorifolia* (Linnaeus) A.P. de Candolle. [NatureServe GNR](#) (Not Yet Ranked).

*Modiola* Moench 1794 (BRISTLY-MALLOW)

A monotypic genus, an herb, currently of North America, Central America, and South America (but likely not native in North and Central America). References: Bayer & Kubitzki in Kubitzki & Bayer (2003); Hill (2015f) in FNA6 (2015).

* *Modiola caroliniana* (Linnaeus) G. Don. BRISTLY-MALLOW. **Hab:** Lawns, roadsides, disturbed areas, pondshores, edges of brackish marshes; probably adventive in our area from an original native range in South America. **Dist:** The original distribution unclear: sometimes considered as ranging as a native from SC south to FL, west to TX, south into the tropics, and adventive northward, but probably wholly introduced in the southeastern United States from a native distribution in South America. **Phen:** Late Mar-Jun (sometimes later). **Syn:** = Ar, C, F, Fl4, FNA6, G, GW2, K1, K3, K4, NcTx, NE, RAB, S, Tx, Va, WH3, WI. [NatureServe G5](#) (Secure).

*Sida* Linnaeus 1753 (SIDA)

A genus of about 100 species, shrubs and herbs, of tropical, subtropical, and warm temperate areas. References: Bayer & Kubitzki in Kubitzki & Bayer (2003); Fryxell & Hill (2015m) in FNA6 (2015); Fryxell (1985); Fuertes Aguilar, Fryxell, & Jansen (2003); Siedo (1999, 2001); Siedo (2014); Verdcourt (2004).

- 2 Mericarps, styles, and stigmas 5; stem with a spine subtending each leaf; leaves usually truncate to subcordate at the base; [section *Spinosae*] *Sida spinosa*
- 2 Mericarps, styles, and stigmas (6-) avg. 10 (-14); stem lacking spines subtending the leaves; leaves usually cuneate to rounded (cordate to subcordate in *S. cordifolia*) at the base.
- 4 Leaves elliptic-rhombic, mostly 2-3× as long as wide; [section *Sidae*] *Sida rhombifolia* var. *rhombifolia*
- 4 Leaves narrowly elliptic to linear, (3-) 4-20× as long as wide; [section *Ellipticifoliae*] *Sida elliottii* var. *elliottii*

Sida elliottii Torrey & A. Gray var. *elliottii*. COASTAL PLAIN SIDA. **Hab:** Stream banks, sandy openings, pineland pond margins, limestone glades and barrens, mesic hammocks. **Dist:** Var. *elliottii* ranges from se. VA south to n. FL, west to LA and north in the interior to c. TN and se. MO. **Phen:** Jul-Oct. **Tax:** *S. inflexa*, of se. VA and ne. NC, is alleged to differ as follows: *S. inflexa* with calyx 7-10 mm long, leaves elliptic to narrowly elliptic, 4-20 mm wide, (3-) 4-10× as long as wide (vs. *S. elliottii* var. *elliottii* with calyx 5-7 mm long; leaves narrowly lanceolate to linear, 1.5-7 mm wide, 10-20× as long as wide). **Syn:** = FNA6, K3, K4, Va, Siedo (2014); < *Sida elliottii* Torrey & A. Gray – Ar, C, Fl4, G, Il, RAB, S, Tn, WH3; >> *Sida elliottii* Torrey & A. Gray – F, K1, Fryxell (1985); > *Sida inflexa* Fernald – F, K1, Fryxell (1985).

* *Sida rhombifolia* Linnaeus var. *rhombifolia*. ARROWLEAF SIDA, AXOCATZIN. **Hab:** Roadsides, fields, gardens, disturbed areas. **Dist:** Southeastern North America west to TX, south through Mexico, Central America, and n. South America; West Indies; the original distribution of this species is uncertain, but Fryxell & Hill in FNA (2015) suggest it is native to the Old World tropics. **Phen:** Apr-Oct. **Tax:** Verdcourt (2004) discussed variation in this taxon, and suggested that "studies throughout the entire range of the species will necessitate recognition of more than one species". He recognized six varieties in e. Africa, aside from the Linnaean var. *rhombifolia* (with type in Jamaica). **Syn:** = FNA6, Va, Verdcourt (2004); < *Sida rhombifolia* – Bah, C, F, Fl4, G, K1, K3, K4, RAB, S, Tn, Tx, W, WH3, WI, Fryxell (1985). NatureServe G5TNR (Not Yet Ranked).

Sida spinosa Linnaeus. PRICKLY SIDA, PRICKLY-MALLOW, FALSE-MALLOW. **Hab:** Disturbed areas, wet fields. **Dist:** Native of the Neotropics and Paleotropics. **Phen:** (May-) Jun-Nov. **Syn:** = Ar, Bah, C, F, Fl4, FNA6, G, GrPl, Il, K1, K3, K4, Mi, NcTx, NE, NY, Pa, RAB, S, Tn, Tx, Va, W, WH3, WI, WV, Fryxell (1985). NatureServe G5? (Secure).

Tilia Linnaeus 1753 (BASSWOOD, WHITEWOOD, LINDEN, LINN)

A genus of about 25-45 species, trees, of temperate regions of North America, Europe and Asia. Hardin's (1990) treatment of American *Tilia* seems a practical and reasonable approach; it gives taxonomic status to the more distinctive (and geographically based) elements of variation, while recognizing the intergradational nature of the variation; McCarthy (2012) agreed with Hardin's entities and their ranks. Pigott (2012), however, differed in his interpretation (see synonymy). Further investigation of this complex group is, however, warranted. References: Bayer & Kubitzki in Kubitzki & Bayer (2003); NE; Hardin (1990); McCarthy (2012); Pigott (2012); Stace (2010); Strother (2015b) in FNA6 (2015).

Identification Notes: While the varieties treated below are broadly distinctive and have definite geographic distributions across e. North America, they are imperfectly distinct in geographic areas of overlap. In our area, their identification is particularly problematic in Virginia, where individuals in many parts of the state show intergradation between the northern var. *americana* and the Southern and Central Appalachian var. *heterophylla*. When not in flower or fruit, *Tilia* and *Morus* are often confused. They can be easily told apart by leaf venation. *Morus* has the main leaf veins splitting towards the margin but then rejoining to form a rather prominent, looping (scalloped) marginal vein; the basal veins 3, palmate, sometimes an additional prominent vein on each side joining the lateral vein above its divergence from the petiole end; and the main lateral leaf veins (above the basal veins) mainly alternate. *Tilia* has the main leaf veins splitting several times towards the leaf margin and leading into the teeth without rejoining and forming a marginal vein; the basal veins 5, palmate, all joining together at the summit of the petiole; and the main lateral leaf veins (above the basal veins) usually opposite

- 3 Lower leaf surfaces grayish or brownish, loosely but densely tomentose with fasciculate and/or stipitate-stellate trichomes, either remaining tomentose or becoming puberulent, or puberulent from emergence and green beneath; lateral buds 3-5 mm long; pericarp 0.5-0.6 mm thick; [generally southern, Coastal Plain and Piedmont of NC, SC, GA and southward and westward]..... *Tilia americana* var. *caroliniana*
- 3 Lower leaf surfaces pale or whitish, densely stellate tomentose with appressed, sessile-stellate trichomes obscuring the surface (rarely becoming puberulent with age but with some stellate trichomes persisting along major veins, the margin, and/or the apex); lateral buds 5-8 mm long; pericarp 0.8-1.0 mm thick; [widespread in our area]..... *Tilia americana* var. *heterophylla*

Tilia americana Linnaeus var. *caroliniana* (P. Miller) Castiglioni. SOUTHERN BASSWOOD, CAROLINA BASSWOOD. **Hab:** Mesic forests, in the outer Coastal Plain usually associated with shell deposits, Indian shell middens, or underlying coquina limestone ("marl"). **Dist:** NC south to c. peninsular FL and west to OK and c. TX. **Phen:** (Apr-) Jun-Jul; Jul-Aug. **Tax:** Pigott (2012) splits this entity into two taxa, each recognized at subspecific rank under *T. caroliniana*. **Syn:** = Ar, Fl4, K1, K3, K4, NcTx, WH3, Hardin (1990), McCarthy (2012); < *Tilia americana* – FNA6; > *Tilia caroliniana* P. Miller – RAB, S, Tx; > *Tilia caroliniana* ssp. *caroliniana* – Pigott (2012); > *Tilia caroliniana* ssp. *floridana* (Small) Murray – Pigott (2012); > *Tilia floridana* Small – F, RAB, S, Tx; > *Tilia georgiana* Sargent – S; > *Tilia leucocarpa* Ashe; > *Tilia littoralis* Sargent – S. NatureServe G5T5 (Secure).

Tilia americana Linnaeus var. *heterophylla* (Ventenat) Loudon. MOUNTAIN BASSWOOD, WHITE BASSWOOD, LINN. **Hab:** Rich coves and mesic to dry slopes (the drier sites usually on limestone), often one of the most abundant trees in Southern Appalachian cove forests. **Dist:** Centered in the Southern Appalachians: sw. PA and WV south to c. NC, wc. GA, FL Panhandle, and westward as disjunct populations to the Ozarkian Highlands of s. MO and n. AR. **Phen:** May-Jul; Jul-Aug. **Tax:** In VA, var. *heterophylla* dominates in sw. VA and along southern Piedmont river bluffs, with disjunct populations in calcareous ravines in the upper Coastal Plain (Surry County); it also extends less commonly into the northern VA mountains and foothills, where var. *americana* is more prevalent, but seems to be absent (or very uncommon) in the Potomac valley east of the Blue Ridge. Pigott (2012) recognizes this entity at subspecific rank and treats it as one of three subspecies of *T. caroliniana*. **Syn:** = Ar, C, Fl4, K1, K3, K4, NE, NE, NY, Pa, Tn, Va, WH3, Hardin (1990), McCarthy (2012); = *Tilia caroliniana* ssp. *heterophylla* (Ventenat) Pigott – Pigott (2012); = *Tilia heterophylla* Ventenat – F, Il, RAB, W, WV; < *Tilia americana* – FNA6; > *Tilia australis* Small – S; > *Tilia eburnea* W.W. Ashe – S; > *Tilia heterophylla* Ventenat – G, S; > *Tilia lasioclada* Sargent – S; > *Tilia michauxii* Nuttall – S; > *Tilia monticola* Sargent – G; > *Tilia venulosa* Sargent. NatureServe G5T5 (Secure).

247. MALVACEAE

Tilia americana
var. *caroliniana*

Tilia americana
var. *heterophylla*

249. THYMELAEACEAE A.L. de Jussieu 1789 (MEZEREUM FAMILY) [in MALVALES]

A family of about 45-53 genera and 500-800 species, mostly trees and shrubs, of cosmopolitan distribution, but especially diverse in Africa (Van der Bank, Fay, & Chase 2002). *Dirca*, *Edgeworthia*, and *Thymelaea* are all in subfamily Thymelaeoideae (Van der Bank, Fay, & Chase 2002).
References: Herber in Kubitzki & Bayer (2003); Nevling & Barringer (2015a) in FNA6 (2015); Van der Bank, Fay, & Chase (2002).

- 1 Annual herb, annual; leaf blades < 2 cm long; fruits capsular, indehiscent..... *Thymelaea*
1 Perennial shrub; leaf blades > 2 cm long; fruits drupaceous or berrylike..... *Dirca*

Dirca Linnaeus 1753 (LEATHERWOOD, LEATHERBARK)

A genus of 4 species, shrubs, of North America (including Mexico). Our species is most closely related to *D. mexicana* Nesom & Mayfield (of the Sierra Madre Oriental, Tamaulipas, Mexico) and *D. decipiens* Floden (of n. AR, s. MO, and e. KS); the other species is *D. occidentalis* A. Gray of California (Schrader & Graves 2004; Floden, Mayfield, & Ferguson 2009). References: Floden & Nevling (2015) in FNA6 (2015); Floden, Mayfield, & Ferguson (2009); Nevling (1962).

Dirca palustris Linnaeus. LEATHERWOOD, LEATHERBARK, WICOPEE, ROPE-BARK. **Hab:** Very rich forests, on slopes or bottomlands, limited to calcareous or mafic rocks such as limestone, calcareous siltstone, calcareous shale, gabbro, or amphibolite, in marl ravine bottoms in the Coastal Plain of VA, in Ashe County NC ascending to 1500 meters elevation. **Dist:** NS and s. QC, south to Panhandle FL, AL, and OK. **Phen:** Mar-May; Jun-Jul. ; Jun-Jul. **Comm:** The common names refer to the extraordinary toughness of the tan-brown bark, which was used by native Americans for cordage. **ID Notes:** The curiously flexible twigs with light brown bark and swollen nodes are distinctive. **Syn:** = Ar, C, F, FI4, FNA6, G, II, K1, K3, K4, Mi, NE, NY, Pa, RAB, S, Tn, Va, W, WH3, WV, Floden, Mayfield, & Ferguson (2009), Nevling (1962). **NatureServe G4** (Apparently Secure).

Thymelaea P. Miller 1754 (MEZEREON)

A genus of ca. 30 species, mainly of Mediterranean Europe. References: Nevling & Barringer (2015b) in FNA6 (2015).

* ***Thymelaea passerina*** (Linnaeus) Lange. MEZEREON, SPURGE FLAX. **Hab:** Disturbed barren. **Dist:** Native of Europe. An apparent waif in AL and MS. **Phen:** Late Jun-Aug; Jul-early Sep. **Syn:** = FNA6, GrPl, II, K1, K3, K4, Mi. **NatureServe GNR** (Not Yet Ranked).

251. CISTACEAE A.L. de Jussieu 1789 (ROCKROSE FAMILY) [in MALVALES]

A family of about 8 genera and 180 species, shrubs and herbs, of warm temperate and subtropical areas, centered in Mediterranean Europe.
References: Arrington & Kubitzki in Kubitzki & Bayer (2003); Strother (2015c) in FNA6 (2015).

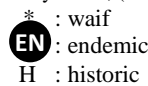

- 2 Flowers of 2 types, the chasmogamous with 5 showy yellow petals, the cleistogamous lacking petals; pubescence of the stem stellate; leaves 10-50 mm long, alternate; plants with shoots of one type only, not producing short basal shoots; capsules 1.3-12.5 mm long, the larger capsules of chasmogamous flowers at least 2.0 mm long..... *Crocanthemum*
2 Flowers of 1 type, with 3 inconspicuous, dark red petals; pubescence of the stem simple; leaves 4-15 mm long (to 30 mm long in *L. pulchella* and *L. mucronata*), linear to linear-elliptic, 0.5-4 mm wide (to 13 mm wide in *L. mucronata*), alternate, opposite, or whorled; plants with shoots of two types, the short, prostrate to ascending basal shoots produced late in the season and overwintering; capsules 0.9-1.7 mm long..... *Lechea*

Crocanthemum Spach 1836 (FROSTWEED, ROCKROSE)

A genus of about 24 species, of eastern North America, California, Mexico, and s. South America. The eastern North American species previously attributed to *Helianthemum* are in a clade distinct from the Old World *Helianthemum*, and should be recognized as *Crocanthemum*. References: Arrington & Kubitzki in Kubitzki & Bayer (2003); Daoud & Wilbur (1965); Obae (2013); Sorrie (2015b) in FNA6 (2015); Wilbur & Daoud (1964).

Identification Notes: The identification of most of our species of *Crocanthemum* requires an understanding of the 2 types of flowers produced. Chasmogamous flowers have showy yellow petals and larger sepals, the distinct portion of the 2 linear outer sepals usually linear, (0.7-) 1.3-5.5 mm long, the distinct portion of the 3

(see introduction for more)

251. CISTACEAE

broader inner sepals 2.5-12 (-14) mm long. Cleistogamous flowers lack petals and have smaller sepals, the distinct portion of the 2 linear outer sepals 0.2-3 mm long, the distinct portion of the 3 broader inner sepals 1.5-4.8 mm long. In some species (*C. canadense*, *C. bicknellii*, *C. propinquum*) the chasmogamous flowers open earlier (Apr-Jul) than the cleistogamous (Jun-Sep). In others (*C. corymbosum*, *C. georgianum*, *C. nashii*, *C. rosmarinifolium*), the two types of flowers open at the same time (Mar-Jun) or cleistogamous flowers are nearly always absent (*C. carolinianum*). Capsules from chasmogamous flowers are larger and contain more seeds than those from cleistogamous flowers.

- 1 Leaves 1-4 (-7) mm wide, (5-) 7-15× as long as wide; capsules from chasmogamous flowers 2-3 mm long, with 1-3 (-6) seeds; capsules from cleistogamous flowers 1.3-1.7 mm long, with 1 (-2) seeds *Crocanthemum rosmarinifolium*
- 1 Leaves 2-20 mm wide, 2-6 (-8)× as long as wide; capsules from chasmogamous flowers (2.4-) 3-9 (-10.5) mm long, with 6-92 (-135) seeds; capsules from cleistogamous flowers 1.5-4.2 mm long, with 1-20 seeds.
 - 2 Leaves basally disposed, the largest and most prominent leaves in a basal rosette; stem leaves 2-5 below those subtending flowers or fruits; stem with spreading trichomes to 2.5 mm long; lower surface of leaves sparsely pubescent, the surface readily visible; cleistogamous flowers usually never produced; capsules 6-9 (-10.5) mm long, with 80-92 (-135) papillate seeds *Crocanthemum carolinianum*
 - 2 Leaves predominantly cauline (in some species a rosette of closely spaced smaller and caducous leaves present at the ground's surface); stem leaves 5-20 below those subtending flowers or fruits; stem glabrate to densely puberulent (the pubescence not long and spreading); lower surface of leaves densely pubescent, hiding the surface; cleistogamous flowers regularly produced, either intermixed with the chasmogamous or in separate inflorescences; capsules 1.3-7 (-8.5) mm long, with 1-46 papillate, reticulate, or smooth seeds (pebbled to somewhat papillate in *H. nashii*).
 - 3 Ovary and capsule densely stellate pubescent *Crocanthemum arenicola*
 - 3 Ovary and capsule glabrous.
 - 7 Flowers borne in dense many-flowered flat-topped cymes terminating the stem and sometimes also the main branches; capsules of the cleistogamous flowers 1.6-3.8 mm long, with 4-8 (-10) seeds; pedicels and calyx with 0.5-1.5 mm long simple trichomes mixed with the shorter stellate trichomes; outer sepals of both chasmogamous and cleistogamous flowers with an expanded, obtuse, spatulate tip, 0.3-1.2 mm wide *Crocanthemum corymbosum*
 - 7 Flowers borne in loose 1-7-flowered cymes or racemes at the ends of the main branches; capsules of the cleistogamous flowers 3.0-4.2 mm long, with 12-20 seeds; pedicels and calyx with short stellate pubescence only; outer sepals of both chasmogamous and cleistogamous flowers linear, 0.2-0.5 mm wide *Crocanthemum georgianum*

Crocanthemum arenicola (Chapman) Barnhart. GULF COAST SUNROSE. **Hab:** Longleaf pine sandhills, dunes, Florida scrub. **Dist:** Panhandle FL west to s. MS. **Syn:** = Fl4, FNA6, K3, K4, S; = *Helianthemum arenicola* Chapman – K1, WH3, Daoud & Wilbur (1965), Wilbur & Daoud (1964). NatureServe G3 (Vulnerable).

Crocanthemum carolinianum (Walter) Spach. CAROLINA SUNROSE. **Hab:** Fields, pine savannas, dry pine flatwoods, scrubby flatwoods. **Dist:** Ne. NC (Dare County) south to s. FL, west to AR and e. TX. **Phen:** (Jan-) Mar-May; Jul-Aug. **Syn:** = Ar, Fl4, FNA6, K3, K4, S; = *Helianthemum carolinianum* (Walter) Michaux – K1, RAB, Tx, WH3, Daoud & Wilbur (1965), Wilbur & Daoud (1964). NatureServe G4 (Apparently Secure).

Crocanthemum corymbosum (Michaux) Britton. PINEBARREN SUNROSE. **Hab:** Openings in maritime forests, dry hammocks, pine rocklands. **Dist:** E. NC south to s. FL, east to s. MS. **Phen:** (Nov-) Feb-May; (Mar-) Jul-Oct. **Syn:** = Fl4, FNA6, K3, K4, S; = *Helianthemum corymbosum* Michaux – K1, RAB, WH3, Daoud & Wilbur (1965), Wilbur & Daoud (1964). NatureServe G4G5 (Apparently Secure).

Crocanthemum georgianum (Chapman) Barnhart. GEORGIA SUNROSE. **Hab:** Openings in maritime forests, sandy disturbed areas. **Dist:** E. NC south to n. FL, west to c. TX and AR. **Phen:** Apr-May; May-Oct. **Syn:** = Ar, Fl4, FNA6, K3, K4, S; = *Helianthemum georgianum* Chapman – K1, NcTx, RAB, Tx, WH3, Daoud & Wilbur (1965), Wilbur & Daoud (1964). NatureServe G4 (Apparently Secure).

Crocanthemum rosmarinifolium (Pursh) Janchen. ROSEMARY SUNROSE. **Hab:** Longleaf pine sandhills, sandy roadsides, fields. **Dist:** S. NC south to Panhandle FL, west to c. TX; West Indies. **Phen:** May-Jun; Jul-Oct. **Syn:** = Ar, Fl4, FNA6, K3, K4, S; = *Helianthemum rosmarinifolium* Pursh – K1, NcTx, RAB, Tx, WH3, Daoud & Wilbur (1965), Wilbur & Daoud (1964). NatureServe G4 (Apparently Secure).

Lechea Linnaeus 1753 (PINWEED)

Contributed by Bruce A. Sorrie

A genus of about 18 species, herbs, of North America, the West Indies, and Central America. References: Arrington & Kubitzki in Kubitzki & Bayer (2003); Hodgdon (1938); Lemke (2014); Lemke (2015) in FNA6 (2015); Sorrie & Weakley (2007b); Sorrie & Weakley (2007c); Spaulding (2013b); Wilbur & Daoud (1961); Wilbur (1974).

Identification Notes: *Lechea* is recognizable by its production of numerous basal shoots (usually prostrate) in the late summer and fall, often with whorled leaves. These are evergreen and overwinter, and the fertile stems (usually erect or ascending) are produced from renewed growth of the basal shoots in the spring and summer.

- 2 Pubescence of the stems strongly spreading, not at all appressed; inner sepals carinate (U- or V-shaped in cross-section) *Lechea mucronata*
- 2 Pubescence of the stems more or less appressed, usually strongly so; inner sepals shallowly curved in cross section, not carinate.
 - 4 Outer (slender) sepals equaling or exceeding the inner (broad) sepals.

Symbology:

* : waif
EN : endemic
H : historic

N : no
P : planted
? : questionable

- 5 Base of the fruiting calyx clearly differentiated into a hardened, shiny, yellowish, obconic base 0.4-0.6 mm long, contrasting in color and texture with the rest of the calyx; pedicels averaging 1.5-3.5 mm long..... *Lechea racemulosa*
- 5 Base of the fruiting calyx not conspicuously differentiated in texture and color; pedicels averaging < 1.5 (-2) mm long.
- 6 Capsule completely enclosed by the sepals, subglobose; leaves averaging > 10× as long as wide; plant short and usually densely bushy, < 3 dm tall *Lechea tenuifolia*
- 6 Capsule exserted, usually conspicuously so, the sepals not enclosing the summit of the fruit, ellipsoid to ovate; leaves < 8× (usually < 6×) as long as wide; plant usually taller, 1-7 dm tall.
- 7 Outer sepals distinctly longer than the inner sepals, usually also longer than the capsule; stem leaves usually whorled, 2 mm wide; plant erect, with short, ascending branches..... *Lechea minor*
- 7 Outer sepals shorter than to barely longer than the inner sepals, shorter than the capsule; stem leaves alternate, rarely wider than 1.5 mm wide; plant ascending (sometimes erect or spreading, branches spreading) *Lechea sessiliflora*
- 4 Outer (slender) sepals shorter than the inner (broad) sepals.
- 9 Capsules ellipsoid to narrowly pyriform, normally about 2× as long as wide (or even longer in *L. racemulosa*).
- 10 Stigmas not persistent; pedicels averaging about 2 mm long; base of the fruiting calyx clearly differentiated into a hardened, shiny, yellowish, obconic base 0.4-0.6 mm long, contrasting in color and texture with the rest of the calyx..... *Lechea racemulosa*
- 10 Stigmas persistent, reddish-brown, conspicuous on the summit of the capsule; base of the fruiting calyx not conspicuously differentiated in texture and color..... *Lechea sessiliflora*
- 9 Capsules of a broader shape, ovoid, broadly ellipsoid, or subglobose, normally < 1.5× as long as wide.
- 11 Capsules obviously longer than the sepals.
- *Lechea pulchella* var. *ramosissima*
- 11 Capsules almost completely enveloped by the sepals.
- *Lechea torreyi* var. *congesta*

Lechea minor Linnaeus. THYMELEAF PINWEED. **Hab:** Longleaf pine savannas, sandhills, pine-oak woodlands, other dry woodlands or openings, sandy disturbed places. **Dist:** MA and VT west to s. ON and n. IN, south to c. peninsular FL and LA (primarily Coastal Plain and around the Great Lakes). **Phen:** Jul-Aug; Aug-Oct. **Syn:** = C, F, FI4, FNA6, G, IL, K1, K3, K4, Mi, NE, NY, Pa, RAB, S, Tn, Va, W, WH3, Hodgdon (1938), Spaulding (2013a), Wilbur & Daoud (1961), Wilbur (1974); = *Lechea thymifolia* Michaux. NatureServe G5 (Secure).

Lechea mucronata Rafinesque. HAIRY PINWEED. **Hab:** Open dry habitats, longleaf pine sandhills, dunes, dry hammocks, woodlands. **Dist:** NH west to MI and OK, south to c. peninsular FL, TX, and n. Mexico. **Phen:** Jun-Aug; Jul-Oct. **Syn:** = Ar, C, FI4, FNA6, IL, K1, K3, K4, Mi, NcTx, NE, NY, Tn, Tx, Va, W, WH3, Spaulding (2013a), Wilbur (1974); = *Lechea villosa* Elliott – F, G, Pa, RAB, S, Wilbur & Daoud (1961); > *Lechea villosa* var. *typica* – Hodgdon (1938). NatureServe G5 (Secure).

Lechea pulchella Rafinesque var. *ramosissima* (Hodgdon) Sorrie & Weakley. SOUTHERN HAIRY PINWEED. **Hab:** Pine-oak woodlands, pine savannas, pine flatwoods, longleaf pine sandhills, openings in maritime forests, sometimes in wet, almost peaty soils. **Dist:** Se. VA south to n. FL and west to e. LA; disjunct in sc. TN (Coffee County). **Phen:** Jun-Aug; Aug-Oct. **Syn:** = FI4, FNA6, K3, K4, Tn, Va, WH3, Sorrie & Weakley (2007b), Spaulding (2013b); = *Lechea leggettii* Britton & Hollick var. *ramosissima* Hodgdon – F, G, Hodgdon (1938), Wilbur & Daoud (1961); < *Lechea leggettii* Britton & Hollick – C, G, RAB, S; < *Lechea pulchella* Rafinesque var. *pulchella* – K1.

Lechea racemulosa Michaux. APPALACHIAN PINWEED. **Hab:** Dry pine woodlands, other woodlands, forest edges, old fields. **Dist:** Se. NY west to s. OH and s. IL, south to se. VA, NC, c. GA, and AL, with a few disjunct occurrences west to MO; the range is centered on the Appalachian Mountains. **Phen:** Jun-Aug; Jul-Oct. **Syn:** = C, F, FNA6, G, K1, K3, K4, NY, Pa, RAB, S, Tn, Va, W, WV, Hodgdon (1938), Wilbur & Daoud (1961). NatureServe G5 (Secure).

Lechea sessiliflora Rafinesque. PINELAND PINWEED. **Hab:** Longleaf pine sandhills and dry flatwoods. **Dist:** A Southeastern Coastal Plain endemic: s. NC south to s. FL and west to s. MS. **Phen:** Jul-Aug; Aug-Oct. **Syn:** = FNA6, K1, K3, K4, WH3, Wilbur (1974); = *Lechea patula* Leggett – RAB, Hodgdon (1938), Wilbur & Daoud (1961); > *Lechea exserta* Small – S; > *Lechea patula* Leggett – S.

Lechea tenuifolia Michaux. NARROWLEAF PINWEED. **Hab:** Dry oak-pine forests and openings. **Dist:** S. ME south to SC (mostly inner Coastal Plain and Piedmont), and from s. IN n. IL, s. MN, and NE south to e. LA and c. TX. **Phen:** Jun-Aug; Aug-Oct. **Syn:** = Ar, FNA6, GrPl, K1, K3, K4, NcTx, NE, NY, RAB, S, Tn, Tx, Va, W, WV, Spaulding (2013a), Wilbur & Daoud (1961); > *Lechea tenuifolia* var. *occidentalis* Hodgdon – IL, Hodgdon (1938); > *Lechea tenuifolia* var. *tenuifolia* – C, F, G, IL; > *Lechea tenuifolia* var. *typica* – Hodgdon (1938).

Lechea torreyi Leggett ex Britton var. *congesta* Hodgdon ex Lemke. SANDHILL PINWEED. **Hab:** Longleaf pine sandhills and pine flatwoods. **Dist:** As interpreted by Hodgdon, *L. torreyi* consists of two varieties, the more widespread var. *congesta* ranging from se. NC south to s. FL and west to s. MS (disjunct in Belize), and the more restricted var. *torreyi* restricted to FL. **Phen:** Jun-Jul; Aug-Oct. **Comm:** Wilbur & Daoud (1961) express doubt about the validity of the two varieties, but present little evidence for or against their recognition. Lemke (2014) supports varietal status and validates the name. **Syn:** = FNA6, K3, K4, Hodgdon (1938), Lemke (2014); < *Lechea torreyi* – K1, RAB, S, WH3, Spaulding (2013a), Wilbur & Daoud (1961), Wilbur (1974). NatureServe G4TNR (Not Yet Ranked).

251. CISTACEAE

261. BATAACEAE Martius ex Perleb 1838 (BATIS FAMILY) [in BRASSICALES]

A monogeneric family, of 2 species, low shrubs, of tropical and subtropical shores of the Americas, New Guinea, the Pacific, and Australia. References: Bayer & Appel in Kubitzki & Bayer (2003); Rogers (1982b); Thorne (2010) in FNA7 (2010).

Batis P. Browne 1756 (SALTWORT, BEACHWORT, BATIS)

A genus of 2 species, low shrubs, of tropical and subtropical shores of the Americas, New Guinea, the Pacific, and Australia. The only other member of the family and genus is *B. argillicola*, of New Guinea and Australia. References: Bayer & Appel in Kubitzki & Bayer (2003); Goldblatt (1976); Rogers (1982b); Thorne (2010) in FNA7 (2010).

Batis maritima Linnaeus. SALTWORT, BEACHWORT, BATIS, TURTLEWEED, VIDRILLOS. **Hab:** Brackish marshes, "Batis flats", other salt flats, mangroves. **Dist:** Se. SC south to s. FL, west to TX, and in Central and South America; West Indies; HI (where apparently introduced). *B. maritima* is alleged (as by FNA and S) to occur as far north as NC, but the documentation is unknown; there is no twentieth century evidence to place *Batis* in NC. **Phen:** Jun-Jul; Oct. **Syn:** = Bah, Fl4, FNA7, GW2, K1, K3, K4, RAB, S, Tx, WH3, Rogers (1982b). NatureServe G5 (Secure).

269. CLEOMACEAE Berchtold & J. Presl 1825 (CLEOME FAMILY) [in BRASSICALES]

A family of ca. 18 genera and ca. 175 species, herbs, of mainly tropical and subtropical areas. The Cleomaceae is here circumscribed to include the members of the Capparaceae, subfamily Cleomoideae, following phylogenetic analyses which show this group to be a monophyletic clade more closely related to Brassicaceae than to the rest of Capparidaceae (Hall, Sytsma, & Iltis 2002). The generic classification is still uncertain and in flux (Patchell, Roalson, & Hall 2014; Roalson et al. 2015). References: Christenhusz, Fay, & Byng (2018); Hall, Sytsma, & Iltis (2002); Judd, Sanders, & Donoghue (1994); Kers in Kubitzki & Bayer (2003); Patchell, Roalson, & Hall (2014); Roalson et al (2015); Sanders & Judd (2000); Tucker & Vanderpool (2010) in FNA7 (2010).

- 1 Stamens (8-) 10-27; petals notched or irregularly lacerate at the apex; gynophore (stipe of the pistil, above the calyx) 2-6 mm long; leaflets (1-) 3 *Polanisia*
- 1 Stamens 6 (except 14-25 in *Corynandra*); petals obtuse or acute at the apex; gynophore (stipe of the pistil, above the calyx) 1-80 mm long; leaflets 5-7. *Tarenaya*

Polanisia Rafinesque 1819 (CLAMMYWEED)

A genus of about 6 species, of North America (including Mexico). References: Tucker (2010f) in FNA7 (2010).

Identification Notes: *Polanisia* has some resemblance to *Warea* (in the Brassicaceae).

Polanisia tenuifolia Torrey & A. Gray. SLENDERLEAF CLAMMYWEED, PINELAND CATCHFLY. **Hab:** Longleaf pine sandhills, Florida scrub, pine rocklands. **Dist:** E. GA (several counties from the SC border) (Jones & Coile 1988) south to s. FL, west to s. MS. **Phen:** Feb. **Syn:** = Fl4, FNA7, K1, K3, K4, WH3; = *Aldenella tenuifolia* (Torrey & A. Gray) Greene – S. NatureServe G5 (Secure).

*Tarenaya* Rafinesque 1838 (SPIDERFLOWER)

A genus of about 40 species, annual herbs, of South America, as interpreted to include *Hemiscola* (Patchell, Roalson, & Hall 2014; Soares Neto et al. 2018). References: Iltis & Cochrane (2007); Patchell, Roalson, & Hall (2014); Soares Neto et al (2018); Tucker & Iltis (2010a) in FNA7 (2010); Tucker & Iltis (2010b) in FNA7 (2010).

* *Tarenaya species 1*. CLEOME, SPIDERFLOWER, PINKQUEEN. **Hab:** Gardens, disturbed areas, sandbars, riverbanks, persistent and self-seeding from cultivation as an ornamental. **Dist:** Native of South America. **Phen:** Jun-Nov. **Tax:** The correct name for this species in *Tarenaya* is a new combination (in press). **Comm:** The petals in bud are a pale pink to nearly white, they turn a deep pink upon opening late in the day; by morning the petals have once again faded to a pale pink or white. **Syn:** =; = *Cleome hasslerana* – Pa, orthographic variant; = *Cleome hassleriana* Chodat – Ar, C, Fl4, K1, NcTx, Tx, WH3, Christenhusz, Fay, & Byng (2018); = *Cleome houtteana* Schlechtendal – RAB, misapplied; = *Tarenaya*

270. BRASSICACEAE Burnett 1835 (MUSTARD FAMILY) [in BRASSICALES]

A family of about 340 genera and 3400 species, annuals, perennials, shrubs, and rarely trees and vines, of cosmopolitan distribution (but most diverse in the temperate Northern Hemisphere). References: Al-Shehbaz (1984); Al-Shehbaz (1985a); Al-Shehbaz (1985b); Al-Shehbaz (1986a); Al-Shehbaz (1986b); Al-Shehbaz (1987); Al-Shehbaz (1988a); Al-Shehbaz (1988b); Al-Shehbaz (2010a) in FNA7 (2010); Appel & Al-Shehbaz in Kubitzki & Bayer (2003); Esmailbegi et al (2018); Rollins (1993).

270. BRASSICACEAE

- 1 Flowers white, pinkish, purple, lavender, or blue.
- 9 Leaves strictly basal or basal and cauline and auriculate.
- 10 Plants with only basal leaves or cauline leaves much reduced. *Cardamine*
- 10 Plants with some well-developed cauline leaves.
- 12 Ovaries and young fruits ovate, orbicular or cordate.
- 14 Ovules 2 (rarely 4) per ovary; [tribe *Lepidieae*] *Lepidium*
- 14 Ovules 6-16 per ovary. *Thlaspi*
- 12 Ovaries and young fruits linear.
- 16 Plants aquatic or semi-aquatic; rooting at nodes; [tribe *Cardamineae*] *Nasturtium*
- 16 Plants terrestrial, though sometimes growing partially submerged; not rooting at nodes.
- 18 Cauline leaves sessile; [tribe *Boechereae*] *Borodinia*
- 18 Cauline leaves usually petiolate; [tribe *Cardamineae*] *Cardamine*
- 9 Leaves basal and cauline but not auriculate.
- 19 Plants aquatic, rooting at nodes; [tribe *Cardamineae*].
- 20 Submersed leaves dissected into filiform segments *Rorippa*
- 20 Leaves not dissected into filiform segments *Nasturtium*
- 19 Plants terrestrial, though sometimes growing partially submerged; not rooting at nodes.
- 21 Stamens 2 or 4.
- 22 Ovaries and young fruits linear; [tribe *Cardamineae*] *Cardamine*
- 22 Ovaries and young fruits ovate, orbicular or cordate. *Lepidium*
- 21 Stamens 6.
- 25 Ovaries and young fruits 2-segmented; [tribe *Brassiceae*] *Cakile*
- 25 Ovaries and young fruits unsegmented.
- 26 Ovaries and young fruits ovate, orbicular or cordate; [tribe *Lepidieae*] *Lepidium*
- 26 Ovaries and young fruits linear.
- 27 Petals with contrasting dark veins; [tribe *Brassiceae*] *Raphanus*
- 27 Petals mostly uniform in color.
- 29 Cauline leaves sessile; [tribe *Boechereae*] *Borodinia*
- 29 Cauline leaves usually petiolate; [tribe *Cardamineae*].
- 30 Base of plant usually glabrous; seeds not winged *Cardamine*
- 30 Base of plant pubescent; seeds winged *Planodes*

Key B - plants in flower, trichomes of plant present with some or most or all branched

- 1
- 1
- 2 Flowers yellow.
- 3 Trichomes sessile, medifixed; [tribe *Erysimeae*] *Erysimum*
- 3 Trichomes not sessile and medifixed.
- 4 Leaves 2-3× pinnately dissected; [tribe *Descurainieae*] *Descurainia*
- 4 Leaves not pinnately dissected. *Camelina*
- 2 Flowers white, pinkish, lavender, or blue.
- 7 Leaves only basal; [tribe *Arabideae*] *Draba*
- 7 Leaves cauline (and often basal as well).
- 8 Ovaries and young fruits not linear.
- 9 Cauline leaves sessile and auriculate; [tribe *Camelineae*].
- 10 Petals pale yellow, fading to whitish *Camelina*
- 10 Petals wholly white *Capsella*
- 9 Cauline leaves petiolate or sessile and not auriculate.
- 12 Leaves 2-3× pinnately dissected; [tribe *Descurainieae*] *Descurainia*
- 12 Leaves not pinnately dissected. *Draba*
- 8 Ovaries and young fruits linear.
- 14 Cauline leaves sessile and auriculate.
- 15 Young fruits ascending to descending; [tribe *Boechereae*] *Borodinia*
- 15 Young fruits ascending to erect or appressed to rachis. *Arabis*
- 14 Cauline leaves usually petiolate and if sessile, not auriculate.
- 17 Stigmas 2-lobed, petals > 15 mm long; [tribe *Hesperideae*] *Hesperis*
- 17 Stigmas entire, petals < 6 mm long.
- 18 Leaves pinnately divided or lobed.
- 19 Leaves lyrate pinnatifid; [tribe *Camelineae*] *Arabidopsis*
- 19 Leaves 2-3× pinnately dissected; [tribe *Descurainieae*] *Descurainia*
- 18 Leaves entire or toothed.
- 20 Sepals 1-2.5 mm; of disturbed habitats; seeds uniseriate; [tribe *Camelineae*] *Arabidopsis*
- 20 Sepals 0.7-1.2 mm or >2.5 mm; of disturbed and natural habitats; seeds biseriate; [tribe *Arabideae*] *Draba*

Arabidopsis Heynhold 1842 (MOUSE-EAR CRESS)

A genus of about 9 species, annual and perennial herbs, circumboreal and most diverse in Eurasia. References: Al-Shehbaz (1988a); Al-Shehbaz (2010a) in FNA7 (2010); Koch & Al-Shehbaz (2002); Koch, Bishop, & Mitchell-Olds (1999); O'Kane & Al-Shehbaz (1997); O'Kane & Al-Shehbaz (2003); Rollins (1993).

- 1 Fruit strongly flattened; petals (4-) 5-8 (-10) mm long; seeds 0.9-1.1 mm long; [native perennial, of calcareous and mafic rock outcrops] *Arabidopsis lyrata* ssp. *lyrata*
 1 Fruit terete; petals 2-4 mm long; seeds 0.3-0.5 mm long; [alien annual, of disturbed, weedy sites] *Arabidopsis thaliana*

Arabidopsis lyrata (Linnaeus) O'Kane & Al-Shehbaz ssp. *lyrata*. LYRELEAF ROCKCRESS, DWARF ROCKCRESS, SANDCRESS. **Hab:** Rock crevices in or thin soil around calcareous or mafic rock outcrops. **Dist:** The species is widespread in n. North America and e. Asia, south in e. North America to NC, e. TN, and n. GA; ssp. *lyrata* is strictly North American, from NY west to AK, south to NC, GA (?), TN, MS, MB, SK, AB, and BC. **Phen:** Mar-Jun; Apr-Sep. **Comm:** The GA record is an old and indefinite collection ("northern Georgia") by Vasey. **Syn:** = FNA7, Il, NE, NY, Va, O'Kane & Al-Shehbaz (1997); = *Arabidopsis lyrata* - K4; = *Arabidopsis lyrata* var. *lyrata* - Al-Shehbaz (1988a), Rollins (1993); < *Arabidopsis lyrata* - Mi, Tn, Tx; < *Arabis lyrata* Linnaeus - C, F, G, K1, Pa, RAB, S, W.

* *Arabidopsis thaliana* (Linnaeus) Heynhold. MOUSE-EAR CRESS. **Hab:** Disturbed areas, fields, roadsides, lawns. **Dist:** Native of Eurasia. **Phen:** Mar-May. **Comm:** *Arabidopsis thaliana* has sometimes been referred to as the white mouse of the vascular plant world, having been very extensively used as an experimental plant. **Syn:** = Ar, C, F, FNA7, G, GrPl, Il, K1, K3, K4, Mi, NE, NY, Pa, RAB, S, Tn, Va, W, Al-Shehbaz (1988a), O'Kane & Al-Shehbaz (1997), Rollins (1993); = *Stenophragma thaliana* (Linnaeus) Čelakovský. NatureServe GNR (Not Yet Ranked).

Arabis Linnaeus 1753 (ROCKCRESS)

The circumscription of *Arabis* is in flux; there is increasing evidence that the broad circumscription traditionally employed in most North American floras includes discordant elements. Based on molecular phylogenetic studies and morphology, the members of *Arabis* (as circumscribed most broadly) in our area should be divided into at least 4 genera, as follows: *Arabidopsis*, *Arabis* sensu stricto, *Boechea*, and *Turritis*. References: Al-Shehbaz (1988a); Al-Shehbaz (2003); Al-Shehbaz (2010a) in FNA7 (2010); Al-Shehbaz (2017); Hopkins (1937); Koch & Al-Shehbaz (2002); Koch, Bishop, & Mitchell-Olds (1999); Rollins (1993).

Arabis patens Sullivant. SPREADING ROCKCRESS. **Hab:** Thin soils around calcareous or dolomitic outcrops, very rarely in nutrient-rich seepage from mafic rocks. **Dist:** Irregularly distributed, primarily in the sedimentary rock Appalachians, from se. PA, c. PA, and IN south to NC, e. TN, and AL. **Phen:** May-Jun; Jun-Aug. **Comm:** In NC, this species occurs over marble at Blowing Spring, Nantahala River Gorge, Swain County, at various sites over calcareous sedimentary rocks in the Hot Springs Window, near Hot Springs, Madison County, and in nutrient-rich seepage from amphibolite at Chimney Rock, Rutherford County. **Syn:** = C, F, FNA7, G, K1, K3, K4, Pa, RAB, S, Va, W, Al-Shehbaz (1988a), Hopkins (1937), Rollins (1993); = *Boechea patens* (Sullivant) Al-Shehbaz - K2, Tn, Al-Shehbaz (2003). NatureServe G3 (Vulnerable).

Aurinia Desvaux 1814 [1815]

A genus of about 7 species, perennial herbs, of e. Europe and w. Asia. References: Al-Shehbaz (2010a) in FNA7 (2010); Rollins (1993).

* *Aurinia saxatilis* (Linnaeus) Desvaux ssp. *saxatilis*. BASKET-OF-GOLD, GOLDENTUFT. **Hab:** Disturbed areas. **Dist:** Native of Eurasia. **Phen:** May-Jul. **Syn:** = FNA7, NY; < *Alyssum saxatile* Linnaeus; < *Aurinia saxatilis* - K3, K4, Mi, Rollins (1993). NatureServe GNR (Not Yet Ranked).

Borodinia N. Busch 1921 (ROCK-CRESS)

A genus of about 7 species, herbs, of eastern North America. References: Alexander et al (2013); Al-Shehbaz & Windham (2010) in FNA7 (2010); Al-Shehbaz (1988a); Al-Shehbaz (2003); Hopkins (1937); Koch & Al-Shehbaz (2002); Koch, Bishop, & Mitchell-Olds (1999); Rollins (1993); Wieboldt (1987); Windham & Al-Shehbaz (2007).

- 1 Pedicels of fruits definitely deflexed; pedicels of flowers spreading (spreading or very slightly ascending in first few mm, then down-curved) *Borodinia canadensis*

270. BRASSICACEAE

- 1 Pedicels of fruits erect or ascending; pedicels of flowers erect, ascending, spreading, or arching.
 - 2 Mature fruits < 4 cm long; stems branched or simple at the base.
 - 3 Stem leaves (most of them) < 5 mm wide; stems branched at the base *Arabidopsis lyrata* ssp. *lyrata*
 - 3 Stem leaves (most of them) > 8 mm wide; stems simple at the base.
 - 4 Lower cauline leaves glabrous or sparsely pubescent on the upper surface; fruits erect and appressed, 3-5 cm long *Arabis*
 - 4 Lower cauline leaves hirsute or strigose on the upper surface; fruits widely ascending or spreading, 1.5-4 cm long.
 - *Arabis patens*
 - 2 Mature fruits > 4 cm long; stems generally simple at the base.
 - 7 Fruits erect, appressed against the stem, the fruiting inflorescence < 2 cm in diameter.
 - *Arabis*
 - 7 Fruits ascending to spreading (not erect and appressed to the stem), the fruiting inflorescence > 4 cm in diameter.
 - *Borodinia laevigata*

Borodinia canadensis (Linnaeus) P.J. Alexander & Windham. SICKLEPOD, CANADA ROCKCRESS. **Hab:** Thin soils around rock outcrops, especially mafic or calcareous, and in dry to mesic, nutrient-rich, often rocky woodlands over mafic or calcareous rocks. **Dist:** QC and ND south to Panhandle FL and TX. **Phen:** (Apr-) May-Jul; Jun-Aug. **Syn:** = K3, K4, NY, Alexander et al (2013); = *Arabis canadensis* Linnaeus – C, F, G, GrPl, K1, NcTx, Pa, RAB, S, W, Al-Shehbaz (1988a), Hopkins (1937), Rollins (1993); = *Boechea canadensis* (Linnaeus) Al-Shehbaz – Ar, Fl4, FNA7, Il, K2, Mi, NE, Tn, Va, WH3, Al-Shehbaz (2003). **NatureServe G5** (Secure).

Borodinia laevigata (Muhlenberg ex Willdenow) P.J. Alexander & Windham. COMMON SMOOTH ROCKCRESS. **Hab:** Rocky woodlands and forests, rock outcrops, especially mafic or calcareous, but also on more acidic substrates, rarely also in bottomlands. **Dist:** ME west to MN and SD, south to GA, AL, MS, AR, OK, and CO. **Phen:** Apr-May; May-Jun. **Comm:** Of our *Borodinia*, *B. laevigata* is the most common, being the least limited to calcareous substrates. **Syn:** = K3, K4, NY, Alexander et al (2013); = *Arabis laevigata* (Muhlenberg ex Willdenow) Poiret var. *laevigata* – C, F, G, K1, Pa, W, Al-Shehbaz (1988a), Hopkins (1937), Rollins (1993), Wieboldt (1987); = *Boechea laevigata* (Muhlenberg ex Willdenow) Al-Shehbaz – Ar, FNA7, Il, Mi, NE, Tn, Va; >> *Arabis burkii* (Porter) Small – S, misapplied in part; < *Arabis laevigata* – GrPl; > *Arabis laevigata* – S; > *Arabis laevigata* (Muhlenberg ex Willdenow) Poiret var. *burkii* Porter – RAB, misapplied; > *Arabis laevigata* (Muhlenberg ex Willdenow) Poiret var. *laevigata* – RAB; < *Boechea laevigata* (Muhlenberg ex Willdenow) Al-Shehbaz – Al-Shehbaz (2003).

Brassica Linnaeus 1753 (MUSTARD, TURNIP, RAPE, CABBAGE, COLLARD GREENS, KALE, BROCCOLI.)

Cauliflower, Kohlrabi, Rutabaga, Bok-Choy, Chinese Cabbage, Brussels Sprouts). References: Al-Shehbaz (1985b); Al-Shehbaz (2021); Rollins (1993); Warwick (2010a) in FNA7 (2010).

A genus of about 40 species, herbs, of the Old World.

- 1 Upper cauline leaves petiolate, or sessile and cuneate.
 - 2 Pedicels and siliques widely spreading to divaricately ascending; siliques 2-4 cm long, terete or nearly so; [section *Rapa*] *Brassica juncea*
 - 2 Pedicels and siliques erect and appressed to the rachis; siliques 1-2 cm long, more-or-less 4-angled; [section *Melanosinapis*] *Rhaphospermum nigrum*
- 1 Upper cauline leaves auriculate, slightly to strongly clasping the stem; [section *Rapa*].
 - 4 Petals 10-18 mm long, pale yellow; beak of the silique usually (5-) 7-10 (-16) mm long; plant usually glaucous; siliques 5-10 cm long *Brassica napus*
 - 4 Petals 6-10 (-11) mm long, deep yellow; beaks of the silique usually (8-) 10-15 (-22) mm long; plant usually green; siliques 3-7 cm long *Brassica rapa*

* ***Brassica juncea*** (Linnaeus) Czernajew. LEAF MUSTARD, BROWN MUSTARD, INDIAN MUSTARD, MUSTARD GREENS, CHINESE MUSTARD. **Hab:** Fields, disturbed areas. **Dist:** Native of Eurasia. **Phen:** Apr-Jun. **Tax:** This species is apparently a recently derived polyploid ($n=18$) of *B. nigra* ($n=8$) and *B. rapa* ($n=10$). **Comm:** The seeds of this species are one source of table mustard; other components include *Brassica nigra* and *Sinapis alba*. **Syn:** = Ar, C, Fl4, FNA7, G, GrPl, Il, K1, K3, K4, Mi, NcTx, NE, NY, Pa, RAB, Tn, Tx, Va, W, WH3, Al-Shehbaz (1985b), Rollins (1993); > *Brassica japonica* (Thunberg) Siebold ex Miquel – S; > *Brassica juncea* (Linnaeus) Czernajew – S. **NatureServe GNR** (Not Yet Ranked).

* ***Brassica napus*** Linnaeus. RUTABAGA, RAPE, CANOLA, COLZA, SWEDE. **Hab:** Fields, disturbed areas. **Dist:** Native of Eurasia. **Phen:** May-Jul. **Tax:** This species is apparently a recently derived polyploid ($n=19$) of *B. oleracea* ($n=9$) and *B. rapa* ($n=10$). **Comm:** The seeds of this species are the source of 'canola' oil, the name coined by marketers from 'Canadian' + 'oil' + 'low' + 'acid' to avoid the negative connotation of the ancient name 'rape'. **Syn:** = Ar, Fl4, FNA7, GrPl, Il, K1, K3, Mi, NE, NY, Tn, W, WH3, Al-Shehbaz (1985b), Rollins (1993); ~ *Brassica napobrassica* (L.) P.Mill.; < *Brassica napus* Linnaeus – RAB.

* ***Brassica rapa*** Linnaeus. TURNIP, BIRD'S-RAPE, FIELD RAPE, FIELD MUSTARD, BOK-CHOY, CHINESE CABBAGE. **Hab:** Fields, disturbed areas. **Dist:** Native of Europe. **Phen:** Mar-Jun. **Tax:** *B. rapa* is cultivated in a variety of forms, these sometimes given varietal rank, such as *B. rapa* var. *chinensis* (Linnaeus) Kitamura (Bok-choy or Pak-choi) and *B. rapa* var. *amplexicaulis* Tanaka & Ono (Chinese Cabbage). They are probably best regarded as cultivars. **Syn:** = Ar, C, FNA7, Il, Mi, NcTx, NE, NY, Pa, Tn, Al-Shehbaz (1985b), Rollins (1993); > *Brassica campestris* Linnaeus – G, GrPl, S, Tx; > *Brassica napus* Linnaeus – RAB; > *Brassica rapa* Linnaeus – G, GrPl, Tx; > *Brassica rapa* var. *amplexicaulis* Tanaka & Ono; > *Brassica rapa* var. *chinensis* (Linnaeus) Kitamura – K4; > *Brassica rapa* Linnaeus var. *rapa* – K1, K3, K4, Va, WH3.

**Cakile** P. Miller 1754 (SEA ROCKET)

A genus of about 7-8 species, annual herbs, primarily of coastal North America, Europe, and North Africa. References: Al-Shehbaz (1985b); Rodman (1974); Rodman (2010) in FNA7 (2010); Rollins (1993).

Identification Notes: The siliques of *Cakile* are divided near their middle by an abscission zone into two halves, each with a single seed: the upper abscises and disperses by water or wind, the lower remains attached to the parent plant. The size of the two segments and the contour of the abscised surface remaining on the lower segment are important taxonomic characters.

- 1 Lower silique segment with 2 opposite lateral horns or wings on the sides prolonged upward into sharp triangular wedges, concave in between; petals lavender (rarely white), 8-14 mm long, 3-6 mm wide; most of the leaves deeply pinnatifid into 6-9 lobes..... *Cakile maritima* ssp. *maritima*
- 1 Lower silique segment without lateral horns, triangular wedges absent to 1.5 mm high; petals white (rarely lavender), 4-10 mm long, 1.2-4.5 mm wide; most of the leaves with a few to many irregular teeth (or pinnatifid in *C. lanceolata*)..... *Cakile constricta*

Cakile constricta Rodman. GULF COAST SEA-ROCKET. **Hab:** Beaches, coastal sands. **Dist:** Panhandle FL west to TX. **Phen:** Feb-Oct. **Syn:** = FNA7, GW2, K1, K3, K4, Al-Shehbaz (1985b), Rodman (1974), Rollins (1993); < *Cakile lanceolata* (Willdenow) O.E. Schulz – S, WH3.

* ***Cakile maritima*** Scopoli ssp. *maritima*. EUROPEAN SEA-ROCKET. **Hab:** Beaches, at or near the wrack line. **Dist:** Native of Europe. The other subspecies are also European but are apparently not introduced in our area. **Comm:** The NC location was on ballast at Wilmington, and is apparently not persistent. VA locations are, however, well-established. **Syn:** = FNA7, NY, Va, Al-Shehbaz (1985b), Rodman (1974); = *Cakile cakile* (Linnaeus) Karstens – S; < *Cakile maritima* – C, F, G, K1, K3, K4, Rollins (1993). NatureServe GNR (Not Yet Ranked).

**Camelina** Crantz 1762 (GOLD-OF-PLEASURE, FALSE-FLAX)

A genus of 6-8 species, herbs, of se. Europe and the Middle East. References: Al-Shehbaz & Beilstein (2010) in FNA7 (2010); Al-Shehbaz (1987); Rollins (1993).

* ***Camelina microcarpa*** Andrzejowski ex A.P. de Candolle. LESSER GOLD-OF-PLEASURE, LITTLEPOD. **Hab:** Fields, disturbed areas. **Dist:** Native of Eurasia. **Phen:** Apr-May (-Jun). **Syn:** = C, F, FNA7, G, GrPl, Il, K1, K3, K4, Mi, NcTx, NE, NY, Pa, RAB, S, Tn, Tx, Va, W, Al-Shehbaz (1987), Rollins (1993). NatureServe GNR (Not Yet Ranked).

Capsella Medikus 1792 (SHEPHERD'S PURSE)

A genus of 1-4 species, annual or biennial herbs, of Europe. References: Al-Shehbaz (1986a); Al-Shehbaz (2010a) in FNA7 (2010); Rollins (1993); GBI2; Stace (2010).

* ***Capsella bursa-pastoris*** (Linnaeus) Medikus. COMMON SHEPHERD'S PURSE. **Hab:** Fields, roadsides, gardens, disturbed areas. **Dist:** Native of Europe. **Phen:** Feb-Jun. **Tax:** *C. rubella* Reuter, Pink Shepherd's Purse, is sometimes distinguished (as by F, G, Stace 2010), and occurs in our area. It is alleged to be diploid (vs. tetraploid), to have pink petals 1-2 mm long (vs. white, 2-3 mm long), and lateral margins of the fruit concave (vs. straight to convex). Al-Shehbaz (1986) considered the character correlations to be poor, not warranting taxonomic recognition. **Syn:** = C, Fl4, FNA7, GBI2, GrPl, Il, K1, K3, K4, Mi, NcTx, NE, NY, Pa, RAB, Tn, Tx, Va, W, WH3, Al-Shehbaz (1986a), Rollins (1993); = *Bursa bursa-pastoris* (Linnaeus) Britton – S; > *Capsella bursa-pastoris* (Linnaeus) Medikus – F, G, Stace (2010); > *Capsella gracilis* Gren. – F; > *Capsella rubella* Reuter – F, G, Stace (2010).

Cardamine Linnaeus 1753 (BITTERCRESS, TOOTHWORT)

A genus of about 200 species, herbs, cosmopolitan. *Dentaria* should apparently be included (Sweeney & Price 2000). References: Al-Shehbaz (1988a); Al-Shehbaz, Marhold, & Lihová (2010) in FNA7 (2010); Franzke et al (1998); Marhold et al (2016); Rollins (1993); Šlenker et al (2018); Sweeney & Price (2000); Sweeney & Price (2001); Wieboldt (1992).

- 1 Leaves palmately divided (if 1-ternate, then palmately so, the terminal leaflets on a petiolule the same length as the those of the lateral leaflets); ["*Dentaria*"].
 - 4 Trichomes of leaf margins appressed and ca. 0.1 mm long; stem leaves 2 (-3), opposite; lateral leaflets of stem leaves very rarely incised, the leaf being (and appearing merely 3-foliate, though teeth may be prominent and lacerate); basal leaves usually present at flowering.
 - 5 Rhizome with 2-3 cm long segments, each separated by a narrow and fragile connecting portion (which typically is broken on herbarium specimens), and lacking "teeth" (actually prominent reduced leaves); leaflets of the stem leaves (2.5×-) avg. 5× (-7×) as long as wide (thus proportionately much narrower than the leaflets of the basal leaves); central leaflet of stem leaves (2.5-) avg. 3.25 (-4) cm long × (0.5-) avg. 0.75 (-1.0) cm wide; taste of fresh plant relatively mildly mustardy *Cardamine angustata*
 - 5 Rhizome elongate and of uniform diameter, lacking definite segments, but with periodic "teeth" (prominent reduced leaves) along it; leaflets of the stem leaves (2×-) avg. 3× (-4×) as long as wide (thus proportionately similar to the leaflets of the basal leaves); central leaflet of stem leaves (4-) avg. 6 (-8) cm long × (1.5-) avg. 2 (-2.5) cm wide; taste of fresh plant strong, like horseradish or wasabi *Cardamine diphylla*
 - 4 Trichomes of leaf margins erect and 0.2-0.3 mm long; stem leaves 3, whorled; lateral leaflets of stem leaves usually incised into 2 main lobes, giving the leaf a superficially somewhat 5-parted appearance; basal leaves usually absent (or often present in *C. maxima*) at flowering. *Cardamine concatenata*
- 1 Leaves simple, pinnately lobed, or pinnately divided (if 1-ternate, then pinnately so, the terminal leaflet on a longer petiolule than those of the lateral leaflets); [*Cardamine* in the narrow sense].
 - 7 Cauline leaves simple, sometimes the lower to middle cauline leaves with 1-2 pairs of very small lateral lobes. *Cardamine bulbosa*
 - 7 Cauline leaves 1-ternate or pinnatifid (if 1-ternate, the lateral leaflets about as large as the terminal leaflet).
 - 17 Stamens 4 (rarely 5 or 6); plant with many, persistent basal leaves forming a compact rosette; stem bases and petioles hirsute *Cardamine hirsuta*
 - 17 Stamens 6; plant with few or no basal leaves, not forming a rosette or forming a loose rosette; stem bases and petioles glabrous (or sparsely hirsute).
 - 18 Cauline leaves 2-4 cm long; terminal leaflet similar to the lateral leaflets in size and shape; leaflets neither decurrent along the rachis nor petiolulate; stem glabrous throughout *Cardamine parviflora* var. *arenicola*
 - 18 Cauline leaves 4-10 cm long; terminal leaflet broader than the lateral leaflets; leaflets either decurrent along the rachis or petiolulate; stem pubescent at base. *Cardamine pensylvanica*

Cardamine angustata O.E. Schulz. EASTERN SLENDER TOOTHWORT. **Hab:** Rich, mesic forests. **Dist:** NJ and IN south to n. GA, c. TN, and ne. MS. **Phen:** Mar-May; Apr-Jun. **Tax:** Material sometimes considered merely disjunct in the Ouachita Mountains of AR, or named as a variety, var. *ouachitana* E.B. Smith, is apparently specifically distinct and not closely related (C.T. Witsell, pers. comm., 2013). **Syn:** = *C. Pa.*, *Va.*, Al-Shehbaz (1988a), Sweeney & Price (2001); = *Cardamine angustata* var. *angustata* – RAB; = *Dentaria heterophylla* Nuttall – F, G, S, Tn, W; < *Cardamine angustata* O.E. Schulz – FNA7, K3, K4, Rollins (1993).

Cardamine bulbosa (Schreber ex Muhlenberg) Britton, Sterns, & Poggenburg. BULBOUS BITTERCRESS. **Hab:** Swampy forests and bogs, primarily (but not strictly) in circumneutral soils over limestone or mafic rocks. **Dist:** ME west to MB, south to FL, LA, and TX. **Phen:** Feb-May; Apr-Jun. **Syn:** = Ar, F, FI4, FNA7, G, GrPl, GW2, Il, K1, K3, K4, Mi, NE, NY, Pa, RAB, S, Tn, Tx, Va, W, WH3, Rollins (1993); = *Cardamine rhomboidea* (Persoon) A.P. de Candolle – C, Al-Shehbaz (1988a). **NatureServe G5** (Secure).

Cardamine concatenata (Michaux) O. Schwarz. CUTLEAF TOOTHWORT. **Hab:** Rich, mesic forests. **Dist:** ME, QC and MN south to FL Panhandle, LA, OK, and TX. **Phen:** (Jan-) Mar-May; Apr-May. **Syn:** = Ar, C, FI4, FNA7, GrPl, K1, K3, K4, Mi, NE, NY, Pa, RAB, Va, WH3, Al-Shehbaz (1988a), Rollins (1993), Sweeney & Price (2001); = *Dentaria laciniata* Muhlenberg ex Willdenow – G, GW2, Il, S, Tn, W; > *Dentaria laciniata* var. *coalescens* Fernald – F; > *Dentaria laciniata* var. *laciniata* – F. **NatureServe G5** (Secure).

Cardamine diphylla (Michaux) Alph. Wood. CRINKLEROOT, TOOTHWORT, TURKEY MUSTARD. **Hab:** Rich, mesic forests. **Dist:** NB west to MN, south to n. GA, SC, and AL. **Phen:** Apr-May; May-Jun. **Syn:** = C, K1, K3, K4, Mi, NE, NY, Pa, RAB, Va, Al-Shehbaz (1988a), Rollins (1993), Sweeney & Price (2001); = *Dentaria diphylla* Michaux – F, G, Il, Tn, W; > *Dentaria diphylla* Michaux – S; > *Dentaria incisa* Small – S. **NatureServe G5** (Secure).

* *Cardamine hirsuta* Linnaeus. HAIRY BITTERCRESS. **Hab:** Disturbed areas, including fields and gardens. **Dist:** Native of Europe. **Phen:** Jan-May (or irregularly earlier in response to mild winter weather). **Syn:** = C, F, FI4, FNA7, G, GW2, Il, K1, K3, Mi, NcTx, NE, NY, Pa, RAB, S, Tn, Tx, Va, W, WH3, Al-Shehbaz (1988a), Marhold et al (2016), Rollins (1993), Šlenker et al (2018); > *Cardamine debilis* – Ar; > *Cardamine hirsuta* Linnaeus – Ar.

Cardamine parviflora Linnaeus var. *arenicola* (Britton) O.E. Schulz. SAND BITTERCRESS. **Hab:** Various habitats, primarily seasonally wet areas with shallow soil or sand, also on mafic outcrop glades, as on greenstone, diabase, and nutrient-rich granites. **Dist:** The typical variety is Eurasian; our variety is widespread in e. North America, also occurring in the Pacific Northwest. **Phen:** Mar-May. **Tax:** Our plant may warrant specific status. **Syn:** = Ar, C, F, GrPl, Il, K1, NcTx, NE, RAB, Tn, Tx, Va, Al-Shehbaz (1988a), Rollins (1993); > *Cardamine arenicola* Britton – S; < *Cardamine parviflora* – FI4, FNA7, G, GW2, K3, K4, Mi, NY, Pa, W, WH3; > *Cardamine parviflora* – S. **NatureServe G5T5** (Secure).

Cardamine pensylvanica Muhlenberg ex Willdenow. QUAKER BITTERCRESS. **Hab:** Various wet habitats, especially swampy depressions, streambanks, small woodland seeps. **Dist:** NL (Newfoundland), NL (Labrador), NT, and AK south to FL, TX, and CA. **Phen:** Mar-May. **Syn:** = Ar,

Erucastrum C. Presl 1826 (DOG-MUSTARD)

A genus of ca. 22 species, herbs, of Africa, Europe, and Arabia. References: Al-Shehbaz (1985b); Luken, Thieret, & Kartesz (1993); Rollins (1993); Warwick (2010d) in FNA7 (2010).

* ***Erucastrum gallicum*** (Willdenow) O.E. Schulz. DOG-MUSTARD, ROCKET-WEED, FRENCH ROCKET. **Hab:** Disturbed areas. **Dist:** Native of Europe. Luken, Thieret, and Kartesz (1993) discuss the introduction and spread of *E. gallicum* in North America. **Phen:** Apr-Sep. **Comm:** While only weakly naturalized in our area, *E. gallicum* seems likely to increase in abundance. The report of *Brassica erucastrum* for NC in RAB is apparently based on material of *Coincya muralis* (Naczi & Thieret (1996). **Syn:** = Bah, C, F, F14, FNA7, G, GrPl, Il, K1, K3, K4, Mi, NcTx, NE, NY, Pa, Tx, WH3, Al-Shehbaz (1985b), Rollins (1993); = *Brassica erucastrum* Linnaeus. NatureServe G5 (Secure).

Erysimum Linnaeus 1753 (WALLFLOWER, TREACLE MUSTARD)

A genus of ca. 150-180 species, of the Northern Hemisphere. References: Al-Shehbaz (1988d); Al-Shehbaz (2010a) in FNA7 (2010); Rollins (1993).

- 2 Sepals 1.8-3.5 mm long; petals 3.5-5.5 mm long; fruits (1-) 1.5-2.5 (-4) cm long; pedicels slender (much narrower than the fruit), 5-13 (-16) mm long
 *Erysimum cheiranthoides*
 2 Sepals 4.5-6 mm long; petals 6-9 (-11) mm long; fruits (2-) 3-8 (-10) cm long; pedicels thick (as wide as the fruit or nearly so), 2-9 (-15) mm long.
 *Erysimum repandum*

* ***Erysimum cheiranthoides*** Linnaeus. WORMSEED MUSTARD, WORMSEED WALLFLOWER. **Hab:** Fields, gardens, roadsides, along railroads, other disturbed areas. **Dist:** Native of Eurasia (or sometimes considered circumboreal and native in n. North America). **Phen:** Jun-Jul; Jul-Aug. **Syn:** = C, F, F14, FNA7, G, GrPl, Il, K1, K3, K4, Mi, NE, NY, Pa, RAB, Tn, Va, W, WH3, WV, Al-Shehbaz (1988d), Rollins (1993); = *Cheirinia cheiranthoides* (Linnaeus) Link – S. NatureServe G5 (Secure).

* ***Erysimum repandum*** Linnaeus. Lepidium Linnaeus 1753 (PEPPERWORT, PEPPERGRASS, PEPPERWEED)

A genus of ca. 220 species, herbs, cosmopolitan. Al-Shehbaz, Mummenhof, & Appel (2002) discuss the inclusion of *Cardaria* and *Coronopus* in *Lepidium*. References: Al-Shehbaz & Gaskin (2010) in FNA7 (2010); Al-Shehbaz (1986a); Al-Shehbaz (1986b); Al-Shehbaz, Mummenhoff, & Appel (2002); Rollins (1993); GB12.

section *Lepidium*: perfoliatum, graminifolium

section *Cardamon*: sativum

section *Lepia*: campestre

section *Dileptium*: austrinum, densiflorum, oblongum, virginicum ssp. virginicum

?: didymum, draba, ruderales, africanum, bonariense, lasiocarpum, schinzii, coronopus

- 1 Upper cauline leaves sessile, and also perfoliate, sagittate, or auriculate at the base.
 - 2 Upper cauline leaves cordate-amplexicaul; basal leaves 2-3-pinnatifid; petals yellow..... *Lepidium perfoliatum*
 - 2 Upper cauline leaves sagittate or auriculate; basal leaves entire, dentate, or sinuate (1-2-pinnatifid in *L. oblongum*); petals white or absent. *Lepidium oblongum*
- 1 Upper cauline leaves petiolate, not perfoliate, sagittate, or auriculate at the base.
 - 5 Valves of the silicles rugose-verrucose; some inflorescences (at least) borne opposite a leaf. *Lepidium didymum*
 - 5 Valves of the silicles smooth; inflorescences not leaf-opposed.
 - 9 Silicles pubescent or only ciliate at the margin. *Lepidium austrinum*
 - 9 Silicles glabrous.
 - 11 Petals 1-2× as long as the sepals..... *Lepidium virginicum* var. *virginicum*
 - 11 Petals 0-0.8× as long as the sepals.
 - 12 Upper cauline leaves lacinate to pinnatifid; inflorescence rachis with hairs to 0.8 mm long. *Lepidium oblongum*
 - 12 Upper cauline leaves entire, serrate, or dentate; inflorescence axis glabrous, papillose, or with hairs < 0.1 mm long.
 - 16 Inflorescence rachis with straight, usually subclavate papillae; silicles widest above the middle..... *Lepidium densiflorum*
 - 16 Inflorescence rachis with minute trichomes, these usually subappressed; silicles widest at or below the middle..... *Lepidium virginicum* var. *virginicum*

Lepidium austrinum Small. SOUTHERN PEPPERWORT. **Hab:** Sandy or loamy open areas, disturbed areas; eastwards as a waif around wool-combing mills in Coastal Plain of SC. **Dist:** MS, se. KS, and NM south through LA, and TX to Mexico. Also reported from MS (Bryson 1991, FNA). **Phen:** Feb-Jun. **Tax:** For further information, see Rollins (1993) and Al-Shehbaz (1986). **Syn:** = FNA7, GrPl, K1, K3, K4, NcTx, Tx, Al-Shehbaz (1986a), Al-Shehbaz (1986b), Rollins (1993). NatureServe G5 (Secure).

Lepidium densiflorum Schrader. PRAIRIE PEPPERWEED, GREEN-FLOWERED PEPPERGRASS. **Hab:** Prairies, glades, disturbed areas. **Dist:** The original distribution difficult to reconstruct, perhaps AB west to AK, south to TX, CA, and Mexico; now much more widespread. **Phen:** (Feb-) May-Jun. **Syn:** = C, F, Fl4, FNA7, G, GB12, GrPl, Il, K3, K4, Mi, NcTx, Pa, S, Tn, Tx, Va, WH3, WV; > *Lepidium densiflorum* var. *densiflorum* – K1, NE, NY, Al-Shehbaz (1986a), Rollins (1993). NatureServe G5T5 (Secure).

* ***Lepidium didymum*** Linnaeus. WART-CRESS, LESSER SWINE-CRESS. **Hab:** Fields, roadsides, disturbed areas. **Dist:** Native of South America. **Syn:** = Ar, Fl4, FNA7, Il, K3, K4, NE, NY, Tn, Va, WH3, Al-Shehbaz, Mummenhoff, & Appel (2002); = *Carara didyma* (Linnaeus) Britton – S; = *Coronopus didymus* (Linnaeus) Smith – Bah, C, F, G, GB12, K1, NcTx, Pa, RAB, Tx, Al-Shehbaz, 1986a., Al-Shehbaz (1986b), Rollins (1993). NatureServe GNR (Not Yet Ranked).

Lepidium oblongum Small. VEINY PEPPERGRASS. **Hab:** Fields and roadsides, also as a waif around wool-combing mills in Coastal Plain of SC. **Dist:** Native of sc. and sw. North America south through Mexico to Central America (perhaps native in the western portions of our area). AL, AR, KS, NM, AZ, and OR south to TX, Mexico, and Central America. Reported for MD (Longbottom, Naczi, & Knapp 2016). **Comm:** For further information, see Rollins (1993) and Al-Shehbaz (1986). **Syn:** = FNA7, GrPl, K3, K4, NcTx, Tx, Al-Shehbaz (1986a), Al-Shehbaz (1986b); > *Lepidium oblongum* var. *oblongum* – Ar, K1, Rollins (1993). 270. BRASSICACEAE

Lepidium virginicum Linnaeus var. *virginicum*. POOR MAN'S PEPPER. **Hab:** Disturbed areas. **Dist:** *L. virginicum* var. *virginicum* is widespread in e. and c. North America; also introduced in various places elsewhere in the world. **Phen:** Feb-Jun (-Dec). **Tax:** Rollins (1993) interprets *L. virginicum* as having seven additional varieties, all in western North America and Central America. For North America, FNA recognizes two subspecies. **Syn:** = C, G, K1, NE, Tx, Al-Shehbaz (1986a), Al-Shehbaz (1986b), Rollins (1993); = *Lepidium virginicum* Linnaeus ssp. *virginicum* – FNA7, K3, K4, NY; < *Lepidium virginicum* – Ar, Bah, F, GB12, GrPl, Il, Mi, NcTx, Pa, RAB, S, Tn, Va, W, WH3, WV. NatureServe G5T5 (Secure).

**Lobularia** Desvaux 1815 (SWEET ALYSSUM)

A genus of 4 species, herbs, of Eurasia and Macaronesia. References: Al-Shehbaz (1987); Borgen (2010) in FNA7 (2010); Rollins (1993).

* **Lobularia maritima** (Linnaeus) Desvaux. SWEET ALYSSUM. **Hab:** Disturbed areas, lawns. **Dist:** Native of Europe. The NC occurrences are doubtfully established, from gardens and a "lawn". **Phen:** Jun-Nov. **Syn:** = Ar, C, F, Fl4, FNA7, G, Il, K1, K3, K4, Mi, NE, NY, Pa, Tx, WH3, Al-Shehbaz (1987), Rollins (1993). NatureServe GNR (Not Yet Ranked).

**Nasturtium** R. Brown 1812 (WATERCRESS)

A genus of 5 species, perennial herbs, of Eurasia, n. Africa, and North America. Al-Shehbaz & Price (1998) summarize the reasons for separating *Nasturtium* from *Rorippa*; Franzke et al. (1998) provide corroboration based on molecular analysis. References: Al-Shehbaz & Price (1998); Al-Shehbaz (1988a); Al-Shehbaz (2010a) in FNA7 (2010); Franzke et al (1998); Green (1962); Rollins (1993); Stuckey (1972).

* **Nasturtium officinale** W.T. Aiton. WATERCRESS. **Hab:** Streams, springs, seepages. **Dist:** Native of Eurasia. **Phen:** Apr-Jul. **Syn:** = Fl4, FNA7, GrPl, GW2, Il, K3, K4, Mi, NE, NY, Pa, Tn, Va, WH3, WV, Al-Shehbaz & Price (1998); = *Rorippa nasturtium-aquaticum* (Linnaeus) Hayek – C, K1, NcTx, Tx, Al-Shehbaz (1988a), Green (1962), Rollins (1993); = *Sisymbrium nasturtium-aquaticum* Linnaeus – S; < *Nasturtium officinale* W.T. Aiton – G, RAB, W; > *Nasturtium officinale* var. *officinale* – F; > *Nasturtium officinale* var. *siifolium* (Reichenbach) W.D.J. Koch – F. NatureServe GNR (Not Yet Ranked).

**Physaria** (Nuttall ex Torrey & A. Gray) A. Gray 1849

A genus of about 98 herbs, of temperate North America and South America (Al-Shehbaz & O'Kane 2002). The genus is most diverse in sw. North America. References: Al-Shehbaz & O'Kane (2002); Al-Shehbaz (1987); O'Kane (2010a) in FNA7 (2010); Rollins & Shaw (1973); Rollins (1993).

Physaria gracilis (Hooker) S. Watson ssp. *gracilis*. SPREADING BLADDERPOD. **Hab:** Prairies, roadsides, old fields. **Dist:** TN, IL, MO, and OK south to AL, MS, LA, and TX. **Phen:** Mar-May. **Syn:** = Ar, FNA7, K3, K4, Mo2, Al-Shehbaz & O'Kane (2002); = *Lesquerella gracilis* (Hooker) S. Watson ssp. *gracilis* – K1, NcTx, Al-Shehbaz (1987), Rollins (1993); = *Lesquerella gracilis* var. *gracilis* – Tx; < *Lesquerella gracilis* – F, G; < *Lesquerella gracilis* (Hooker) S. Watson ssp. *gracilis* – Rollins & Shaw (1973); < *Physaria gracilis* – Il. NatureServe G5T4 (Apparently Secure).

**Planodes** E.L. Greene 1912 (VIRGINIA-CRESS)

A genus of 2 species, of North America and Mexico. References: Al-Shehbaz (1988a); Al-Shehbaz (2010a) in FNA7 (2010); Rollins (1993).

Planodes virginicum (Linnaeus) E.L. Greene. VIRGINIA-CRESS, SIBARA. **Hab:** Disturbed areas, fields, roadsides. **Dist:** VA west to IL, IA, and KS, south to FL and TX. **Phen:** Feb-Jun. **Comm:** A native weed, presumably much more common now than formerly. **Syn:** = Ar, Fl4, FNA7, K3, Va, Rollins (1993); = *Arabis virginica* (Linnaeus) Poiret – GrPl, S; = *Planodes virginica* – Il, K4, Mo2, Tn, orthographic variant; = *Sibara virginica* (Linnaeus) Rollins – C, F, G, K1, NcTx, RAB, Tx, W, WH3, WV, Al-Shehbaz (1988a). NatureServe G5 (Secure).

**Raphanus** Linnaeus 1753 (RADISH)

A genus of 3 species, herbs, of the Old World. References: Al-Shehbaz (1985b); Rollins (1993); Stace (2010); Warwick (2010e) in FNA7 (2010).

- 1 Siliques moniliform (constricted between the seeds), the silique body about the same diameter for most of its length, longitudinally grooved; petals usually yellow, fading white (rarely purple); seeds 4-12 per silique..... **Raphanus raphanistrum** ssp. *raphanistrum*
- 1 Siliques not moniliform, the silique body tapered from its widest point below the middle to the apex, smooth or slightly longitudinally grooved; petals usually purple (rarely white); seeds 1-3 (-5) per silique..... **Raphanus sativus**

270. **BRASSICACEAE**

* ***Raphanus raphanistrum*** Linnaeus ssp. ***raphanistrum***. WILD RADISH, JOINTED CHARLOCK, WHITE CHARLOCK. **Hab:** Fields, roadsides, disturbed areas. **Dist:** Native of Mediterranean Europe. **Phen:** Mar-Jun (and sporadically later). **Tax:** European authors (such as Stace 2010) recognize several infraspecific taxa in *R. raphanistrum*; North American material represents ssp. ***raphanistrum***. **Syn:** = FNA7, NE, NY, Stace (2010); < *Raphanus raphanistrum* Linnaeus – Ar, C, F, Fl4, G, Il, K1, K3, K4, Mi, Mo2, Pa, RAB, Tn, Va, W, WH3, WV, Al-Shehbaz (1985b), Rollins (1993). NatureServe GNR (Not Yet Ranked).

* ***Raphanus sativus*** Linnaeus. RADISH, GARDEN RADISH. **Hab:** Persistent after cultivation or as a "throw-out". **Dist:** Native of Mediterranean Europe. Cultivated for at least 5000 years. **Phen:** Apr-Jun (-Sep). **Syn:** = Ar, C, F, Fl4, FNA7, G, GrPl, Il, K1, K3, K4, Mi, NcTx, NE, NY, Pa, RAB, S, Tx, W, WH3, WV, Al-Shehbaz (1985b), Rollins (1993), Stace (2010). NatureServe GNR (Not Yet Ranked).

***Rhamphospermum*** Andrzejowski ex Besser 1822

A genus of 4 species, annual herbs, of the Eurasia and n. Africa. See Al-Shehbaz (2021). References: Al-Shehbaz (1985b); Al-Shehbaz (2021); Rollins (1993); Warwick (2010g) in FNA7 (2010).

* ***Rhamphospermum arvense*** (Linnaeus) Al-Shehbaz. CHARLOCK, CRUNCHWEED, WILD MUSTARD, CORN CHARLOCK. **Hab:** Disturbed areas. **Dist:** Native of Mediterranean Europe. **Phen:** Apr-Jul. **Syn:** = Al-Shehbaz (2021); = *Sinapis arvensis* Linnaeus – Ar, C, Fl4, FNA7, Il, K1, K3, K4, Mi, NcTx, NE, NY, Pa, S, Tn, WH3, Al-Shehbaz (1985b), Rollins (1993); ? *Brassica kaber* (A.P. de Candolle) L.C. Wheeler – G, GrPl, RAB, Tx; > *Brassica kaber* var. *pinnatifida* (Stokes) L.C. Wheeler – F, WV. NatureServe GNR (Not Yet Ranked).

* ***Rhamphospermum nigrum*** (Linnaeus) Al-Shehbaz. BLACK MUSTARD, CHARLOCK. **Hab:** Fields, disturbed areas. **Dist:** Native of Eurasia. **Phen:** May-Aug. **Comm:** The seeds of this species are one source of table mustard; other species used include *B. juncea* and *Sinapis alba*. **Syn:** = Al-Shehbaz (2021); = *Brassica nigra* (Linnaeus) W.D.J. Koch – Ar, C, F, Fl4, FNA7, G, GrPl, Il, K1, K3, K4, Mi, NcTx, NE, NY, Pa, S, Tn, Tx, Va, WH3, Al-Shehbaz (1985b), Rollins (1993); = *Sinapis nigra* Linnaeus. NatureServe GNR (Not Yet Ranked).

***Rorippa*** Scopoli 1760 (YELLOW CRESS, MARSHCRESS)

A genus of about 75 species, herbs, cosmopolitan. The separation of *Nasturtium* from *Rorippa* is warranted (Al-Shehbaz & Price 1998); Franzke et al. (1998) provide corroboration based on molecular analysis. The species treated here as *R. aquatica* has been placed in several genera in recent years. References: Al-Shehbaz & Bates (1987); Al-Shehbaz (1988a); Al-Shehbaz (1988a); Al-Shehbaz (2010a) in FNA7 (2010); Les, Anderson, & Cleland (1995); Rollins (1993); Stuckey (1972).

- 1 Plant a submerged aquatic, rooting from lower nodes; leaves of two forms, the submerged pectinately divided, the emergent simple, sometimes lobed; fruit < 2.5× as long as wide; petals white..... ***Rorippa aquatica***
- 1 Plant terrestrial or of wet places, not rooting from lower nodes; leaves of one form, pinnately lobed or simple; fruit > 2.5× as long as wide; petals yellow or pale yellow (or absent).
 - 2 Plant a rhizomatous, colony-forming perennial; petals (2.0-) 2.8-6.0 mm long; siliques 3-15× as long as wide. ***Rorippa sylvestris***
 - 2 Plant a taprooted annual or biennial; petals 0-3.5 mm long; siliques either 2-9 (-10)× or 15-50× as long as wide.
 - 4 Flowers nearly sessile; petals absent; lower fruiting pedicels 0.5-1.5 mm long; siliques (3-) 5.4-8.5 (-10.2) mm long, (1.4-) 1.8-2.6 (-3.3) mm wide, mostly 3-5× as long as wide..... ***Rorippa sessiliflora***
 - 4 Flowers clearly pedicellate; petals present (or absent in *R. dubia*); lower fruiting pedicels > 4 mm long; siliques 4-20 mm long, either 2-9 (-10)× or 15-50× as long as wide.
 - 7 Siliques (5.2-) 8.5-12.5 (-20.4) mm long, (4-) 6-9 (-10)× as long as wide; leaves deeply pinnatifid, the pinnae themselves toothed, lobed or dissected; seeds 0.4-0.5 mm long, 100-150 per silique..... ***Rorippa teres***
 - 7 Siliques 2.5-9 mm long, 2-5× as long as wide; leaves serrate, lobed, or pinnately dissected, the pinnae (when present) merely toothed; seeds 0.5-0.9 mm long, 20-80 per silique. ***Rorippa palustris* ssp. *palustris***

(see introduction for more)

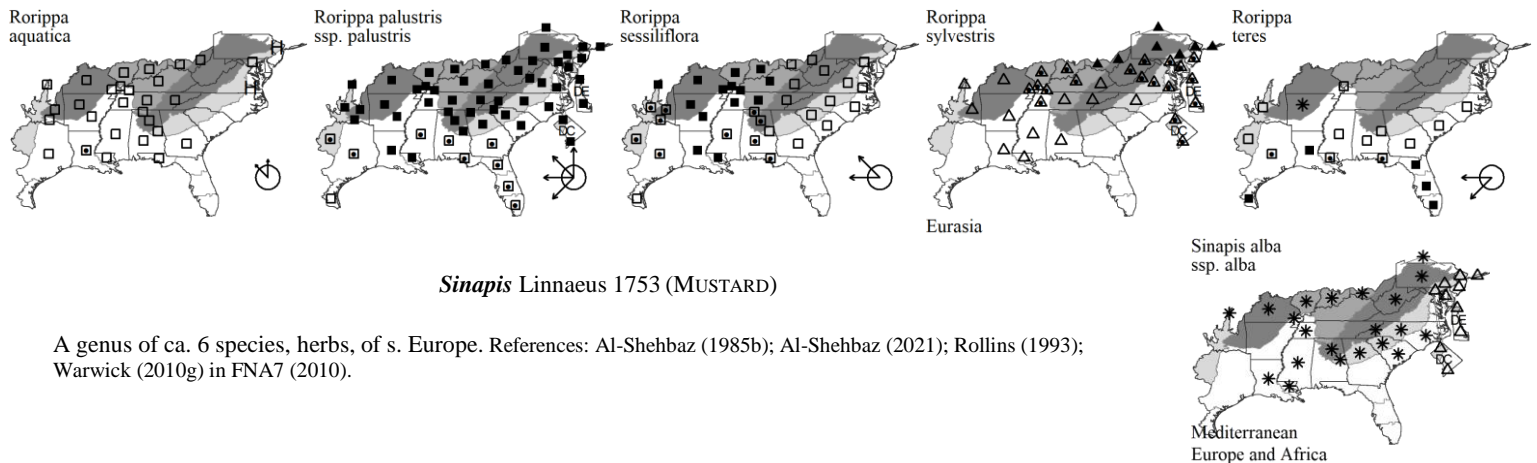

Rorippa aquatica (Eaton) E.J. Palmer & Steyermark. LAKE CRESS. **Hab:** Shallow water of swamps and lake and reservoir margins. **Dist:** VT west to MN, south to s. GA, FL, and e. TX, widely scattered and probably dispersed by waterfowl. **Phen:** May-Aug. **Comm:** See Al-Shehbaz & Bates (1987) and Les, Anderson, & Cleland (1995) for additional information on this interesting plant. Apparently most closely related to *Rorippa*, and here included in that genus. **Syn:** = F14, FNA7, K3, K4, Mi, NE, NY, Tn, Va; = *Armoracia aquatica* (Eaton) Wiegand – F, G, GW2; = *Armoracia lacustris* (A. Gray) Al-Shehbaz & V. Bates – C, Q, Al-Shehbaz & Bates (1987), Rollins (1993); = *Neobeckia aquatica* (Eaton) Greene – Ar, Il, K1, S, WH3, Les, Anderson, & Cleland (1995); = *Rorippa americana* (A. Gray) Britton. NatureServe G4? (Apparently Secure).

Rorippa palustris (Linnaeus) Besser ssp. *palustris*. MARSHCRESS. **Hab:** Marshes, bogs, seeps. **Dist:** ME and NB west to SK, south to FL, TX, ID, and n. South America. **Phen:** May-Oct. **Syn:** = K3, K4, Mi, NY, Va, Al-Shehbaz (1988a); = *Radicula palustris* (Linnaeus) Moench – S; = *Rorippa islandica* (Oeder ex Murray) Borbás – RAB, misapplied; = *Rorippa palustris* var. *palustris* – NE; > *Rorippa islandica* var. *fernaldiana* Butters & Abbe – F, G, WV, misapplied; > *Rorippa islandica* (Oeder ex Murray) Borbás var. *islandica* – F, G, Tx, misapplied; < *Rorippa palustris* – F14, GW2, Pa, W, WH3; > *Rorippa palustris* ssp. *fernaldiana* (Butters & Abbe) Jonsell – K1, NcTx, Tn, Al-Shehbaz (1988a); > *Rorippa palustris* ssp. *glabra* (O.E. Schulz) R. Stuckey var. *fernaldiana* (Butters & Abbe) R. Stuckey – GrPl, Stuckey (1972); > *Rorippa palustris* ssp. *palustris* var. *palustris* – Stuckey (1972); > *Rorippa palustris* var. *fernaldiana* (Butters & Abbe) R. Stuckey – Ar, C, Il, Rollins (1993); > *Rorippa palustris* var. *palustris* – C, Il, Rollins (1993).

Rorippa sessiliflora (Nuttall ex Torrey & A. Gray) A.S. Hitchcock. STALKLESS MARSHCRESS. **Hab:** Wet places, marshes, swamps. **Dist:** MD, WV (Cusick 1994), OH, IN, IL, MN, and NE south to Panhandle FL, s. AL, LA, and c. TX. **Phen:** Apr-Jul. **Syn:** = Ar, C, F, F14, FNA7, G, GrPl, GW2, Il, K1, K3, K4, NcTx, NE, RAB, Tn, Tx, Va, W, WH3, Al-Shehbaz (1988a), Rollins (1993), Stuckey (1972); = *Radicula sessiliflora* (Nuttall ex Torrey & A. Gray) E.L. Greene – S. NatureServe G5 (Secure).

* **Rorippa sylvestris** (Linnaeus) Besser. CREEPING YELLOW CRESS. **Hab:** Lawns, disturbed moist to wet soils. **Dist:** Native of Eurasia. **Phen:** May-Aug. **Syn:** = Ar, C, F, FNA7, G, GrPl, GW2, Il, K1, K3, K4, Mi, NE, NY, Pa, RAB, Tn, Va, W, WV, Al-Shehbaz (1988a), Rollins (1993), Stuckey (1972); = *Radicula sylvestris* (Linnaeus) Druce – S. NatureServe G5 (Secure).

Rorippa teres (Michaux) R. Stuckey. SOUTHERN MARSH YELLOWCRESS. **Hab:** Cypress-gum ponds, marshes, swamps, ditches, disturbed wet areas. **Dist:** Se. NC south to s. FL, west to se. OK, sw. TX, and s. and w. Mexico (SIN). **Phen:** Mar-May. **Syn:** = C, F14, FNA7, Il, K1, K3, K4, NcTx, Tx, WH3; = *Radicula walteri* (Elliott) E.L. Greene – S; = *Rorippa walteri* – RAB; > *Rorippa teres* var. *teres* – Ar, GW2, Al-Shehbaz (1988a), Rollins (1993), Stuckey (1972). NatureServe G5 (Secure).

A genus of ca. 6 species, herbs, of s. Europe. References: Al-Shehbaz (1985b); Al-Shehbaz (2021); Rollins (1993); Warwick (2010g) in FNA7 (2010).

- 1 Beak of silique strongly compressed; silique densely covered with long, stiff trichomes, ca. 4 mm in diameter; pedicels slender, mostly at right angles to the rachis; seeds 4-8 per silique; [section *Sinapis*] *Sinapis alba* ssp. *alba*
 1 Beak of silique conical; silique glabrous or nearly so, ca. 2 mm in diameter; pedicels thick, erect to spreading; seeds 7-13 per silique; [section *Ceratosinapis*] *Rhaphospermum arvense*

* **Sinapis alba** Linnaeus ssp. *alba*. WHITE MUSTARD, YELLOW MUSTARD, WHITE CHARLOCK. **Hab:** Disturbed areas. **Dist:** Native of Mediterranean Europe. **Phen:** Apr-Jun. **Comm:** The seeds of this species are one source of table mustard; other species used include *Brassica juncea* and *B. nigra*. **Syn:** = FNA7; = *Sinapis alba* Linnaeus – Al-Shehbaz (1985b), Rollins (1993); ? *Brassica hirta* – F, G, GrPl, RAB, Tx, WV; < *Sinapis alba* Linnaeus – C, Il, K1, K3, K4, Mi, NcTx, NE, Pa, S; < *Sinapis alba* Linnaeus ssp. *alba*. NatureServe GNRTNR (Not Yet Ranked).

Sisymbrium Linnaeus 1753 (JIM HILL MUSTARD)

A genus of about 41 species, herbs, mainly northern hemisphere. References: Al-Shehbaz (1986b); Al-Shehbaz (1988a); Al-Shehbaz (2010a) in FNA7 (2010); Rollins (1993).

- 1 Silique linear, 5-10 cm long; spreading from the rachis; pedicels 5-20 mm long; petals 6-8 mm long *Sisymbrium altissimum*
 1 Silique subulate, 0.8-1.5 cm long, appressed to the rachis; pedicels 1-3 mm long; petals 3-4 mm long *Sisymbrium officinale*

* **Sisymbrium altissimum** Linnaeus. TUMBLE MUSTARD, JIM HILL MUSTARD, TALL HEDGE-MUSTARD. **Hab:** Fields, disturbed areas. **Dist:** Native of Eurasia. **Phen:** May-Jun (-Aug). **Syn:** = Ar, C, F, F14, FNA7, G, GrPl, Il, K3, K4, Mi, NcTx, NE, NY, Pa, RAB, Tn, Tx, Va, W, WH3, WV, Al-Shehbaz (1986b), Rollins (1993); = *Norta altissima* (Linnaeus) Britton – S. NatureServe GNR (Not Yet Ranked).

270. **BRASSICACEAE**

* ***Sisymbrium officinale*** (Linnaeus) Scopoli. HEDGE MUSTARD. **Hab:** Fields, pastures, barnyards, disturbed areas. **Dist:** Native of Europe. **Phen:** May–Nov. **Syn:** = Ar, C, Fl4, FNA7, K1, K3, K4, Mi, NcTx, NE, NY, Pa, Tn, Tx, Va, WH3, Al-Shehbaz (1986b), Rollins (1993); = *Erysimum officinale* Linnaeus – S; > *Sisymbrium officinale* var. *leiocarpum* A.P. de Candolle – F, G, GrPl, Il, RAB, W, WV; > *Sisymbrium officinale* var. *officinale* – F, G, GrPl, Il, RAB, W, WV.

***Thlaspi*** Linnaeus 1753 (PENNYCRESS)

A genus of about 6 species, as much more narrowly circumscribed, annual herbs, native to Eurasia and n. Africa. Mummenhoff & Koch (1994), Meyer (1973, 1979), Koch & Al-Shehbaz (2004), and Al-Shehbaz (2014) discuss the reasons for separating *Noccaea* from *Thlaspi*; they are now additionally treated in separate tribes. References: Al-Shehbaz (1986a); Al-Shehbaz (2010a) in FNA7 (2010); Esmailbegi et al (2018); Rollins (1993).

* ***Thlaspi arvense*** Linnaeus. FIELD PENNYCRESS, FRENCHWEED. **Hab:** Fields, disturbed areas. **Dist:** Native of Europe. **Phen:** Mar–Jun (–Sep); Apr–Jul (–Oct). **Syn:** = C, F, Fl4, FNA7, G, GrPl, Il, K1, K3, K4, Mi, NcTx, NE, NY, Pa, RAB, S, Tx, Va, W, WH3, WV, Al-Shehbaz (1986a), Rollins (1993). NatureServe GNR (Not Yet Ranked).

Tomostima Rafinesque 1825 (DRABA)

A genus of 6 species, annual herbs, of North America south into Mexico and disjunct in South America. This genus has been segregated from *Draba* on molecular and morphological grounds (Jordon-Thaden et al. 2010; Al-Shehbaz 2012). References: Al-Shehbaz (1987); Al-Shehbaz (2012a); Al-Shehbaz, Windham, & Elven (2010) in FNA7 (2010); Jordon-Thaden et al (2010); Koch & Al-Shehbaz (2002); Rollins (1993).

- 1 Inflorescence congested, the fruiting portion ca. 1.5 cm long; trichomes of the upper leaf surface simple or once-forked; pedicels glabrous (rarely with a few scattered trichomes)..... ***Tomostima reptans***
 1 Inflorescence not congested, the fruiting portion mostly > 2.5 cm long; trichomes of the upper leaf surface dendritic; pedicels densely pubescent..... ***Tomostima cuneifolia***

Tomostima cuneifolia (Nuttall ex Torrey & A. Gray) Al-Shehbaz, M. Koch, & Jordon-Thaden. WEDGELEAF DRABA. **Hab:** Calcareous barrens and glades, open blackland prairies, preferring rocky, bare soil, limestone outcrops, also waste areas around wool-combing mills, possibly other habitats. **Dist:** IL south to LA, west to UT, NV, CA, and Mexico (BCN, BCS, CHH, COA, NLE, SON); scattered eastwards as apparently native disjuncts in OH, KY, TN, GA, AL, MS, and FL, and also as an occasional weed in NC and SC and perhaps other states. **Phen:** Feb–Apr; Mar–May. **Comm:** The species extends as a native at least as far east as c. GA (Houston County) (Echols 2007) and AL, where it occurs in prairies and on limestone outcrops (Diamond & Woods 2009). Taxa previously treated as additional varieties are now considered to be separate species. **Syn:** = K4, Al-Shehbaz (2012a); = *Draba cuneifolia* Nuttall ex Torrey & A. Gray var. *cuneifolia* – Ar, FNA7, Il, K1, K3, Tx, Al-Shehbaz (1987), Rollins (1993); < *Draba cuneifolia* – C, F, Fl4, G, GrPl, NcTx, RAB, S, Tn, WH3. NatureServe G5T5 (Secure).

Tomostima reptans (Lamarck) Al-Shehbaz, M. Koch, & Jordon-Thaden. CAROLINA DRABA. **Hab:** Dry soil. **Dist:** MA and ON west to WA, south to NC, GA, TX and CA. **Phen:** Feb–Mar; Mar–Apr. **Comm:** The few occurrences in the eastern part of our area seem to make little ecological or phytogeographic sense; they may represent introductions. The first collection in our area was, however, by Walter. **Syn:** = K4, NY, Al-Shehbaz (2012a); = *Draba reptans* (Lamarck) Fernald – Ar, FNA7, K1, K3, Mi, NcTx, NE, Pa, RAB, Al-Shehbaz (1987), Rollins (1993); > *Draba caroliniana* Walter – S; > *Draba reptans* var. *micrantha* (Nuttall) Fernald – Tx; > *Draba reptans* var. *reptans* – C, F, G, GrPl, Il, Tx. NatureServe G5 (Secure).

***Warea*** Nuttall 1834 (WAREA, PINELAND-CRESS)

A genus of 4 species, annual herbs, of se. North America. The genus is endemic to se. United States Coastal Plain. This is the only genus of tribe *Thelypodieae* in our area. References: Al-Shehbaz (1985a); Al-Shehbaz (2010a) in FNA7 (2010); Channell & James (964); Rollins (1993).

270. BRASSICACEAE

Identification Notes: *Warea* (Brassicaceae) and *Polanisia* (Cleomaceae) are superficially similar. The genus is quite showy and conspicuous, reminiscent of a small *Cleome* because of its white to pink, clawed petals and silique borne on a long gynophore.

Warea sessilifolia Nash. SESSILE-LEAF WAREA, SESSILE-LEAF PINELAND-CRESS. **Hab:** Longleaf pine sandhills. **Dist:** Panhandle FL and adjacent AL (Pike County) and wc. GA (Stewart County) (Sorrie 1998b). **Phen:** Aug-Sep. **Syn:** = Fl4, FNA7, K3, K4, S, WH3, Al-Shehbaz (1985a), Rollins (1993). NatureServe G2G4 (Vulnerable).

276a. COMANDRACEAE Nickrent & Der 2010 (COMANDRA FAMILY) [in SANTALALES]

A family of 2 genera and 2-4 species, herbs or weak shrubs, of North America and Eurasia. References: Nickrent (2016g) in FNA12 (2016); Nickrent et al (2010).

Comandra Nuttall 1818 (COMANDRA, BASTARD-TOADFLAX)

A genus of 2 species, hemiparasitic perennial herbs, of North America and Europe. *Comandra* is placed in the segregate family Comandraceae by Nickrent et al. (2010). References: Nickrent (2016g) in FNA12 (2016); Piehl (1965).

Comandra umbellata (Linnaeus) Nuttall var. *umbellata*. EASTERN COMANDRA, EASTERN BASTARD-TOADFLAX, STAR-TOADFLAX. **Hab:** Dry forests and woodlands, woodland borders, glades, usually in acidic soils and most common in oak/heath forests. **Dist:** Var. *umbellata* ranges from ME to e. ND, south to SC, n. GA, n. AL, n. MS, s. AR, e. OK, and c. KS. **Phen:** Apr-Jul; Jul-Aug. **Tax:** Other varieties are western or (allegedly) of the Balkan region of Europe. These taxa are sometimes treated at specific or subspecific rank (see synonymy). **Syn:** = C, Va; = *Comandra umbellata* ssp. *umbellata* – Ar, FNA12, GrPl, K1, K3, NE, NY, Piehl (1965); > *Comandra richardsiana* – F, G; < *Comandra umbellata* – Il, Mi, Pa, RAB, S, Tn, W, WV; > *Comandra umbellata* – F, G. NatureServe G5T5 (Secure).

276d. SANTALACEAE R. Brown 1810 (SANDALWOOD FAMILY) [in SANTALALES]

A family of about 11 genera and 67 species, trees and shrubs, primarily of tropical and warm temperate regions of the Old World and New World. All members of the family are hemiparasitic, attaching to the stems or roots of other plants. References: Nickrent & Malécot (2001); Nickrent (2016c) in FNA12 (2016); Nickrent et al (2010).

- 1 Leaves alternate; monoecious herb or shrub. *Comandra*
- 1 Leaves opposite; dioecious shrubs. *Phoradendron*
- 3 Aerial (epiphytic) shrubs, parasitic on tree trunks and branches; leaves either coriaceous and brittle when live, or minute and scale-like; [tribe *Visceae* or family *VISCACEAE*] *Nestronia umbellula*
- 3 Terrestrial shrubs, parasitic via root connections; leaves herbaceous, flexible when live. *Nestronia umbellula*

Nestronia Rafinesque 1836 [1838] (NESTRONIA)

A monotypic genus, a hemiparasitic shrub, endemic to se. United States. *Nestronia* is placed in a much more narrowly circumscribed Santalaceae by Nickrent et al. (2010) and Nickrent in FNA (2016). References: Libby & Bloom (1998); Nickrent (2016c) in FNA12 (2016); Sowers (1979).

Identification Notes: In its clonal, usually knee-high growth, *Nestronia* has something of the aspect of an opposite-leaved lowbush blueberry.

Nestronia umbellula Rafinesque. NESTRONIA, CONJURER'S-NUT, LEECHBRUSH, INDIAN-OLIVE. **Hab:** Relatively mesic sites in sandhills in the upper Coastal Plain, mesic to dry Piedmont and montane oak forests. **Dist:** Sc. VA south and west to sc. GA, se. AL, nc. AL, and sc. TN; disjunct in sc. KY. **Phen:** Apr-Jun; Jul-early Sep. **Comm:** See Sowers (1979) and Libby & Bloom (1998) for interesting discussions of the biology of the species and county distribution maps. It sometimes forms colonies (presumably clones) several hectares in size. **Syn:** = C, F, FNA12, G, K1, K3, K4, RAB, S, Tn, Va, W, Libby & Bloom (1998), Sowers (1979). NatureServe G4 (Apparently Secure).

281. TAMARICACEAE Link 1821 (TAMARISK FAMILY) [in CARYOPHYLLALES]

A family of about 4 genera and 80 species, shrubs and trees, of Eurasia and Africa (especially from the Mediterranean to c. Asia). References: Crins (1989b); Gaskin in Kubitzki & Bayer (2003); Gaskin (2015) in FNA6 (2015); Gaskin et al (2004).

Key to Map
Symbology:

* : waif
 EN : endemic
 H : historic

N : no
 P : planted
 ? : questionable
 X : extirpated

A genus of about 55 species, trees and shrubs, native of Eurasia and Africa. References: Baum (1978); Crins (1989b); Gaskin (2015) in FNA6 (2015).

Identification Notes: An important character is the staminal disk; three terms are used. In holophic disks, the lobe between each stamen is obvious and separate from the stamens on either side, and each is usually 2-lobed. In paralophic disks, each lobe is deeply bipartite, and each half-lobe is fused to the base of the adjacent stamen, but is still somewhat distinct from it. In synlophic disks, the lobes are also deeply bipartite, but each half-lobe is fused confluent with the stamen base, giving the appearance that the filament has swollen base.

* *Tamarix chinensis* Loureiro. CHINESE TAMARISK. **Hab:** Brackish marshes, coastal hammocks, dunes and coastal sands, sand and gravel bars along rivers, disturbed areas. **Dist:** Native of China, Korea, and Japan. **Phen:** May-Sep. **Syn:** = C, FNA6, GrPl, K1, K4, NcTx, Tx, Baum (1978), Crins (1989b); = *Tamarix pentandra* Pallas – G, illegitimate name; > *Tamarix ramosissima* Ledebour – K1, K3.

282. PLUMBAGINACEAE A.L. de Jussieu 1789 (LEADWORT FAMILY) [in CARYOPHYLLALES]

A family of about 24-27 genera and 650-775 species, shrubs, vines, and herbs, of cosmopolitan distribution. Lledó et al. (1998) and other authors suggest that the portion of the Plumbaginaceae often recognized as tribe Staticeae or subfamily Staticeoideae (which includes *Limonium*) would be better treated as a distinct family. References: Kubitzki, Rohwer, & Bittrich (1993); Lledó et al (1998); Morin (2005) in FNA5 (2005).

Limonium P. Miller 1754 (SEA-LAVENDER)

A genus of about 350 species, dwarf shrubs, perennial and annual herbs, of cosmopolitan distribution. References: Kubitzki, Rohwer, & Bittrich (1993); Luteyn (1976); Smith (2005a) in FNA5 (2005).

Limonium carolinianum (Walter) Britton. CAROLINA SEA-LAVENDER, SEASIDE THRIFT, INKROOT, MARSH ROSEMARY. **Hab:** Tidal marshes, especially in hypersaline flats. **Dist:** Along the coast from NL (Labrador) south to s. FL, west to TX and ne. Mexico. **Phen:** Aug-Oct. **Tax:** Various treatments recognize from 1 to 4 taxa in our area. The most recent monographer of the genus in our region, Luteyn (1976), recognized only a polymorphic *L. carolinianum* – a treatment followed by most flora authors since. Although Godfrey & Wooten (1981) followed Luteyn's treatment, they stated "we are not at all confident that Luteyn's treatment is a reasonable one." Modern study is needed. **Comm:** The flowering stems of this species are sometimes gathered in large quantities for dried floral arrangements. Herbalists gather the roots in winter to brew a tea as a remedy for colds, fever, and diarrhea. **Syn:** = C, Fl4, FNA5, GW2, K1, K3, K4, NE, NY, Va, WH3, Luteyn (1976); > *Limonium angustatum* (A. Gray) Small – S; > *Limonium carolinianum* (Walter) Britton – F, S; > *Limonium carolinianum* var. *angustatum* (A. Gray) Blake – G; > *Limonium carolinianum* var. *carolinianum* – G, RAB; > *Limonium carolinianum* var. *obtusilobum* (Blake) H.E. Ahles – RAB; > *Limonium nashii* Small – F, S; > *Limonium nashii* Small var. *angustatum* (A. Gray) H.E. Ahles – RAB, Tx; > *Limonium nashii* Small var. *nashii* – G, RAB, Tx; > *Limonium obtusilobum* Blake – S.

283. POLYGONACEAE A.L. de Jussieu 1789 (SMARTWEED FAMILY) [in CARYOPHYLLALES]

A family of about 43-48 genera and 1100-1200 species, trees, shrubs, vines, and herbs, cosmopolitan, but especially north temperate. Recent changes in the circumscription of various genera (including *Polygonum*, *Persicaria*, *Fallopia*, etc.) have received strong support from molecular phylogenetic studies (Kim & Donoghue 2008; Lamb Frye & Kron 2003; Schuster, Reveal, & Kron 2011). References: Brandbyge in Kubitzki, Rohwer, & Bittrich (1993); Freeman & Reveal in FNA5 (2005); Horton (1972); Kim & Donoghue (2008); Lamb Frye & Kron (2003); Mitchell & Dean (1978); Ronse De Craene & Akeroyd (1988); Schuster et al (2015); Schuster, Reveal, & Kron (2011); Schuster, Wilson, & Kron (2011); Yurtseva et al (2016).

- 1 Woody vine, climbing by tendrils; [subfamily Polygonoideae, tribe Coccolobeae].
 - 2 Leaf base deeply cordate.....*Antigonon*
 - 2 Leaf base truncate to broadly cuneate.....*Brunnichia*
- 1 Herb (sometimes very robust and rather woody), herbaceous vine, tree or shrub (*Coccoloba*), or (*Fallopia baldschuanica*) a somewhat woody vine lacking tendrils.
 - 3 Tree or large shrubs (>2 m tall when mature); bark of medium to mature trees peeling.....*Coccoloba*
 - 3 Herbs, herbaceous vines, woody vines, or small shrubs (<2 m tall); stem not exfoliating.
 - 6 Tepals 6, in 2 series of 3 each; plants with leaves basally disposed, the largest basal (these withering in some species later in the season); [tribe Rumiceae].....*Rumex*
 - 6 Tepals mostly 5 in a single whorl; plants with leaves along the stem, lacking well-developed basal leaves.
 - 9 Flowers in small clusters or very reduced racemes of 1-5 flowers, borne in the axils of normally sized or reduced leaves; plants erect or sprawling herbs with stems < 1 m long, from taproots; leaves jointed at base; [tribe Polygoneae].....*Polygonum*
 - 9 Flowers in diffuse axillary panicles, or in terminal or long-peduncled axillary racemes, corymbs, or heads; plants various, either erect or sprawling herbs, or erect, robust, and suffrutescent herbs, or climbing herbaceous or suffrutescent vines, or suffrutescent bushy herbs; leaves not jointed at base (except *Polygonella*).
 - 11 Leaves cuneate at the base, either linear, spatulate, or oblanceolate, mostly < 4 cm long and < 5 mm wide; leaves jointed at the base; pedicels jointed at the base; [tribe Polygoneae].....*Polygonella*

Key to Map

(see introduction for more)

- 11 Leaves cuneate, cordate, or hastate at the base, either lanceolate or ovate, mostly > 5 cm long and > 8 mm wide; leaves not jointed at the base; pedicels not jointed at the base.
- 13 Outer tepals neither keeled nor winged at maturity; inflorescence of spikelike racemes, heads, or sparse, interrupted racemes; [tribe *Persicarieae*] *Persicaria*
- 13 Outer tepals keeled or winged at maturity; inflorescence a compound panicle of racemes; [tribe *Polygoneae*].
- 14 Plants climbing or sprawling, herbaceous to somewhat woody, the stems slender; perianth usually not enlarging in fruit; stigma capitate or peltate *Fallopia*
- 14 Plants erect, robust (1-4 m tall), woody, the stems generally over 1 cm in diameter, hollow; perianth enlarging in fruit; stigma fimbriate *Reynoutria*

Antigonon Endlicher 1837 (LOVE-CHAIN, CORALVINE, CORALLITA)

A genus of about 6 species, vines, of tropical America. References: Freeman (2005a) in FNA5 (2005).

* ***Antigonon leptopus*** Hooker & Arnott. LOVE-CHAIN, QUEEN'S-JEWELS, CONFEDERATE-VINE, CORALLITA, CORALLINA, CORALVINE, TALLAHASSEE-VINE, ROSA DE MONTANA, COAMECATL. **Hab:** Cultivated and persisting; commonly cultivated, rarely persisting or escaping. **Dist:** Native of tropical America. **Phen:** Jun-Oct. **Syn:** = Bah, Fl4, FNA5, K1, K3, K4, NcTx, Tx, WH3, WI; = *Corculum leptopus* (Hooker & Arnott) Stuntz – S. [NatureServe GNR](#) (Not Yet Ranked).

Brunnichia Banks ex Gaertner 1788 (BUCKWHEAT-VINE)

A genus of 3-4 species, vines, of. e. North America and w. Africa. References: Brandbyge in Kubitzki, Rohwer, & Bittrich (1993); Holmes (2005) in FNA5 (2005).

Brunnichia ovata (Walter) Shinnars. BUCKWHEAT-VINE, EARDROP-VINE, LADIES'-EARDROPS, REDVINE. **Hab:** Floodplain forests, swamp forests. **Dist:** Ne. SC south to n. FL, west to e. TX, and north in the interior to w. TN, w. KY, s. IL, and se. MO. **Phen:** May-Jul; Aug-Sep. **Comm:** Introduced in se. VA. **Syn:** = Ar, Fl4, FNA5, GW2, IL, K1, K3, K4, NcTx, Tn, Tx, WH3, WI; = *Brunnichia cirrhosa* Gaertner – C, F, F, RAB, S. [NatureServe G4G5](#) (Apparently Secure).

Coccoloba P. Browne 1756 (PIGEON-PLUM, SEA-GRAPE)

A genus of about 120 species, trees and shrubs, of tropical America. Koenemann & Burke (2020) discussed the evolution of the genus; the clades in the key are from their work. References: Freeman (2005b) in FNA5 (2005); Koenemann & Burke (2020).

Identification Notes: Wild hybrids between *C. diversifolia* and *C. uvifera* are rarely found but occur spontaneously; they are generally intermediate in characteristics. The hybrid, *Coccoloba ×hybrida* I. Castañeda, Sea-plum, is also commonly used horticulturally.

Coccoloba uvifera (Linnaeus) Linnaeus. SEA-GRAPE. **Hab:** Dunes, sandy shores, coastal hammocks, beach strands. **Dist:** C. and s. peninsular FL; s. MS (where uncertainly native); West Indies, s. TX (where possibly only naturalized), Mexico (Tamaulipas) south through Central America and South America. **Phen:** Mar-Oct. **Syn:** = Bah, Fl4, FNA5, K3, K4, WH3, WI; = *Coccolobis uvifera* (Linnaeus) Jacquin – S. [NatureServe G5](#) (Secure).

Fallopia Adanson 1763 (CLIMBING BUCKWHEAT)

A genus of about 9-10 species, woody and herbaceous vines, of temperate regions of the Northern Hemisphere. If accepted (as here) as a genus distinct from *Polygonum*, this group takes the name *Fallopia* Adanson (1763), which has priority over *Tiniaria* (1832) and *Bilderdykia* (1827). *Reynoutria* is sometimes included. References: Brandbyge in Kubitzki, Rohwer, & Bittrich (1993); Freeman & Hinds (2005) in FNA5 (2005); Ronse De Craene & Akeroyd (1988).

- 1 Plant woody; inflorescences freely branched, strongly paniculate; [sometimes cultivated, apparently naturalizing] *Fallopia baldschuanica*
- 1 Plant herbaceous; inflorescences less-branched, usually a reduced panicle with only a few racemose branches; [collectively common and in various natural and disturbed habitats].
- 3 Achene dull black; outer sepals keeled, not expanding into obvious wings in fruit, the fruit therefore 3.5-4.5 mm long (measured from the pedicel joint to the tip); [weedy annual] *Fallopia convolvulus*
- 3 Achene glossy black; outer sepals expanding into obvious wings in fruit, the fruit therefore 7-15 mm long (measured from the pedicel joint to the tip); [native perennial or weedy annual].
- 5 Perianth 7-10 mm long at maturity (measured from the pedicel joint to the tip); achenes 2-3.5 mm long *Fallopia cristata*
- 5 Perianth 10-15 mm long at maturity (measured from the pedicel joint to the tip); achenes 3.5-6 mm long *Fallopia scandens*

* ***Fallopia baldschuanica*** (Regel) Holub. SILVER-LACE-VINE, CHINA FLEECE-VINE. **Hab:** Disturbed areas, roadsides. **Dist:** Native of Asia. **Syn:** = FNA5, K3, K4, NE, NY, Pa; > *Fallopia aubertii* (Henry) Holub – Ronse De Craene & Akeroyd (1988); > *Polygonum aubertii* Henry – C, F, K1.

**Persicaria** P. Miller 1754 (SMARTWEED, TEARTHUMB, JUMPSEED)

A genus of about 150 species, herbs, nearly cosmopolitan (primarily temperate Northern Hemisphere). The sections are well-marked morphologically and in molecular phylogenies; some advocate their recognition at generic rank. References: Atha & Rall (2020); Atha, Nee, & Naczi (2010); Brandbyge in Kubitzki, Rohwer, & Bittrich (1993); Hinds & Freeman (2005b) in FNA5 (2005); Kim & Donoghue (2008); Kim, Donoghue, & Sultan (2017); Mun & Park (1995); Park (1988); Schuster et al (2015); Shaw (2008); Suh, Kim, & Park (1997).

- 1 Stem, petioles, and lower surface of major leaf veins with abundant recurved prickles; [section *Echinocaulon*]. *Persicaria sagittata*
- 1 Stem, petioles, and lower surface of major leaf veins unarmed.
 - 5 Styles exserted, persistent on achenes; inflorescences spikelike, interrupted; [section *Tovara*]. *Persicaria virginiana*
 - 5 Styles included, rarely exserted, deciduous; inflorescences capitate, paniclelike, or spikelike, uninterrupted or interrupted.
 - 11 Ocreae with a green, herbaceous flange; leaves 3-17 cm wide. *Persicaria orientalis*
 - 11 Ocreae hyaline, tan, brown, or reddish throughout; leaves < 6 (-8) cm wide.
 - 12 Ocreae lacking cilia or with cilia 0-1 mm long.
 - 13 Plants perennial, with rhizomes or stolons; leaves lacking a triangular reddish blotch in the middle of the upper surface.
 - 14 Achenes biconvex; styles 2; leaf base cuneate; ocreae 12-23 mm long. *Persicaria densiflora*
 - 14 Achenes triangular in x-section; styles 3; leaf base rounded to cordate; ocreae 6-12 mm long. *Persicaria hirsuta*
 - 13 Plants annual, lacking rhizomes or stolons; leaves often with a triangular reddish blotch in the middle of the upper surface (except for in *P. minor*).
 - 16 Outer tepals with 3 strong veins, each forked in an anchor shape; tepals 4 (-5); inflorescences usually arching-drooping *Persicaria lapathifolia*
 - 16 Outer tepals with inconspicuous and irregularly-forking veins; tepals 5; inflorescences erect.
 - 17 Flowers heterostylous; achenes usually with central hump on 1 side. *Persicaria bicornis*
 - 17 Flowers homostylous; achenes without central hump on 1 side. *Persicaria pennsylvanica*
 - 12 Ocreae with cilia 1-12 mm long.
 - 18 Perianth with glandular punctae.
 - 19 Achenes minutely textured, dull; axillary inflorescences sometimes included within ocreae. *Persicaria hydropiper*
 - 19 Achenes smooth, shiny; axillary inflorescences never included within ocreae.
 - 20 Glandular punctae not uniformly distributed on the tepals, mainly on the lower portions of the outer tepals and on the inner tepals. *Persicaria hydropiperoides*
 - 20 Glandular punctae uniformly distributed on the tepals, not noticeably absent on the upper portions of the outer tepals. *Persicaria punctata*
 - 18 Perianth lacking glandular punctae.
 - 22 Plants perennial, with rhizomes or stolons; leaves lacking a triangular reddish blotch in the middle of the upper surface.
 - 23 Achenes biconvex; styles 2 *Persicaria amphibia* ssp. *laevimarginata*
 - 23 Achenes triangular in x-section; styles 3.
 - 25 Ocreae glabrous, or strigose toward the base (the hairs stiff and appressed). *Persicaria hydropiperoides*
 - 25 Ocreae strigose and hirsute, at least some of the hairs loosely ascending to spreading.
 - 26 Leaf blades rounded to cordate at the base; stem internodes brownish-hirsute. *Persicaria hirsuta*
 - 26 Leaf blades cuneate to truncate at the base; stem internodes glabrous or loosely spreading-hirsute near the nodes only *Persicaria setacea*
 - 22 Plants annual, lacking rhizomes or stolons.
 - 28 Bristles of ocreae (0.5-) 1-4 (-6) mm long; achenes triangular in x-section; styles 3. *Persicaria setacea*

Reed – Il; > *Persicaria pensylvanica* var. *laevigata* (Fernald) Mohlenbrock – Il; > *Persicaria pensylvanica* var. *pensylvanica* – Il; > *Polygonum pensylvanicum* var. *durum* Stanford – F; > *Polygonum pensylvanicum* var. *eglandulosum* J.C. Myers – F; > *Polygonum pensylvanicum* var. *laevigatum* Fernald – F; > *Polygonum pensylvanicum* var. *pensylvanicum* – F; > *Polygonum pensylvanicum* var. *rosaeflorum* J.B.S. Norton – F.

Persicaria punctata (Elliott) Small. DOTTED SMARTWEED. **Hab:** Swamp forests, bottomlands, marshes. **Dist:** NS, ON, and BC south to FL, TX, and CA, south into the New World tropics. **Phen:** Jul-Nov. **Syn:** = Ar, Fl4, FNA5, Il, K3, K4, Mi, NE, NY, Pa, Tn, Tx, Va; = *Polygonum punctatum* – Bah, GW2, NcTx, RAB, W, WH3, WV; > *Persicaria punctata* (Elliott) Small var. *leptostachya* (Meisner) Small – S; > *Persicaria punctata* (Elliott) Small var. *punctata* – S; < *Polygonum punctatum* – Horton (1972); > *Polygonum punctatum* Elliott var. *confertiflorum* (Meisner) Fassett – C, G, K1, Mitchell & Dean (1978); > *Polygonum punctatum* Elliott var. *leptostachyum* (Meisner) Small – F; > *Polygonum punctatum* var. *parvum* Marie-Victorin & Rousseau – F; > *Polygonum punctatum* Elliott var. *punctatum* – C, F, G, K1, Mitchell & Dean (1978).

Persicaria sagittata (Linnaeus) H. Gross ex Nakai. ARROWLEAF TEARTHUMB, ARROWVINE, SCRATCH-GRASS. **Hab:** Marshes, bogs, beaver impoundments, wet thickets. **Dist:** NL (Newfoundland) west to MB, south to Panhandle FL and e. TX; China, Manchuria, India, Siberia, Korea, and Japan. **Phen:** May-Dec. **Syn:** = Ar, Fl4, FNA5, K3, K4, Mi, NE, NY, Pa, Tn, Va; = *Polygonum sagittatum* Linnaeus – C, G, GW2, K1, RAB, Tx, W, WH3, WV, Horton (1972), Mitchell & Dean (1978); = *Tracaulon sagittatum* (Linnaeus) Small – Il, S; = *Truellum sagittatum* (Linnaeus) Soják; > *Polygonum sagittatum* var. *gracilentum* Fernald – F; > *Polygonum sagittatum* var. *sagittatum* – F.

Persicaria setacea (Baldwin) Small. SWAMP SMARTWEED. **Hab:** Swamp forests, bottomland forests. **Dist:** MA, MI, MO, and OK south to s. FL and TX. **Phen:** Jul-Nov. **Syn:** = Ar, Fl4, FNA5, Il, K3, K4, NE, NY, Pa, S, Tn, Tx, Va; = *Polygonum hydropiperoides* Michaux var. *setaceum* (Baldwin) Gleason – C, G; = *Polygonum setaceum* Baldwin – GW2, NcTx, RAB, W, WH3, Horton (1972), Mitchell & Dean (1978); > *Polygonum setaceum* var. *interjectum* Fernald – F, K1; > *Polygonum setaceum* var. *setaceum* – F, K1; > *Polygonum setaceum* var. *tonsum* Fernald – F, K1.

Persicaria virginiana (Linnaeus) Gaertner. JUMPSEED, VIRGINIA KNOTWEED. **Hab:** Floodplains, moist forests. **Dist:** NH, QC, MN, and NE, south to n. peninsular FL and TX; disjunct in c. Mexico. **Phen:** Jun-Oct. **Tax:** Section *Tovara* consists of 3-5 species of e. North America and e. Asia (Mun & Park 1995); if the section is recognized as a genus (as it often has been), the correct name for this species is *Antenoron virginianum*. Variation in North America, previously sometimes recognized as varieties, as by F and G, is under study by M. Pyne. **Syn:** = Ar, Fl4, FNA5, Mi, NE, NY, Pa, Tn, Va; = *Antenoron virginianum* (Linnaeus) Roberty & Vautier – Il, Horton (1972); = *Polygonum virginianum* Linnaeus – C, GrPl, GW2, K1, NcTx, Tx, W, WH3, Mitchell & Dean (1978); = *Tovara virginiana* (Linnaeus) Rafinesque – RAB, S, WV; < *Persicaria virginiana* (Linnaeus) Gaertner – K3, K4; > *Polygonum virginianum* var. *glaberrimum* (Fernald) Steyermark – G; > *Polygonum virginianum* var. *virginianum* – G; > *Tovara virginiana* var. *glaberrima* Fernald – F; > *Tovara virginiana* var. *virginiana* – F. NatureServe G5 (Secure).

Polygonella Michaux 1803 (JOINTWEED)

A genus of about 12-15 species, herbs and shrubs, of se. and sc. North America. Based on morphology, Ronse Decraene, Hong, & Smets (2004) suggested that *Polygonella* should be merged into *Polygonum*, as part of section *Duravia*; Schuster, Reveal, & Kron (2011) developed molecular evidence of the close relationship of *Polygonella* to the *Duravia* group of *Polygonum* and transferred the species into *Polygonum*. It now seems best to me to pursue an alternative course, of recognizing the very distinctive clades as separate genera – in our area, *Polygonum* s.s., *Polygonella*, and *Duravia*. References: Freeman (2005e) in FNA5 (2005); Horton (1961); Nesom & Bates (1984); Ronse Decraene et al. (1993); Schuster et al (2015); Schuster, Reveal, & Kron (2011); Wunderlin (1981).

7 Style and stigma (0.4-) 0.5-0.8 (-1.0) mm long at anthesis; inner sepals (1.7-) 1.9-2.5 (-2.9) mm long in flower, (3.1-) 3.3-4.7 (-6.0) mm long in fruit; perennial; leaves very numerous, (4.0-) 5.2-12.0 (-19.0) mm long, 0.5-0.9 (-1.2) mm wide, nearly as thick as wide.

.....*Polygonella americana*

7 Style and stigma 0-0.1 (-0.2) mm long at anthesis; inner sepals (0.6-) 0.7-1.8 (-2.3) mm long at anthesis, (1.6-) 1.7-2.8 (-3.6) mm in fruit; annual or perennial; leaves (2.5-) 4.4-39.0 (-65.0) mm long, (0.3-) 0.6-5.0 (-8.0) mm wide, wider than thick.

.....*Polygonella gracilis*

Polygonella americana (Fischer & C.A. Meyer) Small. SOUTHERN JOINTWEED. **Hab:** Longleaf pine sandhills, other dry woodlands, glades, and barrens with sandy or rocky soil. **Dist:** Sc. NC south to c. TX, north in the interior to ec. TN, se. MO, and AR; disjunct in Panhandle TX and NM. **Phen:** Jun-Oct; Aug-Nov. **Syn:** = Ar, F, FNA5, G, GrPl, K1, NcTx, RAB, S, Tn, Tx, Horton (1961); = *Polygonum americanum* (Fischer & C.A. Meyer) T.M. Schuster & Reveal – K3, K4, Schuster, Reveal, & Kron (2011). NatureServe G5 (Secure).

Polygonella gracilis (Nuttall) Meisner. WIREWEED. **Hab:** Longleaf pine sandhills. **Dist:** Sc. NC south to s. FL, west to s. MS, perhaps adventive toward the northern part of the range. **Phen:** Late Aug-Oct; Oct-Jan. **Syn:** = Fl4, FNA5, K1, RAB, WH3, Horton (1961); = *Delopyrum gracile* (Meisner) Small – S, nom. illeg.; = *Polygonum pinicola* T.M. Schuster & Reveal – K3, K4, Schuster, Reveal, & Kron (2011). NatureServe G4G5 (Apparently Secure).

283. **POLYGONACEAE****Polygonum** Linnaeus 1753 (KNOTWEED)

A genus of about 45 species, herbs, of temperate regions of the Northern Hemisphere. Based on morphology, Ronse Decraene, Hong, & Smets (2004) suggested that *Polygonella* should be merged into *Polygonum*, as part of section *Duravia*; the close relationship of *Polygonella* and *Duravia* was confirmed using molecular evidence by Schuster, Reveal, & Kron (2011). References: Brandbyge in Kubitzki, Rohwer, & Bittrich (1993); Brandbyge in Kubitzki, Rohwer, & Bittrich (1993); Costea & Tardif (2003a); Costea, Tardif, & Hinds (2005f) in FNA5 (2005); Horton (1961); Ronse De Craene, Hong, & Smets (2004); Schuster, Reveal, & Kron (2011).

- 1 Flowers in terminal or long-peduncled axillary racemes; branches adnate to stems, therefore appearing to arise internodally; plants suffrutescent bushy herbs *Polygonella*
- 1 Flowers in small clusters or very reduced racemes of 1-5 flowers, borne in the axils of normally sized or reduced leaves; branches not adnate to the stem, and thus arising at nodes; plants erect or sprawling herbs.
- 3 Perianth bottle-shaped, constricted above the achene. *Polygonum erectum*
- 3 Perianth more open, not constricted above the achene.
- 10 Perianth tube 40-57% of the perianth length. *Polygonum aviculare* ssp. *depressum*
- 10 Perianth tube 15-40% of the perianth length. *Polygonum aviculare* ssp. *aviculare*

* ***Polygonum aviculare*** Linnaeus ssp. *aviculare*. KNOTWEED. **Hab:** Disturbed areas. **Dist:** Native of Eurasia. **Phen:** Mar-Nov. **Syn:** = Ar, FNA5, K3, K4, NE, NY, Costea & Tardif (2003a); = *Polygonum aviculare* – C, GrPl, Il, K1, Mi, RAB, S, Tx, W, Mitchell & Dean (1978); < *Polygonum aviculare* – Fl4, G, NcTx, Pa, Tn, Va, WH3, Horton (1972); > *Polygonum aviculare* var. *aviculare* – F, WV; > *Polygonum aviculare* var. *vegetum* Ledebour – F, WV; > *Polygonum monspeliense* Persoon.

* ***Polygonum aviculare*** Linnaeus ssp. *depressum* (Meisner) Arcangeli. DOORYARD KNOTWEED. **Hab:** Bottomlands, marshes, disturbed areas. **Dist:** Native of Europe. **Phen:** Jun-Oct. **Syn:** = Ar, FNA5, K4, NE, NY, Costea & Tardif (2003a); = *Polygonum arenastrum* Boreau – C, GrPl, Il, K1, Mi, Tx; < *Polygonum aviculare* – Fl4, G, NcTx, Pa, Tn, Va, WH3.

Polygonum erectum Linnaeus. ERECT KNOTWEED. **Hab:** Bottomland forests, streambanks, disturbed areas, open places. **Dist:** ME, ON, and AB south to GA, LA, and NM. **Phen:** Jun-Oct; Jul-Oct. **Syn:** = Ar, C, F, FNA5, GrPl, Il, K1, K3, K4, Mi, NE, NY, Pa, RAB, S, Tn, Va, W, WV, Horton (1972), Mitchell & Dean (1978). NatureServe G5 (Secure).

**Reynoutria** Houttuyn 1777

A genus of about 15 species, perennial herbs, of temperate e. Asia. Ronse Decraene & Akeroyd (1988) and most other recent workers in Polygonaceae treat this group as *Fallopia* section *Reynoutria* (Houttuyn) Ronse Decraene, but molecular evidence supports its recognition at genus rank, as a monophyletic genus basal to *Fallopia* and *Muehlenbeckia* (Schuster, Reveal, & Kron 2011). References: Brandbyge in Kubitzki, Rohwer, & Bittrich (1993); Freeman & Hinds (2005) in FNA5 (2005); Ronse De Craene & Akeroyd (1988); Schuster, Reveal, & Kron (2011); Schuster, Wilson, & Kron (2011); Zika & Jacobson (2003).

E. and se. Asia

* ***Reynoutria japonica*** Houttuyn. JAPANESE KNOTWEED, JAPANESE BAMBOO, JAPANESE BUCKWHEAT. **Hab:** Roadsides, disturbed areas, river banks and sandbars, often forming dense thickets. **Dist:** Native of e. Asia. **Phen:** May-Oct; Aug-Oct. **Syn:** = Fl4, Il, K3, K4, NY, Va; = *Fallopia japonica* (Houttuyn) Ronse Decraene – Mi, Tn, Ronse De Craene & Akeroyd (1988); = *Fallopia japonica* (Houttuyn) Ronse Decraene var. *japonica* – Ar, FNA5, NE, Pa; = *Pleuropterus zuccarinii* Small – S; = *Polygonum cuspidatum* Siebold & Zuccarini – C, F, GrPl, K1, RAB, W, WV, Horton (1972), Mitchell & Dean (1978). Rumex Linnaeus 1753 (DOCK)

A genus of about 200 species, perennial and annual herbs (and a few shrubs), of cosmopolitan distribution. Perhaps to be (re)split with *Acetosella* accorded genus rank. References: Brandbyge in Kubitzki, Rohwer, & Bittrich (1993); Löve (1983); Mosyakin (2005) in FNA5 (2005); Stace (2010).

Identification Notes: pedicel measurements include the true pedicel (below the joint) and the pseudopedicel (the stipe-like hypanthium above the joint or articulation).

- 1 Leaf blades of well-developed leaves (at least) hastate or sagittate; plants dioecious (rarely polygamo-monoecious), the flowers mostly unisexual; fresh foliage pleasantly acid to taste.
 - 3 Inner tepals (at fruiting) 2.5-3.2 mm long, much longer and wider than the achene, with an expanded, accrescent wing that develops prominent reticulate veins; pedicel jointed near its middle or base, well below the tepals; plants annual or short-lived perennial; from a taproot; [subgenus *Acetosa*; section *Americanae*] *Rumex hastatulus*
 - 3 Inner tepals (at fruiting) 1.2-1.7 (-2.0) mm long, about as long and wide as the achene, with a minute or absent free wing; pedicel jointed just below the tepals; plant perennial, from a thin, creeping rhizome; [subgenus *Acetosella*] *Rumex acetosella* ssp. *pyrenaicus*
- 1 Leaf blades not hastate or sagittate; plants synoecious (rarely with some dioecious or polygamo-monoecious individuals), the flowers normally bisexual (sometimes bisexual and unisexual flowers in the same inflorescence); fresh foliage "green" or bitter to taste; [subgenus *Rumex*].
 - 5 Leaves primarily cauline; inner tepal margins entire; [subgenus *Rumex*; section *Axillares*].
 - 6 Pedicels 2.5-5× as long as the inner tepals; pedicel joint below the midpoint of the pedicel.
 - 8 Leaf blades 3-5 (-6)× as long as wide; coriaceous and usually somewhat fleshy; inflorescences dense (interrupted only at base); pedicels 2.5-3× as long as the inner tepals; inner tepals as wide as or wider than long *Rumex floridanus*
 - 8 Leaf blades 5-7 (-10)× as long as wide; thin; inflorescences interrupted in at least the lower half; pedicels 3-5× as long as the inner tepals; inner tepals longer than wide (rarely as long as wide) *Rumex verticillatus*
 - 6 Pedicels usually < 2.5× as long as the inner tepals; pedicel joint either the midpoint of the pedicel, or below it.
 *Rumex altissimus*
 - 5 Leaves basally disposed, the largest and best developed in a basal rosette (these sometimes withering at maturity, especially in annual species); inner tepal margins entire or variously dentate; [subgenus *Rumex*; section *Rumex*].
 - 12 Inner tepal margins entire, indistinctly erose, or (rarely) minutely denticulate (the teeth then < 0.2 mm long).
 - 13 Inner tepals ca. 2× as long as wide, margins entire, largest tubercle almost as wide as the inner tepal.
 *Rumex conglomeratus*
 - 13 Inner tepals ca. 1-1.5× as long as wide, margins entire or denticulate, largest tubercle much narrower than the inner tepal.
 *Rumex crispus* ssp. *crispus*
 - 12 Inner tepal margins prominently dentate, at least some of the teeth > 0.3 mm long.
 - 20 Plants perennial; base of leaf blade usually distinctly cordate.
 - 21 Stems 6-12 (-15) dm tall; leaf blades 20-40 cm long; inflorescence branches normally ascending, making an angle of 30-45° with inflorescence axis; tubercles of the inner sepals smooth *Rumex obtusifolius*
 - 21 Stems 2-6 (-7) dm tall; leaf blades 4-10 (-15) cm long; inflorescence branches spreading, making an angle of 60-90° with inflorescence axis; tubercles of the inner sepals usually verrucose *Rumex pulcher*
 - 20 Plants annual or biennial; base of leaf blade cuneate (rarely rounded).
 *Rumex paraguayensis*

* ***Rumex acetosella*** Linnaeus ssp. *pyrenaicus* (Pourret ex Lapeyrouse) Akeroyd. RED DOCK, SHEEP SORREL, SOURGRASS. **Hab:** Pastures, fields, roadsides, rock outcrops, grassy balds, gardens. **Dist:** Native of Eurasia. Variation in *R. acetosella* has been studied in considerable detail in Eurasia, and a number of infrataxa named; the application of these to North American material is unclear at this time. **Phen:** Mar-Sep; May-Nov. **Tax:** *R. acetosella* ssp. *pyrenaicus* (Pourret ex Lapeyrouse) Akeroyd, a hexaploid subspecies from western Europe, is apparently the predominant naturalized subspecies in North America. See Mosyakin in FNA (2005) and the references cited therein for further information. **Syn:** = NE, NY, Stace (2010); = *Acetosella vulgaris* (Koch) Fourreau ssp. *pyrenaica* (Pourret ex Lapeyrouse) Á. Löve – Löve (1983); = *Rumex acetosella* var. *pyrenaicus* (Pourret) Timbal-Lagrave – F; < *Acetosa acetosella* (Linnaeus) P. Miller; < *Acetosella acetosella* (Linnaeus) Small – S; < *Acetosella vulgaris* (Koch) Fourreau; < *Rumex acetosella* Linnaeus – Ar, C, Fl4, FNA5, G, GrPl, GW2, Il, K1, K3, K4, Mi, NcTx, Pa, RAB, Tn, Tx, Va, W, WH3, WV.

Rumex altissimus Alph. Wood. PALE DOCK, TALL DOCK, PEACHLEAF DOCK. **Hab:** Bottomlands, swamps, marshes, roadsides, disturbed areas. **Dist:** ME and MN south to GA, AL, TX, AZ, and n. Mexico. **Phen:** Mar-Jun (sometimes later); May-Jul (sometimes later). **Syn:** = Ar, C, F, FNA5, G, GrPl, GW2, Il, K1, K3, K4, Mi, NcTx, NE, NY, Pa, RAB, S, Tn, Tx, Va, W, WV. **NatureServe G5** (Secure).

* ***Rumex conglomeratus*** Murray. CLUSTERED GREEN DOCK. **Hab:** Marshes, disturbed areas, bottomland forests, pastures. **Dist:** Native of Europe. **Phen:** Apr-Jun; May-Jul. **Syn:** = Ar, C, F, FNA5, G, GW2, Il, K1, K3, NY, RAB, S, Tn, Tx, Va, WV. **NatureServe GNR** (Not Yet Ranked).

* ***Rumex crispus*** Linnaeus ssp. *crispus*. CURLY DOCK. **Hab:** Disturbed areas, pastures, fields. **Dist:** Native of Europe. **Phen:** Mar-Jun; May-Jul. **Syn:** = FNA5, K1, K3, K4, NE, NY, Va; < *Rumex crispus* – Ar, Bah, C, F, Fl4, G, GrPl, GW2, Il, Mi, NcTx, Pa, RAB, S, Tn, Tx, W, WH3, WV. **NatureServe GNRTNR** (Not Yet Ranked).

Rumex floridanus Meisner. FLORIDA DOCK. **Hab:** Swamps and marshes. **Dist:** NJ south to FL, west to LA. Reported for Orangeburg County, SC (S.W. Leonard, pers. comm.). **Syn:** = FNA5, G, K3, K4, S; = *Rumex verticillatus* Linnaeus ssp. *floridanus* (Meisner) Á. Löve; > *Rumex chrysocarpus* Moris – GW2, K1, misapplied; < *Rumex verticillatus* Linnaeus – C, F, GW2, RAB, WH3.

Rumex hastatulus Baldwin. WILD DOCK, HEARTWING DOCK. **Hab:** Glades, barrens, xeric sands; eastwards in fields (especially sandy fields in the Coastal Plain), roadsides, disturbed areas. **Dist:** E. MA, NY, IN, IL, MO, and KS, south to c. peninsular FL, TX, and NM. The eastern part of the distribution seems to be strictly or mostly in altered habitats, suggesting the possibility that the eastern extent (east of the Mississippi River) of the distribution is adventive. **Phen:** Mar-Jun; Apr-Jun. **Syn:** = Ar, C, F, FI4, FNA5, G, GrPl, GW2, IL, K1, K3, K4, NcTx, NE, NY, Pa, RAB, S, Tx, Va, W, WH3; = *Acetosa hastatula* (Baldwin) Å. Löve. NatureServe G5 (Secure).

* ***Rumex obtusifolius*** Linnaeus. BITTER DOCK. **Hab:** Pastures, barnyards, disturbed areas. **Dist:** Native of Europe. **Phen:** Apr-Jun; Jun-Aug. **Syn:** = Ar, C, F, FNA5, G, GrPl, GW2, IL, K1, K3, K4, Mi, Pa, RAB, S, Tn, Va, W, WH3, WV; > *Rumex obtusifolius* ssp. *obtusifolius* – NE, NY. NatureServe GNR (Not Yet Ranked).

* ***Rumex paraguayensis*** D. Parodi. PARAGUAYAN DOCK. **Hab:** Moist maritime shores. **Dist:** Native of South America. **Comm:** See Brown & Marcus (1998) and Berger et al. (2012). **Syn:** = FI4, FNA5, GW2, K1, K3, K4, WH3. NatureServe GNR (Not Yet Ranked).

* ***Rumex pulcher*** Linnaeus. FIDDLE DOCK. **Hab:** Disturbed areas, bottomland fields, bottomland forests. **Dist:** Native of Eurasia. **Phen:** Apr-Jul; Jun-Aug. **Syn:** = Ar, C, F, FI4, FNA5, G, GW2, K1, K3, NcTx, NE, NY, Pa, S, Tx, Va, W, WH3. NatureServe GNR (Not Yet Ranked).

Rumex verticillatus Linnaeus. SWAMP DOCK. **Hab:** Tidal freshwater marshes and swamps, but also inland in disturbed areas. **Dist:** QC, ON, MN, and SD, south to s. FL and se. and c. TX. **Phen:** Apr-Jun; May-Jul. **Syn:** = Ar, FI4, FNA5, GrPl, IL, Mi, NE, NY, S, Tn, Tx, Va; < *Rumex verticillatus* Linnaeus – C, F, G, GW2, K1, K3, K4, Pa, RAB, W, WH3.

284. **DROSERACEAE** Salisbury 1808 (SUNDEW FAMILY) [in CARYOPHYLLALES]

A family of 3 genera (*Drosera*, *Dionaea*, *Aldrovanda*) and about 100 species, nearly cosmopolitan. References: Kubitzki & Bayer (2003); Mellichamp (2015) in FNA6 (2015); Schnell (2002b).

Drosera Linnaeus 1753 (SUNDEW)

A genus of about 170 species, herbs, nearly cosmopolitan. References: Howard (2019); Mellichamp (2015) in FNA6 (2015); Rice, Robinson, & Fleischmann (2017); Schnell (1976); Schnell (1995); Schnell (2002b); Shinnars (1962); Sorrie (1998a); Wood (1960); Wynne (1944).

1 Leaves filiform, the expanded leaf bases forming a corm-like base.

.....*Drosera tracyi*

1 Leaves spatulate or suborbicular, the leaf bases not expanded.

4 Inflorescence stipitate-glandular; basal rosettes 0.8-3.5 cm in diameter; leaf bases cuneate to narrowly cuneate, usually not parallel-sided for any part of their length; stipules absent or obsolete (consisting of a few hair-like segments); seeds black, crateriform.....*Drosera brevifolia*

4 Inflorescence glabrous; basal rosettes (2-) 3-12 cm in diameter; leaf bases obviously stipitate, with parallel margins; stipules present, fimbriate; seeds light brown and longitudinally striate, or reddish brown to black and densely papillose, or brown and coarsely corrugated into 14-16 longitudinal ridges.

5 Leaf blades wider than long, suborbicular or reniform; seeds about 6× as long as wide.....*Drosera rotundifolia*

5 Leaf blades about as wide as long, spatulate to obovate; seeds 1-2× as long as broad.

6 Petioles with few to many long trichomes; petals pink (sometimes fading to white); plants scapose; inflorescence straight at base; seeds coarsely corrugated into 14-16 longitudinal ridges.....*Drosera capillaris*

6 Petioles glabrous; petals white; plants usually with a leafy stem 1-10 cm long; inflorescence arching at base; seeds reddish brown to black and densely papillose.....*Drosera intermedia*

Drosera brevifolia Pursh. DWARF SUNDEW. **Hab:** Pine savannas, other wet sandy sites, rarely in seepage over rock outcrops. **Dist:** The species ranges from e. MD (Howard 2019) and se. VA south to s. FL and west to AR, OK, and TX; disjunct in sc. TN; disjunct in w. SC in the uppermost Piedmont (Blue Ridge Escarpment region); Cuba; Mexico; Central America; South America. **Phen:** Feb-May (-Jun). **Comm:** *D. leucantha* may be the correct name for this taxon; see Shinnars (1962) and Wood (1966) for a contentious discussion of nomenclatural issues. **Syn:** = Ar, C, F, FI4, FNA6, G, GrPl, GW2, K1, K3, K4, NcTx, S, Tn, Va, WH3, Schnell (2002b), Wood (1960), Wynne (1944); = *Drosera leucantha* Shinnars – RAB, Shinnars (1962); > *Drosera annua* E.L. Reed – Tx. NatureServe G5 (Secure).

Drosera capillaris Poiret. PINK SUNDEW. **Hab:** Pine savannas, other wet sandy or peaty sites. **Dist:** Se. VA south to s. FL and west to TX, rarely inland, as in TN; also extending into tropical America, in the West Indies, Mexico, and n. South America. **Phen:** May-Aug. **Syn:** = Ar, C, F, Fl4, FNA6, G, GW2, K1, K3, K4, RAB, S, Tn, Tx, Va, W, WH3, Schnell (2002b), Shinnars (1962), Wood (1960), Wynne (1944). **NatureServe G5** (Secure).

Drosera intermedia Hayne. WATER SUNDEW, SPOONLEAF SUNDEW. **Hab:** Pine savannas, ditches, pocosins, margins of pools or streams, often in standing water. **Dist:** *D. intermedia* is interruptedly circumboreal (Europe and the Caucasus in the Old World), in North America ranging from NL (Newfoundland) and MN south to c. peninsular FL and TX, and into tropical America (Cuba, n. South America). Reported as adventive in a single county in WV (Harmon, Ford-Werntz, & Grafton 2006). **Phen:** Jun-Sep. **Syn:** = C, F, Fl4, FNA6, G, GW2, Il, K1, K3, K4, Mi, NE, NY, Pa, RAB, S, Tn, Tx, Va, W, WH3, Schnell (2002b), Shinnars (1962), Wood (1960), Wynne (1944). **NatureServe G5** (Secure).

Drosera rotundifolia Linnaeus. ROUNDLEAF SUNDEW. **Hab:** Mountain bogs and fens, seepages slopes, vertical seepages on rock (in the mountains) or clay (as along the Little River in the Sandhills of NC), northward also in Coastal Plain wetlands. **Dist:** A circumboreal species ranging south in North America to SC, ne. GA, e. and nc. TN, IL, and CA. **Phen:** Jul-Sep. **Tax:** Var. *comosa* Fernald (of ne. US and e. Canada) does not appear to warrant taxonomic recognition (Haines 2011). **Syn:** = C, FNA6, G, GrPl, GW2, Il, Mi, NE, NY, Pa, RAB, S, Tn, W, WV, Schnell (2002b), Shinnars (1962), Wood (1960), Wynne (1944); > *Drosera rotundifolia* var. *comosa* – F, K1, K3, K4; > *Drosera rotundifolia* var. *rotundifolia* – F, K1, K3, K4, Va.

Drosera tracyi (Diels) MacFarlane. TRACY'S SUNDEW. **Hab:** Pine savannas, hillside seepage bogs; savanna/depression wetland ecotones. **Dist:** Sc. GA and Panhandle FL, west to e. LA. **Phen:** Apr-Jun. **Tax:** The notion that this species is not distinguishable from *D. filiformis* (or is only variably distinct) is erroneous (Sorrie 1998a); see Schnell (1995) for a contrary view. **Comm:** *D. tracyi* has been reported for SC by various authors, including Wynne (1944), but the basis for these reports is unknown. **Syn:** = Fl4, FNA6, GW2, K1, K3, K4, WH3, Shinnars (1962), Sorrie (1998a); = *Drosera filiformis* Rafinesque var. *tracyi* Diels – Schnell (2002b).

295. CARYOPHYLLACEAE A.L. de Jussieu 1789 (PINK FAMILY) [in CARYOPHYLLALES]

A family of about 86 genera and 2200-3000 species, herbs, shrubs, and trees, nearly cosmopolitan, but mostly Northern Hemisphere. References: Bittrich (1993) in Kubitzki, Rohwer, & Bittrich (1993); Madhani et al (2018); Rabeler & Hartman (2005a) in FNA5 (2005).

- 1 Stipules absent.
 - 2 Sepals fused into a toothed or lobed tube **Key A**
 - 2 Sepals distinct, or slightly fused at their bases **Key B**
- 1 Stipules present and readily apparent, scarious or hyaline.
 - 3 Fruit a utricle; seed 1 per fruit; petals absent. **Paronychia**
 - 3 Fruit a capsule; seeds 3-many per fruit; petals present.
 - 6 Stem leaves subulate, 1-2 mm long, pectinate-fringed at the base; basal rosette leaves spatulate (usually withering quickly after overwintering; stems wiry, stiff, subdichotomously branched; [of xeric sands on the Coastal Plain from se. VA southward] **Stipulicida**
 - 6 Stem leaves larger, mostly both longer and broader, not pectinate-fringed at the base; basal rosette present or absent; stems either thicker, more flexuous, or not subdichotomously branched; [collectively more widespread].
 - 7 Leaves appearing verticillate, 10-16 per node, filiform to linear; [tribe *Spergulaeae*] **Spergula**
 - 7 Leaves opposite or in whorls of 4, linear to ovate or spatulate.
 - 9 Leaves orbicular-ovate; styles partly united; [tribe *Polycarpaeae*] **Drymaria**
 - 9 Leaves linear; styles separate; [tribe *Spergulaeae*] **Spergularia**

Key A

- 1 Calyx immediately subtended by 1-3 pairs of bracts; [tribe *Caryophylleae*].
 - 2 Calyx 20-40-nerved **Dianthus**
 - 2 Calyx 15-nerved **Petrorhagia**
- 1 Calyx lacking subtending bracts.
 - 3 Sepals 25-62 mm long; calyx lobes longer than the calyx tube, the lobes as long as or longer than the corolla lobes; [tribe *Sileneae*] **Agrostemma**
 - 3 Sepals (1-) 10-28 (-40) mm long; calyx lobes shorter than the calyx tube, the lobes much shorter than the corolla lobes (except *Gypsophila*).
 - 4 Styles 2; fruit valves 4; petals appendaged or not; [tribe *Caryophylleae*].
 - 5 Sepals 1-5 mm long, the commissures between the sepals scarious. **Gypsophila**
 - 5 Sepals 7-25 mm long, lacking commissures.
 - 7 Calyx tubular, 20-nerved; petals appendaged; perennial **Saponaria**
 - 7 Calyx ovoid, 5-nerved; petals not appendaged; annual **Gypsophila vaccaria**
 - 4 Styles 3-5 (or 0 in staminate plants); fruit valves 3, 4, 5, 6, 8, or 10; petals generally appendaged; [tribe *Sileneae*]
 - 9 Styles mostly 3; capsule with 3 or 6 teeth; calyx tubular or campanulate at anthesis, not greatly inflated (except in *S. vulgaris*) **Silene**
 - 9 Styles mostly 5; capsule with 5 or 10 teeth; calyx tubular at anthesis, becoming strongly inflated later in *S. dioica* and *S. latifolia*. **Silene**

Key B

- 1 Petals absent; fruit a 1-seeded, indehiscent utricle; styles 2; [tribe *Scleranthae*]..... *Scleranthus*
- 1 Petals present (rarely obsolete or essentially absent); fruit a few-many seeded capsule; styles 3-5.
- 3 Styles 4-5.
- 4 Leaves linear-subulate, < 2 mm wide; styles 4-5. *Sagina*
- 4 Leaves ovate, obovate, > 4 mm wide; styles 5; [tribe *Alsineae*]..... *Cerastium*
- 3 Styles 3.
- 7 Inflorescence umbelliform; petals irregularly denticulate at apex; [tribe *Alsineae*]..... *Holosteum*
- 7 Inflorescence cymose or racemiform; petals entire, notched, or deeply cleft.
- 8 Petals shallowly to deeply 2-cleft, notched at least 1/4 of the length, often divided nearly to the base and then appearing almost as 10 petals; [tribe *Alsineae*].
- 9 Capsule cylindric, twice as long as the sepals; petals 2-cleft 1/5 - 1/2 length; styles (3-) 5 (-6), 0.5-2 mm long *Cerastium*
- 9 Capsule spherical, ellipsoid, or globose, as long as or slightly longer than the sepals; petals 2-cleft 2/3-3/4 length (1/2 length in *Rabellera*); styles (2-) 3 (-5), 0.2-7 mm long *Stellaria*
- 8 Petals entire, or emarginate.
- 11 Valves or teeth of the capsule as many as the styles.
- 12 Leaves strongly basally disposed, most in the lowermost 1/3 of the stem, and overlapping (the internodes < the leaf length; leaves firm, with axillary fascicles of leaves; [tribe *Sagineae*] *Sabulina*
- 12 Leaves evenly distributed along the stem and widely spaced (the internodes > the leaf length); leaves herbaceous to slightly fleshy, generally without axillary fascicles of leaves. *Sabulina*
- 11 Valves or teeth of the capsule twice as many as the styles.
- 15 Capsule straight; petals entire or barely emarginated; [tribe *Arenarieae*]..... *Arenaria*
- 15 Capsule cylindrical, and often somewhat curved; petals emarginate to bifid; [tribe *Alsineae*] *Cerastium*

Agrostemma Linnaeus 1753 (CORNCOCKLE)

A genus of 2 species, herbs, of temperate Eurasia. References: Bittrich (1993) in Kubitzki, Rohwer, & Bittrich (1993); Thieret (2005) in FNA5 (2005).

* *Agrostemma githago* Linnaeus var. *githago*. CORNCOCKLE, PURPLE COCKLE, CORN-CAMPION. **Hab:** Fields, disturbed areas. **Dist:** Native of Europe. **Phen:** Mar-Jul. **Syn:** = Ar, FNA5, NE, NY, Va; < *Agrostemma githago* - C, F, Fl4, G, GrPl, Il, K1, K3, K4, Mi, NcTx, Pa, RAB, S, Tn, Tx, W, WH3. **NatureServe GNRTNR** (Not Yet Ranked).

*Arenaria* Linnaeus 1753 (SANDWORT)

A genus of about 150-210 species, herbs, of temperate and subarctic regions of the Northern Hemisphere, extending southward to the montane tropics of South America and Africa. References: Abuhadra (2000); Bittrich (1993) in Kubitzki, Rohwer, & Bittrich (1993); Hartman, Rabeller, & Utech (2005) in FNA5 (2005).

- 1 Leaves lanceolate to oblanceolate, (7-) 15-32 mm long, 2-8 (-14) mm wide; perennial, stems to 8 dm long..... *Arenaria lanuginosa* var. *lanuginosa*
- 1 Leaves ovate, 3-8 mm long, 1-4 mm wide; annual, stems to 3 dm long.
- 2 Fruiting calyx lobes papillate (at 40× magnification); capsule nearly straight-sided, nearly as wide near the top as at the base *Arenaria leptoclados*
- 2 Fruiting calyx lobes not papillate (at 40× magnification); capsule ovoid, distinctly broader at the base *Arenaria serpyllifolia*

Arenaria lanuginosa (Michaux) Rohrbach var. *lanuginosa*. SPREADING SANDWORT. **Hab:** Dunes, maritime forests, coquina limestone outcrops, other rocky bluffs. **Dist:** Se. VA south to c. peninsular FL, west to e. TX, AR, and Mexico, and north in the interior to sc. TN (Chester, Wofford, & Kral 1997). **Phen:** May-Jul. **Comm:** Var. *saxosa* is native to sw. United States and south into Mexico. **Syn:** = C, FNA5, Tx, Va; = *Arenaria lanuginosa* ssp. *lanuginosa* - G; < *Arenaria lanuginosa* - F, Fl4, RAB, S, Tn, WH3; > *Arenaria lanuginosa* ssp. *lanuginosa* var. *lanuginosa* - K1, K3, K4; > *Arenaria lanuginosa* ssp. *lanuginosa* var. *longepedunculata* Duncan - K1, K3, K4; *Spergulastrum lanuginosum* Michaux ssp. *lanuginosum*.

* *Arenaria leptoclados* (Reichenbach) Gussone. SMALL THYME-LEAVED SANDWORT, SLENDER SANDWORT. **Hab:** Disturbed areas. **Dist:** Native of Eurasia. The relative ranges, habitats, and abundance of the *A. leptoclados* and *A. serpyllifolia* are poorly known; additional herbarium work is needed. **Phen:** Mar-Jun. **Comm:** This and *A. serpyllifolia* s.s. have been treated variously by workers in their native range and where introduced (as here). *A. leptoclados* is diploid (2n=20), whereas *A. serpyllifolia* is tetraploid (2n=40). **Syn:** = K4, S, Va, Abuhadra (2000); = *Arenaria serpyllifolia* Linnaeus ssp. *leptoclados* (Reichenbach) Nyman - Fl4, NE, WH3; = *Arenaria serpyllifolia* Linnaeus var. *tenuitor* Mertens & W.D.J. Cerastium Linnaeus 1753 (MOUSE-EAR CHICKWEED, MOUSE-EAR)

A genus of about 100 species, herbs, especially north temperate but nearly cosmopolitan. References: Bittrich (1993) in Kubitzki, Rohwer, & Bittrich (1993); Gustafson et al (2003); Morton (2005a) in FNA5 (2005); Pennell (1930); Rabeler & Thieret (1988); Scheen et al (2004); Sharples & Tripp (2019).

6 Perennial, matted at the base and rooting at the nodes.

..... *Cerastium fontanum* ssp. *vulgare*

6 Annual, taprooted.

8 Sepals with long, appressed, eglandular hairs extending beyond the tip of the sepal.

9 Inflorescence an open cyme, most of the pedicels longer than the sepals..... *Cerastium brachypetalum*

9 Inflorescence a compact, cymose cluster, most of the pedicels shorter than the sepals..... *Cerastium glomeratum*

8 Sepals lacking long, appressed, eglandular hairs.

10 Styles, sepals, and petals 3-4 (-5); capsule teeth 6-8 (-10).

11 Styles, sepals, and petals 4 (-5); capsule teeth 8 (-10); capsules ca. 1.5 × as long as the sepals; cauline leaves 2-3 × as long as wide

..... *Cerastium diffusum*

11 Styles, sepals, and petals 3 (-4); capsule teeth 6 (-8); capsules ca. 2 × as long as the sepals; cauline leaves 8-10 × as long as wide

..... *Cerastium dubium*

10 Styles, sepals, and petals 5; capsule teeth 10.

14 Pedicels 3-10 (-15) mm long; leaves to 3.5 cm long..... *Cerastium brachypodum*

14 Pedicels (10-) 15-40 (-55) mm long; leaves to 8 cm long..... *Cerastium nutans*

* *Cerastium brachypetalum* Desportes. GRAY MOUSE-EAR. **Hab:** Lawns, roadsides, disturbed areas. **Dist:** Native of Europe. The reports of *C. tetrandrum* for e. VA in F and G are actually this species. **Phen:** Apr-Jun. **Syn:** = C, F, Fl4, FNA5, G, GrPl, Il, K4, Mo2, NcTx, RAB, Tn, Va, W, WH3; > *Cerastium brachypetalum* ssp. *brachypetalum* – K1; >> *Cerastium tetrandrum* W. Curtis – F, G, misidentified. **NatureServe GNR** (Not Yet Ranked).

Cerastium brachypodum (Engelmann ex A. Gray) B.L. Robinson. **Hab:** Disturbed areas, roadsides, fields, lawns. **Dist:** IL west to AB and OR, south to NC, nc. GA (Jones & Coile 1988), and AZ. This taxon is perhaps only introduced in the eastern parts of our region from farther west. **Phen:** Apr-May. **Syn:** = Ar, F, FNA5, GrPl, Il, K1, K3, K4, Mi, Mo2, NcTx, S, Tn, Tx; = *Cerastium nutans* Rafinesque var. *brachypodum* Engelmann ex A. Gray – G, RAB, W; < *Cerastium nutans* Rafinesque – C.

* *Cerastium diffusum* Persoon. SEA MOUSE-EAR. **Hab:** Disturbed areas. **Dist:** Native of Europe. **Phen:** Mar-Apr. **Syn:** = Ar, FNA5, Il, K1, K3, K4, Mo2; ? *Cerastium diffusum* ssp. *diffusum* – NE; ? *Cerastium diffusum* var. *diffusum* – C. **NatureServe GNR** (Not Yet Ranked).

* *Cerastium dubium* (Bastard) Guépin. **Hab:** Disturbed areas. **Dist:** Native of s. Europe and Asia. Introduced in scattered states in the United States, including VA, KY, TN, MS (FNA). **Phen:** Mar-May. **Comm:** First reported for VA by Belden et al. (2004). **Syn:** = Ar, C, FNA5, Il, K1, K3, K4, Mo2. **NatureServe GNR** (Not Yet Ranked).

* *Cerastium fontanum* Baumgartner ssp. *vulgare* (Hartman) Greuter & Burdet. COMMON MOUSE-EAR. **Hab:** Fields, disturbed areas. **Dist:** Native of Europe. **Phen:** Mar-Jun. **Syn:** = Ar, Fl4, FNA5, K1, K3, K4, Mo2, NcTx, NE, NY, Pa, Tn, Va, WH3; = *Cerastium holosteoides* Fries var. *vulgare* (Hartman) Hylander – RAB; = *Cerastium vulgatum* Linnaeus – C, GrPl, S; < *Cerastium fontanum* – Il, Mi; ? *Cerastium fontanum* ssp. *triviale* (Link) Jalas – W; > *Cerastium vulgatum* var. *hirsutum* Fries – G; > *Cerastium vulgatum* var. *holosteoides* (Fries) Wahlenberg – F, G, Tx; > *Cerastium vulgatum* var. *vulgatum* – F, G, Tx.

* *Cerastium glomeratum* Thuillier. STICKY MOUSE-EAR. **Hab:** Fields, disturbed areas, lawns. **Dist:** Native of Europe. **Phen:** Feb-May. **Syn:** = Ar, Fl4, FNA5, GrPl, Il, K1, K3, K4, Mi, Mo2, NcTx, NE, NY, Pa, RAB, Tn, Tx, Va, W, WH3; = *Cerastium viscosum* Linnaeus – C, F, G, S, an ambiguous name. **NatureServe GNR** (Not Yet Ranked).

Cerastium nutans Rafinesque. **Hab:** Alluvial forests, bottomlands, moist forests. **Dist:** NS west to NT, south to SC, GA, AZ, Mexico, and OR. **Phen:** Apr-May. **Syn:** = F, GrPl, Il, Mi, NcTx, Tn, Tx, Va, WV; = *Cerastium nutans* ssp. *nutans* – Mo2, NE; = *Cerastium nutans* var. *nutans* – G, K1, K3, K4, RAB, W; > *Cerastium longepedunculatum* Willdenow ex Britton – S; < *Cerastium nutans* Rafinesque – C, Pa; > *Cerastium nutans* var. *nutans* – Ar, FNA5, NY. **NatureServe G5T5** (Secure).

295. CARYOPHYLLACEAE

Cerastium
glomeratumCerastium
nutans

Europe

Dianthus Linnaeus 1753 (PINK, CARNATION)

A genus of about 300-320 species, herbs, of Eurasia and Africa. Species other than those treated here are grown in gardens and may escape or persist. References: Bittrich (1993) in Kubitzki, Rohwer, & Bittrich (1993); Rabeler & Hartman (2005f) in FNA5 (2005).

* *Dianthus armeria* Linnaeus ssp. *armeria*. DEPTFORD PINK. **Hab:** Fields, roadsides, pastures. **Dist:** Native of Europe. **Phen:** May-Sep. **Tax:** Another subspecies occurs in Eurasia. **Syn:** = Ar, FNA5, Mo2, NY, Va; < *Dianthus armeria* – C, F, Fl4, G, GrPl, Il, K1, K3, K4, Mi, NcTx, NE, Pa, RAB, S, Tn, W, WH3, WV. NatureServe GNRTNR (Not Yet Ranked).

Drymaria Willdenow ex J.A. Schultes 1819 (DRYMARY)

A genus of about 48 species, herbs, mostly New World (tropical to temperate), but 1 species pantropical. References: Bittrich (1993) in Kubitzki, Rohwer, & Bittrich (1993); Duke (1961); Hartman (2005a) in FNA5 (2005).

* *Drymaria cordata* (Linnaeus) Willdenow ex Roemer & J.A. Schultes var. *cordata*. DRYMARY, WEST INDIAN CHICKWEED. **Hab:** Moist hammocks, moist disturbed areas. **Dist:** Sc. GA south to s. FL south into the New World tropics, the North American distribution probably all adventive (not reported for the Southeastern US by Chapman 1883, Mohr 1901, or Small 1903); also Old World tropics. **Tax:** Var. *diandra* Blume is restricted to the Old World. **Syn:** = FNA5; = *Drymaria cordata* ssp. *cordata* – K1, K3, K4, Duke (1961); < *Drymaria cordata* – Bah, Fl4, S, WH3. NatureServe GNRTNR (Not Yet Ranked).

Gypsophila Linnaeus 1754 (BABY'S-BREATH)

A genus of about 150 species, annual and perennial herbs, of temperate Eurasia, Africa, and Australia. References: Pringle (2005) in FNA5 (2005).

* *Gypsophila vaccaria* (Linnaeus) Smith. COW-COCKLE, COW-HERB, COW-SOAPWORT. **Hab:** Fields, disturbed areas. **Dist:** Native of Europe. The record from VA (Arlington County) probably represents a waif. **Phen:** May-Jul. **Syn:** = K4, Madhani et al (2018); = *Saponaria vaccaria* Linnaeus – F, WV; = *Vaccaria hispanica* (P. Miller) Rauschert – Ar, C, Fl4, FNA5, Il, K1, K3, Mi, NcTx, NE, NY, Pa, WH3; = *Vaccaria pyramidata* Medikus – GrPl, RAB, Tx; = *Vaccaria vaccaria* (Linnaeus) Britton – S; ? *Vaccaria segetalis* Garcke ex Ascherson – G. NatureServe GNR (Not Yet Ranked).

Holosteum Linnaeus 1753 (JAGGED CHICKWEED)

A genus of 3-4 species, herbs, of temperate Eurasia. References: Bittrich (1993) in Kubitzki, Rohwer, & Bittrich (1993); Rabeler & Hartman (2005d) in FNA5 (2005); Shinnars (1965).

* *Holosteum umbellatum* Linnaeus ssp. *umbellatum*. JAGGED CHICKWEED. **Hab:** Fields, roadsides, lawns, disturbed shale barrens, other disturbed areas. **Dist:** Native of Europe. **Phen:** Mar-Jun. **Tax:** Four additional subspecies are not known to be present in North America. **Syn:** = Ar, FNA5, Mo2, NE, NY, Va; < *Holosteum umbellatum* – C, F, G, GrPl, Il, K1, K3, K4, Mi, Oh3, Pa, RAB, S, Tn, W, WV. NatureServe GNRTNR (Not Yet Ranked).

Paronychia P. Miller 1754 (WHITLOW-WORT, NAILWORT)

A genus of about 110 species, herbs and shrubs, nearly cosmopolitan in distribution. This genus consists mostly of plants of dry rocky or sandy habitats. References: Bittrich (1993) in Kubitzki, Rohwer, & Bittrich (1993); Chaudhri (1968); Hartman, Thieret, & Rabeler (2005) in FNA5 (2005); Rohrer (1997); Schenk & Appleton (2021); Schenk et al (2018); Shinnars (1962h); Turner (1983); Ward (1977a); Ward (1977b).

Identification Notes: Magnification of at least 10× is necessary for the identification of many of the taxa.

11 Sepals petaloid, the tip, margins, or entire sepal whitish; perigynous zone very well developed (mostly equaling or somewhat longer than the sepals); [of the Coastal Plain, from SC southward and westward]; [subgenus *Siphonychia*].

12 Sepals glabrous to the base; plant a caespitose perennial with ascending annual stems.

13 Stems minutely gray-puberulent *Paronychia erecta* var. *corymbosa*

295. CARYOPHYLLACEAE

- 13 Stems glabrous and often also glaucous..... *Paronychia erecta* var. *erecta*
 12 Sepals densely pubescent on the basal portion (glabrous above); plant a sprawling, ascending or erect annual..... *Paronychia patula*
 11 Sepals not petaloid, green, sometimes scarious-margined; perigynous zone somewhat shorter than the sepals; [of various provinces, collectively widespread in our area]; [subgenus *Paronychia*].
 *Paronychia fastigiata* var. *fastigiata*

Paronychia erecta (Chapman) Shinnars var. *corymbosa* (Small) Chaudhri. HAIRY SQUAREFLOWER. **Hab:** Coastal dunes. **Dist:** Panhandle FL west to se. LA. **Phen:** Mar-Nov. **Tax:** Needing additional study. **Syn:** = K1, Chaudhri (1968), Ward (1977a), Ward (1977b); = *Odontonychia corymbosa* Small – S; < *Paronychia erecta* – Fl4, FNA5, K3, K4, WH3, Shinnars (1962h). **NatureServe** G3G4T2T4 (Vulnerable).

Paronychia erecta (Chapman) Shinnars var. *erecta*. SMOOTH SQUAREFLOWER. **Hab:** Coastal dunes. **Dist:** Panhandle FL west to s. MS. **Phen:** Mar-Nov. **Syn:** = K1, Chaudhri (1968), Ward (1977a), Ward (1977b); = *Odontonychia erecta* (Chapman) Small – S; < *Paronychia erecta* – Fl4, FNA5, K3, K4, WH3, Shinnars (1962h). **NatureServe** G3G4TNR (Not Yet Ranked).

Paronychia fastigiata (Rafinesque) Fernald var. *fastigiata*. COMMON FORKED WHITLOW-WORT. **Hab:** Dry, usually rocky, woodlands, often on thin soil around outcrop edges. **Dist:** MA and VT west to se. MN, south to Panhandle FL and e. TX. **Phen:** Jun-Oct. **Tax:** The three varieties of *P. fastigiata* (though accepted by Chaudhri and many recent floras) need additional investigation to confirm their taxonomic status, habitats, and geographic ranges. **Syn:** = Ar, C, F, G, K1, NE, NY, Pa, Tx, WV, Chaudhri (1968); < *Anychia polygonoides* Rafinesque – S; < *Paronychia fastigiata* – GrPl, Il, Mi, NcTx, RAB, Tn, Va, W, Turner (1983); < *Paronychia fastigiata* (Rafinesque) Fernald var. *fastigiata* – FNA5, K3, K4. **NatureServe** G5T5 (Secure).

Paronychia patula Shinnars. PINELAND NAILWORT. **Hab:** Longleaf pine sandhills, sandy disturbed areas. **Dist:** Sw. GA west to s. AL, south to c. peninsular FL. **Phen:** May-Nov. **Syn:** = Fl4, FNA5, K1, K3, K4, WH3, Chaudhri (1968), Shinnars (1962h), Ward (1977a), Ward (1977b); = *Siphonychia diffusa* Chapman – S. **NatureServe** G3G4 (Vulnerable).

*Petrorhagia* (Seringe) Link 1831 (PINK)

A genus of about 28-33 species, herbs, of Eurasia. References: Bittrich (1993) in Kubitzki, Rohwer, & Bittrich (1993); Madhani et al (2018); Rabaler & Hartman (2005e) in FNA5 (2005); Rabaler (1985).

* *Petrorhagia prolifera* (Linnaeus) P.W. Ball & Heywood. CHILDING PINK, PROLIFEROUS PINK. **Hab:** Roadsides, disturbed areas. **Dist:** Native of Europe. **Phen:** May-Sep. **Syn:** = Ar, C, FNA5, K1, K3, K4, Mi, NE, NY, Pa, Va, Madhani et al (2018), Rabaler (1985); = *Dianthus prolifera* Linnaeus – F, WV; = *Petrorhagia prolifera* (Linnaeus) Ball & Heywood – Tx, W, orthographic variant; = *Tunica prolifera* (Linnaeus) Scopoli – G. **NatureServe** GNR (Not Yet Ranked).

*Sabulina* Reichenbach 1832

A genus of ca. 65 or more species, annual and perennial herbs, widely distributed in the Northern Hemisphere, with 2 species in South America, as well. See Schilling et al. (2022) for discussion of generic boundaries in *Sabulina* and related genera. References: Bittrich (1993) in Kubitzki, Rohwer, & Bittrich (1993); Dillenberger & Kadereit (2014); Dillenberger & Rabaler (2018); Rabaler, Hartman, & Utech (2005) in FNA5 (2005); Schilling et al (2022).

Sabulina patula (Michaux) Small. LIME-BARREN SANDWORT. **Hab:** Rocky barrens of calcareous or mafic rocks. **Dist:** Ec. PA and w. VA west to IN and MN, south to AL and TX. **Phen:** Apr-Jun. **Syn:** = Schilling et al (2022), in press; = *Alsinosopsis patula* (Michaux) Small; = *Arenaria patula* Michaux var. *patula* – C, G, GrPl, Tx; = *Minuartia patula* (Michaux) Mattfeld – Ar, FNA5, Il, K1, K3, Mo2, NcTx, Pa, Tn, Va; = *Mononeuria patula* (Michaux) Dillenberger & Kadereit – K4, Dillenberger & Kadereit (2014); < *Arenaria patula* Michaux – F; < *Sabulina patula* (Michaux) Small – S. **NatureServe** G4 (Apparently Secure).

*Sagina* Linnaeus 1753 (PEARLWORT)

A genus of about 25 species, herbs, mainly north temperate. References: Atha, Alvarez, & Chaya (2018); Bittrich (1993) in Kubitzki, Rohwer, & Bittrich (1993); Crow (1978); Crow (2005) in FNA5 (2005).

Key based on Atha, Alvarez, & Chaya (2018).

Sagina decumbens (Elliott) Torrey & A. Gray. EASTERN PEARLWORT, ANNUAL PEARLWORT. **Hab:** Disturbed ground, fields, cracks in pavement or sidewalks. **Dist:** NB west to IL and MO, south to c. peninsular FL and TX, with adventive occurrences farther west. **Phen:** Feb-Jul. **Tax:** Crow (1978) and Crow in FNA (2005) treat *S. decumbens* and *S. occidentalis* S. Watson of the Pacific Coast of North America as subspecies. They differ

295. **CARYOPHYLLACEAE**

primarily in seed architecture. Though clearly closely related, they seem equally well (and more simply) regarded as sibling species. A report of *S. subulata* (Swartz) C. Presl for Bedford County, VA, is apparently actually *S. decumbens*. **Syn:** = C, F, Fl4, G, Il, NcTx, NY, Pa, RAB, S, Tn, Tx, Va, W, WH3, Atha, Alvarez, & Chaya (2018); = *Sagina decumbens* ssp. *decumbens* – Ar, FNA5, GrPl, K1, K4, NE, Crow (1978). **NatureServe G5T5** (Secure).

***Saponaria* Linnaeus 1753 (SOAPWORT)**

A genus of about 40 species, herbs, of temperate regions of Eurasia. References: Bittrich (1993) in Kubitzki, Rohwer, & Bittrich (1993); Thieret & Rabaler (2005e) in FNA5 (2005).

* ***Saponaria officinalis* Linnaeus.** SOAPWORT, BOUNCING BET. **Hab:** Disturbed areas, fields, roadsides. **Dist:** Native of Europe. **Phen:** May-Oct. **Syn:** = C, F, Fl4, FNA5, G, GrPl, Il, K1, K3, K4, NcTx, NE, NY, Pa, RAB, S, Tn, Tx, Va, W, WH3, WV. **NatureServe GNR** (Not Yet Ranked).

***Scleranthus* Linnaeus 1753 (KNAWEL)**

A genus of 10 species, herbs, mainly of temperate regions of the Northern Hemisphere. References: Bittrich (1993) in Kubitzki, Rohwer, & Bittrich (1993).

* ***Scleranthus annuus* Linnaeus ssp. *annuus*.** KNAWEL, ANNUAL KNAWEL, KNOTGRASS. **Hab:** Fields, ditches, roadsides, other disturbed areas. **Dist:** Native of Mediterranean Europe, n. Africa, and w. Asia. **Phen:** Mar-Oct. **Tax:** There are seven other subspecies (Thieret & Rabaler in FNA 2005). **Syn:** = Ar, FNA5, NY; < *Scleranthus annuus* Linnaeus – C, F, Fl4, G, GrPl, Il, K1, K3, K4, Mi, NE, Pa, RAB, Tn, Va, W, WH3, WV. **NatureServe GNRTNR** (Not Yet Ranked).

***Silene* Linnaeus 1753 (CATCHFLY, CAMPION, FIRE-PINK, WILD-PINK)**

A genus of about 700 species, of Eurasia and North America. References: Bittrich (1993) in Kubitzki, Rohwer, & Bittrich (1993); Clausen (1939); Morton (2005c) in FNA5 (2005); Weakley & Poindexter (2020b) in Weakley et al (2020); Wilbur (1970b).

- 5 Middle cauline leaves in whorls of 4; petals fimbriate..... *Silene stellata*
- 5 Middle cauline leaves opposite; petals entire, slightly erose, bilobed, 2-cleft, or 8+-cleft.
 - 6 Flowers bright red.
 - 7 Petals entire or slightly erose at the tip; cauline leaves 5-20 pairs. *Silene regia*
 - 7 Petals 2-cleft at the tip; cauline leaves 2-8 pairs. *Silene virginica* var. *virginica*
 - 6 Flowers white or pink.
 - 11 Petals 8-cleft or more divided; plants perennial; [native]. *Silene ovata*
 - 11 Petals entire, bilobed, or 2-cleft; plants 0.5-8 dm tall, perennial or annual; [either alien weeds occurring mostly in disturbed sites, or native in forests, woodlands, or rock outcrops].
 - 22 Stems glabrous or sparsely pubescent (if pubescent, puberulent). *Silene antirrhina*
 - 22 Stems densely pubescent (hirsute or glandular-hirsute). *Silene gallica*

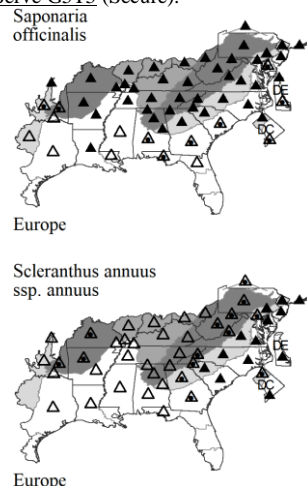

***Silene antirrhina* Linnaeus.** SLEEPY CATCHFLY, GARTER-PINK. **Hab:** Fields, disturbed areas. **Dist:** Nearly throughout North America, south to c. peninsular FL, and in Mexico and South America; introduced in Europe. **Phen:** Apr-Jul. **Syn:** = Ar, C, F, Fl4, FNA5, G, GrPl, K1, K3, K4, Mi, NcTx, NE, NY, Pa, RAB, S, Tn, Tx, Va, W, WH3, WV; > *Silene antirrhina* var. *antirrhina* – Il; > *Silene antirrhina* var. *divaricata* Robins – Il. **NatureServe G5** (Secure).

* ***Silene gallica* Linnaeus.** SMALL-FLOWERED CATCHFLY, COMMON CATCHFLY. **Hab:** Sandy disturbed areas. **Dist:** Native of Europe. **Phen:** May-Jul. **Syn:** = C, F, Fl4, FNA5, G, Il, K1, K3, K4, NE, Pa, RAB, Tx, WH3; > *Silene anglica* Linnaeus – S, misapplied. **NatureServe GNR** (Not Yet Ranked).

***Silene ovata* Pursh.** MOUNTAIN CATCHFLY. **Hab:** Circumneutral soils of woodlands and forests, especially over mafic or calcareous rocks, mostly at medium elevations in the mountains. **Dist:** Sw. VA, KY, s. IN, s. IL, and n. AR, south to e. SC, sw. GA, s. AL, s. MS, and c. AR. **Phen:** Aug-Sep. **Syn:** = Ar, C, F, FNA5, G, Il, K1, K3, K4, RAB, S, Tn, Va, W. **NatureServe G3** (Vulnerable).

***Silene regia* Sims.** ROYAL CATCHFLY. **Hab:** Prairies and calcareous woodlands and forests. **Dist:** OH, n. IN, n. IL, and e. KS south e. TN (Chester, Wofford, & Kral 1997; Tennessee Flora Committee 2015), nw. and sw. GA (Jones & Coile 1988), FL Panhandle (Jackson County), s. AL, s. AR, and sw. OK. **Phen:** Jul-Aug. **Syn:** = Ar, C, F, Fl4, FNA5, G, GrPl, Il, K1, K3, K4, S, Tn, WH3. **NatureServe G3** (Vulnerable).

***Silene stellata* (Linnaeus) W.T. Aiton.** STARRY CAMPION, WIDOW'S-FRILL. **Hab:** Dry to mesic forests, rock outcrops. **Dist:** CT and VT west to SD, south to c. GA and TX. **Phen:** Jun-Aug. Jun-Sep. **Syn:** = Ar, F, FNA5, GrPl, K1, K3, K4, NcTx, NE, NY, Pa, RAB, S, Tn, Tx, Va, W, WV; > *Silene stellata* var. *scabrella* E.J. Palmer & Steyermark – C, G, Il, Mi; > *Silene stellata* var. *stellata* – C, G, Il, Mi.

295. CARYOPHYLLACEAE

Silene virginica Linnaeus var. ***virginica***. FIRE-PINK. **Hab:** Woodlands, rock outcrops, crevices in cliffs, roadbanks. **Dist:** PA west to s. ON and se. MI, south to Panhandle FL (Bay County), GA and OK. **Phen:** Apr-Jul. **Syn:** = K1, Tn, WV; < *Silene virginica* – Ar, C, F, Fl4, FNA5, G, Il, K3, K4, Mi, NY, Pa, RAB, S, Va, W, WH3. [NatureServe G5T5](#) (Secure).

***Spergula*** Linnaeus 1753 (SPURREY)

A genus of 6 species, herbs, of temperate Eurasia and n. Patagonia. References: Bittrich (1993) in Kubitzki, Rohwer, & Bittrich (1993); Hartman & Rabeler (2005a) in FNA5 (2005).

* ***Spergula arvensis*** Linnaeus. CORN SPURREY. **Hab:** Fields, roadsides, disturbed areas. **Dist:** Native of Europe. **Phen:** Apr-Jun. **Tax:** Two varieties are sometimes recognized; var. *arvensis*, with seeds ornamented with white, clavate papillae, the plants sparsely glandular, and var. *sativa*, with seeds reticulate and lacking papillae, the plants sparsely to densely glandular. Additional information is needed on the distinctiveness, range in our area, etc. of the two putative varieties. **Syn:** = Ar, C, Fl4, FNA5, GrPl, Il, K1, K3, K4, Mi, NE, NY, Pa, RAB, S, Tx, Va, WH3, WV; > *Spergula arvensis* Linnaeus var. *arvensis* – F, G; > *Spergula arvensis* Linnaeus var. *sativa* (Boenninghausen) Mertens & W.D.J. Koch – F, G.

***Spergularia*** (Persoon) J. Presl & C. Presl 1819 (SAND-SPURREY)

A genus of about 25 species, herbs, cosmopolitan. The genus is perhaps not distinct from *Spergula*. References: Bittrich (1993) in Kubitzki, Rohwer, & Bittrich (1993); Hartman & Rabeler (2005b) in FNA5 (2005).

1 Stamens 6-10; seeds either 0.4-0.6 or 0.8-1.1 mm long; axillary leaf clusters of 2-4 leaves (or sometimes absent in *S. media*).

..... ***Spergularia media*** var. ***media***

1 Stamens 1-5; seeds 0.5-0.7 (-0.8) mm long; axillary leaf clusters usually absent.

..... ***Spergularia marina***

Spergularia marina (Linnaeus) Besser. SALT MARSH SAND-SPURREY. **Hab:** Brackish and salt marsh flats, inland in salt springs (as in n. LA) and introduced in salt waste (as pickle brine in Mount Olive, NC) and along salted highways. **Dist:** Widespread on coasts of North America (from QC south to c. peninsular FL, from BC south to Baja California), inland along salted highways, in South America, and Eurasia. Considered by some (C, G) to be introduced only in North America, by others native (F, FNA, S). **Phen:** Jun-Oct. **Tax:** Kirschner, Kirschnerová, & Štěpánek (2007) discussed the complicated nomenclature and concluded that *S. marina* (Linnaeus) Besser is correct. **Syn:** = C, F, Fl4, G, GrPl, GW2, K3, K4, Mi, NE, NY, RAB, Tx, WH3; = *Spergularia salina* J. & C. Presl – FNA5, Il, K1, NcTx, Pa, Va; = *Tissa marina* (Linnaeus) Britton – S, misapplied. [NatureServe G5](#) (Secure).

* ***Spergularia media*** (Linnaeus) C. Presl var. ***media***. **Hab:** Disturbed areas. **Dist:** Native of Europe. Known from salted highways in NY, OH, MI, and IL and salt or brackish marsh habitats in coastal NY. **Phen:** Aug-Sep. **Comm:** {synonymy incomplete}. **Syn:** = FNA5, NY; ? *Spergularia maritima* (Linnaeus) Chiovenda – K1; < *Spergularia media* – C, F, G, Il, K3, K4, Mi, Pa. [NatureServe GNRTNR](#) (Not Yet Ranked).

***Stellaria*** Linnaeus 1753 (CHICKWEED, STITCHWORT, STARWORT)

A genus of about 112 species, cosmopolitan (centered in Asia). Generic circumscription follows Sharples & Tripp (2019). References: Bittrich (1993) in Kubitzki, Rohwer, & Bittrich (1993); Morton (2005b) in FNA5 (2005); Sharples & Tripp (2019); Sharples (2019).

2 Leaves narrow, usually linear, lanceolate, oblanceolate, or narrowly elliptic, the blade 3-10× as long as wide, 0.8-10 mm wide; stems prominently 4-angled.

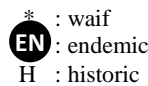

..... ***Stellaria graminea***

2 Leaves broad, usually ovate, obovate, or broadly elliptic, the blade 1-2.5× (or to 4×) as long as wide, 4-30 mm wide (if > 2.5× as long as wide, then definitely > 10 mm wide); stems terete or 4-angled.

295. CARYOPHYLLACEAE

- 9 Leaves (1.0-) 2.5-10 cm long (with strong dimorphism between sterile and fertile shoots, the leaves of sterile shoots much larger); seeds 1.7-2 mm long; sepals 4-11 mm long; stem pubescence in vertical lines or uniformly distributed; perennial, the stems strong and ascending to erect; [native]; [*Insignes* clade].
- 9 Leaves 0.3-4.0 cm long; seeds 0.6-1.7 mm long; sepals 2.5-6.5 mm long; stem pubescence always in vertical lines; annual, the stems weak and in part prostrate, the tips or vigorous growth ascending; [alien]; [*Petiolaes* clade].

..... *Stellaria pubera*..... *Stellaria media*

* *Stellaria graminea* Linnaeus. COMMON STITCHWORT, LESSER STITCHWORT. **Hab:** Fields, roadsides, pastures, disturbed areas. **Dist:** Native of Europe. **Phen:** May-Aug. **Syn:** = C, F, Fl4, FNA5, G, GrPl, GW2, IL, K1, K3, K4, Mi, NE, NY, Pa, RAB, Tn, Va, W, WV; = *Alsine longifolia* (Muhlenberg ex Willdenow) Britton – S, misapplied. NatureServe GNR (Not Yet Ranked).

* *Stellaria media* (Linnaeus) Villars. COMMON CHICKWEED. **Hab:** Disturbed areas, gardens, fields, bottomlands, moist forests. **Dist:** Native of Europe. **Phen:** Jan-Dec. **Syn:** = Ar, Fl4, FNA5, GrPl, IL, K4, Mi, NcTx, NE, NY, Pa, Tn, Tx, Va, WH3; = *Stellaria media* ssp. *media* – K1; < *Alsine media* Linnaeus – S; < *Stellaria media* (Linnaeus) Villars – C, G, RAB, W, WV; < *Stellaria media* var. *media* – F. NatureServe GNRTNR (Not Yet Ranked).

Stellaria pubera Michaux. STAR CHICKWEED, COMMON STARWORT, GIANT CHICKWEED, GREAT CHICKWEED. **Hab:** Bottomland forests, moist slopes, coves, hammocks. **Dist:** NJ west to IL, south to Panhandle FL and AL. **Phen:** Apr-Jun. **ID Notes:** Both *Stellaria corei* and *Stellaria pubera* have an interesting seasonal growth form, producing short and relatively small-leaved flowering shoots in the spring (which wither following fruiting), followed by taller, more vigorous summer shoots with larger and tougher leaves and lacking flowers, which persist until autumn. Some of the description in various manuals of differences in petiole length and leaf size and shape between the two species is obscured or complicated by these seasonal differences; more careful observation is needed. **Syn:** = FNA5, G, IL, K1, K3, K4, NY, Pa, RAB, Tn, Va, W, WH3, WV; = *Alsine pubera* (Michaux) Britton – S; = *Stellaria puber* Michaux – Fl4, K4; = *Stellaria pubera* var. *pubera* – C, F. NatureServe G5 (Secure).

*Stipulicida* Michaux 1803 (WIREPLANT)

A genus of 2 species, herbs, of se. North America. References: Bittrich (1993) in Kubitzki, Rohwer, & Bittrich (1993); James (1957); Judd (1983); Poindexter, Bennett, & Weakley (2014); Swanson & Rabeler (2005) in FNA5 (2005); Ward (2001).

Identification Notes: *Stipulicida* is immediately recognizable by its very wiry, dichotomously branched stems, the stem leaves reduced to subulate scales 0.5-2 mm long. Often overlooked is the basal winter rosette of spatulate leaves, to 15 mm long and 4 mm wide.

Stipulicida setacea Michaux. COASTAL PLAIN WIREPLANT. **Hab:** Xeric sands of longleaf pine sandhills, dry pine flatwoods, maritime forests, very dry clayey roadbanks in the outer Piedmont. **Dist:** Se. VA south to s. FL, west to e. LA (Florida parishes). **Phen:** May-Aug. **Comm:** A variety, var. *filiformis* (Nash) D.B. Ward, endemic to c. Peninsular FL, is sometimes recognized, but is here considered a form of var. *setacea* (see synonymy and references). **Syn:** = K4, Poindexter, Bennett, & Weakley (2014); = *Stipulicida setacea* var. *setacea* – Fl4, FNA5, K1, K3, Va, WH3, James (1957), Judd (1983); > *Stipulicida filiformis* Nash – S; < *Stipulicida setacea* Michaux – C, RAB; >< *Stipulicida setacea* Michaux – S, including var. *lacerata* but not var. *filiformis*; > *Stipulicida setacea* var. *filiformis* – Ward (2001); > *Stipulicida setacea* var. *setacea* – Ward (2001). NatureServe G4G5T4T5 (Apparently Secure).

297a. AMARANTHACEAE A.L. de Jussieu 1789 (AMARANTH FAMILY) [in CARYOPHYLLALES]

A family of about 65 genera and 900 species, mostly herbs, but including shrubs and trees, nearly cosmopolitan, but most diverse in subtropical and temperate regions (Judd & Ferguson 1999). References: Fuentes-Bazan, Mansion, & Borsch (2012); Fuentes-Bazan, Uotila, & Borsch (2012); Judd & Ferguson (1999); Kühn in Kubitzki, Rohwer, & Bittrich (1993); Robertson & Clemants (2003) in FNA4 (2003b); Townsend in Kubitzki, Rohwer, & Bittrich (1993).

Subfamily Amaranthoideae

Tribe Celosieae: *Celosia*.

Tribe Amarantheae, subtribe Amaranthinae: *Amaranthus*.

Tribe Amarantheae, subtribe Aervinae: *Achyranthes*.

Subfamily Gomphrenoideae

Tribe Gomphrenae, subtribe Froelichiinae: *Alternanthera*, *Froelichia*, *Guellimenea*.

Tribe Gomphrenae, subtribe Gomphreninae: *Blutaparon*, *Gomphrena*, *Iresine*.

297a. AMARANTHACEAE

- 1 Leaves mostly or entirely alternate (the lower sometimes opposite).
 2 Flowers unisexual (plants either monoecious or dioecious); utricle 1-seeded *Amaranthus*
 2 Flowers bisexual (plants hermaphroditic); utricle (2) 3+-seeded *Celosia*
- 1 Leaves opposite.
 3 Flowers unisexual (plants dioecious); inflorescences terminal, diffuse panicles *Iresine*
 3 Flowers bisexual (plants hermaphroditic); inflorescences axillary or terminal, either glomerules or dense spikes.
 4 Inflorescences pedunculate simple or compound spikes, elongate, at least 2× as long as broad. *Froelichia*
 4 Inflorescences sessile or pedunculate, globose or cylindric heads, < 2× as long as broad.
 6 Inflorescences either sessile and axillary (subtended by a single leaf) or pedunculate (without any leaves immediately subtending the head) *Alternanthera*
 6 Inflorescences terminal, with a pair of leaves immediately subtending the head. *Gomphrena*

Alternanthera Forsskål 1775 (CHAFF-FLOWER, JOYWEED)

A genus of about 100 species, tropical and warm temperate, especially in America. References: Clemants (2003c) in FNA4 (2003b); Townsend in Kubitzki, Rohwer, & Bittrich (1993).

- 1 Inflorescences borne on peduncles 1-7 cm long, these from the leaf axils or terminal. *Alternanthera philoxeroides*
 1 Inflorescences sessile, in the leaf axils.
 3 Tepals dimorphic; tepal hairs barbed. *Alternanthera caracasana*
 3 Tepals monomorphic; tepal hairs not barbed.
 5 Mature fruit included within the tepals; spikes globular; stems sericeous *Alternanthera paronychioides*
 5 Mature fruit exerted between the tepals; spikes narrow, short-cylindric; stems glabrous to pubescent in lines (the nodes also pubescent) *Alternanthera sessilis*

* *Alternanthera caracasana* Kunth. **Hab:** Disturbed areas. **Dist:** Native of South America. Reported for Coastal Plain of SC, and in s. Coastal Plain of GA (Jones & Coile 1988) and for NC (FNA, K) and MD (K). **Phen:** Jun-Oct. **Syn:** = Bah, FNA4, GrPl, K1, K3, K4, NcTx, Tx, WH3; = *Achyranthes repens* Linnaeus – S, misapplied. NatureServe G5 (Secure).

* *Alternanthera paronychioides* A. Saint-Hilaire. **Hab:** Disturbed areas, wet or dry flats, beaches. **Dist:** Native of tropical America. **Phen:** Jul-Oct. **Syn:** = Ar, Bah, FNA4, WH3; = *Achyranthes polygonoides* (Linnaeus) Lamarck – S, misapplied; = *Alternanthera ficoidea* (Linnaeus) Palisot de Beauvois – K4; = *Alternanthera polygonoides* (Linnaeus) R. Brown ex Sweet – G, RAB, Tx, misapplied; > *Alternanthera paronychioides* St.-Hilaire var. *paronychioides* – K1. NatureServe GNR (Not Yet Ranked).

* *Alternanthera philoxeroides* (Martius) Grisebach. ALLIGATOR-WEED. **Hab:** Floating in mats on the surface of the waters of blackwater rivers, sloughs, ditches, ponds, and in very moist soil of ditches and shores. **Dist:** Native of tropical America. This plant is a serious weed of natural areas. **Phen:** Mar-Oct. **Syn:** = Ar, C, FNA4, IL, K1, K3, K4, NcTx, RAB, Tn, Tx, Va, WH3; = *Achyranthes philoxeroides* (Martius) Standley – S. NatureServe GNR (Not Yet Ranked).

* *Alternanthera sessilis* (Linnaeus) R. Brown ex A.P. de Candolle. SESSILE JOYWEED. **Hab:** Disturbed wet muck. **Dist:** Native of the Tropics. First reported for SC by Nelson & Kelly (1997). Apparently now known in the Southeast from SC, FL, AL, MS, LA, TX (Brown & Marcus 1998) and GA (Jones & Coile 1988). **Syn:** = Ar, FNA4, GW2, K1, K3, K4, WH3. NatureServe G5 (Secure).

*Amaranthus* Linnaeus 1753 (AMARANTH, PIGWEED)

A genus of about 60 species, all annual herbs, of tropical and temperate regions. References: Bayón (2015); Costea & Tardif (2003b); Costea & Tardif (2008); Costea, Sanders, & Waines (2001a); Costea, Sanders, & Waines (2001b); Henrickson (1999); Mosyakin & Robertson (2003) in FNA4 (2003b); Sauer (1955); Townsend in Kubitzki, Rohwer, & Bittrich (1993); Waselkov & Olsen (2014).

Unkeyed waifs: *Amaranthus tricolor*

- 1 Plants dioecious; [subgenus *Acnida*] **Key A**
 1 Plants monoecious (the pistillate and staminate flowers intermingled, or in separate inflorescences on the same plant); [subgenera *Albersia* and *Amaranthus*] **Key B**

Key to Map
 Symbology:

* : waif
 EN : endemic
 H : historic

N : no
 P : planted
 ? : questionable

Key A - *Amaranthus*, subgenus *Acnida*

- 1 Plants pistillate.
- 2 Tepals present and well-developed (usually 5 present, at least the outer tepals >2 mm long and with a visible midvein).
- 3 Tepals 1 or 2, lanceolate to linear; [subgenus *Acnida*, section *Acnida*]..... *Amaranthus tuberculatus*
- 3 Tepals 5, at least the inner spatulate; [subgenus *Acnida*, section *Saueranthus*]..... *Amaranthus palmeri*
- 2 Tepals lacking, or rudimentary (often only 1-2 present, these <1 (2) mm long and lacking a visible midvein); subgenus *Acnida*, section *Acnida*].
- 6 Utricle with conspicuous and regular longitudinal ridges; bract > 1.5 mm long, with a stout midrib not far excurrent beyond the bract blade *Amaranthus australis*
- 6 Utricle smooth or irregularly tuberculate; bract < 1.5 mm long, with a slender excurrent midrib *Amaranthus tuberculatus*
- 1 Plants staminate (some identifications following this lead may not be reliable).
- 8 Outer tepals with prominent midribs, usually longer than the inner tepals; bracts >2 mm long (or 1-2 mm long in *A. tuberculatus*), mostly with prominent midribs.
- 10 Bracts ca. 4 mm long, equaling or exceeding the outer tepals..... *Amaranthus palmeri*
- 10 Bracts ca. 2 mm long, shorter than the outer tepals *Amaranthus tuberculatus*
- 8 Outer tepals without prominent midribs, not appreciably longer than the inner tepals; bracts <2 mm long, the midribs usually not prominent (except sometimes in *A. australis*).
- 13 Bracts with moderately prominent midribs; midribs of outer tepals excurrent *Amaranthus australis*
- 13 Bracts with slender midribs; midribs of outer tepals not excurrent *Amaranthus tuberculatus*

Key B - *Amaranthus*, subgenera *Albersia* and *Amaranthus*

- 1 Inflorescences axillary clusters of glomerules (sometimes leafy terminal spikes also present); [subgenus *Albersia*].
- 3 Utricles indehiscent; leaf blades usually deeply notched at the tip. *Amaranthus blitum* ssp. *emarginatus*
- 3 Utricles dehiscent; leaf blades obtuse, acuminate, or very shallowly notched at the tip. *Amaranthus albus*
- 1 Inflorescences terminal spikes or panicles, leafless or nearly so at least in the distal portions (axillary spikes or clusters usually also present).
- 10 Utricles indehiscent; tepals of pistillate flowers usually 2-3 (5 in *A. spinosus*); inflorescence bracts shorter than the tepals.
- 11 Stems with paired nodal spines; tepals of pistillate flowers 5; [subgenus *Amaranthus*] *Amaranthus spinosus*
- 11 Stems lacking spines; tepals of pistillate flowers 2-3; [subgenus *Albersia*].
- 12 Utricles distinctly rugose, equaling or slightly exceeding the tepals; terminal inflorescences usually thin and interrupted *Amaranthus viridis*
- 12 Utricles smooth to faintly rugose (occasionally wrinkled or rugose in dried material), distinctly exceeding the tepals; terminal inflorescences usually thick and dense (or thin and interrupted in some forms of *A. blitum*). *Amaranthus blitum* ssp. *emarginatus*
- 10 Utricles dehiscent; tepals of pistillate flowers usually 5 (3-5 in *A. powellii*); inflorescence bracts exceeding the tepals (shorter than the tepals in some cultivated forms); [subgenus *Amaranthus*].
- 15 Fully developed inflorescences large and robust, usually brightly colored (red, purple, occasionally white or yellow, rarely green); bracts usually not exceeding style branches at maturity (occasionally longer than the style branches in *A. hypochondriacus*); seeds white, ivory, red, brown, or black; [cultivated, only weakly naturalized]. *Amaranthus hypochondriacus*
- 15 Fully developed inflorescences moderately large, usually green (rarely with some whitish or reddish coloration); bracts exceeding the style branches and tepals; seeds brown or black; [wild and weedy].
- 18 Tepals of pistillate flowers obtuse, rounded, or slightly notched at the tip; plants rather densely pubescent *Amaranthus retroflexus*
- 18 Tepals of pistillate flowers acute, acuminate, or aristate at the tip; plants slightly pubescent when young, becoming glabrous or nearly so.
- 19 Bracts 2-4 mm long; inflorescences usually soft and lax, with spreading branches *Amaranthus hybridus* ssp. *hybridus*
- 19 Bracts 4-7 mm long; inflorescences usually stiff, with erect branches *Amaranthus powellii*

Amaranthus albus Linnaeus. TUMBLEWEED AMARANTH. **Hab:** Disturbed areas, agricultural fields. **Dist:** Central North America, the native distribution difficult to determine. **Phen:** Jul-Dec. **Syn:** = Ar, C, FNA4, G, GrPl, IL, K1, K3, K4, Mi, Mo2, NcTx, NE, NY, Pa, Tn, Va, W, WH3, Bayón (2015), Costea & Tardif (2003b); > *Amaranthus albus* Linnaeus – Tx; > *Amaranthus albus* var. *albus* – F; < *Amaranthus graecizans* Linnaeus – RAB, misapplied; > *Amaranthus pubescens* (Uline & Bray) Rydberg – Tx.

Amaranthus australis (A. Gray) J.D. Sauer. SOUTHERN WATER-HEMP, CARELESS. **Hab:** Tidal marshes, freshwater wetlands (swamps, strands, sloughs, marshes), ditches, disturbed areas. **Dist:** E. NC, TN, LA, and TX south into West Indies, Mexico, and n. South America; perhaps adventive in some of our range, from an original distribution on the Gulf Coast, in FL, and southward into the New World tropics. **Phen:** May-Aug. **Comm:** This annual can get as large as 9 m tall and 30 cm diameter at the base of the stem! **Syn:** = FNA4, GW2, K1, K3, K4, NcTx, WH3, Sauer (1955); > *Acnida alabamensis* Standley – S; > *Acnida cuspidata* Bertero ex Sprengel – S, Tx. **NatureServe G5** (Secure).

* ***Amaranthus blitum*** Linnaeus ssp. *emarginatus* (Uline & W.L. Bray) Carretero, Muñoz Garmendia, & Pedrol. PURPLE AMARANTH, LIVID AMARANTH. **Hab:** Disturbed habitats. **Dist:** Native of the tropics. First reported from South Carolina by Hill & Horn (1997). Reported for greenhouses and outdoor areas for c. KY (Adanick & Medley 2020). **Phen:** Sep-Oct. **Syn:** = *Amaranthus blitum* Linnaeus ssp. *emarginatus* (Uline & W.L. Bray) Carretero, Muñoz Garmendia, & Pedrol var. *emarginatus* – K3, NE; < *Amaranthus blitum* – C, FNA4, K1, NY, Pa, Va; < *Amaranthus blitum* Linnaeus ssp. *emarginatus* (Uline & W.L. Bray) Carretero, Muñoz Garmendia, & Pedrol – Mo2, WH3, Costea & Tardif (2003b); < *Amaranthus blitum* ssp. *polygonoides* (Moquin-Tandon) Carretero; < *Amaranthus lividus* – Ar, Bah, F, G, RAB, misapplied.

Amaranthus hybridus Linnaeus ssp. *hybridus*. SMOOTH AMARANTH, SLIM AMARANTH, GREEN AMARANTH, SMOOTH PIGWEED. **Hab:** Disturbed areas. **Dist:** Original distribution obscure because of its very weedy nature, but apparently native in eastern North America. **Phen:** Jul-Oct. **Syn:** = NE, NY, Bayón (2015), Costea & Tardif (2003b); < *Amaranthus hybridus* – Ar, C, F, FNA4, G, GrPl, IL, K1, K3, K4, Mi, NcTx, Pa, RAB, S, Tn, Tx, Va, W, WH3. **NatureServe G5?TNR** (Not Yet Ranked).

* *Amaranthus hypochondriacus* Linnaeus. PRINCE'S-FEATHER. **Hab:** Disturbed areas. **Dist:** Native of tropical America. The type locality is "Virginia", where apparently early introduced. **Phen:** Jul-Oct. **Tax:** Possibly of hybrid origin, from *A. cruentus* × *powellii*. **Syn:** = C, FNA4, IL, K1, K3, K4, Mi, Mo2, NE, NY, Tx, Bayón (2015). NatureServe G4? (Apparently Secure).

Amaranthus palmeri S. Watson. CARELESS-WEED, PALMER'S AMARANTH. **Hab:** Arroyos, riverbanks, and disturbed areas; eastwards adventive in fields and disturbed areas. **Dist:** Native of c. and sw. North America and the Neotropics. **Phen:** Aug-Oct. **Syn:** = Ar, C, F, FNA4, G, GrPl, IL, K1, K3, K4, Mo2, NcTx, NE, NY, Pa, RAB, Tn, Tx, Va, WH3, Sauer (1955). NatureServe G5 (Secure).

Amaranthus powellii S. Watson. GREEN AMARANTH, POWELL'S AMARANTH. **Hab:** Disturbed areas. **Dist:** Native of w. and sc. North America. Widespread and common in PA (Rhoads & Klein 1993); many earlier reports of *A. retroflexus* may actually pertain to this species. **Phen:** Jul-Oct. **Syn:** = Ar, C, F, FNA4, G, GrPl, IL, K1, K3, K4, Mi, Pa, Tx, Bayón (2015); = *Amaranthus powellii* ssp. *powellii* – Mo2, NE, NY, Costea & Tardif (2003b); = *Amaranthus retroflexus* Linnaeus var. *powellii* (S. Watson) Boivin. NatureServe G5T5 (Secure).

Amaranthus retroflexus Linnaeus. ROUGH PIGWEED, REDROOT, REDROOT AMARANTH. **Hab:** Disturbed areas. **Dist:** Native of c. and e. North America, now nearly worldwide in distribution and the original native range difficult or impossible to determine. **Phen:** May-Oct. **Syn:** = Ar, C, F, FNA4, G, GrPl, IL, K1, K3, K4, Mi, Mo2, NcTx, NE, NY, Pa, RAB, S, Tn, Va, W, WH3, Bayón (2015), Costea & Tardif (2003b); = *Amaranthus retroflexus* var. *retroflexus*; > *Amaranthus retroflexus* var. *retroflexus* – Tx; > *Amaranthus retroflexus* Linnaeus var. *salicifolius* I.M. Johnston – Tx. NatureServe G5 (Secure).

* *Amaranthus spinosus* Linnaeus. SPINY AMARANTH, QUELITE ESPINOSO. **Hab:** Fields, gardens, roadsides, barnyards, pastures. **Dist:** Native of tropical America. **Phen:** Jul-Oct. **Syn:** = Ar, Bah, C, F, FNA4, G, GrPl, IL, K1, K3, K4, Mo2, NcTx, NE, NY, Pa, RAB, S, Tn, Tx, Va, W, WH3, Bayón (2015), Costea & Tardif (2003b). NatureServe G5 (Secure).

* *Amaranthus tricolor* Linnaeus. SUMMER POINSETTIA, JOSEPH'S COAT, CHINESE SPINACH, MALABAR SPINACH. **Hab:** Cultivated as an ornamental and salad green, rarely persistent or escaped. **Dist:** Native of tropical Asia. **Syn:** = FNA4, K3, K4, Mi, Mo2, Bayón (2015). NatureServe GNR (Not Yet Ranked).

Amaranthus tuberculatus (Moquin-Tandon) J.D. Sauer. INLAND WATER-HEMP. **Hab:** Swamps, bottomlands, fields, disturbed areas. **Dist:** The exact boundaries of its native distribution are now obscure, perhaps approximately OH west to ND south to MS and TX. **Phen:** Jul-Oct. **Tax:** The two forms (sometimes treated as varieties or species) are discussed by Costea & Tardif (2003b) and Waselkov & Olsen (2014). **Syn:** = Ar, C, FNA4, GW2, K3, K4, Mi, Mo2, NE, NY, RAB, Tn, W; > *Acnida altissima* – G; > *Acnida altissima* (Riddell) Moquin-Tandon ex Standley var. *altissima* – F; > *Acnida altissima* var. *prostrata* (Uline & Bray) Fernald – F; > *Acnida altissima* var. *subnuda* (S. * ***Celosia argentea*** Linnaeus. COCKSCOMB, CELOSIA, CRESTA DE GALLO. **Hab:** Commonly cultivated, rarely escaped or persistent in disturbed areas, such as along creeks. **Dist:** Native of the Tropics. **Phen:** Jul-Nov. **Tax:** *C. cristata* (with inflorescence distorted into a crest, cockscomb, fanlike, or elaborately lobed, rather than of crowded spikes) is clearly derived from *C. argentea*; it has been variously treated as a species, variety, or form. **Comm:** The '*cristata*' form is popular in gardens and institutional landscaping, but is not universally appreciated; Stace (2010) calls it "probably the world's ugliest plant". **Syn:** = Ar, Bah, Il, Pa, Tx, WH3; > *Celosia argentea* Linnaeus – C, FNA4, G, K1, K3, K4, NY, RAB, Judd & Ferguson (1999), Robertson (1981); > *Celosia argentea* var. *argentea* – F, Mo2; > *Celosia argentea* Linnaeus var. *cristata* (Linnaeus) Kuntze – F, Mo2; > *Celosia cristata* – C, FNA4, G, K1, K3, K4, NE, NY, Judd & Ferguson (1999), Robertson (1981).

Froelichia Moench 1794 (COTTONWEED, SNAKE-COTTON)

A genus of about 18 species, annual, perennials, and shrubs, of tropical, subtropical, and warm temperate America. References: McCauley & Ballard (2007a); McCauley & Ballard (2007b); McCauley (2003) in FNA4 (2003b); McCauley (2004); Robertson (1981); Townsend in Kubitzki, Rohwer, & Bittrich (1993).

- 2 Mature perianth slightly oblique apically, with irregularly and deeply cut ("spiny") lateral wings; flowers 2.4-3.8 mm long; stems slender, branched from base (except in depauperate specimens with only 1 slender stalk); floral spikes 3-ranked; bracteoles glabrous, not pubescent distally; stem pubescence grayish-white ***Froelichia gracilis***
- 2 Mature perianth symmetrical, with irregularly dentate to crenulate lateral wings; flowers 3.5-6 mm long; stems stout with one or more erect to decumbent branches from ground level; floral spikes 5-ranked (rarely 3-ranked); bracteoles glabrous to sparsely or densely pubescent distally; stem pubescence grayish-white or brownish. ***Froelichia floridana* var. *floridana***

Froelichia floridana (Nuttall) Moquin-Tandon var. *floridana*. FLORIDA COTTONSEED, COMMON COTTONWEED. **Hab:** Longleaf pine sandhills, sandy fields, sandy roadsides. **Dist:** S. NC south to n. FL, and west to LA, north in the interior to w. TN; disjunct (probably introduced) in DE, e. MD, s. NJ, and NY (Long Island). **Phen:** Jun-Oct. **Tax:** *Froelichia floridana* var. *campestris* Small is more midwestern, ranging from OH, IN, WI, and SD south to KY, AR, and TX; it is sometimes treated at species or variety rank, or lumped into *F. floridana*, as by McCauley (2004). Additionally, see *Froelichia floridana* var. *pallenscens*. **Syn:** = Robertson (1981); < *Froelichia floridana* (Nuttall) Moquin-Tandon – FNA4, NcTx, NY, RAB, S, WH3, McCauley & Ballard (2007a), McCauley & Ballard (2007b), McCauley (2004); < *Froelichia floridana* (Nuttall) Moquin-Tandon var. *floridana* – C, F, G, GrPl, K1, K3, K4, Tx, Tx.

Froelichia gracilis (Hooker) Moquin-Tandon. SLENDER COTTONWEED. **Hab:** Dry soils; eastwards adventive in vacant lots, sandy fields, railroad banks. **Dist:** Native of mw. United States, the eastern limit of its native distribution uncertain. **Phen:** Jun-Oct. **Syn:** = Ar, C, F, FNA4, G, GrPl, Il, K1, K3, K4, Mi, Mo2, NcTx, NE, NY, Pa, RAB, Tn, Va, W, WV, McCauley & Ballard (2007a), McCauley & Ballard (2007b), McCauley (2004); = *Froelichia braunii* Standley – Tx. NatureServe G5 (Secure).

Gomphrena Linnaeus 1753 (GLOBE-AMARANTH)

A genus of about 100-120 species, of the tropics and subtropics of America and Australia (naturalized elsewhere). References: Clemants (2003d) in FNA4 (2003b); Townsend in Kubitzki, Rohwer, & Bittrich (1993).

- 1 Heads 20-28 mm in diameter; stems erect ***Gomphrena globosa***
- 1 Heads 8-16 mm in diameter; stems prostrate or decumbent ***Gomphrena serrata***

* ***Gomphrena globosa*** Linnaeus. GLOBE-AMARANTH. **Hab:** Disturbed areas. **Dist:** Native of s. Asia. Introduced and known from scattered locations in s. PA (Rhoads & Klein 1993). Also reported for VA (Kartesz 1999) and MD (Reed 1961b). **Phen:** Jul-Sep. **Syn:** = Bah, C, F, FNA4, G, K1, K3, K4, NcTx, NE, NY, Tx. NatureServe GNR (Not Yet Ranked).

* ***Gomphrena serrata*** Linnaeus. ARRASA CON TODO. **Hab:** Sandy woodlands and disturbed areas. **Dist:** Native of tropical America. Reported for chrome ore piles in Newport News, VA (Reed 1961, Virginia Botanical Associates 2019), where presumably only a waif. **Syn:** = FNA4, K3, K4, WH3; > *Gomphrena decumbens* Jacquin – Tx; > *Gomphrena dispersa* Standley – S, Tx. NatureServe G5 (Secure).

Iresine P. Browne 1856 (BLOODLEAF)

A genus of about 80 species of tropical and temperate regions (especially America). References: Clemants (2003e) in FNA4 (2003b); Townsend in Kubitzki, Rohwer, & Bittrich (1993).

Iresine rhizomatosa Standley. BLOODLEAF. **Hab:** Moist interdune thickets, hammocks, edges of maritime forests, moist thickets inland, floodplain forests, riverbanks and river scour, bluff forests of the Coastal Plain. **Dist:** MD south to FL, west to se. TX; also inland from KY and TN west and south to KS and n. TX. **Phen:** Aug-Oct. **Syn:** = Ar, C, F, FNA4, G, GrPl, Il, K1, K3, K4, Mo2, NcTx, RAB, S, Tn, Tx, Va, WH3. [NatureServe G5](#) (Secure).

297b. CHENOPODIACEAE Ventenat 1799 (GOOSEFOOT FAMILY) [in CARYOPHYLLALES]

A family of about 100 genera and about 1500 species, herbs and shrubs, cosmopolitan, but especially in xeric and/or saline areas. Sometimes recently included in the Amaranthaceae, but each traditional family is monophyletic and there seems no reason to combine them. References: Fuentes-Bazan, Mansion, & Borsch (2012); Fuentes-Bazan, Uotila, & Borsch (2012); Judd & Ferguson (1999); Kühn in Kubitzki, Rohwer, & Bittrich (1993); Piirainen, Liebisch, & Kadereit (2017); Welsh, Crompton, & Clemants (2003) in FNA4 (2003b).

Chenopodiaceae

Subfamily Betoideae: *Beta*

Subfamily Chenopodioideae: *Atriplex*, *Blitum*, *Chenopodiastrum*, *Chenopodium*, *Cycloloma*, *Dysphania*, *Oxybasis*, *Spinacia*

Subfamily Suaedoideae: *Suaeda*

Subfamily Salicornioideae: *Salicornia*, *Sarcocornia*

Subfamily Camphorosmoideae: *Bassia*, *Spirobassia*

Subfamily Salsoloideae: *Kali*

{ADD *Dysphania* to KEY}

- 1 Leaves opposite, reduced to scales a few mm long, clasping and appressed against the succulent stem; flowers in groups of 3, sunken into the stem; [subfamily *Salicornioideae*]. *Salicornia*
- 1 Leaves alternate, not reduced to scales; flowers not sunken into the stem.
 - 2 Fruit enclosed and concealed by paired accrescent bracteoles (these usually deltoid, diamond-shaped, or ovoid); [subfamily *Chenopodioideae*]. *Atriplex*
 - 2 Fruit enclosed by the persistent calyx.
 - 4 Leaves sessile, linear, entire, succulent or not.
 - 5 Leaves spine-tipped with a sharp spine > (0.5) 1 mm long; [subfamily *Salsoloideae*]. *Salsola*
 - 5 Leaves not spine-tipped.
 - 6 Leaves glabrous; [subfamily *Suaedoideae*] *Suaeda*
 - 6 Leaves pubescent to villous; [subfamily *Camphorosmoideae*]. *Bassia*
 - 4 Leaves petiolate, lanceolate or wider, the larger leaves generally toothed, not succulent or only slightly so.
 - 9 Fruiting calyx winged horizontally *Dysphania atriplicifolia*
 - 9 Fruiting calyx not winged, the lobes flat, keeled, or hooded.
 - 10 Plants aromatic, leaves and perianth with stalked glandular hairs and/or subsessile glands *Dysphania*
 - 10 Plants non-aromatic (but sometimes fetid), vesicular hairy (farinose) or glabrous.
 - 13 Flowers often dimorphic, in lateral flowers perianth segments 3 (-5), seeds either vertical or horizontal in the fruit; stamens 1-3 *Oxybasis*
 - 13 Flowers not dimorphic, perianth segments 5, seeds exclusively horizontal in the fruit; stamens almost always 5.
 - 14 Young stems and leaves not farinose (with vesicular trichomes that become totally collapsed when dry, and are caducous and therefore rarely present at maturity); perianth segments with prominent midvein visible inside; seeds distinctly pitted to sometimes rugulose or almost smooth *Chenopodiastrum*
 - 14 Young stems and leaves densely farinose (covered with vesicular globose trichomes that become cup-shaped when dry and are mostly persistent at maturity); perianth segments without prominent midvein visible inside; seeds smooth or striate and somewhat rugulose, sometimes pitted *Chenopodium*

Atriplex Linnaeus 1753 (ORACH)

A genus of about 300 species, herbs and shrubs, of cosmopolitan distribution. References: Clemants (1992); Judd & Ferguson (1999); Kühn in Kubitzki, Rohwer, & Bittrich (1993); Welsh (2003) in FNA4 (2003b).

Identification Notes: A number of idiosyncratic characters are used in the identification of the species of *Atriplex*. Many important characters are associated with the mature fruits. The fruit is closely invested by 2 bracteoles, which are variously shaped and ornamented. Mature seeds are dimorphic in most of our species, with larger brown seeds and smaller black seeds. The radicle of the seeds is variously apical, lateral, or basal (which can be seen by observing the seed through the clarified bracteoles or with strong transmitted light).

297b. CHENOPODIACEAE

- 3 Fruiting bracteoles (3.5-) 4.5-7 mm long, 3.5-5.6 mm wide, longer than broad; faces with or without appendages..... *Atriplex mucronata*
 3 Fruiting bracteoles 2.5-4.5 mm long, 2.6-5 mm wide, as wide as or wider than long; faces with appendages..... *Atriplex pentandra*

Atriplex mucronata Rafinesque. SEABEACH ORACH, QUELITE. **Hab:** Ocean beaches, island-end flats. **Dist:** NH south to FL west to TX; Bahamas. **Phen:** Jul-frost. **Comm:** This species and *A. pentandra* are closely related, and have been variously treated as species, subspecies, varieties, and forms. **Syn:** = FNA4, NY, Va; = *Atriplex arenaria* Nuttall – Tx; < *Atriplex arenaria* Nuttall – Bah, C, G, GW2, RAB, S, Clemants (1992); < *Atriplex cristata* Humboldt and Bonpland ex Willdenow – K1, NE; < *Atriplex mucronata* Rafinesque – K2, K4; < *Atriplex pentandra* ssp. *arenaria* H.M. Hall & Clemants.

Atriplex pentandra (Jacquin) Standley. SEABEACH ORACH. **Hab:** Ocean beaches, island-end flats. **Dist:** NC to FL, west to TX; West Indies; South America. **Phen:** Jul-Nov. **Tax:** This species and *A. mucronata* are closely related, and have been variously treated as species, subspecies, varieties, and forms. **Syn:** = Bah, FNA4, WH3; = *Atriplex pentandra* ssp. *pentandra*; < *Atriplex arenaria* Nuttall – C, G, GW2, RAB, S, Clemants (1992); < *Atriplex cristata* Humboldt and Bonpland ex Willdenow – K1; < *Atriplex mucronata* Rafinesque – K3, K4; > *Atriplex pentandra* (Jacquin) Standley – Tx; > *Atriplex texana* – Tx; > *Atriplex wardii* Standley – Tx.

***Bassia*** Allioni 1766 (BASSIA)

A genus of about 21 species, herbs and dwarf shrubs, of Europe, Asia, Africa, and North America. All or part (the annuals) of *Kochia* are now sometimes merged into *Bassia* (Kadereit & Freitag 2011; Judd & Ferguson 1999).

References: Blackwell, Baechle, & Williamson (1978); Collins & Blackwell (1979); Judd & Ferguson (1999); Kadereit & Freitag (2011); Kühn in Kubitzki, Rohwer, & Bittrich (1993); Mosyakin (2003c) in FNA4 (2003b); Mosyakin (2003d) in FNA4 (2003b).

* ***Bassia scoparia*** (Linnaeus) A.J. Scott. SUMMER-CYPRESS, KOCHIA, MEXICAN FIREWEED. **Hab:** Disturbed areas, waste ground, particularly along railroad tracks, also in waste areas near wool-combing mill. **Dist:** Native of Eurasia. Reported for SC (Berkeley Co.) by Pittillo & Brown (1988). **Phen:** Jun-Aug. **Syn:** = K3, K4, Mi, NY, Va, Judd & Ferguson (1999), Kadereit & Freitag (2011); = *Kochia scoparia* (Linnaeus) Schrader – C, F, G, GrPl, Il, K1, NcTx, NE, Pa, Tn, W, Blackwell, Baechle, & Williamson (1978); > *Kochia scoparia* ssp. *scoparia* – Ar, FNA4; > *Kochia scoparia* var. *culta* Farwell – Tx; > *Kochia scoparia* var. *scoparia* – Tx. NatureServe GNR (Not Yet Ranked).

***Chenopodium*** S. Fuentes, Uotila, & Borsch 2012

A genus of 13-15 species, annual and perennial herbs, of cosmopolitan distribution. References: Bassett & Crompton (1982); Clemants & Mosyakin (2003a) in FNA4 (2003b); Fuentes-Bazan, Mansion, & Borsch (2012); Fuentes-Bazan, Uotila, & Borsch (2012); Mosyakin (2013).

* ***Chenopodium murale*** (Linnaeus) S. Fuentes, Uotila, & Borsch. NETTLELEAF GOOSEFOOT, SOWBANE. **Hab:** Disturbed areas. **Dist:** Native of Europe, Asia, and n. Africa. **Phen:** May-Nov. **Syn:** = K3, K4, NY, Fuentes-Bazan, Uotila, & Borsch (2012), Mosyakin (2013); = *Chenopodium murale* Linnaeus – Ar, Bah, C, F, FNA4, G, Il, K1, Mi, NcTx, NE, Pa, RAB, S, Tn, Tx, W, WH3, Bassett & Crompton (1982), Piirainen, Liebisch, & Kadereit (2017). NatureServe GNR (Not Yet Ranked).

***Chenopodium*** Linnaeus 1753 (GOOSEFOOT, LAMB'S-QUARTERS, PIGWEED)

A genus of about 140 species, herbs, shrubs, and small trees, of nearly cosmopolitan distribution. The genus (as traditionally circumscribed) has been determined to be paraphyletic (unless *Atriplex* is included, leading to the segregation of several monophyletic genera (Fuentes-Bazan, Mansion, & Borsch 2012; Fuentes-Bazan, Uotila, & Borsch 2012). References: Bassett & Crompton (1982); Clemants & Mosyakin (2003a) in FNA4 (2003b); Fuentes-Bazan, Mansion, & Borsch (2012); Fuentes-Bazan, Uotila, & Borsch (2012); Judd & Ferguson (1999); Kadereit et al (2010); Kühn in Kubitzki, Rohwer, & Bittrich (1993); Mosyakin & Clemants (1996); Wahl (1954).

- 1 Seeds arranged vertically or both horizontally and vertically in the fruit; leaf blades glabrous or occasionally sparsely farinose..... *Oxybasis glauca*
- 1 Seeds arranged horizontally in the fruit; leaf blades usually farinose.
 - 7 Primary leaves linear, linear-lanceolate, at least 2-3× as long as wide, usually untoothed and unlobed (but often with 2 basal lobes in *C. foggii*); [subsection *Leptophylla*].
 - 11 Seeds honeycomb-pitted; [subsection *Favosa*].
 - 11 Seeds smooth or areolate..... *Chenopodium pratericola*
 - 17 Leaves triangular..... *Chenopodium berlandieri* var. *boscianum*

***Chenopodium berlandieri* Moquin-Tandon var. *boscianum* (Moquin-Tandon) H.A. Wahl.** **Hab:** Beaches, marshes. **Dist:** FL west to e. TX; with scattered occurrences farther north (these of unknown nativity). **Phen:** Aug-Sep. **Syn:** = FNA4, K1, K3, K4, NcTx, Tx, Wahl (1954); < *Chenopodium album* Linnaeus – RAB; < *Chenopodium berlandieri* Moquin-Tandon – Pa, Va, WH3; < *Chenopodium standleyanum* Aellen – GrPl.

***Chenopodium pratericola* Rydberg.** DESERT GOOSEFOOT, NARROWLEAF GOOSEFOOT. **Hab:** Sandy soils, roadsides, disturbed areas. **Dist:** Native of w. North America. Maine and ON west to YT, south to FL, TX, and CA, introduced in the eastern part of that distribution. **Phen:** May-Nov. **Syn:** = Ar, FNA4, GrPl, Il, K1, K3, K4, Mi, NY, Pa, Bassett & Crompton (1982); = *Chenopodium desiccatum* A. Nelson var. *leptophylloides* (J. Murray) H.A. Wahl – RAB, Tx, Fuentes-Bazan et al. (1996), misapplied; = *Chenopodium pratericola* var. *pratericola* – Wahl (1954); ? *Chenopodium leptophyllum* (Moquin-Tandon) Nuttall ex S. Watson – F, G, misapplied; < *Chenopodium pratericola* Rydberg – C.

***Chenopodium standleyanum* Aellen.** WOODLAND GOOSEFOOT. **Hab:** Rock outcrops, steep slopes, bluffs, dry to mesic woodlands, shaded disturbed soils. **Dist:** QC west to ND, south to FL and e. TX. **Syn:** = Ar, C, FNA4, G, Il, K1, K3, K4, Mi, NcTx, NE, NY, Pa, RAB, Tn, Tx, Va, W, Bassett & Crompton (1982); < *Chenopodium boscianum* – F, S, misapplied; < *Chenopodium standleyanum* Aellen – GrPl.

Dysphania R. Brown 1810

A genus of about 32 species, annual and perennial herbs, nearly cosmopolitan, mostly in the tropics, subtropics, and warm temperate areas. The exclusion of *Dysphania* from *Chenopodium* and its placement in a separate tribe (Dysphanieae) is strongly supported (Fuentes-Bazan, Mansion, & Borsch 2012; Kadereit et al. 2010; Uotila et al. 2021). The classification of sections follows Uotila et al. (2021). References: Bassett & Crompton (1982); Clemants & Mosyakin (2003b) in FNA4 (2003b); Fuentes-Bazan, Mansion, & Borsch (2012); Fuentes-Bazan, Uotila, & Borsch (2012); Judd & Ferguson (1999); Kadereit et al. (2010); Kühn in Kubitzki, Rohwer, & Bittrich (1993); Uotila et al. (2021); Wahl (1954).

- 3 Flowers solitary, sessile, and spaced along the inflorescence axis; calyx lobes strongly keeled, at maturity with a continuous, horizontal, scarious wing; [section *Adenois*]. *Dysphania atriplicifolia*
- 3 Flowers in dense glomerules arranged secondarily into spikes and panicles; calyx lobes not winged.
- 4 Leaf blades 2-8 cm long; seeds mostly horizontal; stems 3-15 dm tall; [section *Adenois*].
- 5 Inflorescences foliose throughout; primary leaves not lobed. *Dysphania ambrosioides*
- 5 Inflorescences leafless (leaves in the inflorescence absent or shorter than the glomerules); primary leaves regularly lobed. *Dysphania anthelmintica*
- 4 Leaf blades 0.5-2.7 cm long; seeds vertical; stems 0.5-5 dm tall; [section *Dysphania*]. *Dysphania pumilio*

***Dysphania ambrosioides* (Linnaeus) Mosyakin & Clemants.** MEXICAN-TEA, EPAZOTE. **Hab:** Disturbed habitats; common, probably native southward. **Dist:** Widespread in North America to South America, the original range unclear. **Syn:** = Ar, FNA4, Il, Mi, NE, NY, Pa, Tn, Va; = *Chenopodium ambrosioides* var. *ambrosioides* – F; < *Ambrina ambrosioides* (Linnaeus) Spach – S; < *Chenopodium ambrosioides* – C, G, NcTx, RAB, Tx, W, WH3, Bassett & Crompton (1982), Wahl (1954); < *Chenopodium ambrosioides* var. *ambrosioides* – K1; < *Dysphania ambrosioides* (Linnaeus) Mosyakin & Clemants – K3, K4. **NatureServe GNRTNR** (Not Yet Ranked).

***Dysphania anthelmintica* (Linnaeus) Mosyakin & Clemants.** WORMSEED, EPAZOTE. **Hab:** Dunes, also in disturbed areas. **Dist:** NY south to FL, west to TX; Mexico, West Indies, Bermuda, Central America; scattered inland in North America probably as an introduction. **Phen:** Jun-Oct. **Syn:** = FNA4, Il, NE, NY; = *Chenopodium ambrosioides* var. *anthelminticum* (Linnaeus) A. Gray – F; < *Ambrina ambrosioides* (Linnaeus) Spach – S; < *Chenopodium*

297b. CHENOPODIACEAE

ambrosioides – Bah, C, G, NcTx, RAB, Tx, W, WH3, Wahl (1954); < *Chenopodium ambrosioides* var. *ambrosioides* – K1; < *Dysphania ambrosioides* (Linnaeus) Mosyakin & Clemants – K3, K4.

Dysphania atriplicifolia (Sprengel) G. Kadereit, Sukhorukov, & Uotila. WINGED-PIGWEEED, TUMBLE RINGWING. **Hab:** River-banks, sandy fields, railroad banks, maritime dunes. **Dist:** Native of c. and w. North America, adventive in the eastern part of our area. **Phen:** May–Nov. **Tax:** This species was formerly placed in the monotypic genus *Cycloloma*, but Uotila et al. (2021) showed convincingly its inclusion in *Dysphania*. **Syn:** = Uotila et al (2021); = *Cycloloma atriplicifolium* (Sprengel) Coulter – C, F, FNA4, G, GrPl, GW2, Il, K1, K3, K4, Mi, NcTx, NE, NY, Pa, RAB, S, Va, WV. **NatureServe G5** (Secure).

* ***Dysphania pumilio*** (R. Brown) Mosyakin & Clemants. CLAMMY GOOSEFOOT. **Hab:** Disturbed areas. **Dist:** Native of Australia. First reported for SC by Hill & Horn (1997). Also known from DC. **Phen:** Jul–Aug. **Syn:** = Ar, FNA4, Il, K3, K4, Mi, NE, NY, Pa, Va; = *Chenopodium pumilio* R. Brown – C, G, K1, NcTx, Tx, WH3, Wahl (1954); < *Chenopodium carinatum* R. Brown – F, misapplied.

Oxybasis Karelin & Kirilov 1841

A genus of 6–10 species, annual herbs, widespread. References: Bassett & Crompton (1982); Clemants & Mosyakin (2003a) in FNA4 (2003b); Fuentes-Bazan, Uotila, & Borsch (2012); Kurtto & Uotila (2019); Mosyakin (2013); Wahl (1954).

* ***Oxybasis glauca*** (Linnaeus) S. Fuentes, Uotila, & Borsch. OAKLEAF GOOSEFOOT. **Hab:** Disturbed areas. **Dist:** Native of Eurasia. **Phen:** Aug–Oct. **Tax:** Kurtto & Uotila (2019) separate *Oxybasis glauca* and *Oxybasis salina* at species rank, a conclusion followed here. **Syn:** = Kurtto & Uotila (2019); = *Chenopodium glaucum* ssp. *glaucum* – NE; = *Chenopodium glaucum* var. *glaucum* – FNA4, Mi; = *Oxybasis glauca* (Linnaeus) S. Fuentes, Uotila, & Borsch ssp. *glaucum* – NY, Mosyakin (2013); = *Oxybasis glauca* var. *glaucum* – K3, K4; < *Chenopodium glaucum* Linnaeus – C, F, G, GrPl, K1, Pa, Tx, WH3, WV, Bassett & Crompton (1982); < *Oxybasis glauca* (Linnaeus) S. Fuentes, Uotila, & Borsch – Fuentes-Bazan, Uotila, & Borsch (2012).

Salicornia Linnaeus 1753 (GLASSWORT)

A genus of about 40–50 species, succulent herbs, of cosmopolitan distribution. Here circumscribed to include *Sarcocornia*, following Piirainen, Liebisch, & Kadereit (2017). References: Alonso & Crespo (2008); Ball (2003a) in FNA4 (2003b); Judd & Ferguson (1999); Kadereit et al (2007); Kühn in Kubitzki, Rohwer, & Bittrich (1993); Piirainen, Liebisch, & Kadereit (2017).

- 1 Perennial from a horizontal rhizome; central flower (of each group of 3) slightly or not at all longer than the 2 lateral flowers; [subgenus *Amerocornia*]..... *Salicornia ambigua*
- 1 Annual from a taproot; central flower (of each group of 3) considerably longer than the 2 lateral flowers; [subgenus *Salicornia*]..... *Salicornia bigelovii*

Salicornia ambigua Michaux. WOODY GLASSWORT, PERENNIAL GLASSWORT, GUINEA-BEAD, WILD CORAL. **Hab:** Coastal salt marshes, primarily in salt pannes. **Dist:** NH south to FL, west to TX (at least); south through the West Indies to n. South America. **Phen:** Jul–Oct. **Tax:** Ball in FNA4 (2003b) treats all North American *Sarcocornia* as *Sarcocornia pacifica*, which is also present on the Pacific coast of North America. *Sarcocornia perennis* is restricted to the Pacific and Atlantic coasts of North America, as well as being in Europe, sw. Asia, and Africa. Alonso & Crespo (2008) clarify the species-level taxonomy of *Sarcocornia* in a paper focused on South America, and treat eastern North American material as *Sarcocornia ambigua*, a conclusion here followed, except that we also accept the inclusion of *Sarcocornia* in *Salicornia* (Piirainen, Liebisch, & Kadereit 2017). **Syn:** = NE, NY, Piirainen, Liebisch, & Kadereit (2017); = *Sarcocornia ambigua* (Michaux) M.Á. Alonso & M.B. Crespo – K4, WH3, Alonso & Crespo (2008); ? *Arthrocnemum perenne* (P. Miller) Moss, misapplied to East Coast material; ? *Salicornia perennis* P. Miller – S, Judd & Ferguson (1999), misapplied to East Coast material; ? *Salicornia virginica* Linnaeus – Bah, C, F, G, GW2, RAB, Tx, misapplied; >> *Sarcocornia pacifica* (Standley) A.J. Scott – FNA4, K3, Va, misapplied to East Coast material; >> *Sarcocornia perennis* (P. Miller) A.J. Scott – K1, misapplied to East Coast material.

Salicornia bigelovii Torrey. DWARF GLASSWORT, DWARF SALTWORT. **Hab:** Salt pannes in coastal marshes. **Dist:** ME (NS?) south to FL, west to TX; West Indies; also CA. **Phen:** Jul–Oct. **Syn:** = Bah, C, F, FNA4, G, GW2, K1, K3, K4, NE, NY, RAB, S, Tx, Va, WH3, Judd & Ferguson (1999). **NatureServe G5** (Secure).

Salsola Linnaeus 1753 (SALTWORT)

A genus of about 30 species, herbs, and shrubs, of Europe, Asia, n. Africa, and America. A proposal by Akhani, Greuter, & Roalson (2007, 2014) that would have resulted in use of the genus name *Kali* P. Miller for our taxa was overruled by the establishment of *S. kali* as the conserved type of *Salsola*. References: Akhani, Greuter, & Roalson (2007); Akhani, Greuter, & Roalson (2014); Judd & Ferguson (1999); Kühn in Kubitzki, Rohwer, & Bittrich (1993); Mosyakin (2003e) in FNA4 (2003b).

* ***Salsola tragus*** Linnaeus. RUSSIAN THISTLE, TUMBLEWEED. **Hab:** Disturbed areas. **Dist:** Native of Eurasia. **Phen:** Jun-frost. **Syn:** = Ar, C, FNA4, Il, K1, K3, Mi, NeTx, NE, NY, Pa, Tn, Va; = *Salsola iberica* Sennen & Pau – GrPl; = *Salsola kali* var. *tenuifolia* Tausch – F, G, WV; = *Salsola pestifer* A. Nelson – S, Judd & Ferguson (1999); < *Kali tragus* (Linnaeus) Scopoli ssp. *tragus* – K4; < *Salsola kali* Linnaeus – RAB, Tx.

*Suaeda* Forsskål ex Scopoli 1777 (SEA-BLITE)

A genus of about 100 species, herbs and subshrubs, of cosmopolitan distribution. References: Ferren & Schenk (2003) in FNA4 (2003b); Fisher et al (1997); Hopkins & Blackwell (1977); Judd & Ferguson (1999); Kühn in Kubitzki, Rohwer, & Bittrich (1993).

Suaeda linearis (Elliott) Moquin-Tandon. SOUTHERN SEA-BLITE. **Hab:** Island-end flats, marsh edges, brackish flats, rarely adventive inland in disturbed areas. **Dist:** ME south to FL, west to TX, and south into Mexico; West Indies. **Phen:** Aug-Dec. **Syn:** = Bah, C, F, FNA4, G, GW2, K1, K3, K4, NE, NY, RAB, Tx, Va, WH3, Hopkins & Blackwell (1977), Judd & Ferguson (1999); = *Dondia linearis* (Elliott) Heller – S. [NatureServe G5](#) (Secure).

304. AIZOACEAE Martinov 1820 (FIG-MARIGOLD FAMILY) [in CARYOPHYLLALES]

A family of about 128 genera and about 1850-2500 species, mostly succulent herbs and subshrubs, of tropical and subtropical regions, especially in s. Africa and Australia. References: Boetsch (2002); Ferren (2003a) in FNA4 (2003b); Hartmann in Kubitzki, Rohwer, & Bittrich (1993); Klak, Hanáček, & Bruyns (2017); Vivrette, Bleck, & Ferren (2003) in FNA4 (2003b).

- 2 Leaves linear, lanceolate, or oblanceolate, the blade > 3× as long as wide; [subfamily *Sesuvioideae*] *Sesuvium*
- 2 Leaves orbicular, obovate, or triangular-ovate, the blade < 2.5× as long as wide.
 - 4 Sepals lacking appendages; stamens 1-3 (-5); seeds ca. 150 per capsule *Sesuvium humifusum*
 - 4 Sepals appendaged; stamens 5-10; seeds 1-12 per capsule *Trianthema portulacastrum*

Sesuvium Linnaeus 1759 (SEA-PURLANE)

A genus of about 14 species, especially in tropical and subtropical coastal areas. Here circumscribed to include *Cypselea*, following Bohley, Winter & Kadereit (2017). References: Boetsch (2002); Bohley, Winter, & Kadereit (2017); Ferren (2003a) in FNA4 (2003b); Ferren (2003b) in FNA4 (2003b); Hartmann in Kubitzki, Rohwer, & Bittrich (1993).

- 1 Petiole with lateral flap margins fimbriate; leaves of each opposite pair distinctly unequal in size *Sesuvium humifusum*
- 1 Petiole with lateral flap margins entire; leaves of each opposite pair equal in size (or nearly so).
 - 2 Shoots densely covered with bulging bladder cells (crystalline globular papillae); plants not rooting at nodes. *Sesuvium verrucosum*
 - 2 Shoots smooth; plants rooting at nodes or not.
 - 4 Flowers and fruits on pedicels (3-) 5-20 mm long; plants perennial, rooting at nodes; styles and locules 5 *Sesuvium portulacastrum*
 - 4 Flowers and fruits sessile (or on pedicels to 1 mm long); plants annual, not rooting at nodes; styles and locules 2-3. *Sesuvium maritimum*

* ***Sesuvium humifusum*** (Turpin) Bohley & G. Kadereit. PANAL. **Hab:** Pineland depression marshes, disturbed wet areas. **Dist:** Reputedly native of West Indies. **Phen:** Mar-Dec. **Syn:** = K4, Bohley, Winter, & Kadereit (2017); = *Cypselea humifusa* Turpin – Bah, Fl5, FNA4, K3, S, WH3. [NatureServe GNR](#) (Not Yet Ranked).

Sesuvium maritimum (Walter) Britton, Sterns, & Poggenburg. SMALL SEA-PURLANE, SLENDER SEA-PURLANE. **Hab:** Island end flats and sea beaches, salt flats; less typically inland (AL, LA) in saline marshes or seeps (associated with salt domes). **Dist:** NY south to s. FL, west to TX, south to Mexico (Yucatan); West Indies. **Phen:** May-Dec (-Apr). **Syn:** = Bah, C, F, Fl5, FNA4, G, GW2, Il, K1, K3, K4, NE, NY, RAB, S, Tx, Va, WH3, Boetsch (2002), Bohley, Winter, & Kadereit (2017). [NatureServe G5](#) (Secure).

Sesuvium portulacastrum (Linnaeus) Linnaeus. LARGE SEA-PURLANE, SHORELINE SEA-PURLANE. **Hab:** Island end flats and sea beaches; less typically inland (LA) in saline marshes or seeps (associated with salt domes). **Dist:** A pantropical coastal species, in North America from e. NC south to s. FL, west to e. TX; also in the West Indies and south into the tropics (introduced on ballast in se. PA). Essentially cosmopolitan on tropical and subtropical shores. **Phen:** May-Dec. **Syn:** = Bah, Fl5, FNA4, GW2, K1, K3, K4, Mo2, RAB, S, WH3, Boetsch (2002), Bohley, Winter, & Kadereit (2017). [NatureServe G5](#) (Secure).

Sesuvium verrucosum Rafinesque. WESTERN SEA-PURLANE. **Hab:** Salt flats, beaches, saline marshes. **Dist:** S. MS west through TX to CA, south to s. Mexico. **Phen:** Apr-Aug. **Syn:** = FNA4, GrPl, K3, K4, Bohley, Winter, & Kadereit (2017); > *Sesuvium erectum* Correll – Tx; > *Sesuvium verrucosum* Rafinesque – Tx. [NatureServe G5](#) (Secure).

Trianthema Linnaeus 1753 (HORSE-PURLANE)

A genus of about 17-20 species, of tropical and warm temperate areas, especially Australia. References: Boetsch (2002); Ferren (2003c) in FNA4 (2003b); Hartmann in Kubitzki, Rohwer, & Bittrich (1993); Hartmann, Meve, & Liede-Schumann (2011).

Trianthema portulacastrum Linnaeus. HORSE-PURLANE, CENECILLA. **Hab:** Saline flats, disturbed areas.

Dist: Native of the Old World and New World tropics, the limits of its native distribution unclear. **Phen:** Apr-Nov.

Syn: = Ar, Bah, C, F, Fl5, FNA4, G, GrPl, GW2, K1, K3, K4, NcTx, RAB, S, Tx, WH3, Boetsch (2002), Hartmann, Meve, & Liede-Schumann (2011). NatureServe G5 (Secure).

305. PHYTOLACCACEAE R. Brown 1818 (POKEWEED FAMILY) [in CARYOPHYLLALES]

A family of about 18 genera and 70 species, herbs, shrubs, vines, and trees, of tropical and warm temperate regions, especially America. References: Nienaber & Thieret (2003) in FNA4 (2003b); Rohwer in Kubitzki, Rohwer, & Bittrich (1993).

Phytolacca Linnaeus 1753 (POKEWEED)

A genus of about 25 species, herbs, shrubs, and trees, of tropical and warm temperate regions. References: Caulkins & Wyatt (1990); Hardin (1964a); Nienaber & Thieret (2003) in FNA4 (2003b); Rogers (1985); Rohwer in Kubitzki, Rohwer, & Bittrich (1993).

- 1 Fruiting pedicels (6-) 7-12 (-15) mm long; raceme (not including the peduncle) 10-20 (-25) cm long, divergent or drooping in flower and fruit (or ascending in flower); [widespread in our area]..... *Phytolacca americana*
- 1 Fruiting pedicels (2-) 4-6 (-7) mm long; raceme (not including the peduncle) (3-) 6-9 (-13) cm long, erect (rarely divergent) in flower and fruit; [restricted northwards to maritime habitats, but more general southward, as in FL]..... *Phytolacca rigida*

Phytolacca americana Linnaeus. COMMON POKEWEED. **Hab:** In a wide variety of natural and disturbed habitats, usually associated with exposed mineral soil. **Dist:** ME, ON, s. MN, and NE south to FL and sc. TX. **Phen:** May-Nov. **Comm:** An abundant 'native weed' occurring throughout e. North America, *P. americana* is widely dispersed by birds and quickly colonizes exposed mineral soil even in undisturbed forests, such as on tree-fall tip-up mounds or flood scours. It is most abundant, however, as a weed of urban, suburban, and agricultural disturbances. The berries and mature stems are poisonous; the young stems have been used as a potherb and the purple berries as a source of ink. **Syn:** = C, F, G, GrPl, Il, Mi, Pa, S, Tn, W, WV, Hardin (1964a), Rogers (1985); = *Phytolacca americana* var. *americana* – Ar, FNA4, K1, K3, K4, NE, NY, Va, Caulkins & Wyatt (1990); < *Phytolacca americana* Linnaeus – Fl5, GW2, NcTx, RAB, Tx, WH3. NatureServe GST5 (Secure).

Phytolacca rigida Small. MARITIME POKEWEED. **Hab:** Dune slacks, dune slopes, edges of tidal marshes, disturbed areas on barrier islands, xeric sandhills near the coast. **Dist:** DE (reportedly), se. VA south to FL and west to TX in the Southeastern Coastal Plain. **Phen:** May-Dec. **Tax:** Caulkins & Wyatt (1990) reduced *P. rigida* to varietal rank, but it seems distinct at species rank. **Comm:** In the northern parts of our area, in NC and VA, *P. rigida* is rather rare, limited to the vicinity of the coast, and less weedy than *P. americana*. **Syn:** = S, Hardin (1964a), Rogers (1985); = *Phytolacca americana* var. *rigida* (Small) Caulkins & Wyatt – FNA4, K1, K3, K4, Va, Caulkins & Wyatt (1990); < *Phytolacca americana* Linnaeus – Fl5, GW2, RAB, Tx, WH3.

308. NYCTAGINACEAE A.L. de Jussieu 1789 (FOUR-O'CLOCK FAMILY) [in CARYOPHYLLALES]

A family of about 31 genera and 400 species, trees, shrubs, vines, and herbs, of tropical, subtropical, and (less commonly) warm temperate regions, especially diverse in the New World. Tribal classification follows Douglas & Spellenberg (2010). References: Bittrich & Kühn in Kubitzki, Rohwer, & Bittrich (1993); Bogle (1974); Douglas & Spellenberg (2010); Spellenberg (2003) in FNA4 (2003b).

308. NYCTAGINACEAE

561

- 3 Flowers < 3 mm long, lacking involucre bracts subtending the petaloid calyx..... *Boerhavia*
 3 Flowers > 10 mm long, with involucre bracts (in *Mirabilis* these simulating a calyx, subtending the petaloid calyx).
 *Mirabilis*

Boerhavia Linnaeus 1753 (SPIDERLING)

A genus of about 20-40 species, annual and perennial herbs, of tropical, subtropical, and warm temperate regions of the Old and New World. References: Bittrich & Kühn in Kubitzki, Rohwer, & Bittrich (1993); Bogle (1974); Spellenberg (2003b) in FNA4 (2003b).

- 1 Fruit truncate at the apex, glabrous, with longitudinal ribs acute and winglike; annual..... *Boerhavia erecta*
 1 Fruit rounded at apex, stipitate-glandular, with longitudinal ribs rounded; perennial.
 *Boerhavia diffusa*

Boerhavia diffusa Linnaeus. RED SPIDERLING, SPREADING HOGWEED. **Hab:** Longleaf pine sandhills, vacant lots, road shoulders, other dry disturbed areas. **Dist:** Pantropical and subtropical, in North America from se. NC south to s. FL, west to s. MS. **Syn:** = Bah, Fl5, FNA4, K1, K3, K4, WH3, Bogle (1974); < *Boerhavia diffusa* Linnaeus – NcTx.

Boerhavia erecta Linnaeus. ERECT SPIDERLING, SMOOTH HOGWEED. **Hab:** Sandy fields, roadsides, disturbed areas, railroad yards. **Dist:** NC south to FL, west to TX and AZ, likely only introduced in the northern portions of our area (see map). **Phen:** May-Oct. **Syn:** = Ar, Bah, Fl5, FNA4, K1, K3, K4, NcTx, RAB, Bogle (1974); = *Boerhavia erecta* – G, GrPl, S, Tx, orthographic variant. NatureServe G5 (Secure).

Mirabilis Linnaeus 1753 (UMBRELLA-WORT, FOUR-O'CLOCK)

A genus of about 55-60 species, annual and perennial herbs, of warm temperate America and s. Asia. References: Bittrich & Kühn in Kubitzki, Rohwer, & Bittrich (1993); Le Duc (1995); Spellenberg (2003e) in FNA4 (2003b).

- 1 Petaloid calyx with a narrow tube 3-4 cm long, the spreading portion to 5 cm in diameter; involucre with 1 flower, not expanding in fruit; [section *Mirabilis*]..... *Mirabilis jalapa* var. *jalapa*
 1 Petaloid calyx with a broad tube < 0.5 cm long, the spreading portion < 1.5 cm in diameter; involucre with 3-5 flowers, expanding in fruit; [section *Oxybaphus*].
 3 Leaves cordate at the base, 1-2× as long as wide; [introduced, of disturbed habitats] *Mirabilis nyctaginea*
 3 Leaves cuneate at the base, 2.5-6× as long as wide; [native, of dry sandy or calcareous habitats, sometimes disturbed] *Mirabilis albida*

Mirabilis albida (Walter) Heimerl. WILD FOUR-O'CLOCK, PALE UMBRELLA-WORT, WHITE FOUR-O'CLOCK. **Hab:** Sandhills, limestone glades and barrens, prairies, pastures, adjacent disturbed dry soils. **Dist:** S. SC south to GA, west to TX, north in the interior to c. TN, IA, and KS. **Phen:** May-Oct. **Syn:** = Ar, C, F, FNA4, GrPl, K1, K3, K4, Mi, NcTx, NY, RAB, Tn, Bogle (1974); = *Allionia albida* Walter – S; = *Oxybaphus albidus* (Walter) Sweet – G; > *Mirabilis aggregata* – Tx, misapplied; > *Mirabilis albida* (Walter) Heimerl – IL, NE, Tx; > *Mirabilis hirsuta* – IL, NE; > *Mirabilis pauciflora* (Buckley) Standley – Tx.

* ***Mirabilis jalapa*** Linnaeus var. *jalapa*. GARDEN FOUR-O'CLOCK, MARVEL-OF-PERU, MORNING-ROSE. **Hab:** Disturbed areas, or persistent at former garden sites. **Dist:** Native of tropical America. **Phen:** Jun-Nov (-May). **Tax:** A second variety is not known from our area. **Syn:** = Ar, FNA4; < *Mirabilis jalapa* Linnaeus – Bah, C, F, Fl4, G, IL, K1, K3, K4, NcTx, NE, NY, Pa, RAB, S, Va, WH3, Bogle (1974); > *Mirabilis jalapa* – Tx; > *Mirabilis lindheimeri* (Standley) Shinnery – Tx.

Mirabilis nyctaginea (Michaux) MacMillan. HEART-LEAVED UMBRELLA-WORT, HEARTLEAF FOUR-O'CLOCK. **Hab:** Upland prairies, streambanks, riverbanks, also in disturbed situations (as eastwards) such as railroad embankments, other disturbed areas. **Dist:** MI, WI, ON, and AB south to LA, TX, and NM, the exact native distribution obscured by subsequent spread. André Michaux collected this species from bluffs of the Tennessee River in 1795, suggesting native status for that area. **Phen:** May-Oct. **Syn:** = Ar, C, F, FNA4, GrPl, IL, K1, K3, K4, Mi, NcTx, NE, NY, Pa, RAB, Tn, Va, W, WV, Bogle (1974); = *Allionia nyctaginea* Michaux – S; = *Oxybaphus nyctagineus* (Michaux) Sweet – G; > *Mirabilis collina* Shinnery – Tx; > *Mirabilis nyctaginea* (Michaux) MacMillan – Tx.

309. MOLLUGINACEAE Bartling 1825 (CARPETWEED FAMILY) [in CARYOPHYLLALES]

A family of about 13-14 genera and 120-125 species, herbs, of tropical and warm temperate areas. References: Boetsch (2002); Endress & Bittrich in Kubitzki, Rohwer, & Bittrich (1993); Vincent (2003b) in FNA4 (2003b).

Mollugo Linnaeus 1753 (CARPETWEED)

A genus of about 35 species, annual herbs, of tropical and subtropical regions of both hemispheres, introduced in temperate regions. References: Endress & Bittrich in Kubitzki, Rohwer, & Bittrich (1993); Vincent (2003b) in FNA4 (2003b).

* ***Mollugo verticillata*** Linnaeus. CARPETWEED, INDIAN-CHICKWEED. **Hab:** Fields, disturbed areas, drawdown zones on river- and pond-shores. **Dist:** Native of tropical America. **Phen:** May-Dec. **Syn:** = Ar, C, F, FI5, FNA4, G, GrPl, GW2, Il, K1, K3, K4, Mi, NcTx, NE, NY, Pa, RAB, S, Tn, Tx, Va, W, WH3, WV, Boetsch (2002). [NatureServe G5](#) (Secure).

310. MONTIACEAE Rafinesque 1820 (MONTIA FAMILY) [in CARYOPHYLLALES]

A family of about 14 genera and 250 species, annual and perennial herbs and subshrubs, primarily of the Southern Hemisphere, but also occurring in North America and e. Asia. References: Carolin in Kubitzki, Rohwer, & Bittrich (1993); Hershkovitz (2019); Nyffeler & Eggli (2010); Packer (2003a) in FNA4 (2003b).

- 2 Stems with 2 opposite cauline leaves; petals 6-14 mm long *Claytonia*
 2 Stems with > 2 leaves, opposite or alternate; petals 1-6 mm long..... *Montia*

Calandrinia Kunth 1823

A genus of ca. 14 species, annual herbs, of w. North America, Central America and South America. This circumscription excludes Old World taxa sometimes treated as part of *Calandrinia*. References: Kelley (2003) in FNA4 (2003b).

* ***Calandrinia menziesii*** (Hooker) Torrey & A. Gray. RED MAIDS, FRINGED REDMAID. **Hab:** Agricultural fields. **Dist:** Native of w. North America, Central America, and n. South America. See Urbatsch & Meszaros (2013) for detailed information on its locally abundant occurrence in Rapides Parish, LA (west of our area). **Phen:** Feb-Mar. **Comm:** {not yet keyed}. **Syn:** = K4; < *Calandrinia ciliata* (Ruiz & Pavón) A.P. de Candolle – FNA4, K3, NE. [NatureServe G4](#) (Apparently Secure).

Claytonia Linnaeus 1753 (SPRING-BEAUTY)

A genus of about 33 species (with an additional 20 infraspecific taxa), annual and perennial herbs, of North America and e. Asia. References: Carolin in Kubitzki, Rohwer, & Bittrich (1993); Davis (1966); Lewis & Suda (1968); Lewis, Oliver, & Suda (1967); Miller & Chambers (2006); Miller (2003a) in FNA4 (2003b); Schneider (2019); Snyder (1992a); Yatskievych, Evans, & Witsell (2013).

Claytonia virginica Linnaeus var. *virginica*. SPRING-BEAUTY. **Hab:** Moist forests, lawns. **Dist:** NS west to MN, south to GA and TX. **Phen:** (Jan-) Feb-Apr (-May). **Tax:** Differences in ploidy and subtle differences in morphology have been used to differentiate two varieties in the more widespread white-to-pink-flowered plants, and this may be warranted but needs more careful study using modern techniques. Var. *virginica* has chromosome numbers of n=8 and polyploid and polyploid/aneuploid derivatives of that number, broader leaves [the widest leaves on a plant 5-10 (-20) mm wide], and a broader distribution (NS west to MN, south to sw. GA and TX. Var. *acutiflora* A.P. de Candolle has chromosome numbers of n=6, n=7, and polyploid and polyploid/aneuploid derivatives of those numbers, narrower leaves [the widest leaves on a plant 1-2 (-4) mm wide], and a more restricted, southerly distribution (north to VA and IL). Wide-leaved plants, corresponding to *C. virginica* f. *robusta* (Somes) Palmer & Steyermark, have been confused with plants of both *C. arkansana* and *C. caroliniana* in Arkansas in the past. **Syn:** = K3, K4, Snyder (1992a); = *Claytonia virginica* – F, G, Il, Mo1, Pa, RAB, Tx, Va, W, Miller & Chambers (2006); > *Claytonia media* (A.P. de Candolle) Link – S; > *Claytonia simsii* Sweet; < *Claytonia virginica* – Ar, FNA4, GrPl, Mi, NcTx, NE, NY, Schneider (2019); > *Claytonia virginica* var. *acutiflora* – C, K1; > *Claytonia virginica* var. *simsii* (Sweet) R.J. Davis – Davis (1966); > *Claytonia virginica* Linnaeus var. *virginica* – C, K1, Davis (1966).

Montia Linnaeus 1753 (BLINKS, MONTIA)

A genus of about 10-20 species, annual herbs (or perennial by rooting at the nodes), of nearly cosmopolitan distribution in temperate regions. References: Carolin in Kubitzki, Rohwer, & Bittrich (1993); Miller (2003b) in FNA4 (2003b).

310. MONTIACEAE

* **Montia linearis** (Douglas ex Hooker) Greene. NARROW-LEAVED MONTIA. **Hab:** Lawns, disturbed areas. **Dist:** Native of western North America. Also in c. TN (Chester, Wofford, & Kral 1997). **Syn:** = Ar, FNA4, II, K1, K3, K4, NE. NatureServe G5 (Secure).

315. PORTULACACEAE A.L. de Jussieu 1789 (PURSLANE FAMILY) [in CARYOPHYLLALES]

A family of 1 genus and 40-100 species, annual and perennial herbs, primarily of the Southern Hemisphere, but also occurring natively in North America and e. Asia. References: Carolin in Kubitzki, Rohwer, & Bittrich (1993); Nyffeler & Eggli (2010); Packer (2003a) in FNA4 (2003b).

- 1 Flowers sessile or subsessile; capsule circumscissile..... **Portulaca**
 1 Flowers pedicelled; capsule opening longitudinally..... **Montiaceae**

Portulaca Linnaeus 1753 (PURSLANE, PORTULACA)

A genus of about 40-100 species, annual and perennial herbs, nearly cosmopolitan, but especially in tropical, subtropical, and warm temperate regions. *Portulaca* flowers open only for a few hours each on sunny days (Matthews & Levins 1985). References: Banfi, Galasso, & Soldano (2011); Bradley, Matthews, & Anderson (2019) in Weakley et al (2019a); Carolin in Kubitzki, Rohwer, & Bittrich (1993); Danin, Baker, & Baker (1978); Matthews & Ketron (1991); Matthews & Levins (1985); Matthews & Levins (1986); Matthews (2003) in FNA4 (2003b); Matthews, Faircloth, & Allison (1991); Matthews, Ketron, & Zane (1992a); Matthews, Ketron, & Zane (1992b); Matthews, Ketron, & Zane (1993).

- 1 Plants in flower.
 2 Petals yellow, orange, copper, bronze, or white.
 3 Flowers > 25 mm across (individual petals > 15 mm long).
 4 Leaves terete; capsule not encircled by an expanded, membranaceous wing..... **Portulaca grandiflora**
 4 Leaves flat; capsule encircled by an expanded, membranaceous wing
 5 Petals yellow, tipped with copper or red; [MS and AR westwards]..... **Portulaca umbraticola ssp. lanceolata**
 5 Petals variable in color; [alien, in disturbed situations or naturalized on granite flatrocks in SC and GA] **Portulaca umbraticola ssp. lanceolata**
 3 Flowers < 20 mm across (individual petals < 12 mm long).
 **Portulaca oleracea**
 2 Petals pink to purple.
 8 Flowers > 25 mm across (individual petals > 15 mm long)..... **Portulaca grandiflora**
 8 Flowers < 20 mm across (individual petals < 12 mm long).
 9 Leaves flattened in cross-section, > 2.5 mm wide, elliptic..... **Portulaca amilis**
 9 Leaves terete to hemispherical in cross-section, usually < 2 mm wide, linear to lanceolate.
 **Portulaca pilosa**
 1 Plants in fruit.
 14 Leaves flattened in cross-section, > 2.5 mm wide, obovate to spatulate.
 15 Trichomes at nodes conspicuous; seeds round, < 0.6 mm wide; leaves elliptic, with an acute to acuminate apex **Portulaca amilis**
 15 Trichomes at nodes inconspicuous; seeds elongate, > 0.6 mm long; leaves spatulate, with a rounded apex **Portulaca oleracea**
 14 Leaves terete to hemispherical in cross-section, usually < 2 mm wide, linear to lanceolate.
 17 Seeds > 0.65 mm wide.
 **Portulaca grandiflora**
 17 Seeds < 0.65 mm wide
 **Portulaca pilosa**

* **Portulaca amilis** Spegazzini. BROADLEAF PINK PURSLANE. **Hab:** Sandy fields, lawns, and other dry, sandy, disturbed habitats. **Dist:** Native of South America. Matthews & Levins (1985) describe the spread of this alien species in North America, apparently from an introduction in North Carolina (the earliest North American collection in 1932 in Robeson County, NC). Reported for Lowndes County, MS (Whitson 2010). **Phen:** May-Sep. **Syn:** = FNA4, K1, K3, K4, Va, WH3, Bradley, Matthews, & Anderson (2019) in Weakley et al (2019a), Matthews & Levins (1985). NatureServe GNR (Not Yet Ranked).

* **Portulaca grandiflora** Hooker. ROSE-MOSS, CULTIVATED PURSLANE. **Hab:** In sandy soil or around granitic flatrocks, other disturbed areas. **Dist:** Native of Argentina. **Phen:** Jul-Sep. **Syn:** = C, FI5, FNA4, G, II, K1, K3, K4, Mi, NE, NY, Pa, RAB, S, WH3, Bradley, Matthews, & Anderson (2019) in Weakley et al (2019a), Matthews & Levins (1985). NatureServe GNR (Not Yet Ranked).

* **Portulaca oleracea** Linnaeus. COMMON PURSLANE, GARDEN PURSLANE, PUSSLEY, PURSLEY. **Hab:** Gardens, disturbed areas, cracks in sidewalks; partly native in our area (different genotypes, sometimes treated as varieties, subspecies, or species, appear to have different areas of origin but are now widely distributed by introduction). **Phen:** May-Nov. **Tax:** The appropriate taxonomic treatment of variation in *P. oleracea* s.l. remains unclear. In North America, *P. oleracea* (in the broad sense) is a widespread, sometimes noxious weed, probably representing native and introduced genotypes, treated as multiple subspecies by some authors. In North America, these genotypes appear to have intermixed; in our area (at least), the recognition of infraspecific taxa has been considered unwarranted, difficult, and unmeaningful (see Matthews, Ketron, & Zane 1993); see Danin & Anderson (1986) for a contrasting opinion. **Comm:** During the Great Depression, *P. oleracea* was eaten extensively in the Valley of Virginia and elsewhere in our region as a potherb. **Syn:** = NY, S; < *Portulaca oleracea* Linnaeus – Ar, Bah, C, F, FNA4, G, II, K1, K3, K4, Mi, NcTx, NE, Pa, RAB, Tn, Va, W, WH3, WV, Bradley, Matthews, & Anderson (2019) in Weakley et al (2019a), Matthews & Levins (1985), Matthews, Ketron, & Zane (1993); > *Portulaca oleracea* Linnaeus – GrPl, Tx; > *Portulaca oleracea* ssp. *granulato-stellata* (Poellnitz) Danin & H.G. 315. PORTULACACEAE

oleracea ssp. *papillato-stellata* Danin & H.G. Baker – Danin, Baker, & Baker (1978), orthographic variant; > *Portulaca oleracea* ssp. *papillatostellata* Danin & H.G. Baker; > *Portulaca retusa* Engelmann – GrPl, Tx.

Portulaca pilosa Linnaeus. KISS-ME-QUICK. **Hab:** Disturbed sandy soils, calcareous glades. **Dist:** NC south to s. FL, west to NM, north in the interior to c. TN, AR, and OK, and in Central America; the native range perhaps obscure. **Phen:** May-Oct. **Tax:** See Matthews, Ketron, & Zane (1992a) for a further discussion of this species. **Syn:** = Ar, Bah, FNA4, K1, K3, NcTx, RAB, S, Tn, WH3, Bradley, Matthews, & Anderson (2019) in Weakley et al (2019a), Matthews & Levins (1985); > *Portulaca mundula* I.M. Johnston – GrPl, Tx. **NatureServe G5** (Secure).

Portulaca umbraticola Kunth ssp. *lanceolata* J.F. Matthews & Ketron. **Hab:** Prairies, outcrops, disturbed areas. **Dist:** AR, s. OK, NM, and AZ south to TX and Mexico. **Phen:** Mar-Nov. **Syn:** = Ar, FNA4, K1, K4, NcTx, Matthews & Ketron (1991), Matthews, Ketron, & Zane (1992a), Matthews, Ketron, & Zane (1992b); < *Portulaca umbraticola* Kunth – GrPl, Tx; < *Portulaca umbraticola* Kunth ssp. *umbraticola* – K3.

317. CACTACEAE A.L. de Jussieu 1789 (CACTUS FAMILY) [in CARYOPHYLLALES]

A family of about 110-139 genera and about 1450-1800 species, perennial herbs, shrubs, vines, and trees, endemic to tropical, subtropical, and temperate America (a single species, *Rhipsalis baccifera*, occurring as well in Africa, Madagascar, and Sri Lanka, presumably as a result of long-distance dispersal from the Americas), with centers of diversity in sw. United States-n. Mexico, s. South America, and the West Indies. The base chromosome number for the family is $n=11$. References: Anderson (2001); Barthlott & Hunt in Kubitzki, Rohwer, & Bittrich (1993); Benson (1982); Fenstermacher (2016); Hunt et al (2006); Nyffeler & Eggli (2010); Parfitt & Gibson (2003a) in FNA4 (2003b).

Opuntia P. Miller 1754 (PRICKLY-PEAR CACTUS)

Contributed by Lucas C. Majure

A genus of approximately 150-200 species, perennial herbs, shrubs, and trees, widespread in the Americas from s. Canada to Patagonia, Argentina, which originated in southern South America and eventually spread to North American arid regions; subsequently occupied edaphically xeric regions of the eastern US (sandy soils, rock outcrops, saline soils, etc.). The genus represents the most widespread taxon in all of Cactaceae. Hybridization and polyploidization are common in this clade. Economically important, numerous species have been introduced worldwide as forage for livestock, as well as for ornamentals and agricultural products. References: Adanick & Medley (2020); Anderson (2001); Barthlott & Hunt in Kubitzki, Rohwer, & Bittrich (1993); Benson (1982); Britton & Rose (1920); Doyle (1990); Majure & Puente (2014); Majure (2012); Majure (2014); Majure et al. (2012a, 2012b, 2012c, 2013); Majure et al (2017); Pinkava (2003b) in FNA4 (2003b); Pinkava (2003e) in FNA4 (2003b); Ward (2009e).

Identification Notes: *Opuntia* species are notoriously difficult to identify and are best-identified using live material with information regarding population morphological variation. Three-dimensional characters are most often lost in dried herbarium specimens, which make their identification using those materials more problematic. *Opuntia ellisiana* Griffiths is commonly planted as an ornamental in n. FL but is not covered here, as no escaped populations are known. *Opuntia santa-rita* (Griffiths & Hare) Rose, purple prickly pear, is sometimes planted as an ornamental in the eastern United States. Various additional cultivated species may be encountered and may weakly naturalize.

- 1 Plants forming low, spreading shrubs.
 - 2 Tepals yellow with red or maroon bases adaxially.
 - 4 Central spines mostly 0-2 (when 2, both spines generally in the same plane, i.e., both reflexed or both erect); spines monomorphic (central spines only produced); [widespread in eastern US, mostly west of the Appalachian Mts. and east of the MS River]..... *Opuntia cespitosa*
 - 4 Central spines mostly 0-3 per areole (when 2-3, the lower spines generally reflexed and the upper spine porrect on upper cladodes); spines monomorphic (central spines only) or dimorphic (with smaller hairlike radial spines and larger central spines); [mostly west of the Mississippi River, in our area as a rare disjunct in w. MS]..... *Opuntia macrorhiza*
 - 2 Tepals entirely yellow or greenish yellow.
 - 5 Cladodes spineless; cladodes never easily disarticulating; areoles typically 4-5 per diagonal row at the widest point of the cladode; [central Appalachian Mts. and n. Atlantic Coast, disjunct in nc. MS]..... *Opuntia humifusa*
 - 5 Cladodes generally with 1 or more spines per areole on at least some of the uppermost areoles; cladodes easily disarticulating or not; areoles typically 1-4 per diagonal row at the widest point of the cladode; [widespread in Atlantic and Gulf Coastal Plain and Atlantic Piedmont].
 - 6 Terminal cladodes easily disarticulating, 0.8-11.1 cm × 0.6-3.4 cm, often cylindrical or only moderately flattened; spines strongly retrorsely barbed; terminal cladodes with 1-2 areoles per diagonal row at the widest point of the cladode *Opuntia drummondii*
 - 6 Terminal cladodes disarticulating or not, 3.1-17.7 cm × 2-9 cm, strongly flattened; spines retrorsely barbed (to the touch) or not; cladodes with 3-4 areoles per diagonal row at the widest point of the cladode.
 - 7 Seeds with funicular envelope smooth, only moderate, if any, protrusion of the cotyledons and hypocotyl, cladodes typically scalloped-margined, elliptical or rotund in outline, spines delicate, 0.7-0.9 mm in diameter; [restricted to the outer Gulf Coastal and Atlantic Coastal Plain] *Opuntia mesacantha* ssp. *lata*
 - 7 Seeds with funicular envelope bumpy, cotyledons and hypocotyl noticeably protruding, cladodes typically smooth-margined, obovate or rotund in outline, spines stout, 0.95-1.3 mm in diameter; [of Atlantic Southern Piedmont, FL panhandle along the coast west to coastal MS and e. LA, otherwise mostly inner Gulf Coastal and Atlantic Coastal Plain] *Opuntia mesacantha* ssp. *mesacantha*

Key to Map
Symbology:

1 Plants forming erect or ascending shrubs or small trees.

- 12 Glochid pattern generally of an adaxial crescent in the areole, i.e. glochids forming a dense fascicle in the upper portion of the areole, not widely separated throughout, exerted or not from the areole; spines yellow, sometimes with dark lateral banding; cladodes typically tuberculate with scalloped margins; [native, collectively widespread in coastal areas and also occasionally cultivated].

- *Opuntia stricta* var. *stricta*
 12 Glochid pattern generally of a pin-cushion type, with the glochids widely separated and exerted from the areole; spines white with dark bases or yellow; cladodes not strongly tuberculate, the margins smooth not scalloped; [cultivated widely, and seemingly introduced in remote areas on barrier islands of SC, NC, and se. VA].

- 15 Cladodes rotund, elliptical or obovate in outline, obviously determinate..... *Opuntia lindheimeri*

- 15 Cladodes elongate, ovate or narrowly ovate (lanceolate) in outline, appearing indeterminate as a result of the lengthening and narrowing of the cladode apex..... *Opuntia engelmannii* var. *linguiformis*

Opuntia cespitosa Rafinesque. COMMON EASTERN PRICKLY-PEAR. **Hab:** Limestone and chalk outcrops, dolomite outcrops, glades, sandy or blackland prairies, upland hardwood or mixed hardwood-pine forests in dry, clay soils. **Dist:** This is the most common species (a tetraploid, $2n = 44$) in the eastern United States; it has traditionally been considered conspecific with *O. humifusa*. **Phen:** May-Jun; Aug-Dec (-Feb). **Comm:** *O. cespitosa* is most common west of the Appalachian Mountains and is found throughout most of the Midwestern states, east of the MS river. *O. cespitosa* can be differentiated from *O. humifusa* by its yellow tepals that are basally tinged red, crimson or red-brown, as well as dark brown or red glochids and the presence of spines (note: populations in Bibb Co., AL tend to have lighter colored glochids as in *O. humifusa* or *O. mesacantha*). Vegetatively, it is most similar to *O. mesacantha* ssp. *mesacantha*, from which this allopolyploid may be partially derived, although floral features are quite different, and *O. cespitosa* does not have the strongly retrorsely-barbed spines common in *O. mesacantha*. This species also can be confused with certain forms of *O. macrorhiza*, another putative parent of *O. cespitosa*; both species have yellow inner tepals basally tinged red adaxially. **Syn:** = K4, NY, Majure et al (2017); = *Opuntia rafinesquei* Engelm.; < *Opuntia compressa* – RAB; > *Opuntia compressa* – WV; < *Opuntia compressa* (Salisbury) J.F. Macbride var. *compressa* – G; > *Opuntia compressa* (Salisbury) MacBride var. *microsperma* (Engelmann) L.D. Crook & Mottram; < *Opuntia humifusa* (Rafinesque) Rafinesque var. *humifusa* – FNA4, K1, Va, Benson (1982), Doyle (1990); > *Opuntia humifusa* (Rafinesque) Rafinesque var. *microsperma* (Engelmann) A. Heller; > *Opuntia humifusa* (Rafinesque) Rafinesque var. *parva* (Coulter) A. Heller; > *Opuntia mesacantha* Rafinesque var. *microsperma* (Engelmann) J.M. Coulter; > *Opuntia mesacantha* Rafinesque var. *parva* J.M. Coulter; > *Opuntia opuntia* (Linnaeus) H. Karsten – S; > *Opuntia rafinesquei* Engelm.; > *Opuntia rafinesquei* Engelm.; > *Opuntia rafinesquei* Engelm. var. *minor* Engelm.

Opuntia drummondii Graham. DUNE PRICKLY-PEAR, SAND-BUR PRICKLY-PEAR, LITTLE PRICKLY-PEAR, CREEPING CACTUS. **Hab:** Dunes on barrier islands, less commonly inland on river-associated sands and on granite outcrops. **Dist:** This species is found most commonly along coastal dune systems and Gulf Coast barrier islands but also inland along riverine sands, and rarely on granite outcrops (often associated with *O. mesacantha* subsp. *mesacantha*). **Phen:** Apr-Jun; Aug-Oct. **Comm:** As mentioned by Small (1933) and Radford, Ahles, & Bell (1968), this little coastal cactus is inconspicuous and often becomes attached by its retrorsely barbed-spines to the pants or shoes of people walking through the dunes. It can inflict painful wounds, the spines not easily removed from flesh or clothing because of the retrorse barbs. *O. drummondii* sometimes forms hybrid swarms with *O. mesacantha* on coastal dunes (see Y for additional discussion). *O. drummondii* is easily separated from other species in the eastern US by the production of very small cladodes with strongly retrorsely barbed spines; the cladodes easily disarticulate at the nodes and are often dispersed vegetatively forming clones of the parent plants. This species most often has fibrous root systems but sometimes produces small tubers as well. *O. drummondii* is most easily confused with *O. nemoralis* Griffiths of coastal w. LA, AR, MO, and TX. Intermediates between *O. drummondii* and *O. mesacantha* subsp. *mesacantha* have been found along the Atlantic and Gulf coasts and on granite in n. GA. Found throughout the Atlantic and Gulf Coastal Plain, but mostly absent from the FL peninsula, forming a disjunction between the Gulf and Atlantic coasts. A species with diploid, triploid, and tetraploid populations ($2n=22, 33, 44$). **Syn:** = K4, RAB, Majure et al (2017); = *Opuntia pusilla* (Haworth) Haworth – F15, FNA4, K1, K3, WH3, Doyle (1990), Ward (2009e), apparently misapplied; > *Opuntia drummondii* Graham – S; > *Opuntia frustulenta* Gibbs; > *Opuntia pes-corvi* LeConte ex Engelm.; > *Opuntia tracyi* Britton – S. **NatureServe G4** (Apparently Secure).

* ***Opuntia engelmannii*** Salm-Dyck ex Engelm. var. *linguiformis* (Griffiths) B.D. Parfitt & Pinkava. COW'S-TONGUE PRICKLY-PEAR. **Hab:** Planted as an ornamental in our area (not known from wild populations in its putative region of origin), rarely persisting or perhaps spreading. **Syn:** = FNA4, K3, K4, NcTx; = *Opuntia lindheimeri* Engelm. var. *linguiformis* (Griffiths) L.D. Benson – Tx; = *Opuntia linguiformis* Griffiths. **NatureServe G5TUQ** (Unrankable).

Opuntia humifusa (Rafinesque) Rafinesque. EASTERN PRICKLY PEAR. **Hab:** Slate outcrops, sandy soils, upland hardwood forests or mixed pine-hardwood forests in dry, clay or silty soils. **Dist:** *O. humifusa* is restricted primarily to the Appalachian Mountains and mid-Atlantic Coastal Plain, but also occurs in the inner Coastal Plain of c. and nc. MS (Attala, Choctaw, Grenada, Webster cos.). **Phen:** May-Jun; Aug-Dec. **Comm:** More work may illuminate populations in n. AL, nw. GA, w. SC, w. NC, and ne. TN, however, at present populations are disjunct between the eastern states (DE, MD, NJ, VA, WV) and MS. *O. humifusa* is an allotetraploid ($2n=44$), cryptic species that is most easily confused with *O. mesacantha* ssp. *mesacantha*, from which it can be separated by its lack of spines (although see *O. mesacantha*), and generally increased number of areoles per diagonal row across the cladode face at midstem (4-5 vs. 3-4 in *O. mesacantha*), generally inserted glochids (vs. exerted in *O. mesacantha*), and smaller seeds (4.0-4.6 mm long vs. 5.0-5.9 mm long in *O. mesacantha* ssp. *mesacantha*) with a smooth funicular envelop (instead of the upraised funicular envelope in *O. mesacantha* ssp. *mesacantha*). *Opuntia humifusa* also tends to have rotund or elliptic-oblong cladodes vs. *O. mesacantha* ssp. *mesacantha*, which more often has rotund to obovate cladodes, but cladode shape is highly variable. Populations of *O. humifusa* are typically located geographically between populations of *O. cespitosa* and *O. mesacantha* ssp. *mesacantha*. See Kalmbacher (1976) and Leuenberger (1993) for a discussion of the proper name for this taxon. **Syn:** = K4, NY, Majure et al (2017); > *Opuntia calcicola* Wherry – WV; < *Opuntia compressa* – RAB; > *Opuntia compressa* – WV; < *Opuntia compressa* (Salisbury) J.F. Macbride var. *compressa* – G; < *Opuntia humifusa* (Rafinesque) Rafinesque – C, F, K2, Pa, W, WH3; > *Opuntia humifusa* (Rafinesque) Rafinesque – Ward (2009e); < *Opuntia humifusa* (Rafinesque) Rafinesque var. *humifusa* – FNA4, K1, Va, Benson (1982), Doyle (1990); > *Opuntia impedita* Small – S; > *Opuntia macrartha* – S; > *Opuntia opuntia* (Linnaeus) H. Karsten – S.

Opuntia lindheimeri Engelm. TEXAS PRICKLY-PEAR. **Hab:** Disturbed areas, where persistent or spreading from cultivation (Majure et al. 2011), but also apparently early introduced by native Americans or early settlers on coastal dunes and sand barrens on barrier islands. **Dist:** Native of sc. United States south into Mexico. Although found along the coast in NC (New Hanover Co., where it grows with *O. drummondii*), SC, and VA (Henrico and Isle of Wight cos.), the origin(s) of those populations is unknown. The native range of *O. engelmannii* var. *lindheimeri* is the western US (although occurring in coastal w. LA) and Mexico, so it seems unlikely that the coastal Atlantic populations are native; however, certain

317. CACTACEAE

populations along the SC coast can be found in quite isolated locations (P. McMillan, pers. comm.). Small (1933) reported *O. cantabrigiensis* Lynch from dunes near Beaufort, NC, based on a fragmentary 1930 collection accompanied by a photograph. Similar plants were apparently seen near Beaufort by Engelmänn, prior to 1856. Benson (1982) refers the collection tentatively to *O. lindheimeri* Engelmänn var. *cuija* (Griffiths & Hare) L.D. Benson, treated in K as *O. engelmannii* Salm-Dyck ex Engelmänn var. *cuija* Griffiths & Hare, a native of Mexico. Benson (1982) also stated, however, that it could also be var. *lindheimeri* (primarily of TX and Mexico), or, indeed, *O. tuna* (Linnaeus) P. Miller (native to the West Indies). Benson (1982) failed to relocate the plant in the field in 1956, but stated there was "insufficient time for a thorough search." Unless relocated, the identity of the plant will probably remain a mystery, as well as whether it represents a native species, an established population from aboriginal use, or a more recent introduction or adventive. **Phen:** May-Jun; Aug-Nov (-Feb). **Syn:** = GrPl, K4; = *Opuntia engelmannii* Salm-Dyck ex Engelmänn var. *lindheimeri* (Engelmänn) B.D. Parfitt & Pinkava – FNA4, NcTx, Tx; > *Opuntia cantabrigiensis* – S; > *Opuntia lindheimeri* Engelmänn – S.

Opuntia macrorhiza Engelmänn. TUBEROUS-ROOTED PRICKLY-PEAR, PLAINS PRICKLY-PEAR. **Hab:** Sandy or silty prairies, glades, limestone rock outcrops. **Dist:** Mostly of the southwestern United States and northern Mexico, w. LA, AR, MO into the Midwestern states; in our range only occurring in w. MS in Yazoo, Holmes, and Bolivar counties. **Phen:** May-Jun; Aug-Dec (-Feb). **Comm:** What is currently recognized as *Opuntia macrorhiza* s.l. is a group of closely related taxa (species complex), that is currently under revision (Majure, unpubl. data). Material that occurs in w. MS is of the *O. grandiflora* form (see Britton & Rose 1920), which is mostly spineless or may have 1-3 spines per areole. Those plants form large colonies and grow slightly ascending, produce inner tepals that are yellow with red bases adaxially and elongated fruit maturing dark purple to red (see Majure and Ervin 2008; treated as *O. aff. allairei*). This species often has tuberous roots. A species complex with diploid and tetraploid components ($2n=22, 44$). **Syn:** = FNA4, IL, K3, K4, NcTx; = *Opuntia macrorhiza* var. *macrorhiza* – GrPl, Tx; ? *Opuntia allairei* Griffiths. [NatureServe G5T5](#) (Secure).

Opuntia mesacantha Rafinesque ssp. *lata* (Small) Majure. PRICKLY-PEAR. **Hab:** Coastal dunes and scrub, sandhills, borders of pine flatwoods, scrub, coastal islands (FL, GA, SC), riverine sands. **Dist:** Ssp. *lata* is restricted to the outer Atlantic and Gulf Coastal Plains and the FL peninsula. **Phen:** (Mid Mar-) Apr-May (-Jun); Jul-Feb. **Comm:** Co-occurs with *O. austrina* in parts of the FL peninsula. A diploid taxon ($2n = 22$). **Syn:** = K4, Majure et al (2017); < *Opuntia compressa* – RAB; < *Opuntia compressa* (Salisbury) J.F. Macbride var. *compressa* – G; > *Opuntia eburnispina* Small; < *Opuntia humifusa* (Rafinesque) Rafinesque – C, F, FI5, K3, Pa, W, WH3; < *Opuntia humifusa* (Rafinesque) Rafinesque var. *humifusa* – FNA4, K1, Va, Benson (1982), Doyle (1990); > *Opuntia impedita* Small; > *Opuntia impedita* Small – S; > *Opuntia lata* Small; > *Opuntia macrarthra*.

Opuntia mesacantha Rafinesque ssp. *mesacantha*. PRICKLY-PEAR. **Hab:** Granite outcrops, coastal dunes and scrub, longleaf pine sandhills, pine forests in sandy soils, Gulf Coast barrier Islands (AL, FL panhandle, MS), riverine sands. **Dist:** S. NJ south to sc. GA, c. AL, c. and n. MS, and se. TN; disjunct in FL Panhandle, s. AL, s. MS; disjunct in w. LA. Throughout the southern Piedmont, Atlantic and Gulf Coastal Plain, but absent from the FL peninsula forming a disjunction between the Gulf and Atlantic coasts, as in *O. drummondii*, with which this subspecies is often associated, at least along the coast and in certain Piedmont populations on granite. See McAvoy (2021) for details of DE occurrence. **Phen:** Apr-Jun; Jun-May. **Comm:** This is the most common species in the Atlantic and Gulf Coastal Plain and Atlantic Southern Piedmont. *O. mesacantha* is a low-spreading shrub with typically spiny cladodes with 1-2 spines per areole (although populations exist with individuals with up to 6 or more spines per areole, while other population may consist of nearly spineless plants), those spines generally, but not always, strongly retrorsely barbed. This species was mostly referred to as *O. humifusa* var. *austrina* or *O. humifusa* var. *humifusa* by Benson (1982). Vegetative propagules of this taxon have been found widely dispersed in coastal areas after hurricanes. This is a tetraploid taxon ($2n=44$). **Syn:** = K4, Majure et al (2017); < *Opuntia compressa* – RAB; < *Opuntia compressa* (Salisbury) J.F. Macbride var. *compressa* – G; < *Opuntia humifusa* (Rafinesque) Rafinesque – C, F, FI5, K2, Pa, Tn, W, WH3; > *Opuntia humifusa* (Rafinesque) Rafinesque – Ward (2009e); < *Opuntia humifusa* (Rafinesque) Rafinesque var. *humifusa* – FNA4, FNA4, K1, Va, Benson (1982), Doyle (1990); > *Opuntia pollardii* Britton & Rose – G, S, Ward (2009e).

Opuntia stricta (Haworth) Haworth var. *stricta*. COASTAL PRICKLY PEAR, SHELL MIDDEN PRICKLY-PEAR. **Hab:** Coastal dunes and coastal scrub, shell middens in salt marshes of the Gulf Coast, occasionally in water-logged saline soils of mangroves. **Dist:** Se. NC (reports from VA are based on a misidentification) south to s. FL, west to e. LA. **Phen:** Apr-Jun; Aug-Dec (-Feb). **Comm:** *O. stricta* is introduced throughout the world, in the Americas occurring throughout the Antilles, se. US, parts of coastal TX and eastern Mexico, northern South America, Ecuador, and Peru. Mostly restricted to coastal areas from se. NC to e. LA in our area, unless planted as an ornamental; coastal hammocks, shell middens, coastal dunes, barrier islands. Small (1933) recorded *O. stricta* (as *O. tunoidea*) from NC, and the species is still present in dune scrub and grasslands in the southern counties. The restricted distribution of this species in the se. US likely is the result of its lack of cold tolerance (Majure, pers. obs.). This species has long been used as a food source for native peoples; Small (1933) identifies it as the "the prickly-pears the early Spanish records tell us the aborigines feasted on for three months of each year and also cured, like figs, for food when out of season". *O. stricta* has been heavily impacted by the non-native cactus moth, *Cactoblastis cactorum*. Two varieties of *O. stricta*, *O. stricta* var. *stricta* and *O. stricta* var. *dillenii*, are recognized in our area, which sometimes are elevated to species level. Although the distinction of *O. stricta* var. *dillenii* is mostly straightforward in the Antilles, intermediate morphotypes and overlapping populations of the two in the southeastern U.S. make differentiation into species very difficult. Both taxa can sometimes produce spineless cladodes, but *O. stricta* var. *dillenii* tends to have more tuberculate stems. More taxonomic and genetic work needs to be carried out on this species complex. *O. stricta* has been involved in numerous hybridization events throughout its range (see Majure et al. 2012c). Intermediates between *O. stricta* and *O. mesacantha* ssp. *mesacantha* have been found in coastal AL (Majure, pers. obs.). Var. *stricta* is apparently restricted to the se. US along the coast, although spineless material from the Caribbean is often attributed to it. Inland material in sw. MS (Adams Co.) may be the result of escaped individuals from ornamental plantings. Vegetative propagules of this taxon have been found widely dispersed in coastal areas after hurricanes (Majure, pers. obs.). This taxon is hexaploid ($2n=66$). **ID Notes:** This species forms an erect or ascending shrub from 1-2 (-3) m tall, which are generally highly branching. The gray-green, dull color of the pads, yellow spines, and dark purple fruit can help

317. CACTACEAE

distinguish this species from *O. austrina*, with which it is sometimes associated on the FL Atlantic Coast. **Syn:** = K1, K4, Tx, Benson (1982), Doyle (1990), Ward (2009e); < *Opuntia stricta* – F15, FNA4, K3, WH3; >> *Opuntia stricta* – S; > *Opuntia tunoidea* Gibbes – S. NatureServe G4?TNR (Not Yet Ranked).

318. NYSSACEAE A.L. de Jussieu ex Dumortier 1829 (TUPELO FAMILY) [in CORNALES]

A family of 5 genera and 22 species, trees and shrubs, of e. Asia, se. Asia, e. North America, and Central America. The circumscription and recognition of this family has been controversial; Nyssaceae has sometimes been included in a broadly circumscribed Cornaceae, but this appears to be phylogenetically incorrect (Xiang et al. 2002). References: Tucker (2016d) in FNA12 (2016); Xiang et al (2002).

Nyssa Linnaeus 1753 (TUPELO, SOUR GUM, BLACK GUM)

A genus of about 8-10 species, trees and shrubs, of e. North America, e. Asia, se. Asia, and Central America. The only other members of the genus are 2-4 e. and se. Asian species and a single species of Costa Rica (Hammel & Zamora 1990; Wen & Stuessy 1993). References: Burckhalter (1992); Eyde (1966); Tucker & Park (2016) in FNA12 (2016); Ward (2008b); Wen & Stuessy (1993); Zhou et al (2018); Zhou, Xiang, & Wen (2020).

Identification Notes: *Nyssa sylvatica* is often mistaken (especially as seedlings, saplings, or fire-sprouts) for *Diospyros virginiana*, because of their similar, alternate, glossy-green, acuminate leaves. *Nyssa* can be distinguished by its three vascular bundle scars per leaf scar (vs. one *Diospyros*), leaves often with a few irregular teeth (vs. never toothed), leaves pale to medium green beneath (vs. whitish-green beneath), leaves lacking reddish to dark glands on the midrib above and the petiole (vs. present), and leaves glabrous or nearly so below (vs. glabrate to tomentose with curly hairs) (McKenney 1967).

- 1 Petioles of mature leaves 3-6 cm long; leaves to 30 cm long and 15 cm wide, at least the larger on a tree normally > 8 cm wide, often with a few irregular teeth, these typically located near the widest part of the blade *Nyssa aquatica*
- 1 Petioles of mature leaves 0.5-2.0 (-2.5 cm) long; leaves to 18 cm long and 10 cm wide, the largest leaves on a tree rarely > 7 cm wide, generally entire, rarely with a few irregular teeth, these typically located toward the leaf apex.
- 3 Pistillate flowers and fruits (2-) 3-5 (-8) per peduncle; leaves with thin texture, pliable, typically widest near the middle, the apex typically acuminate, the margins often with a few irregular teeth near the apex (though sometimes an entire tree with no toothed leaves); trunk not swollen or buttressed at base (even when growing in moist or wet habitats); bark of large trees rough, divided by deep vertical and horizontal furrows into a pattern of squarish checks; [trees of dry to mesic upland forests, less commonly in bottomlands or other wetlands, where flooding occurs at most occasionally and is of short duration; throughout our area] *Nyssa sylvatica*
- 3 Pistillate flowers and fruits (1-) 2 (-3) per peduncle; leaves with thick texture, rather stiff, typically widest beyond the middle, the apex typically obtuse, the margins entire (rarely with a few teeth on vigorous sprouts); trunk swollen or buttressed at base; bark of large trees rough, a vertical ridge-furrow pattern most prominent; [trees of swamps with periodic or seasonal flooding; mostly on the Coastal Plain] *Nyssa biflora*

Nyssa aquatica Linnaeus. WATER TUPELO, TUPELO GUM, COTTON GUM. **Hab:** River swamps, less typically in isolated upland ponds, where inundated for substantial periods of time. **Dist:** Se. VA south to Panhandle FL, west to se. TX, north in the Mississippi Embayment to se. MO, s. IL, and e. KY, primarily on the Coastal Plain, but with scattered locations in other physiographic provinces, such as in sc. TN. **Phen:** Apr-May; Sep-Oct. **Syn:** = Ar, C, F, F15, FNA12, GW2, Il, K1, K3, K4, Mo2, RAB, S, Tn, Tx, Va, WH3, Burckhalter (1992), Eyde (1966), Ward (2008b), Wen & Stuessy (1993); = *Nyssa uniflora* Wengenheim – G. NatureServe G5 (Secure).

Nyssa biflora Walter. SWAMP TUPELO, WATER GUM, SWAMP BLACK GUM. **Hab:** Blackwater river swamps, depressions in pinelands, pocosins, either where inundated for substantial periods of time or in more-or-less permanently saturated organic peaty soils. **Dist:** NJ south to s. FL, west to e. TX, primarily on the Coastal Plain, but scattered inland to c. NC, w. SC, c. TN, w. KY (Clark et al. 2005), se. MO, and c. AR. **Phen:** Apr-Jun; Aug-Oct. **Syn:** = FNA12, G, Il, K1, K3, K4, Mo2, S, Va, Burckhalter (1992); = *Nyssa biflora* ssp. *biflora* – Zhou et al (2018); = *Nyssa biflora* var. *biflora* – Ward (2008b); = *Nyssa sylvatica* Marshall var. *biflora* (Walter) Sargent – C, F, RAB, Tn, Tx, Eyde (1966), Wen & Stuessy (1993); < *Nyssa sylvatica* Marshall var. *biflora* (Walter) Sargent – F15, GW2, WH3.

Nyssa sylvatica Marshall. SOUR GUM, BLACK GUM, PEPPERIDGE. **Hab:** Dry or mesic upland forests, less commonly in bottomlands, pine savannas, or upland depressions, where occasionally inundated briefly. **Dist:** S. ME west to MI and se. WI, south to c. peninsular FL, west to e. TX and e. OK; disjunct in Chiapas). **Phen:** Apr-Jun; Aug-Oct. **Tax:** The status of varieties recognized by previous authors (such as Fernald 1950) needs reassessment; *N. sylvatica* is quite variable in morphology and ecology, at least some of the morphologic variation correlated with geography and ecology, but not so far readily tractable taxonomically. In the Mountains of our area, *N. sylvatica* is typically found in dry woodlands, such as pine-oak/heath, with xerophytic species such as *Pinus virginiana* and *Quercus montana*. In the outer Coastal Plain of the Carolinas, a swamp variant of *N. sylvatica* often occurs in wet savannas with *Pinus serotina*, where often mistaken (because of the wetland habitat and some superficial similarities) for *N. biflora*. **ID Notes:** The leaves turn a brilliant orange-red in fall (often a few on any tree coloring prematurely in Jul or Aug). **Syn:** = Ar, FNA12, G, K1, K3, K4, Meso4.1, Mi, Mo2, NcTx, NY, Pa, S, Va, WV, Burckhalter (1992), Ward (2008b), Zhou et al (2018); = *Nyssa sylvatica* var. *sylvatica* – C, F15, GW2, RAB, Tn, Tx, WH3, Eyde (1966), Wen & Stuessy (1993); > *Nyssa sylvatica* var. *caroliniana* (Poiret) Fernald – F, Il; > *Nyssa sylvatica* var. *dilatata* Fernald – F; > *Nyssa sylvatica* var. *sylvatica* – F, Il.

318. NYSSACEAE

320. HYDRANGEACEAE Dumortier 1829 (HYDRANGEA FAMILY) [in CORNALES]

A family of about 17 genera and 190-220 species, trees, shrubs, vines, and herbs, primarily north temperate. As here interpreted, the family Hydrangeaceae includes two well-marked groups, the Hydrangeae (including *Decumaria* and *Hydrangea*) and the Philadelphae (including *Deutzia* and *Philadelphus*). This group has been shown by molecular research to be unrelated to the Saxifragaceae, and to have its closest affinities to the Loasaceae, Cornaceae, and Nyssaceae (Xiang et al. 2002; Soltis, Xiang, & Hufford 1995; Morgan & Soltis 1993). References: Freeman (2016a) in FNA12 (2016); Hufford (2004) in Kubitzki et al (2004); Soltis, Xiang, & Hufford (1995); Spongberg (1972); Xiang et al (2002).

- 1 Woody vine, climbing by aerial rootlets; petals 7-10; [tribe *Hydrangeae*] *Hydrangea barbara*
- 1 Shrub; petals 4-5 (rarely 10 or many in the cultivars of *Deutzia* and *Philadelphus*).
 - 2 Pubescence of leaves and twigs stellate; stamens 10; [a cultivated alien, rarely escaped]; [tribe *Philadelphae*]..... *Deutzia*
 - 2 Pubescence of leaves and twigs simple; stamens 8-10 (*Hydrangea*) or 25-90 (*Philadelphus*); [natives and aliens].
 - 3 Leaf blades 10-30 cm long; inflorescences of 25-many flowers; stamens 8-10; [tribe *Hydrangeae*] *Hydrangea*
 - 3 Leaf blades 3-8 cm long; inflorescences of 1-7 flowers; stamens 25-90; [tribe *Philadelphae*]..... *Philadelphus*

Deutzia Thunberg 1781 (DEUTZIA)

A genus of about 60 species, shrubs, mainly Asian. References: Brock (2022); Hufford (2004) in Kubitzki et al (2004); McGregor (2016a) in FNA12 (2016).

* *Deutzia gracilis* Siebold & Zuccarini. SLENDER DEUTZIA. **Hab:** Disturbed areas. **Dist:** Native of Japan and China. **Phen:** Apr-Jun. **Syn:** = FNA12, K3, K4. NatureServe GNR (Not Yet Ranked).

*Hydrangea* Linnaeus 1753 (HYDRANGEA, SEVENBARK)

A genus of about 45 species, shrubs and lianas, of e. North America and e. Asia. Molecular analyses have long suggested that *Hydrangea* as usually interpreted is polyphyletic (Soltis, Xiang, & Hufford 1995; Samain, Wanke, & Goetghebeur 2010) and should either be circumscribed more broadly to include other genera in tribe Hydrangeae that are phylogenetically embedded (including, in our area, *Decumaria*), an approach that has been further developed and formalized by De Smet et al. (2015). Alternatively, *Hydrangea* s.l. could be separated into multiple, monophyletic segregate genera, an approach promoted by Ohba & Akiyama (2016). For now, we have followed the broad approach (with generic and sectional circumscriptions follow De Smet et al. 2015). If split, our species would end up in 4 genera: *Hydrangea* s.s. (*arborescens*, *cinerea*, *radiata*, and *quercifolia*), *Decumaria* (*barbara*), *Heteromalla* (*paniculata*), and *Hortensia* (*macrophylla*). See Dirr (2004) and van Gelderen & van Gelderen (2004) for information on cultivated hydrangeas. References: Freeman (2016b) in FNA12 (2016); Hufford (2004) in Kubitzki et al (2004); McClintock (1957); McGregor (2016b) in FNA12 (2016); Ohba & Akiyama (2016); Pilatowski (1982); Samain, Wanke, & Goetghebeur (2010).

Identification Notes: *Hydrangea barbara* is readily distinguished from the other opposite-leaved, woody vines in our flora (*Gelsemium*, *Trachelospermum*, *Lonicera*, *Bignonia*, *Campsis*, and *Clematis*) by its leaves (simple, ovate, and usually serrate) and climbing structures (adventitious roots).

- 1 Woody vine, climbing by adventitious roots; petals 7-10; [section *Decumaria* of clade *Hydrangea* I; or genus *Decumaria*] *Hydrangea barbara*
- 1 Shrub; petals 4-5.
 - 2 Leaves pinnately lobed, the lobes toothed; inflorescence a panicle; large sterile flowers many (> 20 per inflorescence), borne throughout the inflorescence; [section undetermined ("incertae sedis") of clade *Hydrangea* I; or genus *Hydrangea* s.s.]..... *Hydrangea quercifolia*
 - 2 Leaves unlobed, merely toothed; inflorescence a corymb (except *H. paniculata*); large sterile flowers absent to relatively few (0-15 per inflorescence), borne around the periphery of the corymb (except *H. paniculata*).
 - 4 Lower leaf surface glabrous or inconspicuously puberulent, appearing green; trichomes of the lower leaf surface restricted to the midrib and major veins; sterile flowers absent, or, if present, usually < 1 cm in diameter..... *Hydrangea arborescens*
 - 4 Lower leaf surface variously pubescent, appearing white or gray; trichomes of the lower leaf surface on veins and interveinal areas; sterile flowers usually present, large and showy, usually greater than 1 cm in diameter. *Hydrangea cinerea*

Hydrangea arborescens Linnaeus. SMOOTH HYDRANGEA, NORTHERN WILD HYDRANGEA, SEVENBARK. **Hab:** Forests, especially around rock outcrops and along streambanks. **Dist:** NJ, s. NY, OH, IN, IL, MO, and se. KS south to e. NC, c. SC, c. GA, Panhandle FL, s. AL, LA, and OK. **Phen:** May-Jul. **Syn:** = Ar, Fl5, FNA12, Il, K1, K3, K4, NE, NY, Pa, S, Tn, Va, W, WH3, Pilatowski (1982); = *Hydrangea arborescens* ssp. *arborescens* – RAB, McClintock (1957); = *Hydrangea arborescens* var. *arborescens* – C, G, WV; > *Hydrangea arborescens* var. *arborescens* – F; > *Hydrangea arborescens* var. *oblonga* Torrey & A. Gray – F.

Hydrangea barbara (Linnaeus) B. Schulz. CLIMBING HYDRANGEA, WOODVAMP, DECUMARY. **Hab:** Swamp forests and bottomlands, moist forests in the mountains. **Dist:** Se. VA south to FL and west to LA, s. AR, and e. TX (Singhurst, Keith, & Holmes 2005), inland to nw. SC, se. TN, and w. TN. **Phen:** May-Jun; Jul-Oct. **ID Notes:** This handsome vine climbs to the tops of trees via adventitious roots. The opposite leaves are somewhat fleshy in texture. **Syn:** = K4; = *Decumaria barbara* Linnaeus – Ar, C, F, FI5, FNA12, G, GW2, K1, K3, RAB, S, Tn, Tx, Va, W, WH3. NatureServe G5 (Secure).

Hydrangea cinerea Small. ASHY HYDRANGEA, SOUTHERN WILD HYDRANGEA. **Hab:** Rocky forests and rock outcrops, roadbanks, perhaps strictly or mostly associated with mafic or calcareous rocks. **Dist:** Sw. NC, c. IN, c. IL, and c. MO south to n. SC, sc. AL, and c. AR. **Phen:** May-Jul (-Aug). **Syn:** = FNA12, IL, K1, K3, NE, S, Tn, W, Pilatowski (1982); = *Hydrangea arborescens* ssp. *discolor* (Seringe) McClintock – RAB, McClintock (1957); = *Hydrangea arborescens* Linnaeus var. *deamii* E. St. John – F; = *Hydrangea arborescens* var. *discolor* Seringe – C, G; < *Hydrangea arborescens* Linnaeus – GrPl.

Hydrangea quercifolia Bartram. OAKLEAF HYDRANGEA. **Hab:** Native in hammocks, moist forests, also in disturbed areas, thickets, or forests adjacent to urban or suburban areas. **Dist:** C. and sw. TN, south through w. GA, AL, and MS to Panhandle FL and e. LA; scattered elsewhere as a remnant or escape from cultivation. **Phen:** May-Jul. **Comm:** Boufford & Wood (1977) describe a purportedly native occurrence in nw. SC, but it seems more likely to be an escape from cultivation (R. Clark, pers. comm.). This southeastern native is a spectacular garden plant, frequently planted, rarely escaping or persisting. **Syn:** = Ar, C, F, FI5, FNA12, G, K1, K3, K4, NE, S, Tn, WH3. NatureServe G5 (Secure).

Philadelphus Linnaeus 1753 (MOCK-ORANGE)

A genus of 65 (or fewer) species, shrubs, of north temperate areas. The most recent monographer of the genus, Hu (1954-1955) recognizes many species and varieties on the basis of minor differences in pubescence. Many of the recognized taxa are based only on cultivated material. The native distributions of the varieties have little phylogeographic coherence, and several varieties are often reported from the same site, suggesting that they reflect merely variation within a population (if genetically based at all). For instance, Hu recognizes three varieties in *P. hirsutus* and five in *P. inodorus*, but these seem to be no more than forms. As Hu writes, "the formerly recognized species, *P. grandiflorus* Willd., and *P. laxis* Schrad., are merely different forms of a species with heterogeneous leaf shape, size, and margins. Fostered by growers, propagated and distributed through cuttings, these forms have maintained their distinction in gardens since their discoveries. But when they are projected on the spectrum of variations exhibited by a large number of specimens collected from the homeland of *P. inodorus* Linn. they appear to be nothing but a few transitional forms. In this paper, these forms are treated as varieties." Hu's "varieties" should be treated as forms or cultivars, if recognized at all. I have taken a conservative approach, though variation in several of our native species could use additional study. References: Hu (1954-1956); Hufford (2004) in Kubitzki et al (2004); Weakley & Henrickson (2016) in FNA12 (2016); Weakley (2002).

- 1 Axillary buds exposed above the petiole base (best observed in mature long-shoot leaves, not always visible in axils of young leaves or on short-shoot leaves); twigs of the current year villous-hirsute; seeds not caudate; style 1, clavate, 4-6 mm long; [calcareous and mafic sites]; [subgenus *Deutzioides*] *Philadelphus hirsutus*
- 1 Axillary buds contained within a distinct pouch directly below the petiole (best observed in mature, long-shoot leaves); twigs of the current year glabrous; seeds with caudate tails about as long as the embryo; styles 4, 6-16 mm long, the 4 branches 1.5-8 mm long; [ecologically more generalist collectively, including calcareous and mafic sites]; [subgenus *Philadelphus*] *Philadelphus inodorus*

Philadelphus hirsutus Nuttall. HAIRY MOCK-ORANGE, CUMBERLAND MOCK-ORANGE. **Hab:** Bluffs, rock outcrops, rocky woodlands, often with seepage, over mafic or calcareous rocks. **Dist:** A Southern Appalachian species: sw. VA and KY south and west to w. NC, TN, n. GA, and n. AL. **Phen:** Apr-May; Jun-Aug. **Tax:** *P. sharpianus* Hu, known from e. TN and nc. AR, is similar to *P. hirsutus*, allegedly differing in the hypanthium glabrous (vs. more or less pubescent), the leaves strigose-pilose above, glabrous or sparsely strigose or with the nerves only villous beneath (vs. scabrous-hirsute above, uniformly villous beneath); it is probably best considered only a form of *P. hirsutus*. *P. hirsutus* is cultivated and it may escape outside of the range stated. **Syn:** = Ar, C, F, FNA12, G, K3, K4, RAB, S, Tn, Va, W; > *Philadelphus hirsutus* Nuttall – K1; > *Philadelphus hirsutus* Nuttall – Hu (1954-1956); > *Philadelphus hirsutus* var. *intermedius* Hu – Hu (1954-1956); > *Philadelphus hirsutus* var. *nanus* Hu – Hu (1954-1956); > *Philadelphus sharpianus* Hu – K1, Hu (1954-1956); > *Philadelphus sharpianus* Hu var. *parviflorus* Hu – Hu (1954-1956).

Philadelphus inodorus Linnaeus. APPALACHIAN MOCK-ORANGE. **Hab:** Rich forests and woodlands, rocky bluffs over mafic or calcareous rocks, and also cultivated and persistent. **Dist:** VA and TN south to Panhandle FL (Gadsden, Liberty, and Jackson counties), GA, and s. AL (and according to C, also in e. PA). **Phen:** Apr-May; Jun-Aug. **Comm:** *P. floridus* Beadle, known from nw. GA, is similar to *P. inodorus*, allegedly differing in the pedicels and hypanthium pubescent (vs. glabrous); it is probably only a form of *P. inodorus*. **Syn:** = Ar, C, FI5, FNA12, G, K3, K4, Mi, NE, NY, Pa, RAB, Tn, Va, W, WH3; > *Philadelphus floridus* Beadle – IL, K1, S, Hu (1954-1956); > *Philadelphus gloriosus* Beadle – S; > *Philadelphus grandiflorus* Willdenow – S; > *Philadelphus inodorus* Linnaeus – IL, K1; > *Philadelphus inodorus* var. *carolinus* Hu – Hu (1954-1956); > *Philadelphus inodorus* var. *grandiflorus* (Willdenow) A. Gray – F, Hu (1954-1956); > *Philadelphus inodorus* var. *inodorus* – F, S, Hu (1954-1956); > *Philadelphus inodorus* var. *laxis* (Schrad.) Hu – Hu (1954-1956); > *Philadelphus inodorus* var. *strigosus* Beadle – S, Hu (1954-1956).

320. **HYDRANGEACEAE**324. **CORNACEAE** Berchtold ex J. Presl 1825 (DOGWOOD FAMILY) [in CORNALES]

Derick B. Poindexter, Zack E. Murrell, and Alan S. Weakley

A family of 5-6 genera (as here interpreted) and about 50-85 species, trees, shrubs, lianas, and subshrubs, semicosmopolitan (mainly northern hemisphere). The Cornaceae is best circumscribed to exclude *Nyssa*, which probably is not even sister to Cornaceae (Xiang et al. 2002; Fu et al. 2019). The generic limits within core Cornaceae have long been controversial. The segregate genera of *Cornus* used here date back to 1756-1839, and in the southeastern United States, Small (1903, 1913, 1933) treated our native species in *Cynoxylon* and *Svida*. Phylogenetic analyses show that *Cornus* treated very broadly is monophyletic, but various clades within it are also monophyletic and have ages and levels of genetic and morphologic divergence generally regarded as warranting generic distinction. Fu et al. (2019) estimated that the five major clades (including four in our area) have divergence times of 60-75 million years ago (about at the end of the Cretaceous). Yu et al. (2017) estimated that the major clades in Cornaceae (including the separation between *Alangium* and *Cornus* s.l.) date to 66-85 million years ago, with the exception of a more recent split between the big-bracted dogwoods (here treated as *Benthamidia*) and the dwarf cornels (here treated as *Chamaepericlymenum*). In all other families of the Cornales, clades with divergence times of such age are universally treated as separate genera, and separation times of half that are often accorded genus rank. Based on our increased knowledge of the age and distinctiveness of these groups, it seems almost certain that the traditional 'subgenera' will be recognized by consensus in the future as warranting generic rank, and we treat them so here. That consensus has not yet arrived: Eyde's (1987) irritated and impassioned defense of a "broad *Cornus*" remains influential and is still followed by many -- though its reasoning seems increasingly irrelevant following a third of a century's elucidation of the relationships within Cornaceae and related families. Cornaceae is represented in the southeastern United States by native members of three of the five major clades (here treated as genera: *Swida*, *Benthamidia*, and *Chamaepericlymenum*) and by a fourth clade (genus *Cornus* sensu stricto). References: Eyde (1987); Fu et al (2019); Kubitzki et al (2004); Murrell & Poindexter (2016) in FNA12 (2016); Thomas et al (2021); Xiang et al (2002); Yu et al (2017).

- 1 Leaves alternate (the internodes typically short and therefore the leaves looking nearly whorled)..... *Swida alternifolia*
 1 Leaves opposite.
 3 Inflorescence subtended by 4 showy (white, creamy, or pink) bracts..... *Benthamidia*
 3 Inflorescence with green, tan, or brown (non-petaloid) bracts..... *Swida*

***Benthamidia* Spach 1839 (BIG-BRACTED DOGWOOD)**

A genus of about 7 species, trees, of Asia, e. North America, w. North America, and montane Mexico. See Cornaceae for discussion of generic treatment. We here circumscribe *Benthamidia* broadly to include the syncarpous, big-bracted dogwoods of e. Asia, sometimes separated as genus *Dendrobenthamia* Hutchinson. References: Murrell & Poindexter (2016) in FNA12 (2016).

Benthamidia florida (Linnaeus) Spach. FLOWERING DOGWOOD. **Hab:** In a wide variety of dry to moist forests and woodlands, especially over acidic substrates. **Dist:** ME west to MI, south to c. peninsular FL and e. TX. **Phen:** Mar-May; Sep-Oct. **Tax:** Populations in the Sierra Madre Oriental of ne. Mexico (Coahuila, Nuevo León, San Luis Potosí, Tamaulipas, Veracruz) sometimes treated as conspecific with *Benthamidia florida* (variously as a subspecies, a variety, or not distinguished taxonomically at all) warrant recognition based on morphology and disjunction as *Cornus urbiniana* J.N. Rose -- a combination in *Benthamidia* is available only at variety rank: *Benthamidia florida* var. *urbiniana* (J.N. Rose) H. Hara. **Comm:** *Benthamidia florida* has been impacted since the 1980s by widespread infection by the dogwood anthracnose fungus (*Discula destructiva*). **Syn:** = NE; = *Cornus florida* Linnaeus – Ar, C, F, FI5, FNA12, G, GrPl, Il, K1, K3, K4, Mi, NeTx, NY, Pa, RAB, Tn, Tx, Va, W, WH3, WV, Ferguson (1966c), Ferguson (1966d), Godfrey (1988); = *Cornus florida* ssp. *florida* – Pais, Whetten, & Xiang (2016); = *Cynoxylon floridum* (Linnaeus) Rafinesque ex B.D. Jackson – S. NatureServe G5 (Secure).

***Swida* Opiz 1838**

A genus of about 32 species, shrubs and trees, of North America, Central America, n. and w. South America, and Eurasia. See Cornaceae for discussion of generic treatment. References: Murrell & Poindexter (2016) in FNA12 (2016).

- 1 Leaves alternate (the internodes typically short and therefore the leaves looking nearly whorled)..... *Swida alternifolia*
 1 Leaves opposite.
 2 Veins usually 5 or more per leaf side..... *Swida amomum*

324. CORNACEAE

571

- 2 Veins usually 3-4 per leaf side.
6 Trichomes appressed or slightly raised on the lower leaf surface.

..... *Swida foemina*

- 6 Trichomes erect on the lower leaf surface.
9 Petioles 3-7 mm long; leaf veins evenly spaced..... *Swida asperifolia*
9 Petioles 8-25 mm long; leaf veins emanate from the basal half of the leaf *Swida drummondii*

Swida alternifolia (Linnaeus f.) Small. ALTERNATE-LEAF DOGWOOD, PAGODA CORNEL, PAGODA DOGWOOD. **Hab:** Mesic to dry-mesic forests. **Dist:** NL (Newfoundland) west to MN, south to Panhandle FL, AL, s. MS, and AR. **Phen:** Apr-Jun; Jun-Sep. **Syn:** = NE; = *Cornus alternifolia* Linnaeus f. – Ar, C, F, Fl5, FNA12, G, Il, K1, K3, K4, Mi, NY, Pa, RAB, Tn, Va, W, WH3, WV, Ferguson (1966c), Ferguson (1966d), Godfrey (1988); = *Svida alternifolia* – S, orthographic variant. [NatureServe G5](#) (Secure).

Swida amomum (P. Miller) Small. SILKY DOGWOOD. **Hab:** Shores, streams, bottomlands. **Dist:** NY and MA west to IN, south to GA, Panhandle FL, and MS. **Phen:** May-Jul; Aug-Sep. **Syn:** =; = *Cornus amomum* P. Miller – F, Fl5, FNA12, G, Il, K1, K3, K4, RAB, Tn, Va, W, WH3, WV; = *Cornus amomum* P. Miller ssp. *amomum* – GW2, Mi, NY, Pa, Ferguson (1966c), Ferguson (1966d), Godfrey (1988); = *Cornus amomum* var. *amomum* – C; = *Svida amomum* – S; = *Swida amomum* (P. Miller) Small var. *amomum* – NE. [NatureServe G5](#) (Secure).

Swida asperifolia (Michaux) Small. EASTERN ROUGHLEAF DOGWOOD. **Hab:** Mesic calcareous forests and thickets, shell middens, calcareous hammocks. **Dist:** Se. NC south to n. peninsular FL, west to s. AL. **Phen:** Apr-Jun; Aug-Sep. **Tax:** Nash (1896) collected *S. asperifolia* Michaux at River Junction, Florida; based upon conflicting reports of fruit colors given by Chapman (1860) and Coulter and Evans (1890) for the two rough-leaved dogwoods (*S. asperifolia* and *S. drummondii*), Nash decided to name the rough-leaved dogwood with blue fruit as *C. microcarpa*. However, Michaux's (1803) description, even without reference to fruit color, is clearly attributable to this species, as its locality was given as 'Carolinae inferioris'. The populations of this rough-leaved dogwood in NC and SC have morphology intermediate between *S. foemina* and *S. asperifolia* and these should possibly be attributed to a hybrid origin. More analysis needs to be done on this complex. **Syn:** =; = *Cornus asperifolia* Michaux – Fl5, FNA12, K1, K3, K4, RAB, WH3, Ferguson (1966c), Ferguson (1966d), Godfrey (1988); = *Cornus foemina* P. Miller ssp. *microcarpa* (Nash) J.S. Wilson – GW2; = *Svida microcarpa* (Nash) Small – S. [NatureServe G4](#) (Apparently Secure).

Swida drummondii (C.A. Meyer) Soják. MIDWESTERN ROUGHLEAF DOGWOOD. **Hab:** Open woodlands and glades over calcareous rocks (limestone, calcareous shale); also naturalized in wetlands and slopes along old railroad tracks (in VA). **Dist:** NY, ON, and SD south to e. TN, nw. GA, LA, and TX. Reported as naturalized in City of Alexandria, VA (Simmons et al. 2020). **Phen:** Apr-Jul; Aug-Oct. **Syn:** =; = *Cornus drummondii* C.A. Meyer – Ar, C, FNA12, G, GrPl, GW2, Il, K1, K3, K4, Mi, NcTx, NY, Pa, Tx, Ferguson (1966c), Ferguson (1966d); > *Cornus drummondii* C.A. Meyer – F; > *Cornus priceae* Small – F; > *Svida asperifolia* – S, misapplied; > *Svida priceae* (Small) Small – S. [NatureServe G5](#) (Secure).

Swida foemina (P. Miller) Rydberg. SOUTHERN SWAMP DOGWOOD. **Hab:** Swamps, streambanks, marshes, alluvial forests. **Dist:** DE south to s. FL, west to TX, and north in the interior to TN, s. IN, s. IL, AR, and se. OK. **Phen:** Mar-Jun; Jul-Oct. **Tax:** Although the name *Cornus foemina* P. Miller predates *C. stricta* Lamarck, it is very unclear what plant was intended by that name (the description is very obscure and no type is available), so *C. foemina* should arguably be rejected as a nomen dubium. Until and unless such an action is taken, it is arguably best to use *C. foemina*, the course followed here. **Syn:** = *Cornus foemina* P. Miller – Ar, F, Fl5, FNA12, Il, K1, K3, K4, Tn, Tx, WH3, Z; = *Cornus foemina* P. Miller ssp. *foemina* – GW2, W, Ferguson (1966c), Ferguson (1966d); = *Cornus stricta* Lamarck – C, G, RAB, Va; = *Svida stricta* (Lamarck) Small – S.

325. BALSAMINACEAE A. Richard 1822 (TOUCH-ME-NOT FAMILY) [in ERICALEs]

A family of 2 genera and 850-1000 species, primarily of the Old World tropics. References: Fischer in Kubitzki et al (2004).

Impatiens Linnaeus 1753 (JEWELWEED, TOUCH-ME-NOT, SNAPWEED, BALSAM)

A genus of 850-1000 species, herbs and subshrubs, primarily tropical and north temperate Old World. References: Fischer in Kubitzki et al (2004).

Impatiens capensis Meerburgh. ORANGE JEWELWEED, ORANGE TOUCH-ME-NOT, SPOTTED TOUCH-ME-NOT.

Hab: Moist forests, bottomlands, cove forests, streambanks, bogs. **Dist:** NL (Newfoundland) west to SK, NT, and BC, south to SC, Panhandle FL, AL, TX, CO, ID, and OR. **Phen:** May-Nov. **ID Notes:** Within the portion of our area where *I. capensis* and *I. pallida* overlap, the two species often occur in mixed populations. *I. capensis* tends to have the leaf apices and crenulations more rounded than *I. pallida*, but the character is overlapping and variable. **Syn:** = Ar, C, F, Fl5, GrPl, GW2, Il, K1, K3, K4, Mi, Mo2, NcTx, NE, NY, Pa, RAB, Tn, Tx, Va, W, WH3, WV; = *Impatiens biflora* Walter – G, S. [NatureServe G5](#) (Secure).

329. POLEMONIACEAE A.L. de Jussieu 1789 (JACOB'S-LADDER FAMILY) [in ERICALES]

A family of 18 genera and 350-380 species, herbs, vines, and shrubs (rarely trees), mainly of temperate North America, but extending into tropical America and also in Eurasia. All genera in our flora are in subfamily *Polemoniodeae*. References: Grant (1997); Grant (1998); Prather, Ferguson, & Jansen (2000); Wilken in Kubitzki et al (2004); Wilson (1960a).

- 1 Leaves simple and entire. *Phlox*
- 1 Leaves compound or deeply pinnatifid. *Polemonium*
 - 3 Leaf segments ovate or elliptic, 5-16 mm wide; corolla blue; [subfamily *Polemoniodeae*; tribe *Polemoniae*]. *Polemonium*
 - 3 Leaf segments linear, most ca. 1 mm wide; corolla red, yellow, blue, or white. *Ipomopsis*

Ipomopsis Michaux 1803 (STANDING-CYPRESS)

A genus of about 30 species, herbs, mainly of w. North America (1 species in se. North America, 1 in w. South America); an example of the affinities of the Sandhill flora to that of the dry sw. United States. References: Grant (1956); Sorrie, Weakley, & Bradley (2018); Wilken in Kubitzki et al (2004).

Ipomopsis rubra (Linnaeus) Wherry. STANDING-CYPRESS, SPANISH-LARKSPUR. **Hab:** Longleaf pine sandhills, sand rims of Carolina bays, dolomitic glades and woodlands, dunes, dry sandy and rocky woodlands and openings, roadbanks, disturbed areas. **Dist:** Sc. NC south to c. peninsular FL, west to TX and OK, spread from cultivation in other areas to the north (including sites in the Piedmont and Mountains of GA and NC). **Phen:** May-Aug (-Sep); Aug-Sep. **Comm:** Sorrie, Weakley, & Bradley (2018) discussed the biogeography, habitats, and nativity of the species. **Syn:** = Ar, Fl5, GrPl, Il, K1, K3, K4, Mi, NcTx, NE, RAB, Tx, W, WH3, Grant (1956); = *Gilia rubra* (Linnaeus) A.A. Heller – C, F, G, S. NatureServe G4G5 (Apparently Secure).

Phlox Linnaeus 1753 (PHLOX)

A genus of about 70 species, herbs (and creeping subshrubs), of temperate North America (with 1 species in ne. Asia). References: Ferguson, Krämer, & Jansen (1999); Levin (1966); Levin (1967); Turner (1998 [2000]); Ward (2012a); Wherry (1955); Wilken in Kubitzki et al (2004).

Key based on Wherry (1955) and other sources.

- 1 Stems woody or suffrutescent, trailing or decumbent; leaves to 25 mm long (-60 mm long in *P. bifida*), to 3 (-5) mm wide, generally with short-shoots or fascicles of leaves in the axils of leaves of the sterile shoots. *Phlox subulata*
- 1 Stems herbaceous, erect or decumbent; leaves (at least the larger) > 25 mm long and/or > 5 mm wide, generally lacking axillary fascicles of leaves.
 - 7 Style long, (12-) 14-26 mm long, the united portion 3-30× as long as the cleft portion; stamens equaling or exceeding the corolla tube (thus in part exerted).
 - 10 Leaf margin ciliate-serrulate; lateral veins of the leaves readily apparent, these joining to form a connecting vein parallel to the leaf margin.
 - 11 Bracts of the inflorescence pubescent with glandular hairs; corolla tube glabrous; leaves opposite; nodes usually 8-15; leaves usually 2-3× as long as wide. *Phlox amplifolia*
 - 11 Bracts of the inflorescence pubescent with non-glandular hairs; corolla tube pubescent (rarely glabrous); leaves subopposite (at least near the inflorescence); nodes usually 15-40; leaves usually 3-4× as long as wide. *Phlox paniculata*
 - 10 Leaf margin smooth or slightly rough; lateral veins of the leaves not readily apparent, not forming a connecting vein parallel to the leaf margin.
 - 16 Calyx subcylindric, the sepals fairly broad, with a rather weak midrib, the junction-membranes thin, narrow, becoming markedly plicate-keeled. *Phlox carolina*
 - 16 Calyx subcampanulate, the sepals narrow with a well-developed midrib, the junction-membranes firm, broad and flat (to slightly plicate-keeled). *Phlox glaberrima*
 - 7 Style short, 1-4 mm long, the united portion 1-1.5 (-2)× as long as the cleft portion; stamens shorter than the corolla tube (thus included).
 - 17 Upper leaves alternate; annual; corollas red, white, bright purple, purplish-pink, or variegated. *Phlox drummondii* var. *peregrina*
 - 17 Upper leaves opposite or subopposite; perennial; corollas blue, lavender, or pink; [native, mostly of forests, woodlands, or roadbanks].
 - 24 Sterile shoots rooting at the nodes; leaves broad-elliptic, ca. 2-3× as long as wide; sepals acuminate to very slightly awned, the awn 0-0.5 mm long; corolla tube glabrous. *Phlox divaricata* var. *laphamii*
 - 24 Sterile shoots not rooting at the nodes; leaves narrowly ovate, lanceolate, or linear, ca. 4-10× as long as wide; sepals awned, the awn 0.5-3.0 mm long; corolla glabrous, pilose, or glandular-pubescent.
 - 26 Cymes compact, the lowest branches short, < 0.5 cm long; corolla glabrous; pedicels 1-6 mm long. *Phlox amoena*
 - 26 Cymes open, the lowest branches elongate, > 1 cm long; corolla usually glandular-pubescent or pilose (rarely glabrous); pedicels 1-8 (-12) mm long
 - 29 Plants glabrous. *Phlox pilosa* ssp. *detonsa*
 - 29 Plants pubescent with glandular and/or nonglandular hairs. *Phlox pilosa* ssp. *pilosa*

Polemonium Linnaeus 1753 (JACOB'S-LADDER)

A genus of about 25 species, of temperate regions of North America and Eurasia. References: Davidson (1950); Wilken in Kubitzki et al (2004); Worley, Ghazvini, & Schemske (2009).

Polemonium reptans Linnaeus var. *reptans*. SPREADING JACOB'S-LADDER. **Hab:** Moist, nutrient-rich forests, such as bottomlands and rich slopes. **Dist:** NY west to MN, south to VA, nc. NC, nw. GA, AL, and e. OK. **Phen:** Apr-Jun; Jun-Jul. **Syn:** = Ar, C, K1, K3, NE, NY, Tn, Va; > *Polemonium longii* Fernald – F, K4; < *Polemonium reptans* – F, G, GrPl, Il, Mi, Pa, RAB, S, W, WV; > *Polemonium reptans* Linnaeus var. *reptans* – K4.

333. SAPOTACEAE A.L. de Jussieu 1789 (SAPODILLA FAMILY) [in ERICALES]

A family of about 53-54 genera and 1100-1250 species, trees and shrubs, primarily tropical (rarely temperate), of Old World and New World. References: Elisens, Whetstone, & Wunderlin (2009) in FNA8 (2009); Govaerts, Frodin, & Pennington (2001); Pennington (2004) in Kubitzki et al (2004).

[*Chrysophyllum*, *Manilkara*, *Mimusops*, *Pouteria*, *Sideroxylon*]

Sideroxylon Linnaeus 1754 (BUMELIA, BUCKTHORN, BULLY)

As defined broadly by Pennington (1991), *Sideroxylon* includes about 75 species, widely distributed in the New World and Old World Tropics (our species are the northern tip of a "tropical iceberg"). Pennington found that no consistent set of characters could be used to separate *Bumelia* from other New World genera (such as *Mastichodendron* and *Dipholis*), and that the New World segregate genera were also not separable from several Old World genera. The Linnaean *Sideroxylon* has nomenclatural priority. References: Allison (2006a); Anderson (1996); Clark (1942); Corogin & Judd (2014); Corogin (2015); Cronquist (1945a); Cronquist (1949); Elisens & Jones (2009) in FNA8 (2009); Godfrey (1988); Govaerts, Frodin, & Pennington (2001); Lakela (1963); Pennington (1991).

Identification Notes: Ket based in part on Corogin (2015).

- 4 Lower leaf surfaces hairy only when leaves are very young, quickly sloughing all or most hairs to become entirely glabrous or with hairs only on the midvein.
 - 6 Berries (7-) 9-16 mm long; central corolla lobe 1.8-2.0 mm long; leaf trichomes transparent and colorless, often flattened in x-section (use at least 20× magnification); stomatal chamber openings closed to a narrow slit, the guard cells not visible through the opening; [widespread in our region] *Sideroxylon lycioides*
 - 6 Berries 4-9 mm long; central corolla lobe 1.1-1.3 mm long; leaf trichomes opaque, light brown to gray, mostly terete in x-section; stomatal chamber openings wide and elliptic, the guard cells visible through the opening; [moist to wet habitats, SC, GA, and FL west to sw. LA] *Sideroxylon reclinatum* ssp. *reclinatum*
- 4 Lower leaf surfaces persistently (through the season) hairy (on the surface and not just on the midvein, either slightly to densely sericeous to woolly). *Sideroxylon lanuginosum* ssp. *lanuginosum*

Sideroxylon lanuginosum Michaux ssp. *lanuginosum*. EASTERN GUM BUMELIA, EASTERN GUM BULLY. **Hab:** Dry upland forests and woodlands, glades, bluffs, prairies and saline barrens, roadsides, pastures, rises in bottomland forests. **Dist:** E. GA, KY, and KS, south to nc. FL and e. and nc. TX. **Syn:** = Corogin (2015); = *Bumelia lanuginosa* (Michaux) Persoon ssp. *typica* – Cronquist (1949); < *Bumelia lanuginosa* (Michaux) Persoon – S; > *Bumelia lanuginosa* ssp. *lanuginosa* – K4, Godfrey (1988); < *Bumelia lanuginosa* (Michaux) Persoon ssp. *typica* – Cronquist (1945a); > *Bumelia lanuginosa* (Michaux) Persoon var. *lanuginosa* – C, F, G; >> *Bumelia lanuginosa* (Michaux) Persoon var. *lanuginosa* – Clark (1942); > *Bumelia lanuginosa* (Michaux) Persoon var. *oblongifolia* (Nuttall) R.B. Clark – Il; > *Bumelia lanuginosa* (Michaux) Persoon var. *oblongifolia* (Nuttall) R.B. Clark – C, F, G, V > S. – Govaerts, Frodin, & Pennington (2001); > *Bumelia rufa* Rafinesque – Clark (1942); < *Sideroxylon lanuginosum* – Ar, Fl5, WH3, Pennington (1991); > *Sideroxylon lanuginosum* Michaux ssp. *albicans* (Sargent) Kartesz & Gandhi – K1; >> *Sideroxylon lanuginosum* Michaux ssp. *albicans* (Sargent) Kartesz & Gandhi – K3; >> *Sideroxylon lanuginosum* ssp. *oblongifolia* – FNA12, K1, K3, NcTx, Govaerts, Frodin, & Pennington (2001).

Sideroxylon lycioides Linnaeus. BUCKTHORN BUMELIA, BUCKTHORN BULLY, CAROLINA BUCKTHORN. **Hab:** Maritime forests, maritime scrub, river bluffs, swamp margins, usually in circumneutral soil (over shell hash, coquina limestone, marl, or limestone), in the Piedmont and Mountains in rich, mesic forests over mafic or calcareous rocks. **Dist:** Se. VA south to Panhandle FL, west to se. TX, north in the interior to s. IN, s. IL, and se. MO, mostly on the Coastal Plain, but extending (in our area in NC and SC) to the upper Piedmont and north in the interior (primarily on limestone) to KY and TN. **Phen:** Jun-Aug; Sep-Nov. **ID Notes:** This species is extremely variable in leaf shape; though described in most works as up to 10-12 cm long and up to 4 cm wide, the leaves can be to 15 cm long and 8 cm wide. The leaf apex can be acuminate, acute, rounded, or notched. **Syn:** = Ar, Fl5, FNA12, K1, K3, K4, Tn, Va, WH3, Govaerts, Frodin, & Pennington (2001), Pennington (1991); = *Bumelia lycioides* (Linnaeus) Persoon – C, G, GW2, Il, RAB, S, Cronquist (1945a), Godfrey (1988); > *Bumelia cassiniifolia* Small – Clark (1942); > *Bumelia lycioides* (Linnaeus) Persoon – Tx; > *Bumelia lycioides* var. *ellipsoidalis* R.B. Clark – Clark (1942); > *Bumelia lycioides* var. *lycioides* – F, Clark (1942); > *Bumelia lycioides* var. *virginiana* Fernald – F, Clark (1942); > *Bumelia smallii* R.B. Clark – F, Tx, Clark (1942). **NatureServe G5** (Secure).

Sideroxylon reclinatum Michaux ssp. *reclinatum*. SMOOTH BUMELIA, FLORIDA BULLY. **Hab:** Floodplain forests and river margins. **Dist:** Ssp. *reclinatum* ranges from s. SC and se. GA south to s. peninsular FL. **Phen:** Apr-Jun; Jul-Aug. **Tax:** See extensive discussion in Corogin & Judd (2014). **Syn:** = Fl5, FNA12, K1, K3, K4, WH3, Corogin & Judd (2014), Corogin (2015), Govaerts, Frodin, & Pennington (2001); > *Bumelia microcarpa* Small – S; < *Bumelia reclinata* (Michaux) Ventenat – GW2, Clark (1942); > *Bumelia reclinata* (Michaux) Ventenat – S; < *Bumelia reclinata* (Michaux) Ventenat var. *reclinata* – Cronquist (1945a), Godfrey (1988); < *Sideroxylon reclinatum* – Pennington (1991). **NatureServe G4G5TNR** (Not Yet Ranked).

333. SAPOTACEAE

Sideroxylon lanuginosum
ssp. *lanuginosum*

Sideroxylon
lycioides

Sideroxylon reclinatum
ssp. *reclinatum*

334. EBENACEAE Gürke 1891 (EBONY FAMILY) [in ERICALEs]

A family of 2-6 genera and 500-600 species, trees and shrubs, distributed in tropical and subtropical (rarely warm temperate) regions. References: Eckenwalder (2009) in FNA8 (2009); Wallnöfer in Kubitzki et al (2004).

Diospyros Linnaeus 1753 (PERSIMMON)

A genus of 500-600 species, trees and shrubs, of tropical and subtropical regions (with very few exceptions). The genus includes a variety of tropical trees called ebony in the wood trade. References: Eckenwalder (2009) in FNA8 (2009); Spongberg (1977); Wallnöfer in Kubitzki et al (2004).

Identification Notes: Seedlings and fire sprouts of *Diospyros virginiana* are superficially very similar to *Nyssa sylvatica*, but can be separated in the following ways: bundle scar 1 per bud scar, narrowly crescent-shaped (vs. *Nyssa* with 3 distinct, circular, bundle scars arranged in a broad V pattern), leaves never with teeth (vs. *Nyssa* leaves sometimes with a few irregular teeth), leaves glabrate to tomentose with curly hairs (vs. glabrous or with a few straight, forward-pointing hairs), leaves with sessile to short-stipitate glands on upper surface of midrib and outer petiole, later becoming necrotic spots (vs. leaves without glands).

Diospyros virginiana Linnaeus. AMERICAN PERSIMMON, POSSUMWOOD. **Hab:** Dry forests and woodlands, longleaf pine sandhills, prairies, disturbed places, floodplain and mesic forests, fencerows, roadsides, other disturbed areas. **Dist:** CT, PA, OH, IN, IL, MO, and e. KS south to s. FL and TX. **Phen:** Apr-Jun; Sep-Dec (and persisting). **Tax:** East of the Mississippi River, *D. virginiana* var. *virginiana* has leaves cuneate to rounded at the base, with glabrous or glabrescent surfaces; mostly west of the Mississippi River and perhaps eastward along the Coastal Plain, *D. virginiana* var. *pubescens* (Pursh) Nuttall has leaves subcordate, and persistently pubescent. Though these differences seem relatively trivial, they are consistent, geographically correlated, and may be worthy of varietal recognition. Other varieties have been named based on fruit size and ripening time. Var. *platycarpa* Sargent of floodplain forests in the Mississippi River drainage, with exceptionally large and early-ripening fruits, may warrant recognition. **Comm:** Persimmons are famous for their sweet and edible fruits, and infamous for the bitter-astringency of the not fully ripe fruit. The species is dioecious, the male trees appear to reach a greater size than the females. The wood is one of the heaviest and hardest in e. North America. **Syn:** = Ar, Fl5, FNA8, GrPl, GW2, K1, K3, K4, NcTx, NE, NY, Pa, RAB, Tn, Tx, Va, W, WH3, WV; > *Diospyros mosieri* Small – S; > *Diospyros virginiana* Linnaeus – S; > *Diospyros virginiana* var. *platycarpa* Sargent – Il; > *Diospyros virginiana* var. *pubescens* (Pursh) Nuttall – Il; > *Diospyros virginiana* var. *virginiana* – C, F, G, Il, Spongberg (1977). **NatureServe** G5 (Secure).

335. PRIMULACEAE Batsch 1794 (PRIMROSE FAMILY) [in ERICALEs]

As broadly circumscribed to include Myrsinaceae and Samolaceae, cosmopolitan in distribution. Following the discovery that various herbaceous and largely temperate genera (*Lysimachia*, *Trientalis*, *Anagallis*, and *Samolus*, etc.) traditionally placed in Primulaceae actually were more closely related to the largely tropical and woody Myrsinaceae, various authors, including Källersjö, Bergqvist, & Anderberg (2000) and Martins, Oberprieler, & Hellwig (2003) proposed the transfer of these genera respectively to Myrsinaceae and Theophrastaceae. Angiosperm Phylogeny Group (2009, 2016) alternatively merges Samolaceae and Myrsinaceae into Primulaceae, and recognizes variation at the subfamilial and tribal ranks; this approach is followed here. References: Anderberg in Kubitzki et al (2004); APG I (1998); APG (2009); Channell & Wood (1959); Cholewa & Kelso (2009) in FNA8 (2009); Cholewa (2009a) in FNA8 (2009); Cholewa, Pipoly, & Ricketson (2009) in FNA8 (2009); Källersjö, Bergqvist, & Anderberg (2000); Martins, Oberprieler, & Hellwig (2003); Ståhl & Anderberg (2004) in Kubitzki et al (2004); Ståhl & Källersjö (2004); Yan et al (2018).

- 5 Aquatic; leaves pectinate (deeply pinnatifid into linear segments); [subfamily *Primuloideae*].....*Hottonia inflata*
- 5 Terrestrial (though sometimes in wetlands or submersed for short periods of time); leaves entire or shallowly toothed.
- 6 Leaves strictly in a basal rosette or basally disposed (with a basal rosette and smaller stem leaves).
- 8 Inflorescence a raceme or a panicle of racemes; larger leaves basal and smaller leaves on the stem; [subfamily *Theophrastidoideae*, tribe *Samoleae*]*Samolus*
- 8 Inflorescence an umbel; leaves strictly basal; [subfamily *Primuloideae*]*Primula*
- 6 Leaves all or chiefly cauline; [subfamily *Myrsinoideae*]
- 10 Leaves all or chiefly alternate; flowers white or whitish.
- 11 Flowers solitary and nearly sessile in leaf axils*Centunculus*
- 11 Flowers in a terminal raceme.....*Lysimachia*
- 10 Leaves all or chiefly opposite or whorled; flowers yellow, blue, red, or whitish.
- 13 Flowers blue or red.....*Anagallis*
- 13 Flowers yellow.

- 14 Flowers lacking staminodes; filaments either connate below or free (*Lysimachia thyrsiflora*); leaves “punctate” with sinuous, elongate markings (visible with the naked eye, but more readily observed with 10 × magnification and ideally with transmitted light). *Lysimachia*
- 14 Flowers with staminodes alternating with the stamens; filaments free; leaves not “punctate” (see above). *Steironema*

Anagallis Linnaeus 1753 (PIMPERNEL)

A genus of about 6 species, annual herbs, of Eurasia. The genus is here recognized, rather than being included in a very broad *Lysimachia*, but given a narrower circumscription based on the phylogeny of Yan et al. (2018).

References: Cholewa (2009e) in FNA8 (2009); Jiménez-López et al (2022); Manns & Anderberg (2007); Yan et al (2018).

* *Anagallis arvensis* Linnaeus. SCARLET PIMPERNEL, COMMON PIMPERNEL, HIERBA DEL PÁJARO. **Hab:** Lawns, fields, disturbed areas. **Dist:** Native of Europe. **Phen:** (Mar-) Apr-Nov. **Tax:** The taxonomy and distributions of this taxon and the closely related *A. foemina* (sometimes treated as a subspecies, variety, or form) are complicated by differences of opinion about distinguishing characteristics. **Syn:** = *Anagallis arvensis* Linnaeus ssp. *arvensis* – K1, S, Va; = *Anagallis arvensis* var. *arvensis* – C, G; = *Lysimachia arvensis* (Linnaeus) U. Manns & A. Anderberg – NY, Jiménez-López et al (2022), Manns & Anderberg (2007); < *Anagallis arvensis* Linnaeus – Ar, F, Fl5, FNA8, GrPl, GW2, Il, Meso4.1, Mi, NcTx, Pa, RAB, Tn, Tx, W, WH3; < *Lysimachia arvensis* (Linnaeus) U. Manns & A. Anderberg – K3, K4, NE.

Centunculus Linnaeus 1753 (CHAFFWEED, PIMPERNEL)

A genus of about 25 species, annual and perennial herbs, semi-cosmopolitan in distribution. Recently, *Centunculus* has often been submerged into *Anagallis*, or both submerged into a very broad *Lysimachia*. We here recognize it, but with an augmented circumscription including many species (outside our area) traditionally placed in *Anagallis*, following the phylogenetic results of Yan et al. (2019). References: Cholewa (2009e) in FNA8 (2009); Manns & Anderberg (2007); Yan et al (2018).

Centunculus minimus Linnaeus. CHAFFWEED, FALSE-PIMPERNEL. **Hab:** Ditches, wet disturbed areas, savannas, pond margins. **Dist:** This species occurs in widely scattered areas, nearly cosmopolitan. **Phen:** (Feb-) Mar-Aug. **Syn:** = C, F, G, GrPl, RAB, S, Tx, W; = *Anagallis minima* (Linnaeus) E.H. Krause – Ar, Fl5, FNA8, GW2, Il, K1, Meso4.1, NcTx, Tn, Va, WH3; = *Lysimachia minima* (Linnaeus) U. Manns & A. Anderberg – K3, K4, NE, Manns & Anderberg (2009). NatureServe G5 (Secure).

Hottonia Linnaeus 1753 (WATER-VIOLET)

A genus of 2 species, aquatic herbs, of North America and Eurasia. References: Anderberg in Kubitzki et al (2004); Cholewa (2009c) in FNA8 (2009).

Hottonia inflata Elliott. FEATHERFOIL, WATER-VIOLET. **Hab:** Slow-moving or stagnant waters of swamps, millponds, beaverponds, sag ponds, oxbows, rivers, probably dispersed by waterfowl, primarily in the Coastal Plain, very rarely in the Piedmont and Mountains. **Dist:** ME south to GA, west to TX, inland up the Mississippi Embayment to IL, and at other scattered locations inland (as w. WV, and especially around the Great Lakes). Townsend (1995) documented its first SC record. **Phen:** Apr-Jul; May-Aug. **Comm:** The species shows large population fluctuations, and may be essentially ephemeral at many locations. **Syn:** = Ar, C, F, FNA8, G, GW2, Il, K1, K3, K4, NE, NY, Pa, RAB, S, Tn, Tx, Va, WV. NatureServe G4 (Apparently Secure).

Lysimachia Linnaeus 1753 (LOOSESTRIFE)

A genus of about 140 species, herbs (rarely shrubs), cosmopolitan. Hao et al. (2004) showed that the traditional subgeneric classification of *Lysimachia* is highly artificial, and that *Glaux* is embedded within *Lysimachia*. Yan et al. (2018), in a strongly sampled, Bayesian analysis, presented a phylogeny which supports retention of *Trientalis* ('clade XI'), *Steironema* ('clade IX'), a broadened *Centunculus* ('clade VIII'), and a narrowed *Anagallis* ('clade VII') as a series of basal grade clades to a still very diverse and heterogeneous *Lysimachia* ('clades I, II, III, IV, V, and VI'), including *Glaux* ('clade III'). It seems to us a better choice to retain the traditionally recognized and phylogenetically supported genera *Trientalis*, *Steironema*, *Centunculus*, and *Anagallis* than to combine them in to a hyperdiverse *Lysimachia* in the broadest sense possible. References: Cholewa (2009f) in FNA8 (2009); Coffey & Jones (1980); Estes, Shaw, & Mausert-Mooney (2015); Hao et al (2004); Manns & Anderberg (2009); Ståhl & Anderberg (2004) in Kubitzki et al (2004); Yan et al (2018).

- 1 Leaves alternate (or with some opposite or subopposite); flowers white.

- 1 Leaves opposite or whorled; flowers yellow, white, pink, red, or blue.

- 5 Leaves < 2 cm long (and distinctly longer than wide); flowers red, blue, white, or pink.

- 5 Leaves > 2 cm long (sometimes less in *L. nummularia*, and then orbicular, and about as wide as long); flowers yellow

- 7 Leaves nearly round; plant trailing, rooting at nodes

- *Lysimachia nummularia*

- 7 Leaves linear, lanceolate, elliptic, or ovate; plant erect (or trailing and rooting at the nodes in *L. radicans*, which has lanceolate leaves).

- *Steironema*

Europe

Europe

Europe

Europe

* *Lysimachia nummularia* Linnaeus. CREEPING JENNY, CREEPING CHARLIE, MONEYWORT. **Hab:** Lawns, pastures, seepages, other moist, disturbed places. **Dist:** Native of Europe. **Phen:** May-Aug; Aug-Sep. **ID Notes:** The leaves have many minute, maroon dots (glandular punctae). **Syn:** = Ar, C, F, FNA8, G, GrPl, GW2, Il, K1, K3, K4, Mi, NE, NY, Pa, RAB, S, Tn, Va, W. NatureServe GNR (Not Yet Ranked).

Primula Linnaeus 1753 (SHOOTING STAR)

A genus of about 450 species, primarily of the temperate Northern Hemisphere. Mast et al. (2004) show that *Dodecatheon* is nested within *Primula*, and is closely related to (and derived from) *Primula* subgenus *Auriculastrum*, apparently via a relatively simple alteration of the corolla for buzz-pollination. References: Fassett (1944); Kelso (2009b) in FNA8 (2009); Mast & Reveal (2007); Mast et al (2004); Oberle & Esselman (2011); Reveal (2009) in FNA8 (2009).

Primula meadia (Linnaeus) A.R. Mast & Reveal. EASTERN SHOOTING STAR. **Hab:** Rich forests, woodlands, and rock outcrops (primarily calcareous or mafic), especially with nutrient-rich seepage, prairies, bluffs. **Dist:** MD and PA west to s. WI, se. MN, IA, and OK, south to sc. SC, n. GA, n. FL (Gadsden County), AL, and TX. **Phen:** Late Mar-early Jun; late May-Jun. **Tax:** Segregate taxa (at species and varietal rank) included here may have merit and warrant re-study. **Syn:** = Ar, Fl5, K4, Ky, Mi, NY, Va, WH3, Mast & Reveal (2007); = *Dodecatheon meadia* – FNA8, K3, NcTx, Pa, RAB, Tx, W, WV, Oberle & Esselman (2011); > *Dodecatheon brachycarpa* Small – S; > *Dodecatheon hugeri* Small – S; > *Dodecatheon meadia* – S; > *Dodecatheon meadia* ssp. *brachycarpum* (Small) R. Knuth – K1; > *Dodecatheon meadia* ssp. *meadia* – K1; > *Dodecatheon meadia* Linnaeus var. *brachycarpum* (Small) Fassett – C, F, G, GrPl, Il, Fassett (1944); > *Dodecatheon meadia* var. *genuinum* – Fassett (1944); > *Dodecatheon meadia* Linnaeus var. *meadia* – C, F, G, GrPl, Il, Fassett (1944); > *Dodecatheon meadia* var. *obesum* Fassett – Fassett (1944).

Samolus Linnaeus 1753 (WATER-PIMPERNEL)

A genus of about 10-15 species, herbs and subshrubs, nearly cosmopolitan. References: Cholewa (2009b) in FNA8 (2009); Henrickson (1983); Ståhl & Källersjö (2004).

Samolus parviflorus Rafinesque. WATER-PIMPERNEL, BROOKWEED. **Hab:** Stream banks, tidal freshwater and oligohaline marshes, pools in floodplains, calcareous seepage swamps, interdune ponds. **Dist:** NB west to BC, south to Central America; c. and s. South America; Bahamas. **Phen:** Apr-Oct. **Tax:** Sometimes treated as a subspecies or other component of the European *S. valerandi*; the American plant is sufficiently distinct to warrant specific status. Cholewa in FNA8 (2009) states: "Some taxonomists include this species within the European *S. valerandi*; that species has larger flowers and capsules, fewer racemes, and stamens occurring in clusters of one to three. No specimens have been found of true European *S. valerandi* in the flora area; previous specimens labeled as *S. valerandi* are native species, usually *S. parviflorus*". A different opinion is expressed by Jones et al. (2012), who prefer to treat *S. parviflorus* within a broadly circumscribed *S. valerandi*. If treated at species rank (as here), the name *S. floribundus* has also sometimes been used for the North American taxon at species rank; *S. parviflorus* has nomenclatural priority over *S. floribundus* by a month. **Syn:** = Ar, Bah, F, FNA8, GrPl, GW2, Il, K3, Mi, Pa, RAB, Tn, Tx, Va, W, WV; = *Samolus floribundus* Kunth – C, G, Meso4.1, S; = *Samolus valerandi* Linnaeus ssp. *parviflorus* (Rafinesque) Hultén – Fl5, K1, NcTx, NE, WH3; < *Samolus valerandi* – K4, NY.

Steironema Rafinesque 1821 (LOOSESTRIFE)

A genus of about 8 species, perennial herbs, of North America. *Steironema* has occasionally been accorded genus rank in eastern North American floras (notably Small 1933, Gleason & Cronquist 1952, and Mohlenbrock 2014), but has more usually been included in *Lysimachia*. The morphologic differences from *Lysimachia* are more profound than the superficially similar flowers suggest. Yan et al. (2018) shows *Steironema* and *Trientalis* in a clade basal to *Centunculus*, *Anagallis*, and *Lysimachia* (in a narrower sense). References: Cholewa (2009f) in FNA8 (2009); Estes, Shaw, & Mausert-Mooney (2015); Yan et al (2018).

- 1 Leaves linear, 1-7 mm wide, 10-20× longer than wide, mid-cauline leaves sessile or short petiolate, petioles when present 1-5 mm long. *Steironema lanceolatum*
- 1 Leaves lanceolate, narrowly elliptic-lanceolate, or narrowly oblong, 5-60 mm wide, mostly 1.5-10× longer than wide, mid-cauline leaves usually with well-developed petioles 5-20+ mm long (except in *L. lanceolata* where petioles are mostly <5 mm long).
 - 4 Petioles ciliate along their entire length. *Steironema ciliatum*
 - 5 Leaves ovate to ovate-lanceolate, 17-60 mm wide..... *Steironema ciliatum*
 - 5 Leaves narrowly oblong, elliptic, lanceolate, or oblanceolate, 5-20 mm wide. *Steironema lanceolatum*
 - 4 Petioles eciliate or with cilia confined to the proximal half (or less) only. *Steironema radicans*

Steironema ciliatum (Linnaeus) Baudo. FRINGED LOOSESTRIFE. **Hab:** Mesic forests, especially bottomlands and coves dominated by hardwoods. **Dist:** NL (Newfoundland) west to AK, south to GA, Panhandle FL, AL, MS, AR, KS, NE, CO, NM, UT, ID, and OR. **Phen:** May-Sep; Aug-Oct. **Syn:** = G, Il, S; = *Lysimachia ciliata* Linnaeus – Ar, C, F, Fl5, FNA8, GrPl, GW2, K1, K3, K4, Mi, NE, NY, Pa, RAB, Tn, Tx, Va, W, WH3, WV, Coffey & Jones (1980), Estes, Shaw, & Mausert-Mooney (2015). NatureServe G5 (Secure).

Steironema lanceolatum (Walter) Gray. LANCELEAF LOOSESTRIFE. **Hab:** Mesic to relatively dry forests, mafic and calcareous fens, bogs, forest edges, roadbanks, primarily on circumneutral soils. **Dist:** NJ, PA, OH, MI, and WI south to GA, Panhandle FL, AL, MS, LA, and ne. TX. **Phen:**

335. PRIMULACEAE

May-Aug; Sep-Oct. **Syn:** = G, II; = *Lysimachia lanceolata* Walter – Ar, C, F, FNA8, K1, K3, K4, Mi, NcTx, Pa, Tn, Tx, Va, W, WV, Coffey & Jones (1980), Estes, Shaw, & Mausert-Mooney (2015); = *Lysimachia lanceolata* var. *lanceolata* – GW2, RAB, WH3; < *Lysimachia lanceolata* Walter – FI5; > *Steironema heterophyllum* (Michaux) Baudo – S; > *Steironema lanceolatum* (Walter) Gray – S. NatureServe G5 (Secure).

Steironema radicans (Hooker) A. Gray. TRAILING LOOSESTRIFE. **Hab:** Moist forests, swamps, marshes, eastwards in mountain sinkhole ponds and interdunal ponds. **Dist:** The main distribution of this species is in the Mississippi Embayment, from MO and w. TN south to MS, AR, LA, and e. TX; disjunct occurrences in e. and w. VA and e. NC are curious. **Phen:** (May-) Jun-Sep. **Syn:** = G, II, S; = *Lysimachia radicans* Hooker – Ar, C, F, FNA8, K1, K3, K4, Tn, Tx, Va, W, Coffey & Jones (1980), Estes, Shaw, & Mausert-Mooney (2015). NatureServe G4G5 (Apparently Secure).

336. THEACEAE Mirbel 1816 (TEA FAMILY) [in ERICALES]

With a more circumscribed definition (excluding Pentaphylacaceae), a family of about 9 genera and 200-450 species, trees and shrubs, of primarily tropical and subtropical regions of the Old and New Worlds. References: Li et al (2019); Prince & Parks (2001); Prince (2009) in FNA8 (2009); Stevens, Dressler, & Weitzman in Kubitzki et al (2004); Zhang et al (2022).

1 Leaves deciduous, medium green above, herbaceous in texture.

..... *Stewartia*

1 Leaves evergreen, dark green above, coriaceous in texture.

..... *Gordonia*

Gordonia J. Ellis 1771 (LOBLOLLY BAY, GORDONIA)

As recircumscribed, a genus of 2 species, trees, of se. North America and Central America (*Gordonia brandegeei* H. Keng). The other 20-70 species of se. Asian trees and shrubs previously assigned to *Gordonia* are actually in a different tribe and are reassigned to *Polyspora* (Yang et al. 2004; Choo et al. 2020). References: Choo et al (2020); Prince (2009) in FNA8 (2009); Stevens, Dressler, & Weitzman in Kubitzki et al (2004); Yang et al (2004); Zhang et al (2022).

Identification Notes: *Gordonia* is one of the "bay trees" so typical of acid Coastal Plain wetlands of our area – the other two being Sweet Bay (*Magnolia virginiana* of the Magnoliaceae) and Swamp Red Bay (*Tamala palustris* of the Lauraceae).

Gordonia can be distinguished from the other two species by its smooth leaves, serrate toward the tip, odorless when crushed (vs. pubescent leaves, entire-margined, aromatic when crushed). *Gordonia* is also distinctive in its narrow, conical crown, resembling *Liriodendron* or *Chamaecyparis*, and its medium-gray, deeply furrowed bark. Most individuals of *Gordonia* have at least a few orange-red leaves visible, at any season.

Gordonia lasianthus (Linnaeus) J. Ellis. LOBLOLLY BAY, GORDONIA. **Hab:** Pocosins, bayheads, acidic, organic-rich swamp forests, wet pine savannas, bay forests. **Dist:** Ne. NC south to s. peninsular FL, west to s. MS (Sorrie & Leonard 1999), a Southeastern Coastal Plain endemic. **Phen:** Jul-Sep; Sep-Oct. **Comm:** Peat-filled Carolina bays and large peat dome pocosins from se. VA to e. GA typically have *Gordonia* as an important tree, surpassed in abundance and importance only by *Pinus serotina*. On deep peats, *Gordonia* individuals are stunted and reach sizes hardly larger than pocosin shrubs. **ID Notes:** Trees almost always have a few orange-red leaves at whatever season. The toothed margin immediately separates *Gordonia* from other "bays": *Magnolia* and *Tamala*. **Syn:** = FI5, FNA8, GW2, K1, K3, K4, RAB, S, WH3. NatureServe G5 (Secure).

Stewartia I. Lawson 1753 (STEWARTIA, WILD CAMELLIA)

A genus of about 20 species (if circumscribed to include *Hartia*), trees and shrubs, of temperate e. Asia and e. North America. Both our species of *Stewartia* are very attractive shrubs. The other species of the genus are Asian. Lin et al. (2019) show *S. malacodendron* as basal to the rest of the genus (if *Hartia* is included in *Stewartia*), and *Stewartia ovata* as basal to *Stewartia* s.s.; Li et al. (2002a) and Prince (2002) show different tree topologies and relationships. References: Li et al (2002a); Lin et al (2019a); Prince (2002); Prince (2009) in FNA8 (2009); Spongberg (1974); Stevens, Dressler, & Weitzman in Kubitzki et al (2004); Zhang et al (2022).

Identification Notes: The leaves are borne in horizontal planes, reminiscent of *Benthamidia* (*Cornus*) *florida* and *Swida* (*Cornus*) *alternifolia*. The leaves of both species are obscurely serrate or crenate, and also conspicuously and copiously ciliate-margined.

1 Style 1, with a 5-lobed stigma; seeds 5-7 mm long, shiny, plump, angled; fruit lobes rounded; leaves mostly 4-10 cm long, with 7-8 pairs of lateral veins; petioles narrowly winged (0.1-1 mm wide), not enclosing and concealing the terminal and lateral buds; calyx subtended by 2 persistent bracts, each 2-4 mm long; seeds shiny

..... *Stewartia malacodendron*

336. **THEACEAE**

- 1 Styles 5, separate; seeds 8-10 mm long, dull, flat, thin (to slightly winged); fruit lobes angled; leaves mostly 7-15 cm long, with 5-7 pairs of lateral veins; petioles widely winged (1-2 mm wide), enclosing and concealing the terminal and lateral buds; calyx subtended by 1 persistent bract, 11-14 mm long; seeds dull..... *Stewartia ovata*

Stewartia malacodendron Linnaeus. SILKY CAMELLIA, VIRGINIA STEWARTIA. **Hab:** Mesic forests, especially on beech-dominated bluffs or 'upland islands' in Coastal Plain swamps, steepheads, bayheads. **Dist:** Primarily Coastal Plain, se. VA south to FL, west to se. TX, but extending inland to the Piedmont of GA, NC, and SC and the Mountains of AL and NC. **Phen:** Apr-Jun; Sep-Oct. **Tax:** In the phylogenetic tree of *Stewartia*, *S. malacodendron* is the first-branching taxon in the genus, not closely related to *S. ovata*. **Syn:** = Ar, Fl5, FNA8, K1, K3, K4, RAB, Tx, Va, W, WH3, Spongberg (1974); = *Stewartia malachodendron* – C, F, G, orthographic variant; = *Stuartia malachodendron* – S, orthographic variant. NatureServe G4 (Apparently Secure).

Stewartia ovata (Cavanilles) Weatherby. MOUNTAIN CAMELLIA, MOUNTAIN STEWARTIA. **Hab:** Mesic forests, especially along streams and on acidic bluffs, often in openings in rhododendron thickets ('hells'), in the Coastal Plain of VA restricted to ravines. **Dist:** Primarily Appalachian: e. KY, sc. VA, e. VA south to c. NC, w. SC, e. and c. TN to n. GA and n. AL, avoiding, however, the higher mountains, and extending into the Coastal Plain in e. VA. The species is most abundant in the Cumberland Plateau of s. KY and TN. **Phen:** Late Jun-Jul; Aug-Sep. **Syn:** = C, F, FNA8, G, K1, K3, K4, RAB, Tn, Va, W, Spongberg (1974); = *Malachodendron pentagynum* (L'Héritier) Small – S. NatureServe G4 (Apparently Secure).

337. **SYMPLOCACEAE** Desfontaines 1820 (SWEETLEAF FAMILY) [in ERICALES]

A family of 1 genus and about 250-300 species, trees and shrubs, of tropical and warm temperate America and Asia. References: Almeda & Fritsch (2009) in FNA8 (2009); Nooteboom in Kubitzki et al (2004).

Symplocos Jacquin 1760 (SWEETLEAF)

A genus of about 300 species, trees and shrubs, of tropical and warm temperate America and Asia. Wang et al. (2004) found that the affinities of *S. tinctoria* are with South American species of subgenus *Epigenia*, rather than with east Asian species of subgenus *Hopea*, section *Palaeosymplocos*. References: Almeda & Fritsch (2009) in FNA8 (2009); Harbison (1931); Hardin (1966); Nooteboom in Kubitzki et al (2004); Wang et al (2004).

Identification Notes: The foliage of *S. tinctoria* has a sweet taste, and an odor and taste similar to green apples. Sometimes the leaves are glossy and appear subcoriaceous, somewhat resembling *Kalmia latifolia*.

Symplocos tinctoria (Linnaeus) L'Héritier. SWEETLEAF, HORSESUGAR, DYEBUSH. **Hab:** Moist bottomland forests, pocosin edges, mesic forests, ridgetop pine and oak/pine forests, pine flatwoods, longleaf pine sandhills. **Dist:** DE south to n. FL and west to e. TX and se. OK. The range in our area is discontinuous and interesting, the species rather abundant in the Coastal Plain throughout our area, and in the Mountains of NC and SC (absent from the VA mountains!), but present in the Piedmont only near its borders with the other provinces and in scattered sites in the central Piedmont. Plants in the part of the distribution in the Southern Appalachians have been described as var. *ashei* Harbison on the basis of hairier leaves, stems, and fruits; the correlation of morphology and biogeography is suggestive of varietal distinction reflecting past history of the species in our area (see Hardin 1966). **Phen:** Mar-May; Aug-Sep. **Tax:** Var. *ashei*, with mainly or strictly montane distribution, needs additional taxonomic consideration; see Hardin (1966) and Harbison (1931). **ID Notes:** The leaves have a subcoriaceous and rather evergreen appearance, but are only semi-evergreen or tardily deciduous. As the name implies, the leaves are somewhat sweet (especially near the midvein), but the sweetness seems variable from plant to plant, season to season, and taster to taster. Whether sweet or not, the 'green apple' taste is distinctive and is helpful (once learned) in distinguishing this rather nondescript shrub or small tree. Where protected from fire, *S. tinctoria* can reach considerable size, to at least 20 cm in diameter and 12 m tall, with longitudinally striped bark. **Syn:** = Ar, C, Fl5, GW2, K1, K3, NY, RAB, S, Tn, Tx, Va, W, WH3, Hardin (1966); > *Symplocos tinctoria* (Linnaeus) L'Héritier var. *ashei* Harbison – Harbison (1931); > *Symplocos tinctoria* var. *pygmaea* Fernald – F, G; > *Symplocos tinctoria* var. *tinctoria* – F, G, Harbison (1931). NatureServe G5 (Secure).

339. **STYRACACEAE** A.P. de Candolle & Sprengel 1821 (STORAX FAMILY) [in ERICALES]

A family of about 11 genera and 160 species, trees and shrubs, of warm temperate and tropical regions of America, Mediterranean Europe, se. Asia, Malaysia. References: Fritsch in Kubitzki et al (2004); Fritsch (2009) in FNA8 (2009).

- 1 Corolla lobes 4; fruit elongate, winged, 2.5-5 cm long; petioles 15-25 mm long..... *Halesia*
1 Corolla lobes 5; fruit globose, not winged, 0.5-0.9 cm in diameter; petioles 2-10 mm long..... *Styrax*

Halesia J. Ellis ex Linnaeus 1759 (SILVERBELL, SNOWDROP TREE)

A genus of about 4 species, trees and shrubs, of e. North America and e. Asia. The genus was named to honor Stephen Hales; it therefore seems more appropriate to pronounce the genus with three syllables (the accent on the first) than the commonly heard four, which thoroughly distorts the honoree's name. The number of taxa in our area and their appropriate taxonomic level are in dispute; recent analyses vary from 2-5, with specific or varietal status. References: Fritsch & Lucas (2000); Fritsch (2009) in FNA8 (2009); Godfrey (1988); Reveal & Seldin (1976); Sargent (1921a).

- 1 Petals united only basally, the lobes longer than the tube; fruits broadly 2-winged (and sometimes also with 2 narrow wings or ridges alternating with the 2 broad wings); leaves broadly obovate to suborbicular, 1-2× as long as wide. *Halesia diptera* var. *diptera*
- 1 Petals united for most of their length, the tube longer than the lobes; fruits narrowly or broadly 4-winged; leaves elliptic-oblong, ca. 2× as long as wide.
 - 3 Corolla 7-10 (-12) mm long, the style strongly exserted (1/3 to 1/2 the length of the corolla tube beyond its mouth), the anthers at the mouth of the corolla tube or slightly exserted; fruit obovate in outline, broadest toward the tip, strongly narrowed to the base, narrowly winged. *Halesia carolina*
 - 3 Corolla (12-) 15-30 mm long, the style included or slightly exserted, the anthers within the mouth of the corolla tube; fruit ellipsoid to slightly obovate in outline, broadest near the middle, broadly winged. *Halesia tetraptera*

Halesia carolina Linnaeus. LITTLE SILVERBELL. **Hab:** Sandy alluvial forests, calcareous hammocks. **Dist:** S. SC south to Panhandle FL, west to s. MS. **Phen:** Mar-Apr; Sep-Oct. **Syn:** = F15, K1, WH3, Godfrey (1988), Reveal & Seldin (1976); = *Halesia parviflora* Michaux – GW2, RAB, S; < *Halesia carolina* Linnaeus – FNA8, K3, K4, Fritsch & Lucas (2000).

Halesia diptera J. Ellis var. *diptera*. COMMON TWO-WING SILVERBELL. **Hab:** Bottomland forests, forested edges of brackish marshes. **Dist:** Var. *diptera* ranges from s. SC south to Panhandle FL, west to n. AL, sw. AR, and e. TX. **Phen:** Mar-May; Jul-Sep. **Syn:** = Godfrey (1988), Reveal & Seldin (1976); < *Halesia diptera* J. Ellis – F15, FNA8, GW2, K1, K3, K4, RAB, S, Tx, WH3; < *Mohrodendrum dipterum* (J. Ellis) Britton.

Halesia tetraptera J. Ellis. COMMON SILVERBELL, MOUNTAIN SILVERBELL. **Hab:** Moist slopes, coves, creek-banks, bottomlands. **Dist:** W. VA, s. WV, and s. IL, south to FL and s. MS (and cultivated elsewhere); disjunct in AR and OK. **Phen:** Mar-May; Aug-Sep. **Tax:** Two varieties or species have sometimes been recognized (see synonymy): "*monticola*," a large tree, restricted to the Southern Appalachians (and especially the Great Smoky Mountains), the corolla (18-) 20-30 mm long, the style included, the anthers well inside the mouth of the corolla tube, and "*tetraptera*," a smaller tree more widely distributed, the corolla (12-) 15-20 mm long, the style slightly exserted, the anthers just within the mouth of the corolla tube. Most studies have judged them too intergradient to be practically delimited. **Syn:** = C, Va; = *Halesia carolina* Linnaeus – F, G, RAB, W, WV; < *Halesia carolina* Linnaeus – FNA8, II, K4, Mi, NE, NY, Pa, Tn, Fritsch & Lucas (2000); > *Halesia carolina* Linnaeus – S; > *Halesia monticola* (Rehder) Sargent – S; > *Halesia tetraptera* Ellis var. *monticola* (Rehder) Reveal & Seldin – K1, Reveal & Seldin (1976); > *Halesia tetraptera* Ellis var. *tetraptera* – K1, Reveal & Seldin (1976).

*Styrax* Linnaeus 1753 (SNOWBELL, STORAX)

A genus of about 120-130 species, trees and shrubs, of s. Europe, Malesia, se. Asia, se. North America, and tropical America. Nicolson & Steyskal (1976) discussed at length the grammatical gender of the genus, and concluded that it should be treated as masculine. References: Fritsch (2009) in FNA8 (2009); Gonsoulin (1974); Nicolson & Steyskal (1976).

- 2 Leaves generally broadly obovate, sometimes broadly ovate, 5-14 cm long, 4-10 cm wide, the apices acute to short-acuminate, densely and finely pubescent beneath, giving the underside of the leaf a pale color; inflorescence usually of 5-20 flowers. *Styrax grandifolius*
- 2 Leaves narrowly elliptic to ovate or obovate, usually 2-8 cm long, 1-4 cm wide, the apices short- to long-acuminate, glabrous or sparsely pubescent beneath (to densely pubescent and then giving the underside of the leaf a rusty color in var. *pulverulentus*); inflorescence usually of 1-7 flowers.
 - 3 Leaves oblong-elliptic, glabrous or sparsely pubescent on the undersurfaces and petioles, the margins usually distantly toothed toward the apices; pedicels 10-14 mm long; calyces essentially glabrous; new growth glabrous to sparsely pubescent. *Styrax americanus* var. *americanus*
 - 3 Leaves elliptic to ovate to oblanceolate or obovate, sparsely to densely scurfy-hairy on the undersurfaces and petioles, margins entire to serrate; pedicels 4-6 mm long; calyces and pedicels densely scurfy-hairy; new growth densely matted pubescent. *Styrax americanus* var. *pulverulentus*

Styrax americanus Lamarck var. *americanus*. AMERICAN SNOWBELL, AMERICAN STORAX. **Hab:** Swamp forests, pocosin edges, depression wetlands, other moist to wet habitats. **Dist:** Var. *americanus* ranges from ne. WV, OH, s. IN, s. IL, s. MO, south to s. FL and e. TX. **Phen:** Apr-Jun; Jul-Sep. **Comm:** See discussion below on var. *pulverulentus* and the existence of transitional plants. **Syn:** = C, Va; = *Styrax americana* – S; = *Styrax americana* var. *americana* – F, Gonsoulin (1974); < *Styrax americana* – Ar, G, GW2, RAB, Tx, Tx, W; < *Styrax americanum* – II; < *Styrax americanus* – F15, FNA8, K1, K3, K4, Tn, WH3.

Styrax americanus Lamarck var. *pulverulentus* (Michaux) Perkins ex Rehder. DOWNY AMERICAN SNOWBELL. **Hab:** Wet pine flatwoods. **Dist:** 'Good' var. *pulverulentus* ranges from SC south to s. FL and west to e. TX and se. MO; some plants in NC and SC are transitional between the two varieties and will not be easily assigned. **Phen:** Apr-May; Jul-Sep. **Syn:** = C, Gonsoulin (1974); = *Styrax americana* var. *americana* – Gonsoulin (1974); = *Styrax pulverulenta* Michaux – S; < *Styrax americana* – Ar, G, GW2, RAB, Tx, Tx, W; < *Styrax americanus* – F15, FNA8, K1, K3, K4, WH3.

339. STYRACACEAE

Styrax grandifolius Aiton. BIGLEAF SNOWBELL, BIGLEAF STORAX. **Hab:** Mesic to dry upland forests, bluffs. **Dist:** Se. VA south to ne. FL and. Panhandle FL, west to e. TX, north to se. MO. **Phen:** Apr-May; Aug-Sep. **Syn:** = Ar, C, F15, FNA8, K1, K3, K4, Tn, Va, WH3; = *Styrax grandifolia* – F, G, RAB, S, W, Gonsoulin (1974); < *Styrax grandifolium* – Il. NatureServe G5 (Secure).

340. SARRACENIACEAE Dumortier 1829 (PITCHERPLANT FAMILY) [in ERICALEs]

A family of 3 genera and about 22 species, perennial insectivorous herbs, of e. North America (*Sarracenia*), w. North America (*Darlingtonia*), and ne. South America (*Heliamphora*). References: Kubitzki et al (2004); Mellichamp (2009b) in FNA8 (2009); Neyland & Merchant (2006); Schnell (2002b).

Sarracenia Linnaeus 1753 (PITCHERPLANT)

A genus of about 11 species, perennial insectivorous herbs, of e. North America. The sections that have sometimes been recognized do not accord with recent findings about clades and relationships within *Sarracenia*, so are not recognized here. The status of *Sarracenia* as a genus with intense horticultural interest is responsible for both conservation challenges and opportunities facing taxa in the genus. Interest in color forms by collectors and growers is also responsible for the naming of many taxa at variety rank that are merely coloration forms. References: Bell & Case (1956); Bell (1949); Bell (1952); Carstens & Satler (2013); Case & Case (1976); Catalani (2004); Cheek (1994); Cheek (2001); Godt & Hamrick (1999); McDaniel (1971); McPherson & Schnell (2011); McPherson (2006); McPherson (2007); Mellichamp & Case (2009) in FNA8 (2009); Mellichamp (2008); Naczi et al (1999); Neyland & Merchant (2006); Reveal (1993b); Rice (2018); Romanowski (2002); Schnell & Determann (1997); Schnell (1979); Schnell (1981); Schnell (1993); Schnell (1998); Schnell (2002a); Schnell (2002b); Wood (1960).

Identification Notes: Hybrids between the various species of pitcherplants are relatively frequent; see Bell (1952), Bell & Case (1956), Mellichamp (2008), Mellichamp in FNA (2009), and McPherson & Schnell (2011) for further discussion. They are usually rather easy to determine in geographic context, since they show intermediacy in characters, and usually are found in close proximity to both parents.

Sarracenia - Key to *Sarracenia*

- 1 Pitchers mostly decumbent; lateral wing of the pitcher very prominent; petals maroon to pink.
 - 2 Pitchers prominently marked with white on the hood; hood of the pitcher globose; orifice formed by the fusion of the hood margins *Sarracenia psittacina*
 - 2 Pitchers not marked with white on the hood; hood of the pitcher expanded and erect; orifice not involving the hood margins; [*S. purpurea* complex] *Sarracenia rosea*
- 1 Pitchers erect; lateral wing of the pitcher generally not prominent; petals maroon, red, or yellow.
 - 6 Pitchers with white (or whitish and translucent) patches toward the summit of the pitcher and behind the orifice and/or on the hood. *Sarracenia leucophylla*
 - 6 Pitchers without white or translucent patches toward the summit of the pitcher.
 - 9 Petals yellow; pitcher hood 4-10 (-14) cm wide.
 - 11 Narrowed base of the hood not purple-spotted, its sides revolute but not rolled backward and nearly touching; blade of the hood ovate, slightly cordate basally; [of the Coastal Plain, from s. AL west to e. TX] *Sarracenia alata*
 - 11 Narrowed base of the hood usually purple-spotted, its sides strongly rolled backward (away from the orifice) such that they nearly touch; blade of the hood broadly reniform to orbicular-reniform, broadly cordate basally; [of the Coastal Plain and rarely Piedmont, from se. VA southward to n. FL and west to se. MS] *Sarracenia flava*
 - 9 Petals maroon; pitcher hood < 4 cm wide (except *S. alabamensis* ssp. *alabamensis*, which can be up to 8.8 cm wide). *Sarracenia alabamensis* ssp. *wherryi*

Sarracenia alabamensis F.W. Case & R.B. Case ssp. *wherryi* F.W. Case & R.B. Case. WHERRY'S PITCHERPLANT. **Hab:** Seepage bogs and pine savannas. **Dist:** FL Panhandle, s. AL, and s. MS. **Phen:** Apr-May. **Comm:** See Case (2005). **Syn:** = FNA8, K3, Case & Case (1976), Rice (2018); = *Sarracenia rubra* Walter ssp. *wherryi* (F.W. Case & R.B. Case) D.E. Schnell – F15, K1, WH3, McPherson & Schnell (2011), Schnell (2002b); < *Sarracenia rubra* – GW2, S, McDaniel (1971), Wood (1960).

Sarracenia alata Alph. Wood. PALE PITCHERPLANT. **Hab:** Pine savannas, seepage bogs. **Dist:** S. AL west to e. TX. **Phen:** Mar-Apr. **Tax:** Carstens & Satler (2013) argued that this species as defined includes two cryptic species, one east of the Mississippi River (*S. alata* s.s.) and one west of the Mississippi River (*Sarracenia* sp. nov.). The western segregate has not been named. **Syn:** = FNA8, GW2, K1, K3, K4, NcTx, Tx, McDaniel (1971), Schnell (2002b), Wood (1960); = *Sarracenia sledgei* Macfarlane – S, Bell (1949); > *Sarracenia alata* Alph. Sarracenia leucophylla Rafinesque. WHITETOP PITCHERPLANT, CRIMSON PITCHERPLANT. **Hab:** Wet pine savannas. **Dist:** Sw. GA, w. FL, s. AL, and se. MS, a Gulf Coastal Plain endemic; introduced in eastern NC (and likely to be found elsewhere outside its natural range). Sometimes planted in natural areas by carnivorous plant enthusiasts outside of its natural range, such as in the Coastal Plain of NC, where it has been seen in at least 3 localities. The NC population on Croatan National Forest, Carteret Co. was apparently introduced in the 1980s; it is not known whether this species will spread in NC, but it is still persisting (as of 2015) and has been independently "discovered" several times. **Phen:** Early Mar-late Apr. **Syn:** = F15, FNA8, GW2, K1, K3, K4, WH3, McDaniel (1971), Schnell (2002b), Wood (1960); = n/a – RAB; = *Sarracenia drummondii* Croom – S, Bell (1949); > *Sarracenia leucophylla* var. *alba* (Hort. T. Baines ex R. Hogg & T. Moore) J. Pietropaolo & P. Pietropaolo ex S. McPherson & D.E. Schnell – McPherson & Schnell (2011); > *Sarracenia leucophylla* var. *leucophylla* – McPherson & Schnell (2011). **NatureServe G3** (Vulnerable).

Sarracenia psittacina Michaux. PARROT PITCHERPLANT. **Hab:** Savannas, less commonly on floating peat mats. **Dist:** This distinctive species is distributed primarily in the East Gulf Coastal Plain, but ranges east to the Atlantic Coastal Plain of e. GA (Bullock County), in close proximity to the SC border. **Phen:** Late Mar-May. **Tax:** Var. *okefenokeensis* may have merit, but needs additional study. **Syn:** = F15, FNA8, GW2, K1, K3, K4, S, WH3, Bell (1949), McDaniel (1971), Schnell (2002b), Wood (1960); = n/a – RAB; > *Sarracenia psittacina* var. *okefenokeensis* S. McPherson & D.E. Schnell – McPherson & Schnell (2011); > *Sarracenia psittacina* var. *psittacina* – McPherson & Schnell (2011). **NatureServe G4** (Apparently Secure).

Sarracenia rosea Naczi, F.W. Case, & R.B. Case. ROSE PITCHERPLANT. **Hab:** Wet pine savannas and seepage bogs. **Dist:** Sw. GA and Panhandle FL west to s. MS and (?) e. LA. **Phen:** Mar-Apr. **Comm:** Schnell (1993) distinguished the RAB, distinctive East Gulf Coastal Plain population (with short peduncles, white stigmas, and pale pink petals) as *S. purpurea* ssp. *venosa* var. *burkii* Schnell; Naczi et al. (1999) elevated this to species rank, as *S. rosea*. See Naczi et al. (1999) and Schnell (1993) for more detailed information and color photographs. Naczi et al.'s (1999) treatment of this taxon at specific rank is supported by the greater genetic distance found by Godt and Hamrick (1999) and morphologic and genetic analyses (Ellison et al. 2004). See MacRoberts & MacRoberts (2004) for a detailed discussion about old LA collections of *S. purpurea* or *S. rosea*. **Syn:** = F15, FNA8, K3, WH3; = *Sarracenia purpurea* Linnaeus ssp. *purpurea* var. *burkii* Schnell – K1; = *Sarracenia purpurea* ssp. *venosa* (Rafinesque) Fernald var. *burkii* Schnell – McPherson & Schnell (2011), Schnell & Determann (1997), Schnell (2002b); < *Sarracenia purpurea* – GW2, S, Bell (1949), McDaniel (1971), Wood (1960); < *Sarracenia purpurea* Linnaeus var. *purpurea* – Reveal (1993b).

343. CLETHRACEAE Klotzsch 1851 (CLETHRA FAMILY) [in ERICALES]

A monogeneric family of 65-95 species, shrubs and trees, primarily of tropical America and Asia. Sometimes combined into the Cyrillaceae. References: Anderberg & Zhang (2002); Schneider & Bayer in Kubitzki et al (2004); Sleumer (1967b); Tucker & Jones (2009) in FNA8 (2009).

Clethra Linnaeus 1753 (SWEET PEPPERBUSH, WHITE-ALDER, CLETHRA)

A genus of 65-95 species, shrubs and trees, primarily of tropical America and Asia. References: Schneider & Bayer in Kubitzki et al (2004); Sleumer (1967b); Tucker & Jones (2009) in FNA8 (2009).

- 2 Lower leaf surface sparsely hairy; petioles 2.5-3.5 (-6) cm long; styles 6-7 mm long, hairy at the base with straight hairs; filaments 0.2-0.3 (-0.4) mm in diameter..... *Clethra alnifolia*
- 2 Lower leaf surface woolly-tomentose; petioles 0.5-1 (-1.5) cm long; styles 3.5-5 mm long, downy throughout; filaments 0.4-0.5 (-0.7) mm in diameter..... *Clethra tomentosa*

Clethra alnifolia Linnaeus. COASTAL SWEET-PEPPERBUSH, COASTAL WHITE-ALDER. **Hab:** Pocosins, blackwater swamp forests, nonriverine swamp forests. **Dist:** Primarily a southeastern Coastal Plain species, *C. alnifolia* ranges from NS and ME south to FL, west to TX; disjunct in sc. TN (Coffee County) (Chester, Wofford, & Kral 1997). **Phen:** Jun-Aug; Sep-Oct. **Syn:** = FNA8, NE, NY, S, Tn, Tx, Va; = *Clethra alnifolia* var. *alnifolia* – K4, RAB, Sleumer (1967b); < *Clethra alnifolia* Linnaeus – C, F, G, GW2, K1, K3, Pa, WH3. **NatureServe G5** (Secure).

Clethra tomentosa Lamarck. DOWNY SWEET-PEPPERBUSH, DOWNY WHITE-ALDER. **Hab:** Pocosins, swamps, streambanks. **Dist:** E. SC south to FL, and west to e. LA (east of the Mississippi River). **Tax:** If recognized at varietal rank, the correct name is var. *pubescens* Aiton, which predates

343. CLETHRACEAE

var. *tomentosa* (Lamarck) Michaux (Sleumer 1967b, Wilbur 1970b). **Syn:** = FNA8, S; = *Clethra alnifolia* var. *pubescens* Aiton – K4, Sleumer (1967b); = *Clethra alnifolia* var. *tomentosa* (Lamarck) Michaux – RAB; < *Clethra alnifolia* Linnaeus – Fl5, GW2, K1, K3, WH3.

344. CYRILLACEAE Lindley 1846 (TITI FAMILY) [in ERICALES]

A family of 2 genera and 5 or more species, ranging from se. North America to the West Indies and n. South America (following the removal of *Purdiaea* to the Clethraceae (Anderberg & Zhang 2002). References: Anderberg & Zhang (2002); Godfrey (1988); Kubitzki et al (2004); Lemke (2009) in FNA8 (2009); Thomas (1960).

- 1 Lateral veins of the leaf blades scarcely or not at all apparent on either surface; flowers in terminal and axillary racemes, the racemes solitary or several at a node, not markedly radiating; fruit 5-7 mm long, 2-5 winged..... *Cliftonia*
- 1 Lateral veins of the leaf blades readily apparent on both surfaces, the main laterals neatly pinnate, the smaller veins forming a fine reticulum; flowers in lateral racemes, the racemes clustered together at the summit of the previous year's growth and radiating outward or reflexed; fruit 2-2.5 mm long, not winged *Cyrilla*

Cliftonia Banks ex C.F. Gaertner 1807 (BLACK TITI, BUCKWHEAT-TREE)

A monotypic genus, shrub or small tree, of se. North America. References: Kubitzki et al (2004); Lemke (2009) in FNA8 (2009); Thomas (1960).

Cliftonia monophylla (Lamarck) Britton ex Sargent. BLACK TITI, BUCKWHEAT-TREE. **Hab:** Acid bogs, bayheads, swamps, and streambanks. **Dist:** Se. SC south to n. FL, west to se. LA. **Phen:** Late Feb-May. **Syn:** = Fl5, FNA5, GW2, K1, K3, S, Tx, WH3, Thomas (1960); = n/a – RAB. **NatureServe G4G5** (Apparently Secure).

Cyrilla Garden ex Linnaeus 1767 (TITI)

A genus of 3-10 (or more) species, trees and shrubs, of warm temperate to tropical North America, the West Indies, and n. South America. The most recent monographer (Thomas 1960) treated *Cyrilla* as monotypic, clearly the diversity of habit (from subshrubs to large forest trees) and floral structure warrant the recognition of multiple taxa at specific rank; the genus is badly in need of modern study. References: Kubitzki et al (2004); Kurz & Godfrey (1962); Lemke (2009) in FNA8 (2009); Small (1924b); Thomas (1960).

Cyrilla racemiflora Linnaeus. TITI. **Hab:** Pocosins, swamps, lake and pine flatwood pond margins, streambanks, pine flatwoods. **Dist:** E. VA (Accomack County) south to sc. peninsular FL, west to e. TX. **Phen:** May-Jul; Sep-Oct. **Tax:** Thomas (1960) interprets this species very broadly, as also distributed in the West Indies, Belize, Mexico, and n. South America (notably the tepuis and Gran Sabana of s. Venezuela), but I interpret plants in these areas as belonging to other species. The leaves are quite variable in shape and size; the venation and glossy smoothness, however, are distinctive once learned. **Syn:** = C, G, K1, RAB, S, Tx, Va, Kurz & Godfrey (1962), Small (1924b); < *Cyrilla racemiflora* Linnaeus – Fl5, FNA12, GW2, K3, K4, WH3, Thomas (1960); > *Cyrilla racemiflora* var. *racemiflora* – F; > *Cyrilla racemiflora* var. *subglobosa* Fernald – F. **NatureServe G5** (Secure).

345. ERICACEAE A.L. de Jussieu 1789 (HEATH FAMILY) [in ERICALES]

A family of about 107-124 genera and 3400-4100 species, primarily shrubs, small trees, and subshrubs, nearly cosmopolitan. The Ericaceae is very important in our area, which is one of the north temperate centers of diversity for the Ericaceae, with a great diversity of genera and species, many of them rather narrowly endemic. Along with *Quercus* and *Pinus*, various members of this family are dominant in much of our landscape. References: Cullings & Hileman (1997); Dorr & Barrie (1993); Gillespie & Kron (2010); Gillespie & Kron (2013); Judd & Kron (1993); Kron & Chase (1993); Kron et al (2002); Kron, Powell, & Luteyn (2002); Luteyn et al (1996); Stevens et al. in Kubitzki et al (2004); Tucker (2009a) in FNA8 (2009); Wood (1961).

Main Key, for use with flowering or fruiting material.

- 1 Plant an herb, subshrub, or sprawling shrub, not clonal by underground rhizomes (except *Gaultheria procumbens* and *Epigaea repens*), rarely > 3 dm tall; plants mycotrophic or hemi-mycotrophic (except *Epigaea*, *Gaultheria*, and *Arctostaphylos*).

N : no
P : planted
? : questionable

- 2 Plants without chlorophyll (fully mycotrophic); stems fleshy; leaves represented by bract-like scales, white or variously colored, but not green; pollen grains single; [subfamily *Monotropoideae*; tribe *Monotropeae*].
- 4 Flowers few to many, racemose; stem pubescent, at least in the inflorescence; plant yellow, orange, or red when fresh, aging or drying dark brown *Hypopitys*
- 4 Flower solitary; stem glabrous; plant white (rarely pink) when fresh, aging or drying black..... *Monotropa*
- 2 Plants with chlorophyll (hemi-mycotrophic or autotrophic); stems woody; leaves present and well-developed, green; pollen grains in tetrads (single in *Orthilia*).
- 7 Plant erect, the leaves clustered near the apex of the single stem. *Chimaphila*
- 7 Plant creeping or sprawling, leaves scattered along the stems. *Epigaea*
- 1 Plant either a shrub (> 3 dm tall), or a shrub 1-3 dm tall and definitely and obviously clonal by underground rhizomes; plants not mycotrophic or hemi-mycotrophic.
- 11 Leaves ca. 1 mm wide, 3-12 mm long, appearing opposite, alternate, or whorled (the internodes very short, thus the leaves generally appearing whorled); petals absent; fruit a subglobose, 2-stoned drupe, 1-3 mm in diameter; branches often appearing in whorls of 3-7; [subfamily *Ericoideae*; tribe *Empetreae*] *Ceratiola*
- 11 Leaves either > 2 mm wide or < 5 mm long, mostly alternate or whorled; petals present; fruit not as above, mostly either a capsule or 10- or many-seeded berry; branches appearing alternate or whorled; [subfamily *Vaccinioideae*; tribe *Vaccinieae*].
- 13 Ovary inferior; fruit indehiscent, a fleshy berry; [blueberries and huckleberries].
- 14 Ovary 10 locular; seeds 10; leaves glandular-punctate, at least on the lower surface (except *G. brachycera*)..... *Gaylussacia*
- 14 Ovary 4-5 locular; seeds numerous; leaves not glandular-punctate..... *Vaccinium*
- 13 Ovary superior; fruit dehiscent, a dry capsule; [other heaths].
- 21 Leaves coriaceous, evergreen, shiny and dark green above.
- 22 Leaves sharply and distinctly serrate. *Leucothoe*
- 22 Leaves entire, or obscurely and finely crenulate-serrulate.
- 24 Capsules elongate, > 2× as long as broad, 8-18 mm long; [subfamily *Ericoideae*; tribe *Rhodoreae*]..... *Rhododendron*
- 24 Capsules ovoid to globose or subglobose, about as long as broad, 5-8 mm long.
- 25 Leaves with a prominent vein running parallel to (and about 1 mm in from) the margin; [subfamily *Vaccinioideae*; tribe *Lyonieae*] *Lyonia lucida*
- 25 Leaves without a prominent marginal vein.
- 26 Corolla saucer-shaped, 10-30 mm across; leaves entire; [subfamily *Ericoideae*; tribe *Phyllodoceae*]..... *Kalmia*
- 26 Corolla narrowly urceolate, 4-6 mm across; leaves finely crenulate-serrulate; [subfamily *Vaccinioideae*; tribe *Lyonieae*] *Pieris*
- 21 Leaves membranaceous or subcoriaceous, deciduous or evergreen, if subcoriaceous and evergreen, then not shiny and dark green above.
- 28 Capsules elongate, > 2× as long as broad, 7-23 mm long; [subfamily *Ericoideae*; tribe *Rhodoreae*]..... *Rhododendron*
- 28 Capsules ovoid to globose or subglobose, about as long as broad, or broader than long, 2-7 mm long.
- 29 Leaves (at least the larger) > 2.5 cm wide.
- 30 Pedicels with 2 bracteoles.
- 31 Capsule broader than long; shrub; bracteoles just below the calyx; [subfamily *Vaccinioideae*; tribe *Gaultherieae*]..... *Eubotrys*
- 31 Capsule longer than broad; tree; bracteoles generally near the middle of the pedicel; [subfamily *Vaccinioideae*; tribe *Oxydendreae*] *Oxydendrum arboreum*
- 30 Pedicels without bracteoles. *Lyonia*
- 29 Leaves < 2.5 cm wide.
- 34 Leaves whorled or alternate; corolla saucer-shaped, 10-20 mm across; [subfamily *Ericoideae*; tribe *Phyllodoceae*]..... *Kalmia*
- 34 Leaves alternate; corolla narrowly urceolate, 2-8 mm across. *Lyonia*

Alternate Key - to Ericaceae (including some relatives), emphasizing vegetative characters
[This key includes some related shrubs, of the Diapensiaceae, Clethraceae, and Cyrillaceae]

- 1 Leaves and stems lacking chlorophyll (either white or variously tinted with colors such as pink, tan, red, or violet)..... **Key A**
- 1 Leaves and stems with chlorophyll (green, though some parts may have the green pigment obscured with purple or other colors).
- 3 Subshrub or sprawling shrub, 0-1 (-2) dm tall, not clonal by underground rhizomes (except *Gaultheria procumbens*), though often clonal by creeping stems, or sprawling and patch-forming (many of these species are only ambiguously shrublike and are considered herbs by the casual observer)..... **Key C**
- 3 Shrub, > 3 dm tall, or 1-3 dm tall and definitely and obviously clonal by underground rhizomes..... **Key D**

Key A - Achlorophyllose plants

- 1 Flower solitary; stem glabrous; plant white (rarely pink) when fresh, aging or drying black..... *Monotropa uniflora*
- 1 Flowers few to many, racemose; stem glabrous (*Monotropis*) or pubescent, at least in the inflorescence (*Hypopitys*); plant yellow, orange, or red when fresh, aging or drying dark brown. *Hypopitys*

Key C - Evergreen subshrubs and sprawling shrubs

- 1 Plant erect, the leaves few (< 10), clustered near the apex of the single stem. *Chimaphila maculata*
- 1 Plant creeping or sprawling, leaves scattered along the stems, or tufted at the base. *Epigaea repens*

Key to Map
 Symbology:

←rare ←uncommon ←common
 (see introduction for more)

N : no X : extirpated
 P : planted
 ? : questionable

Key D - Evergreen ericaceous shrubs (either tall or obviously clonal) and trees

- 1 Leaves linear, needle-like, either appearing whorled (at least in part, sometimes also with nodes appearing opposite or alternate) or opposite (*Calluna*).
 *Ceratiola ericoides*
- 1 Leaves broader, alternate (or whorled or opposite in some *Kalmia*).
 5 Leaves (all of them) < 2 cm long.
 *Vaccinium darrowii*
- 5 Leaves (at least the larger) > 3 cm long.
 10 Leaves toothed, at least toward the tip of the leaf (note that fine serrations or crenations can be obscured by revolute margins).
 11 Leaves elliptic to oblanceolate, widest near or above the middle, obtuse, acute, or short-acuminate, 1.5-7 cm long, 0.5-2.5 cm wide; leaf serrations fine and obscure; leaf surfaces with small stipitate glands (*Pieris*) or lepidote with scales (*Chamaedaphne*).
 *Pieris phillyreifolia*
- 11 Leaves lanceolate or ovate, widest below the middle, short-acuminate to acuminate, 4-15 cm long, 1-5 cm wide; leaf serrations generally obvious (at least toward the acuminate leaf tip); leaf surfaces glabrous, or with non-stipitate hairs on the lower surface.
 *Leucothoe axillaris*
- 10 Leaves entire.
 27 Leaf with a prominent vein running the length of the margin, about 1 mm in; [shrub to 4 m tall] *Lyonia lucida*
 27 Leaf venation not as above; [shrub to small tree] { *Kalmia latifolia*, *Cyrilla*, *Cliftonia*, *Bejaria* }

Ceratiola Michaux 1803 (FLORIDA ROSEMARY)

A monotypic genus, a shrub, of se. North America. References: Elisens (2009c) in FNA8 (2009); Johnson (1982); Judd & Kron (1993); Kron & Chase (1993); Stevens et al. in Kubitzki et al (2004).

Ceratiola ericoides Michaux. ROSEMARY, FLORIDA ROSEMARY, SANDHILL ROSEMARY, SAND HEATH. **Hab:** Xeric sandhills, usually in white "sugar sand". **Dist:** Ne. SC south to s. FL and west to s. MS. **Phen:** Oct-Nov. **Comm:** Its content of aromatic compounds makes it very flammable. Trapnell et al. (2007) studied genetic differentiation in the species. **Syn:** = FI5, K1, K3, K4, RAB, S, WH3, Luteyn et al (1996). NatureServe G4 (Apparently Secure).

*Chimaphila* Pursh 1814 (PIPSISSEWA)

A genus of 4-5 species, subshrubs, of temperate and tropical America, and Eurasia. References: Freeman (2009d) in FNA8 (2009); Stevens et al. in Kubitzki et al (2004).

Chimaphila maculata (Linnaeus) Pursh. PIPSISSEWA, STRIPED WINTERGREEN, RAT'S BANE. **Hab:** Forests and woodlands, mostly rather xeric and acid. **Dist:** ME west to MI, south to GA, FL Panhandle, and AL. **Phen:** May-Jul; Jul-Oct. **Tax:** The populations attributed to *Chimaphila maculata* in montane areas of s. AZ, Mexico (21 states), and Central America (south to Panama) represent a far disjunct population, which also differs consistently in its narrower leaf shape and more appressed or obscure leaf teeth than eastern North American plants. I here conservatively regard the eastern North American and Mexican-Central American populations as separate at species rank; they have usually been given either species or variety rank, as *Chimaphila acuminata* (Lange) Rydberg or *Chimaphila maculata* var. *acuminata* Lange. **Syn:** = C, F, FI5, G, IL, K1, K3, K4, Mi, NE, NY, Pa, RAB, S, Tn, Va, W, WH3, Luteyn et al (1996); < *Chimaphila maculata* (Linnaeus) Pursh – FNA8, Meso4.1. NatureServe G5 (Secure).

*Epigaea* Linnaeus 1753 (TRAILING ARBUTUS)

A genus of 3 species, subshrubs, in e. North America and Eurasia; the other 2 species of the genus occur in the Caucasus and Asia Minor, and in Japan. References: Judd & Kron (2009b) in FNA8 (2009); Stevens et al. in Kubitzki et al (2004).

Epigaea repens Linnaeus. TRAILING ARBUTUS, MAYFLOWER, GROUND LAUREL. **Hab:** In a wide variety of acidic forests, xeric to mesic, sandy, rocky, and loamy. **Dist:** NL (Newfoundland) and QC west to MB, south to FL Panhandle, MS, and MN. **Phen:** Late Feb-early May; Apr-Jun. **Comm:** At maturity, the fruits split along the sutures, exposing tiny brown seeds embedded in "sticky, white, placental tissue" which is "distinctly sweet to the taste;" ants are strongly attracted to the placental tissue, and in carrying it away disperse the seeds (Clay 1983). **Syn:** = C, FI5, FNA8, G, IL, K1, K3, K4, Mi, NE, NY, Pa, RAB, S, Tn, Va, W, WH3, WV, Luteyn et al (1996); > *Epigaea repens* var. *glabrifolia* Fernald – F; > *Epigaea repens* var. *repens* – F. NatureServe G5 (Secure).

*Eubotrys* Nuttall 1842 (DECIDUOUS FETTERBUSH)

A genus of 2 species, shrubs to small trees, of e. North America. Recent molecular evidence supports the recognition of *Eubotrys* as a genus separate from *Leucothoe*, and more closely related to *Chamaedaphne*, supporting the views, based on morphological grounds, of many earlier authors (Kron et al. 2002). The genus is often treated as feminine in grammatical gender (like most Ericaceae), but the Code is unequivocal that names ending in

various suffixes, including “-botrys” should be treated as masculine. References: Judd et al (2012); Kron et al (2002); Stevens et al. in Kubitzki et al (2004); Tucker (2009f) in FNA8 (2009).

Eubotrys racemosus (Linnaeus) Nuttall. COASTAL FETTERBUSH. **Hab:** Swamps, pocosins, streambanks, and other wet places. **Dist:** E. MA south to c. peninsular FL and west to LA, primarily on the Coastal Plain; disjunct inland, as in c. and e. TN. **Phen:** Late Mar-early Jun; Sep-Oct. **Syn:** = K4; = *Eubotrys racemosa* – C, Fl5, FNA8, G, NE, NY, Tn, Va, WH3, Judd et al (2012), orthographic (gender) variant; = *Leucothoe racemosa* (Linnaeus) A. Gray – GW2, K1, K3, Pa, RAB, Tx, W, Luteyn et al (1996); > *Eubotrys elongata* Small – S; > *Eubotrys racemosa* – S; > *Leucothoe racemosa* var. *projecta* Fernald – F; > *Leucothoe racemosa* var. *racemosa* – F. [NatureServe G5](#) (Secure).

Gaylussacia Kunth 1819 (HUCKLEBERRY)

A genus of ca. 50 species, shrubs, of North and South America (centered in South America). The sections and subsections follow Sleumer (1967a). A study of the phylogeny of the genus *Gaylussacia* provided some evidence for the treatment of *Gaylussacia brachycera* as a monotypic genus or within *Vaccinium*; additional study is needed. References: Camp (1935); Coville (1919); Duncan & Brittain (1966); Fernald (1911); Gajdeczka et al (2010); Godfrey (1988); Kron, Powell, & Luteyn (2002); Pooler, Dix, & Griesbach (2006); Pooler, Nicholson, & Vandegrift (2008); Sleumer (1967a); Sorrie & Weakley (2007a); Sorrie (2017a) in Weakley et al (2017); Sorrie, Weakley, & Tucker (2009) in FNA8 (2009); Stevens et al. in Kubitzki et al (2004).

- 2 Leaves subcoriaceous, upper surface shining, dark green, 1.5-4 cm long; bracts of the inflorescence equal to or longer than the pedicels (5-12 mm long), persistent; sepals, pedicels, bracts, and leaves stipitate-glandular and pubescent; [section *Gaylussacia*].
 - 3 Plant < 3 dm high. *Gaylussacia dumosa*
 - 3 Plant 4-10 (-15 dm) tall. *Gaylussacia mosieri*
- 2 Leaves membranaceous to subcoriaceous, upper surface dull, yellow-green to medium-green, 2-10 cm long; bracts of the inflorescence shorter than the pedicels, early deciduous; sepals, pedicels, bracts, and leaves with sessile glands, pubescent or not pubescent; [section *Decamerium*].
 - 3 Plant 4-10 (-15 dm) tall. *Gaylussacia nana*

Gaylussacia dumosa (Andrews) Torrey & A. Gray. SOUTHERN DWARF HUCKLEBERRY. **Hab:** Longleaf pine sandhills, pine flatwoods, other xeric to mesic, acidic forests and woodlands. **Dist:** This is one of the most common shrubs of the Southeastern Coastal Plain, with an overall range from NJ south to FL and west to e. LA, primarily in the Coastal Plain, less commonly inland (as in sc. TN and se. WV). Reported for MD and DE (Longbottom, Naczi, & Knapp 2016). **Phen:** (Dec-) Mar-Jun; Jun-Oct. **Syn:** = FNA8, K4, Tn, Va, Gajdeczka et al (2010), Sorrie & Weakley (2007a); = *Gaylussacia dumosa* (Andrews) Torrey var. *dumosa* – C, F, G, Camp (1935); = *Lasiococcus dumosus* (Andrews) Small – S; < *Gaylussacia dumosa* (Andrews) Torrey & A. Gray – Fl5, GW2, K1, K3, Pa, RAB, W, WH3, WV, Duncan & Brittain (1966), Godfrey (1988), Luteyn et al (1996), Sleumer (1967a).

Gaylussacia mosieri Small. MOSIER'S HUCKLEBERRY, HIRSUTE HUCKLEBERRY. **Hab:** Pine savannas and seepages. **Dist:** S. GA, ne. FL (Duval County), n. peninsular FL (Volusia County) west through Panhandle FL to e. LA. **Comm:** Material from Lexington County, SC originally identified as this taxon has been reassigned to *G. bigeloviana*. **Syn:** = Fl5, FNA8, GW2, K1, K3, K4, WH3, Camp (1935), Duncan & Brittain (1966), Gajdeczka et al (2010), Godfrey (1988), Luteyn et al (1996), Sleumer (1967a), Sorrie & Weakley (2007a); = *Lasiococcus mosieri* (Small) Small – S. [NatureServe G4](#) (Apparently Secure).

Gaylussacia nana (A. Gray) Small. DWARF DANGLEBERRY. **Hab:** Xeric longleaf pine sandhills, pine flatwoods, pocosin ecotones, pine savannas. **Dist:** Se. NC (New Hanover County) (Sorrie & LeBlond 2008) and sc. SC (Berkeley and Williamsburg counties) south to n. and c. FL peninsula, FL Panhandle, and west to e. LA (Florida parishes). **Tax:** *G. nana* has a diploid chromosome complement (n=12), compared to tetraploid for *G. tomentosa* (n=12) (Luteyn et al. 1996). See Sorrie (2017a) for additional details about identification of this species and *G. tomentosa*. **Comm:** In NC, this species is somewhat disjunct from ec. SC in xeric sandhills of se. NC (on the Carolina Beach peninsula and the 421 Sandhills nw. of Wilmington). In the central and southern Coastal Plain of South Carolina, it is probably more common than *G. frondosa* (just not frequently distinguished from it) (P. McMillan, pers.comm. 2020). **Syn:** = FNA8, K1, K3, K4, Camp (1935), Duncan & Brittain (1966), Gajdeczka et al (2010), Luteyn et al (1996), Sorrie (2017a) in Weakley et al (2017); = *Decachaena nana* (A. Gray) Small – S; = *Gaylussacia frondosa* (Linnaeus) Torrey & A. Gray ex Torrey var. *nana* A. Gray – GW2, Camp (1935), Godfrey (1988); = n/a – RAB; < *Gaylussacia frondosa* (Linnaeus) Torrey & A. Gray ex Torrey – Fl5; < *Gaylussacia frondosa* (Linnaeus) Torrey & A. Gray ex Torrey var. *tomentosa* A. Gray – WH3.

Hypopitys Crantz 1766 (PINESAP)

A genus of 6-10 species, mycoheterotrophic herbs, of circumboreal distribution. Recent molecular evidence supports its separation as a genus distinct from *Monotropa* (as has often been done in the past) (Neyland & Hennigan 2004; Broe 2014). These studies also demonstrate that several cryptic to semi-cryptic species should be recognized; plants in North America are not conspecific with those in Eurasia, and at least six species appear to be present in e. North America (Broe 2014; Klooster & Culley 2010; Haines 2011). References: Bidartondo & Bruns (2001); Broe (2014); Klooster & Culley (2010); Stevens et al. in Kubitzki et al (2004); Wallace (1975); Wallace (2009a) in FNA8 (2009).

 (see introduction for more)

- 1 Stems of living plants pink to deep red; bracts of stem yellow; stigma densely and retrorsely puberulent in a collar; funnel of stigma hairy within; flowering in the fall (late Aug-Oct); anthers held below the stigma; [broadly Appalachian] *Hypopitys lanuginosa*
- 1 Stems of living plants tan, yellow, or pale salmon; stigma with sparse pubescence; funnel of stigma glabrous within; flowering in the summer (May-early Aug); anthers held at height of the stigma; [collectively widespread in our area].

..... *Hypopitys species 3*

Hypopitys lanuginosa (Michaux) Small. APPALACHIAN RED PINESAP, HAIRY PINESAP. **Hab:** Acid forests. **Dist:** ME and VT south to GA and AL (and more widespread, the precise distribution uncertain). Apparently widely distributed in eastern North America, but the precise distribution unknown. This and *H. lanuginosa* are mapped the same for now, as they are being disentangled. **Phen:** Early Aug-early Nov. **Tax:** The "Eastern Clade sensu stricto" (Broe 2014). **Syn:** = K3, K4, NE, NY, S, Broe (2014); = *Monotropa lanuginosa* Michaux; >> *Hypopitys americana* (A.P. de Candolle) Small – S, misapplied; > *Hypopitys insignata* E.P. Bicknell; < *Hypopitys monotropa* – Va, misapplied to North American plants; < *Monotropa hypopithys* Linnaeus – C, F, Fl5, FNA8, G, Pa, RAB, Tn, W, WH3, WV, Luteyn et al (1996), Wallace (1975), misapplied to North American plants; < *Monotropa hypopitys* – Ar.

Hypopitys species 3. COMMON EASTERN PINESAP. **Hab:** Forests. **Dist:** Apparently widely distributed in eastern North America, but the precise distribution unknown. This and *H. lanuginosa* are mapped the same for now, as they are being disentangled. **Phen:** May-Jul (-Aug). **Tax:** The "Eastern clade" of Broe (2014), once the distinctive "Eastern Clade sensu stricto" is removed. **Syn:** < *Hypopitys americana* (A.P. de Candolle) Small – K4; >> *Hypopitys americana* (A.P. de Candolle) Small – S, misapplied; < *Hypopitys monotropa* – K3, Va, misapplied to North American plants; < *Monotropa hypopithys* Linnaeus – C, F, Fl5, FNA8, G, NcTx, Pa, RAB, Tn, Tx, W, WH3, WV, Luteyn et al (1996), Wallace (1975), misapplied to North American plants; < *Monotropa hypopitys* – Ar.

Kalmia Linnaeus 1753 (WICKY, SHEEPKILL, MOUNTAIN LAUREL, IVY, SAND-MYRTLE)

A genus of 9-11 species, shrubs, of North America and Cuba, except the circumboreal *K. procumbens* (formerly *Loiseleuria*). *Leiophyllum*, traditionally treated as a monotypic or small genus of se. United States, is better treated as a part of *Kalmia* along with the northern *Loiseleuria*, based on molecular and morphological studies (Kron & King 1996, Kron et al. 2002). While this idea may initially seem outlandish (particularly to those whose concept of *Kalmia* is based only on *Kalmia latifolia*), the morphological and habitat similarities of *Leiophyllum* to *Kalmia* are striking. The foliage and wood of all species (and the smoke from burning them) are poisonous. References: Camp (1938); Ebinger (1974); Haines (2010); Kron & King (1996); Kron et al (2002); Kron, Judd, & Anderberg (2008); Liu et al (2009) in FNA8 (2009); Southall & Hardin (1974); Stevens et al. in Kubitzki et al (2004); Strand & Wyatt (1991); Wilbur & Racine (1971).

Kalmia latifolia Linnaeus. MOUNTAIN LAUREL, IVY, CALICO-BUSH. **Hab:** Acidic forests, bluffs, bogs, along sandhill steams, and in a wide range of other habitats, nearly ubiquitous in the mountains, up to at least 1600m, more restricted in habitat in the lower Piedmont and Coastal Plain. **Dist:** ME, OH, and IN south to Panhandle FL and extreme e. LA. **Phen:** Mar-Jul; Aug-Oct. **Comm:** Unlike our other species of *Kalmia*, which are strictly shrubs, *K. latifolia* reaches the stature and diameter of a small tree. **Syn:** = C, Fl5, FNA8, K1, K3, K4, NE, NY, Pa, RAB, S, Tn, Va, W, WH3, WV, Ebinger (1974), Luteyn et al (1996), Southall & Hardin (1974); > *Kalmia latifolia* var. *laevipes* Fernald – F, G; > *Kalmia latifolia* var. *latifolia* – F, G. NatureServe G5 (Secure).

Leucothoe D. Don 1834 (FETTERBUSH, LEUCOTHOE)

A genus of 5 species, shrubs, of Japan, Himalayan Asia, w. North America, and e. North America. References: Judd et al (2013); Stevens et al. in Kubitzki et al (2004); Tucker (2009e) in FNA8 (2009).

Leucothoe axillaris (Lamarck) D. Don. COASTAL DOGHOBBLE. **Hab:** Pocosins, blackwater swamp forests, and moist and acid slopes. **Dist:** A Southeastern Coastal Plain endemic: se. VA south to c. peninsular FL and west to extreme e. LA (several parish records reported for west of the Mississippi River are non-native, from cultivation). **Phen:** Late Mar-May; Sep-Oct. **Syn:** = C, Fl5, FNA8, G, GW2, K1, K3, K4, S, Va, WH3, Luteyn et al (1996); = *Leucothoe axillaris* var. *axillaris* – RAB; > *Leucothoe axillaris* var. *ambigens* Fernald – F; > *Leucothoe axillaris* var. *axillaris* – F; > *Leucothoe platyphylla* Small. NatureServe G5 (Secure).

Lyonia Nuttall 1818 (STAGGERBUSH, MALEBERRY, FETTERBUSH)

A genus of about 35 species, shrubs and small trees, of e. and se. Asia, e. North America, Mexico, and the West Indies. References: Judd (1981); Judd (2009e) in FNA8 (2009); Stevens et al. in Kubitzki et al (2004).

- 3 Leaves evergreen (some leaves present on wood of the previous year), coriaceous, and shining *Lyonia lucida*
- 3 Leaves deciduous (no leaves present on wood of the previous year), subcoriaceous, and dull.

..... *Lyonia ligustrina* var. *foliosiflora*

? : questionable

Lyonia ligustrina (Linnaeus) A.P. de Candolle var. ***foliosiflora*** (Michaux) Fernald. SOUTHERN MALEBERRY, HE-HUCKLEBERRY. **Hab:** Pocosins, seepage bogs, and other wet habitats. **Dist:** Se. VA south to s. FL, west to e. TX and e. OK, and (west of the mountains) north to TN and nc. AR. Var. *foliosiflora* is the usual variety on the Coastal Plain (including the fall-line sandhills). **Phen:** (Late Dec-) Apr-Jun; Sep-Oct. **ID Notes:** Rather nondescript when sterile, the gray-green hue of the leaves is a useful character, and at 5-10× magnification the appressed white hairs are an excellent diagnostic feature for *Lyonia ligustrina*. **Syn:** = Ar, FNA8, GW2, K1, K3, K4, Tn, Va, W, WH3, Judd (1981), Luteyn et al (1996); = *Arsenococcus frondosus* (Pursh) Small – S; = *Xolisma foliosiflora* (Michaux) Small; < *Lyonia ligustrina* – C, Fl5, G, RAB, Tx; > *Lyonia ligustrina* var. *capreaefolia* (Watson) A.P. de Candolle – F; > *Lyonia ligustrina* (Linnaeus) A.P. de Candolle var. *foliosiflora* (Michaux) Fernald – F; > *Lyonia ligustrina* var. *salicifolia* (Watson) A.P. de Candolle – F. **NatureServe G5T5?** (Secure).

Lyonia lucida (Lamarck) K. Koch. SHINING FETTERBUSH. **Hab:** Pocosins, wet woodlands, blackwater swamp forests, other acidic wetlands, especially if peaty. **Dist:** Se. VA south to s. FL and west to e. and c. LA; also in w. Cuba. **Phen:** Feb-early Jun; Sep-Oct. **Comm:** Readily distinguished by the glossy, coriaceous leaves with a prominent vein running along the margins. When in flower in large numbers, the odor is cloyingly sweet. **Syn:** = C, F, Fl5, FNA8, G, GW2, K1, K3, K4, RAB, Va, WH3, Judd (1981), Luteyn et al (1996); = *Desmothamnus lucidus* (Lamarck) Small – S; = *Neopieris nitida* (Bartram ex Marshall) Britton; = *Pieris nitida* (Bartram) Benth & Hooker. **NatureServe G5** (Secure).

Monotropa Linnaeus 1753 (GHOST PIPES, INDIAN PIPES)

A genus of 3 or more species, mycoheterotrophic herbs, of North America, Central America, South America, and e. Asia. *Monotropa* has a primary fungal associate with the basidiomycete *Russula*. The segregation of *Monotropa*, *Hypopitys*, and *Monotropopsis* into the Monotropaceae or their inclusion in the Ericaceae has sometimes been controversial. Their inclusion in the Ericaceae has been defended (Kron & Chase 1993, Judd & Kron 1993) and as become the consensus position (APG IV), but as a monophyletic clade sister to a narrower Ericaceae, family level recognition is a credible alternative. References: Bidartondo & Bruns (2001); Keesling (2020); Keesling, Broe, & Freudenstein (2021); Stevens et al. in Kubitzki et al (2004); Wallace (1975); Wallace (2009a) in FNA8 (2009).

- 1 Flowers few to many per stalk, racemose; stem pubescent, at least in the inflorescence; plant yellow, orange, or red when fresh, aging or drying dark brown.....***Hypopitys***
- 1 Flower solitary and terminal on the stalk; stem glabrous; plant white, pink, yellow, orange, or salmon when fresh, aging or drying black.
 - 2 Flowers and stems orangish-yellow; nectaries upturned towards the flower opening; interior surface of flower segments densely pubescent (the margins of the segments strongly ciliate); stamen filaments strongly decreasing in diameter upwards.....***Monotropa brittonii***
 - 2 Flowers and stems white or pale pink; nectaries downturned away from the flower opening; interior surface of flower segments glabrous (the margins of the segments sparingly ciliate); stamen filaments nearly isodiametric from base to summit.....***Monotropa uniflora***

Monotropa brittonii Small. SCRUB GHOST-PIPE, SOUTHERN GHOST-PIPE. **Hab:** Florida scrub, longleaf pine sandhills, other dry, sandy habitats. **Dist:** Peninsular FL, apparently extending northwards to e. NC and westward to se. LA on the Coastal Plain (J. Freudenstein, pers. comm., 2019). **Phen:** Nov. **Tax:** Molecular evidence suggests that *M. brittonii* is worthy of taxonomic recognition; additional work is underway to understand its distribution and morphology. See Keesling (2020) for discussion. **ID Notes:** *Monotropa brittonii* is noticeable as different from *Monotropa uniflora* in its xeric habitat and greater suffusion of reddish or salmon color in the stems, flowers, and fruits, but is most authoritatively separated by the finer scale differences in the key. **Syn:** = S, Keesling (2020), Keesling, Broe, & Freudenstein (2021); < *Monotropa uniflora* Linnaeus – FNA8, K3, K4, RAB, WH3, Luteyn et al (1996).

Monotropa uniflora Linnaeus. COMMON GHOST-PIPE, INDIAN PIPES. **Hab:** In a wide variety of moist to dry forests. **Dist:** NL (Labrador) and AK south to c. FL, TX, CA; e. Asia. **Phen:** Jun-Oct; Aug-Dec. **Tax:** A preliminary molecular study suggests that splitting of worldwide *Monotropa uniflora* into several geographic species or varieties may be warranted (Neyland & Hennigan 2004). We tentatively remove Mexico, Central America, and South America from the distribution of *Monotropa uniflora*, based on the morphology of these plants and preliminary findings in Keesling, Broe, & Freudenstein (2021) that Mexican accessions clade separately. Asian material needs evaluation as well. **Syn:** = S, Keesling (2020); < *Monotropa uniflora* Linnaeus – Ar, C, F, Fl5, FNA8, G, Il, K1, K3, K4, Meso4.1, Mi, NcTx, NE, NY, Pa, RAB, Tn, Tx, Va, W, WH3, WV, Luteyn et al (1996), Wallace (1975). **NatureServe G5** (Secure).

Oxydendrum A.P. de Candolle 1839 (SOURWOOD)

A monotypic genus, a tree, of se. North America. The genus *Oxydendrum* is "isolated ... among the Ericaceae, apparently with no close relatives" (Wood 1961). References: Judd (2009a) in FNA8 (2009); Stevens et al. in Kubitzki et al (2004).

Oxydendrum arboreum (Linnaeus) A.P. de Candolle. SOURWOOD, SORREL-TREE. **Hab:** Mesic to xeric deciduous forests, especially dry-mesic to xeric oak-hickory and oak-pine forests, and also often in sandhill/pocosin ecotones. **Dist:** Se. and sw. PA west to IL, south to n. FL and se. and c. LA. **Phen:** Jun-Jul; Sep-Oct. **Comm:** It is an especially characteristic understory tree of upland forests of the Piedmont and lower Mountains. The bark is dark grayish-brown and fairly deeply furrowed; the tree often has a characteristic lean (toward a former canopy light-gap). The finely serrate, elliptic leaves are distinctive, with the sour taste of garden sorrel (*Rumex acetosa*), sheep sorrel (*Rumex acetosella*), or wood sorrel (*Oxalis*). **Syn:** = C, F, FI5, FNA8, G, II, K1, K3, K4, NY, Pa, RAB, S, Tn, Va, W, WH3, WV, Luteyn et al (1996). NatureServe G5 (Secure).

*Pieris* D. Don 1834 (EVERGREEN FETTERBUSH)

A genus of 7 species, shrubs, of e. Asia, e. North America, and Cuba. Judd (1982a) treats *Pieris* as a genus of 7 species, 4 in e. Asia, 1 in the Southern Appalachian Mountains, 1 in the se. United States Coastal Plain, and 1 in w. Cuba. References: Judd (1979); Judd (1982a); Judd (2009b) in FNA8 (2009); Stevens et al. in Kubitzki et al (2004).

Pieris phillyreifolia (Hooker) A.P. de Candolle. VINE-WICKY, CLIMBING FETTERBUSH. **Hab:** Acidic swamp forests. **Dist:** E. SC south to c. peninsular FL west to s. AL. **Phen:** Late Feb-Apr. **Tax:** It is apparently most closely related to the other two members of subgenus *Pieris*, section *Phillyreoides*, *P. cubensis* (Grisebach) Small, endemic to w. Cuba, and *P. swinhoei* Hemsley, of se. China, neither of which shares its unusual habit. **Comm:** This southeastern species has the remarkable habit of often growing as a creeping vine under the bark of *Taxodium ascendens* or *Chamaecyparis*, the branches exerted through the cypress bark, sometimes ascending into the upper canopy with the main stem never visible except at the very base of the tree; it also sometimes grows as a low shrub. Godfrey (1969) documents the occurrence of this species in our area. See Godfrey & Wooten (1981) and Godfrey (1989) for excellent descriptions and illustrations of this curious "shrub-vine". **Syn:** = FI5, FNA8, GW2, K1, K3, K4, WH3, Judd (1982a), Luteyn et al (1996); = *Ampelothamnus phillyreifolius* (Hooker) Small – S; = n/a – RAB. NatureServe G3 (Vulnerable).

*Rhododendron* Linnaeus 1753 (RHODODENDRON, AZALEA)

A genus of about 860 species, shrubs and trees, mostly north temperate (centered in Himalayan Asia). Molecular evidence appears to show that *Menziesia* should be included in *Rhododendron*, and is actually closely related within *Rhododendron* to *R. vaseyi* (Goetsch, Eckert, & Hall 2005; Kurashige et al. 2001); while the urceolate corolla is rather anomalous in *Rhododendron*, many other morphological characters do ally *Menziesia* with basal clades in *Rhododendron* s.l. References: Albach & Bauer (2021); Chamberlain (1982); Craven (2011); Cullen (1980); Davidian (1982); Duncan & Pullen (1962); Fabijan (2009a) in FNA8 (2009); Goetsch, Eckert, & Hall (2005); Horn (2019); Judd & Kron (1995); Judd & Kron (2009a) in FNA8 (2009); Kron & Creel (1999); Kron (1993); Miller (2011); Stevens et al. in Kubitzki et al (2004); Towe (2004); Zhou et al (2008).

Considerable additional work is needed to clarify *Rhododendron* taxonomy in our region. A new species in the "*Punctatum* complex" is in the process of being described. Additional entities appear to warrant recognition in the "*Viscosum* complex" and the "*Canescens* complex"; these will be more thoroughly tackled in the next edition.

Identification Notes: This key makes as much use as possible of vegetative characters, geography, and capsule characters; capsules are generally available for longer during the year than flowers, and even when plants are in flower, last year's capsules can often be found.

Unkeyed taxa: *Rhododendron coryi*

- 11 Outer (abaxial) surface of the vegetative bud scales densely pubescent; flowers appearing before or with the leaves (at least some of the leaves still folded or the vegetative bud scales still present) (except *R. viscosum*).
 - 12 Capsule cylindroid, (3-) 4-5× as long as broad.
 - 13 Corolla yellow-orange to orange-red; upper corolla lobe with a contrasting blotch; [s. GA west to se. MS] *Rhododendron austrinum*
 - 13 Corolla white to pink; upper corolla lobe uniform in color (lacking a contrasting blotch); [collectively widespread in our area] *Rhododendron canescens*
 - 12 Capsule ovoid, 2-3 (-4)× as long as broad (if capsules absent, try both leads).
 - 17 Shrubs to 7 m tall; floral winter bud scales 15-20, at least the inner acute and aristate; corolla tube glabrous within, > 2× as long as the lobes; [primarily Coastal Plain] *Rhododendron serrulatum*
 - 17 Shrubs 1-2 (-5) m tall; floral winter bud scales 8-12 (-15), rounded (-mucronate) apically; corolla tube pubescent within, < 2× as long as the lobes; [more widespread] *Rhododendron viscosum* var. *viscosum*
- 11 Outer (abaxial) surface of the vegetative bud scales glabrous or sparsely pubescent; flowers appearing before, with, or after the leaves.
 - 19 Capsule cylindric, (3-) 4-5 × as long as broad; flowers appearing before or with the leaves (at least some of the leaves still folded or the vegetative bud scales still present).
 - 20 Corolla white, with a contrasting yellowish blotch on the upper lobe; [se. TN and w. GA westward] *Rhododendron alabamense*
 - 20 Corolla deep pink (rarely white or nearly so), lacking a contrasting blotch on the upper lobe; [widespread in our area] *Rhododendron periclymenoides*

Rhododendron alabamense Rehder. ALABAMA AZALEA. **Hab:** Moist slopes, bluffs, streambanks. **Dist:** W. GA and Panhandle FL west through AL to e. MS. **Phen:** Mar-Apr. **Comm:** *R. alabamense* is reported for Calhoun County, SC (Radford, Ahles, & Bell 1968), but this record actually represents the more recently described *R. eastmanii*. **Syn:** = FI5, FNA8, K1, K3, K4, Tn, WH3, Kron (1993), Luteyn et al (1996), Zhou et al (2008); = *Azalea alabamensis* (Rehder) Small – S.

Rhododendron arborescens (Pursh) Torrey. SWEET AZALEA, SMOOTH AZALEA. **Hab:** Rocky riversides, wooded stream banks, swamps, high elevation forests, shrub balds. **Dist:** Primarily Appalachian: ne. PA and se. KY south to sc. NC, w. SC, c. GA, and c. AL. **Phen:** Late May-Jul; Jul-Oct. **Syn:** = C, F, FNA8, G, K1, K3, K4, Pa, RAB, Tn, Va, W, WV, Horn (2019), Kron (1993), Luteyn et al (1996); = *Azalea arborescens* Pursh – S. **NatureServe G4G5** (Apparently Secure).

Rhododendron austrinum (Small) Rehder. FLORIDA FLAME AZALEA. **Hab:** Hammocks, bluffs, floodplain forests. **Dist:** Sc. GA and ne. FL west to s. AL and se. MS (Kron 1993); also reported for e. GA (Jones & Coile 1988). **Phen:** Mar. **Tax:** See Miller (2011) for details about this species. **Syn:** = FI5, FNA8, K1, K3, K4, WH3, Kron (1993), Luteyn et al (1996), Zhou et al (2008); = *Azalea austrina* Small – S. **NatureServe G3** (Vulnerable).

Rhododendron canescens (Michaux) Sweet. PIEDMONT AZALEA, SOUTHERN PINXTER AZALEA, WILD AZALEA. **Hab:** Swamps, pocosins, and pine savannas. **Dist:** Se. and sc. NC, n. TN, se. KY, s. IL, and e. OK, south to n. peninsular FL and se. TX. **Phen:** Mar-early May; Sep-Oct. **Syn:** = Ar, C, F, FI5, FNA8, G, GW2, IL, K3, K4, RAB, Tn, Tx, W, WH3, Horn (2019), Kron (1993), Luteyn et al (1996); > *Azalea candida* Small – S; > *Azalea canescens* Michaux – S; > *Rhododendron canescens* var. *candidum* (Small) Rehder – K1; > *Rhododendron canescens* var. *canescens* – K1; > *Rhododendron canescens* var. *subglabrum* Rehder – K1.

Rhododendron coryi Shinnars. **Hab:** Longleaf pine savanna ecotones to bayheads. **Dist:** S. GA west to e. TX, in the Coastal Plain. **Syn:** = Tx; = *Rhododendron viscosum* (Linnaeus) Torrey var. *aemulans* Rehder; < *Azalea viscosa* Linnaeus – S; < *Rhododendron viscosum* (Linnaeus) Torrey – FI5, FNA8, GW2, K1, K3, K4, WH3, Luteyn et al (1996).

Rhododendron periclymenoides (Michaux) Shinnars. WILD AZALEA, PINXTERFLOWER, PINXTERBLOOM AZALEA, ELECTION PINK. **Hab:** Moist to dry slopes and streambanks. **Dist:** Fairly widespread in e. United States, ranging from MA, NY, and s. OH, south to GA and AL. **Phen:** Late Mar-May; Sep-Oct. **Comm:** See Shinnars (1962) for explanation of the change from the name *R. nudiflorum*. **Syn:** = C, FNA8, IL, K1, K3, K4, NE, NY, Pa, Tn, Va, W, Horn (2019), Kron (1993), Luteyn et al (1996); = *Azalea nudiflora* Linnaeus – S; = *Rhododendron nudiflorum* (Linnaeus) Torrey – F, G, GW2, RAB, WV. **NatureServe G5** (Secure).

Rhododendron serrulatum (Small) Millais. SWAMP AZALEA, CLAMMY AZALEA. **Hab:** Bogs, pocosins, wet pine savannas. **Dist:** S. GA south to c. peninsular FL, west to e. LA. Its distribution northwards into the Carolinas and se. VA is uncertain. **Phen:** Apr-Jun; Jul-Oct. **Tax:** This taxon seems to warrant specific rank, based on morphology and distribution. It is sometimes treated at variety rank or lumped into *R. viscosum* (see synonymy). **Syn:** = C, F, G; = *Azalea serrulata* Small – S; = *Rhododendron viscosum* (Linnaeus) Torrey var. *serrulatum* (Small) H.E. Ahles – RAB; < *Rhododendron viscosum* (Linnaeus) Torrey – FI5, FNA8, GW2, K1, K3, K4, NE, NY, Pa, Va, W, WH3, WV, Horn (2019), Luteyn et al (1996); > *Rhododendron viscosum* (Linnaeus) Torrey – Horn (2019).

Rhododendron viscosum (Linnaeus) Torrey var. *viscosum*. SWAMP AZALEA, CLAMMY AZALEA. **Hab:** Moist streambanks, shrub balds, and other moist habitats. **Dist:** ME and MY, WV, e. TN, n. AR, and ne. OK, south to c. peninsular FL and e. TX. **Phen:** Jun-Jul; Jul-Oct. **Syn:** > *Azalea oblongifolia* Small; > *Azalea viscosa* Linnaeus – S; > *Rhododendron oblongifolium* (Small) Millais – Tx; < *Rhododendron viscosum* (Linnaeus) Torrey – Ar, C, F, FI5, FNA8, G, GW2, K1, K3, K4, NE, NY, Pa, Va, W, WH3, WV, Horn (2019), Luteyn et al (1996); > *Rhododendron viscosum* (Linnaeus) Torrey var. *montanum* Rehder; < *Rhododendron viscosum* (Linnaeus) Torrey var. *viscosum* – RAB.

Vaccinium Linnaeus 1753 (BLUEBERRY)

A genus of ca. 500 species, shrubs, lianas, and small trees, semicosmopolitan (centered in e. Asia and Malesia, absent from Australia). *Vaccinium* in our area is divided into 6 strongly differentiated sections, sometimes, as by Small, treated as separate genera. The taxonomy of *Vaccinium* remains

Key to Map
 Symbology:
 native maybe exotic exotic (see introduction for more) rare uncommon common EN : endemic H : historic N : no X : extirpated P : planted ? : questionable

345. *ERICACEAE*

unclear at all ranks (genus, species, infrataxon); divergence of opinion is obvious in the synonymy. For instance, Small (1933) recognizes 6 genera and 25 species for our area, Ahles in RAB (1968) recognizes 1 genus and 14 species (one with 2 varieties) (not including VA), and Vander Kloet (1988) recognizes 1 genus and 9 species. The highbush blueberries of section *Cyanococcus* are particularly difficult. Vander Kloet's extremely broad concept of the highbush blueberries as consisting of a single species, *V. corymbosum*, including *V. fuscatum* (*V. atrococcum* – RAB), *V. simulatum* (“*V. constablaei*” – RAB), *V. virgatum* (*V. amoenum* – RAB), *V. elliotii*, *V. formosum* (*V. australe*), and *V. caesariense* (and many other named taxa not recognized here) has been adopted by some recent authors, at least partly for its ease of application. I agree with Godfrey (1988), though, that *V. elliotii* has “such distinctiveness as to be recognizable in the field at a glance”. The other taxa are less easily recognizable, but seem to have substantial morphological and phylogeographic integrity. The fairly frequent presence of hybrid individuals and populations can make identification frustrating, but I agree with Ward (1974) that “the genus *Vaccinium* ... is difficult but not in any way an irresolvable tangle of intergrading populations. The vast bulk of individuals encountered in the field may be assigned, as with any non-apomict genus, to a relatively few, discrete, and wholly recognizable species”. Many of the taxa included in *V. corymbosum* by Vander Kloet (1988) and Luteyn et al. (1996) occur together in combinations of two to four, are immediately recognizable in the field, bloom at different times, and have different flower, fruit, and leaf morphology. Failure to recognize multiple entities within the highbush blueberries results in the taxonomic homogenization of the diversity of the group and obscures important phylogeographic patterns. Our area, with 20 species (24 taxa) in 6 sections, has a greater diversity of *Vaccinium* than any other comparably sized area in North America. References: Ashe (1931); Camp (1945); Luteyn et al (1996); Rayner & Henderson (1980); Redpath et al (2022); Smith et al (2015); Stevens et al. in Kubitzki et al (2004); Uttal (1986b); Uttal (1986c); Uttal (1987); Vander Kloet & Dickenson (1999); Vander Kloet & Dickinson (2009); Vander Kloet & Hall (1981); Vander Kloet (1977); Vander Kloet (1977, 1978a, 1978b, 1980, 1982, 1983a, 1983b); Vander Kloet (1978a); Vander Kloet (1978b); Vander Kloet (1980); Vander Kloet (1982); Vander Kloet (1983a); Vander Kloet (1983b); Vander Kloet (1988); Vander Kloet (2009) in FNA8 (2009); Ward (1974).

- 3 Twigs of the season verrucose (the surface abundantly covered with small bumps, readily visible without magnification); [blueberries; section *Cyanococcus*]..... **Key C**
- 3 Twigs of the season not verrucose.
- 5 Mature leaves green (or glaucous), glandular beneath, mostly elliptic to round, generally 1.5-4.5 cm long; corolla broad-urceolate to narrow-campanulate, the stamens included; berry black, lustrous, 5-9 mm long; [farkleberry; section *Batodendron*]..... **Vaccinium arboreum**
- 5 Mature leaves pale and glaucous, eglandular beneath, mostly elliptic, 3-10 cm long; corolla campanulate, the stamens long-exserted; berry green, yellow, pink, or purple, usually glaucous, 7-18 mm long; [deerberries; section *Polycodium*]..... **Key D**

Key C - blueberries, section *Cyanococcus*

- 1 Shrubs rhizomatous, forming clonal colonies, the upright stems < 1 m tall (and often < 0.5 m tall); [“lowbush blueberries”].
- 2 Leaves evergreen, 5-15 mm long (rarely to 30 mm long on fire sprouts), subcoriaceous, glossy dark-green or dull blue-green; [se. SC southward to s. FL, west to e. LA].
- **Vaccinium darrowii**
- 2 Leaves deciduous to semi-evergreen, herbaceous, generally > 20 mm in length, dull to somewhat glossy and medium green; [collectively widespread in our area].
- 4 Lower surfaces of the leaves with red stipitate glands (sometimes pubescent as well when young); berry usually black and lustrous; [Coastal Plain and lower Piedmont]..... **Vaccinium tenellum**
- 4 Lower surfaces of the leaves eglandular, pubescent or glabrous; berry either blue and glaucous, or black and glandular-hirsute; [collectively widespread in our area].
- **Vaccinium pallidum**
- 1 Shrubs crown-forming, single-stemmed or several-stemmed from the base, the upright stems generally > 1 m tall (often 2-3 m tall, and rarely to 7 m); [“highbush blueberries”].
- 9 Leaves with stipitate glands on the lower surface; [Coastal Plain of SC and s. NC south to FL, west to TX]..... **Vaccinium virgatum**
- 9 Leaves lacking stipitate glands on the lower surface (variously glabrous to pubescent with eglandular hairs); [collectively widespread].
- 10 Leaves 0.7-3.5 cm long, 0.3-1.5 cm wide, with serrulate margins; twigs slender, numerous..... **Vaccinium elliotii**
- 10 Leaves 3-10 cm long, 1.5-4.5 cm wide, with entire, ciliate, or serrulate margins; twigs stouter, fewer.
- 11 Young twigs glabrous; leaf surfaces glabrous; leaf margins eciliate or ciliate.
- **Vaccinium formosum**
- 11 Young twigs puberulent, at least in lines; leaf surfaces more-or-less pubescent; leaf margins ciliate (rarely eciliate).
- **Vaccinium fuscatum**

Key D - deerberries, section *Polycodium*

- 5 Hypanthium and fruit pubescent..... **Vaccinium stamineum var. sericeum**
- 5 Hypanthium and fruit glabrous..... **Vaccinium stamineum var. stamineum**

Vaccinium arboreum Marshall. FARKLEBERRY, SPARKLEBERRY. **Hab:** Rocky or sandy woodlands, bluffs, and cliffs, usually xeric and often fire-maintained, and unlike most other *Vaccinium*, often on mafic, ultramafic, or calcareous rocks. **Dist:** This species is widely distributed in se. North America, from TX and FL north to MO, IN, KY, and VA. **Phen:** Late Apr-Jun; Sep-Oct. **Tax:** *V. arboreum* is a diploid species (2x=24) (Redpath et al. 2022). Var. *glaucescens* (Greene) Sargent may be worthy of recognition; it differs from var. *arborescens* in its subglaucous to conspicuously blue-green (vs. dark green) leaves and the bracts at the base of the pedicels nearly equal in size and shape to the leaves (vs. bracts distinctly smaller and often also different in shape than the leaves). **ID Notes:** *Vaccinium arboreum* can be a small tree, to 35 cm DBH and 10 m tall. The leaves are coriaceous and semi-evergreen, often being retained for much or all of the winter, especially in the southern part of our area. **Syn:** = Ar, C, FI5, FNA8, G, GrPl, K1, K3, K4, NcTx, RAB, Tn, Va, W, WH3, Camp (1945), Luteyn et al (1996), Redpath et al (2022), Uttal (1987), Vander Kloet (1988); = *Batodendron arboreum* (Marshall) Nuttall – S; > *Vaccinium arboreum* var. *arboreum* – F, Il, Tx; > *Vaccinium arboreum* var. *glaucescens* (Greene) Sargent – F, Il, Tx.

Vaccinium darrowii Camp. DARROW'S BLUEBERRY. **Hab:** Pine flatwoods. **Dist:** S. GA south to s. peninsular FL and west to e. LA. **Phen:** Mar. **Tax:** *Vaccinium darrowii* is a diploid species, 2x=24 (Redpath et al. 2022). **Syn:** = FI5, FNA8, K1, K3, K4, Tx, Va, WH3, Camp (1945), Luteyn et al (1996),

Redpath et al (2022), Vander Kloet (1988); = *Cyanococcus myrsinites* (Lamarck) Small var. *glaucum* A. Gray – S; = *Vaccinium darrowii* – GW2, orthographic variant. NatureServe G5 (Secure).

Vaccinium elliotii Chapman. MAYBERRY. **Hab:** Bottomlands, slopes, sandy river terraces, natural levees. **Dist:** Primarily a Coastal Plain species, *V. elliotii* ranges from se. VA south to n. FL, west to se. TX and AR; disjunct in Coffee County, TN (Chester, Wofford, & Kral 1997). **Phen:** Jan-Apr; May-Jun. **Tax:** Unquestionably distinct at species rank from other members of the *Vaccinium corymbosum* complex. *Vaccinium elliotii* is a diploid species, $2x=24$ (Redpath et al. 2022). **Syn:** = Ar, C, F, G, GW2, K1, K3, K4, RAB, Tn, Tx, Va, Camp (1945), Redpath et al (2022), Uttal (1987); = *Cyanococcus elliotii* (Chapman) Small – S; < *Vaccinium corymbosum* Linnaeus – F15, FNA8, WH3, Luteyn et al (1996), Vander Kloet (1988).

Vaccinium formosum H.C. Andrews. SOUTHERN Highbush BLUEBERRY, SWAMP Highbush BLUEBERRY. **Hab:** Bogs, swamps (especially blackwater, or at least where away from strong alluvial influence), seepages, depression ponds (dolines), other moist ground. **Dist:** NJ south to n. FL and s. AL (and apparently to e. LA), primarily on the Coastal Plain. **Phen:** Late Feb-May; Jun-Aug. **Tax:** *Vaccinium formosum* is a tetraploid species, $4x=48$ (Redpath et al. 2022). **Comm:** This species is the primary genetic source of the cultivated highbush blueberries. It has the largest and arguably the highest quality fruit of the native highbush blueberries. **Syn:** = K1, K3, K4, Va, Uttal (1987); = *Cyanococcus virgatus* (Aiton) Small – S, misapplied; = *Vaccinium australe* Small – G, GW2, Camp (1945); < *Vaccinium corymbosum* Linnaeus – C, F15, FNA8, NY, Pa, RAB, WH3, Luteyn et al (1996), Redpath et al (2022), Vander Kloet (1988).

Vaccinium fuscum Aiton. HAIRY Highbush BLUEBERRY, BLACK Highbush BLUEBERRY. **Hab:** Bogs, pocosins, swamps, also in uplands. **Dist:** ME and NB to s. MI, south to sc. peninsular FL and e. TX. **Phen:** Feb-May; Jun-Aug. **Tax:** *Vaccinium fuscum* is a diploid species, $2x=24$ (Redpath et al. 2022). **Syn:** = Ar, GW2, II, K1, K3, K4, NE, Tn, Va, W, Camp (1945), Redpath et al (2022), Uttal (1987); = *Vaccinium atrococcum* (Gray) Heller – F, G, RAB, Camp (1945); = *Vaccinium corymbosum* Linnaeus var. *atrococcum* A. Gray – Mi; > *Cyanococcus atrococcus* (A. Gray) Small – S; > *Cyanococcus fuscus* (Aiton) Small – S; > *Vaccinium arkansanum* Ashe – Tx; < *Vaccinium corymbosum* Linnaeus – C, F15, FNA8, NY, Pa, WH3, Luteyn et al (1996), Vander Kloet (1988); ? *Vaccinium marianum* S. Watson – G.

Vaccinium pallidum Aiton. HILLSIDE BLUEBERRY, DRYLAND BLUEBERRY. **Hab:** Forested slopes, usually rather xeric. **Dist:** Widespread in e. United States, *V. pallidum* is centered in the Appalachians and Ozarks. **Phen:** Mar-Apr; Jun-Jul. **Tax:** Vander Kloet (1978, 1988) and Uttal (1987) do not favor Camp's (1945) separation of *V. pallidum* and *V. vacillans*. If the two taxa are combined (as here), *V. pallidum* has nomenclatural priority. *V. pallidum* is primarily diploid; Redpath et al. (2022) report diploid and tetraploid counts for *V. pallidum*, but the tetraploid counts likely are based on what is here treated as a separate species, *V. altomontanum*. See *V. altomontanum* for discussion of its relationship to *V. pallidum*. **Syn:** = Ar, C, GrPl, K1, K3, K4, Mi, NE, NY, Pa, Va, W, WV, Luteyn et al (1996), Uttal (1987), Vander Kloet (1978b), Vander Kloet (1988); = *Vaccinium vacillans* Kalm ex Torrey – RAB; > *Cyanococcus pallidus* (Aiton) Small – S; > *Cyanococcus vacillans* (Kalm ex Torrey) Rydberg – S; < *Vaccinium pallidum* Aiton – FNA8, Tn, Redpath et al (2022); > *Vaccinium pallidum* Aiton – F, G, Camp (1945); > *Vaccinium pallidum* var. *crinitum* (Fernald) Mohlenbrock – II; > *Vaccinium pallidum* var. *pallidum* – II; > *Vaccinium vacillans* Kalm ex Torrey – G, Camp (1945); > *Vaccinium vacillans* var. *crinitum* Fernald – F; > *Vaccinium vacillans* Torrey var. *vacillans* – F.

Vaccinium stamineum Linnaeus var. *sericeum* (C. Mohr) D.B. Ward. SOUTHERN DEERBERRY. **Hab:** Xeric woodlands. **Dist:** S. SC, w. NC, TN, and AR south to Panhandle FL and TX; disjunct in Mexico. **Phen:** Apr-Jun; Aug-Oct. **Syn:** = Ward (1974); = *Polycodium sericeum* (C. Mohr) C.B. Robinson – Ashe (1931); ? *Polycodium melanocarpum* (C. Mohr) Small – S, misapplied; ? *Vaccinium melanocarpum* (C. Mohr) C. Mohr ex Kearney – G, misapplied; < *Vaccinium stamineum* – Ar, C, F15, FNA8, K1, K3, Tn, Tx, W, WH3, Luteyn et al (1996), Uttal (1987), Vander Kloet (1988); ? *Vaccinium stamineum* var. *melanocarpum* C. Mohr – F, RAB, misapplied.

Vaccinium stamineum Linnaeus var. *stamineum*. COMMON DEERBERRY. **Hab:** Xeric to submesic woodlands, forests, and rock outcrops (unlike most *Vaccinium*, often on mafic, ultramafic, or calcareous rocks). **Dist:** MA, NY, s. ON, and MO south to Panhandle FL and TX. **Phen:** Apr-Jun; Aug-Oct. **Tax:** *Vaccinium stamineum* (in the broad sense) is reported as a diploid species, $2x=24$ (Redpath et al. 2022). **Syn:** = Ward (1974); < *Polycodium candicans* Small – S; > *Polycodium neglectum* Small – S, Ashe (1931); > *Polycodium stamineum* (Linnaeus) Greene – S, Ashe (1931); > *Vaccinium neglectum* (Small) Fernald – G; < *Vaccinium stamineum* – Ar, C, F15, FNA8, GrPl, K1, K3, K4, NE, NY, Pa, Tn, Tx, Va, W, WH3, Luteyn et al (1996), Uttal (1987), Vander Kloet (1988); > *Vaccinium stamineum* var. *interius* (W.W. Ashe) Palmer & Steyermark – F, WV; > *Vaccinium stamineum* var. *neglectum* (Small) Deam – F, WV; < *Vaccinium stamineum* Linnaeus var. *stamineum* – RAB; > *Vaccinium stamineum* Linnaeus var. *stamineum* – F, WV.

Vaccinium tenellum Aiton. SOUTHERN DWARF BLUEBERRY, SMALL CLUSTER BLUEBERRY. **Hab:** Longleaf pine sandhills, pine flatwoods, other xeric woodlands. **Dist:** Though abundant in the Carolinas, *V. tenellum* is rather restricted, occurring as a common species from se. VA to c. GA, with a range extension (where it is scattered and rare) south and west to n. FL, s. AL, and se. MS. **Phen:** Late Mar-early May; Jun-Jul. **Tax:** *Vaccinium tenellum* is a diploid species, $2x=24$ (Redpath et al. 2022). **Syn:** = C, F, FNA8, G, K1, K3, K4, RAB, Va, Camp (1945), Luteyn et al (1996), Redpath et al (2022), Uttal (1987), Vander Kloet (1988); = *Cyanococcus tenellus* (Aiton) Small – S. NatureServe G5 (Secure).

Vaccinium virgatum Aiton. SWAMP BLUEBERRY, RABBITEYE BLUEBERRY. **Hab:** Pocosins and *Chamaecyparis* swamps, also in various drier habitats, including turkey oak sandhills. **Dist:** A Southeastern Coastal Plain species, *V. virgatum* occurs from se. NC south to FL and west to e. TX. **Phen:** Mar-Apr; May-Jun. **Tax:** *Vaccinium virgatum* is a hexaploid species, $6x=72$ (Redpath et al. 2022). **ID Notes:** Uttal (1989) comments: "In a notoriously difficult genus, *Vaccinium virgatum* is a snap to identify because its oval shiny leaves are serrate and bear on their undersurface blackish glands similar to those borne by its dwarf relative *V. tenellum*. *Vaccinium virgatum* is much grosser in dimensions than *V. tenellum*. Both are rhizomatous and often grow together, but are easily distinguished. The corollas of *Vaccinium virgatum* are narrowly cylindro-urceolate, up to 12 mm long, white, or often deep pink and showy. The fruit is shiny to dull black, rarely glaucous and are usually insipid, but in certain plants they are sweet. The latter are sometimes found on a glabrescent, firm-leaved phase found in the lower Savannah River basin." **Syn:** = Ar, GW2, K1, Redpath et al (2022); = *Cyanococcus amoenus* (Aiton) Small – S; = *Vaccinium amoenum* Aiton – RAB; > *Vaccinium amoenum* Aiton – Tx, Camp (1945); > *Vaccinium ashei* Reade – Camp (1945); < *Vaccinium corymbosum* Linnaeus – K3, K4, WH3, Luteyn et al (1996), Vander Kloet (1988); > *Vaccinium virgatum* Aiton – Tx, Camp (1945).

352. RUBIACEAE A.L. de Jussieu 1789 (MADDER FAMILY) [in GENTIANALES]

A family of about 630-650 genera and 10,200-13,000 species, trees, shrubs, vines, and rarely herbs, cosmopolitan, but especially diverse in tropical and subtropical areas. Subfamily and tribe classification follows Bremer & Eriksson (2009). References: Bremer & Eriksson (2009); Paudyal et al (2018); Rogers (1987); Rogers (2005).

Subfamily Cinchonoideae

Tribe 1.1 Chiococceae: *Chiococca*, *Catesbaea*, *Erithalis*, *Exostema*, *Strumpfia*

Tribe 1.3 Guettardeae: *Guettarda*

Tribe 1.5 Hamelieae: *Hamelia*

Tribe 1.8 Naucleaeae: *Cephalanthus*

Subfamily Ixoroideae

Tribe Condamineae: *Pinckneya*

Tribe Ixoreae: *Ixora*

Tribe Gardenieae: *Gardenia*, *Casasia*, *Randia*

Subfamily Rubioideae

Tribe 3.8 Spermacoceae: *Pentodon*, *Houstonia*, *Oldenlandia*, *Richardia*, *Spermacoce*, *Borreria*, *Mitracarpus*, *Hexasepalum*, *Diodia*, *Ernodea*

Tribe 3.11 Paederieae: *Paederia*

Tribe 3.13 Rubieae: *Galium*

Tribe 3.18a Mitchellleae: *Mitchella*

Tribe 3.19 Psychotrieae: *Psychotria*

Tribe 3.20 Morindeae: *Morinda*

- 1 Trees, shrubs, or woody vines.
 - 3 Inflorescence spherical or globular; [collectively widespread] *Cephalanthus occidentalis*
 - 3 Inflorescence cymose, thyrsoid, or corymbose; [Coastal Plain, from s. SC southward] *Gardenia jasminoides*
- 1 Herbs (or creeping subshrubs in *Mitchella*).
 - 9 Leaves whorled; [subfamily Rubioideae; tribe Rubieae] *Galium*
 - 9 Leaves opposite
 - 10 Flowers paired, the ovaries connate and developing into a single fleshy red fruit; leaves roundish; creeping subshrub; [subfamily Rubioideae; tribe Mitchellleae] *Mitchella repens*
 - 10 Flowers single or in inflorescences with multiple flowers, the fruits either dry or fleshy and yellowish or black; leaves various; herb; [subfamily Rubioideae; tribe Spermacoceae].
 - 11 Carpels with few to many seeds.
 - 12 Corolla 5-lobed *Pentodon pentandrus*
 - 12 Corolla 4-lobed.
 - 13 Capsule longer than the calyx tube; flowers blue, pink, or white *Houstonia*
 - 13 Capsule not longer than the calyx tube; flowers white *Oldenlandia*
 - 11 Carpels 1-seeded.
 - 14 Flowers in dense, terminal, involucre heads; flowers 4- or 6-lobed; styles 3 *Richardia*
 - 14 Flowers in axillary or terminal clusters, or single in axils, not involucre; flowers 4-lobed; styles 2.
 - 15 Flowers usually solitary in leaf axils; fruit separating into 2 parts.
 - 16 Sepals 4 and similar in size; style entire; [of dry habitats] *Hexasepalum*
 - 16 Sepals 2 (or 4, and then markedly dimorphic); style cleft; [of moist to wet habitats] *Diodia*
 - 15 Flowers in terminal and axillary clusters; fruits not separating into 2 parts.
 - 17 Carpels opening transversely *Mitracarpus hirtus*
 - 17 Carpels opening longitudinally *Spermacoce*

Cephalanthus Linnaeus 1753 (BUTTONBUSH)

Key to Map
Symbology:

* : waif
 EN : endemic
 H : historic

A genus of about 6 species, of tropical and temperate America, Asia, and Africa (Rogers 1987). References: Ridsdale (1976); Rogers (1987).

Cephalanthus occidentalis Linnaeus. BUTTONBUSH. **Hab:** Streambanks, riverbanks, depressional wetlands, lakes, marshes, often in standing water. **Dist:** NL, ME, ON, MI, WI, MN, NE, NM, AZ, and CA south through Mexico to Guatemala and Honduras; Cuba (where uncertainly native). **Phen:** Jun-Jul. **Syn:** = Ar, Fl5, GrPl, K1, K3, K4, Meso4.2, Mi, NcTx, NE, NY, Pa, RAB, S, Tn, Va, W, WH3, Ridsdale (1976), Rogers (1987); = *Cephalanthus occidentalis* var. *occidentalis* – GW2, including var. *pubescens*; > *Cephalanthus occidentalis* Linnaeus var. *californicus* Benth – Tx; > *Cephalanthus occidentalis* var. *occidentalis* – C, F, G, Il, Tx; > *Cephalanthus occidentalis* var. *pubescens* – C, F, G, Il, Tx.

Diodia Linnaeus 1753

Contributed by B.A. Sorrie and A.S. Weakley

A genus of about 5 species (as narrowed in circumscription), herbs, of tropical and warm temperate America and Africa. References: Bacigalupo & Cabral (1999); Rogers (2005); Sorrie (2016).

- 1 Sepals 4 and similar in size; style entire; [of dry habitats] *Hexasepalum*
 1 Sepals 2 (or 4, and then markedly dimorphic); style cleft; [of moist to wet habitats].
 2 Capsule length 3.5-5.5 mm, rotund to broadly ellipsoid; corolla tube length 4.0-7.5 mm; leaf length at midstem 14-36 mm *Diodia harperi*
 2 Capsule length 6.5-9.0 mm, narrowly ellipsoid to broadly ellipsoid; corolla tube length 6.5-10.0 mm; leaf length at midstem 27-65 mm *Diodia virginiana*

Diodia harperi Small. HARPER'S BUTTONWEED. **Hab:** Pondshores, other moist sites. **Dist:** E. NC south to s. peninsular FL, west to e. TX and AR. **Phen:** May-Aug (-Oct); May-Nov. **Tax:** See Sorrie (2016) for detailed information. **Syn:** = K4, S, Sorrie (2016); < *Diodia virginiana* Linnaeus – Ar, Fl5, GW2, K3, WH3.

Diodia virginiana Linnaeus. LARGE BUTTONWEED. **Hab:** Ditches, wet fields, wet swales along highways, other moist to wet habitats. **Dist:** CT, PA, IL, and KS south to FL and TX; West Indies; Mexico and Central America. **Phen:** Jun-Dec. **ID Notes:** The leaves frequently turn bright yellow, caused by a viral infection. **Syn:** = GrPl, K4, Sorrie (2016); > *Diodia hirsuta* Pursh – S; > *Diodia tetragona* Walter – S; < *Diodia virginiana* Linnaeus – Ar, C, Fl5, G, GW2, Il, K3, Meso4.2, NcTx, RAB, Tn, Va, W, WH3, WI, WV; > *Diodia virginiana* Linnaeus – S; > *Diodia virginiana* var. *attenuata* Fernald – F, K1; > *Diodia virginiana* var. *latifolia* Torrey & A. Gray – K1; > *Diodia virginiana* var. *virginiana* – F, K1, NE.

Edrastima Rafinesque 1838 (OLDENLANDIA)

A genus of 5 species, annual herbs, of North America to South America, Africa, and Asia. References: Gibbons (2020); Rogers (1987); Terrell & Robinson (2006); Terrell (1991); Ward (2012a).

Edrastima uniflora (Linnaeus) Rafinesque. OLDENLANDIA. **Hab:** Pondshores, muddy drawdown shores, moist to wet ecotones of Coastal Plain streamheads, other moist to wet places. **Dist:** Mostly a species of the Southeastern Coastal Plain: NY (Long Island) south to s. FL and west to TX, north in the interior to MO. Alleged by some to be non-native, and of African origin (Ward 2012a). Discovered in PA Coastal Plain in 2009 (S. Grund, pers.comm., 2019). **Phen:** May-Oct. **Syn:** = K4; = *Hedyotis glomerata* Elliott, a later name; = *Hedyotis uniflora* (Linnaeus) Lamarck – C, F, GW2, Rogers (1987); = *Oldenlandia uniflora* Linnaeus – Ar, Fl5, G, Il, K1, K3, NY, RAB, S, Tn, Va, WH3, Terrell & Robinson (2006), Terrell (1991); > *Hedyotis uniflora* (Linnaeus) Lamarck var. *fasciculata* (Bertoloni) W.H. Lewis – Tx; > *Hedyotis uniflora* var. *uniflora* – Tx; > *Oldenlandia fasciculata* (Bertoloni) Small – S; > *Oldenlandia uniflora* var. *fasciculata* (Bertoloni) D.B. Ward – Ward (2012a); > *Oldenlandia uniflora* var. *uniflora* – Ward (2012a). NatureServe G5 (Secure).

Galium Linnaeus 1753 (BEDSTRAW, CLEAVERS, WOODRUFF)

A genus of ca. 500 species, herbs, cosmopolitan. Here circumscribed to include *Asperula*, *Cruciata*, and *Sherardia*, following an analysis by Soza & Olmstead (2010) that shows the genera *Galium*, *Cruciata*, and *Sherardia* each to be paraphyletic relative to one another, if circumscribed as traditionally. Other solutions are possible, including the recognition of these genera and segregates of them, including the dispersal of *Galium* into two or more genera; this approach has recently been suggested by Ehrendorfer & Barfuss (2014). Interestingly, the number of leaves per whorl appears to be a more fundamental character than those (such as tubular corollas) used to separate genera in the past. References: Allen (2013); Braun (2017); Dempster (1978); Dempster (1981); Ehrendorfer & Barfuss (2014); Lipscomb & Nesom (2007); Moore (1975); Puff (1976); Puff (1977); Reveal et al (2007); Rogers (2005); Soza & Olmstead (2010); Stace (2010); Yang et al (2018).

Identification Notes: The whorled “leaves” are apparently evolutionarily derived from stipules, but are nonetheless here termed “leaves”. The clades mentioned in the keys are those delineated in Soza & Olmstead (2010).

- 1 Leaves mostly in whorls of 4 (rarely a few in whorls of 5-6 in some species) at the primary nodes..... **Key A**
 1 Leaves mostly in whorls of 6 or 8 at the primary nodes..... **Key B**
 2 Leaves mostly 6 per node (ranging from 5-8) at the primary nodes..... **Key B**
 2 Leaves mostly 8 (or more) per node at the primary nodes; [clade III] **Key C**

Key A - Bedstraws with leaves mostly in whorls of 4 (rarely a few in whorls of 5-6 in some species)

- 1 Largest leaves < 8 mm long; flowers white, yellow, or creamy; plant an annual, 0.5-3 dm tall; [clade VII].
 3 Flowers (1-) 2-3 in small clusters in leaf axils, the pedicels 1-2 mm long; fruits and ovaries glabrous *Galium pedemontanum*
 3 Flowers solitary, sessile or subsessile in the leaf axils, the pedicels 0.3-0.8 mm long; fruits and ovaries pubescent with hooked hairs *Galium virgatum*
 1 Largest leaves > 8 mm long; flowers white, creamy, greenish-purple, maroon, or purple; plant a perennial, 1-8 dm tall.
 4 Larger leaves 2.5-25 mm wide, mostly 1.5-5 (-8)× as long as wide; fruits uncinat-hispid (except smooth in *G. latifolium* and *G. arkansanum*); flowers greenish or purplish; leaves normally of very similar length and forming a symmetrical, neat whorl; [clade VII].
 9 Flowers (some of them) sessile or subsessile along the inflorescence branches; leaves 1.5-5 cm long, the larger usually > 2.5 cm long *Galium circaeazans*
 9 Flowers all distinctly pedicelled; leaves 1-2.5 cm long
 10 Stem glabrous; plants sprawling; leaves 2-5× as long as wide..... *Galium orizabense* ssp. *laevicaule*
 10 Stem pubescent with either straight or upwardly incurved hairs; plants erect; leaves 1.5-2.5× as long as wide..... *Galium pilosum*
 4 Larger leaves 1-6 mm wide, mostly 4-20× as long as wide (or 2-3.5× as long as wide in *G. bermudense*); fruits smooth or pubescent (if pubescent, the hairs not hooked at the end, though they may curve through their length, except uncinat in *G. texense*), either fleshy or dry; flowers white or creamy; leaves normally of differing lengths and also often forming asymmetrical, 'sloppy' whorls (the angles between the leaves not being 90°).
 11 Fruits fleshy and blue-black; leaves firm, more-or-less evergreen, glandular-punctate beneath; [clade undetermined].
 12 Leaves elliptic, 7-18 mm long, 3-6 mm wide, 2-3.5× as long as wide *Galium bermudense*
 12 Leaves linear, 15-25 mm long, 2-4 mm wide, 5-10× as long as wide *Galium uniflorum*
 11 Fruits dry, and green, tan, or purplish; leaves herbaceous, deciduous, not glandular-punctate beneath.
 14 Stems smooth on the angles or with few, scattered hairs; stem nodes densely retrorsely bearded; corollas 4-lobed, the lobes longer than wide; leaves strictly 4 per node (very rarely 5 at a few nodes).
 *Galium obtusum* var. *obtusum*
 14 Stems retrorsely scabrous on the angles; stem nodes not conspicuously bearded; corollas 3-4-lobed, the lobes about as wide as long, or wider than long; leaves 4 per node, but most plants with at least some main stem nodes with 5 or 6 leaves.
 *Galium tinctorium* var. *floridanum*

Key B - Bedstraws with leaves mostly 6 per node (ranging from 4-8)

- 1 Flowers pink, purple, or blue, in terminal heads, subtended by an involucre of leaves fused at the base; stem rough-hairy or retrorse-scidrid; [alien].
 *Galium sherardia*
 1 Flowers white, yellow, or green, in axillary or terminal diffuse inflorescences, not subtended by an involucre; stems either smooth, retrorse-scidrid, or pubescent.
 3 Largest leaves < 10 mm long; fruits 0.7-1 mm across; annual; [alien]; [clade III].
 5 Fruit surface without hairs, smooth to shallowly papillate *Galium anglicum*
 5 Fruit surface bristly-hispid with uncinat-tipped hairs, distinctly papillate *Galium parisiense*
 3 Largest leaves > 10 mm long; fruits 1-2.5 mm across; perennial; [native].
 6 Fruits and ovaries uncinat-hispid; leaves 15-50 mm long, 7-10 mm wide; [clade III] *Galium triflorum*
 6 Fruits and ovaries glabrous or papillose; leaves 5-25 mm long, 1-6 mm wide.
 *Galium tinctorium* var. *floridanum*

Key C - Bedstraws with leaves mostly 8 or more per node (ranging from 5-12)

- 3 Stems retrorsely scabrous; annual.
 *Galium aparine*
 3 Stems glabrous or pubescent, but not scabrous; perennial.
 *Galium mollugo*

* ***Galium anglicum* Hudson.** **Hab:** Pastures, disturbed areas. **Dist:** Native of w. Europe. **Phen:** May-Jul. **Syn:** = Ar, K4, Tn, Va, Lipscomb & Nesom (2007); = *Galium parisiense* ssp. *anglicum* (Hudson) Arcangeli; < *Galium divaricatum* Pourret ex Lamarck – K1; < *Galium parisiense* Linnaeus – F, G, RAB, S, W, WV, Stace (2010); < *Galium parisiense* var. *leiocarpum* Tausch – C.

***Galium aparine* Linnaeus.** CLEAVERS, STICKY-WILLY. **Hab:** Meadows, thickets, disturbed areas, forests. **Dist:** Nearly cosmopolitan, from n. North America south through Central and South America. **Phen:** Apr-Jul. **Tax:** Apparently represented in North America (including our area) by both native and introduced genotypes. *Galium spurium* may warrant recognition as a separate taxon from *Galium aparine* (see Moore 1975), but the records have not been studied in our region. **Comm:** Schübler. **Syn:** = Stace (2010), Stace (2010); = *Galium aparine* ssp. *spurium* (Linnaeus) Simonkai; = *Galium aparine* var. *aparine* – II; < *Galium aparine* Linnaeus – Ar, F, FI5, G, GW2, K1, K3, K4, Mi, NcTx, NY, Pa, RAB, S, Tn, Va, W, WH3, WV, Dempster (1981); > *Galium aparine* Linnaeus – Bremer et al. (2010); > *Galium aparine* ssp. *infestum* (Waldstein & Kitaibel) Schübler & Martens – GBI4; > *Galium aparine* var. *aparine* – C, GrPl; > *Galium aparine* var. *echinospermum* (Wallroth) Farwell – GrPl; > *Galium spurium* ssp. *spurium* – GBI4.

***Galium bermudense* Linnaeus.** COASTAL BEDSTRAW. **Hab:** Maritime forests, longleaf pine sandhills, dry sandy forests. **Dist:** S. NJ south to FL, west to LA, primarily on the Coastal Plain; Bahamas; Bermuda. **Phen:** Jun-Aug; Aug-Sep. **Tax:** This species has long been generally known as *G.*

hispidulum Michaux, but *G. bermudense* Linnaeus has priority and that name has been clearly established to apply to this species (Reveal et al. 2007). **Syn:** = S, WI, Reveal et al (2007); = *Galium hispidulum* Michaux – Bah, C, F, FI5, G, K1, K3, K4, RAB, Va, W, WH3. **NatureServe G5** (Secure).

Galium circaeazans Michaux. FOREST BEDSTRAW, LICORICE BEDSTRAW. **Hab:** Mesic to dry forests. **Dist:** QC west to MN and NE, south to FL and TX. **Phen:** Apr-Jul. **Tax:** Two varieties are sometimes distinguished and need additional study (see synonymy). Var. *circaeazans*, more southern, has lower leaf surface glabrous or sparsely short-hispid on the veins, and larger leaves 1.5-2.5 (-4.0) cm long and 0.7-1.4 (-1.8) cm wide. Var. *hypomalacum* Fernald, more northern, has lower leaf surface appressed-pilose, long-hirsute on the veins, and larger leaves 2-5 cm long, 1-2.5 cm wide. **Syn:** = Ar, FI5, K3, K4, Mi, NcTx, NY, RAB, S, Tn, Va, W, WH3; > *Galium circaeazans* var. *circaeazans* – C, F, G, GrPl, Il, K1, NE, Pa, Tx, WV; > *Galium circaeazans* var. *hypomalacum* – C, F, G, GrPl, Il, K1, NE, Pa, Tx, WV.

* **Galium mollugo** Linnaeus. SMOOTH BEDSTRAW, HEDGE BEDSTRAW. **Hab:** Moist roadsides, disturbed areas. **Dist:** Native of Europe. **Phen:** May-Jun. **Tax:** Taxa in the *G. mollugo* complex need additional study (also see *G. album*). **Syn:** = F, Il, NE; = *Galium mollugo* var. *mollugo* – C, G; < *Galium mollugo* Linnaeus – F, K1, K4, Pa, RAB, Tn, Va, W, WV.

Galium obtusum Bigelow var. *obtusum*. BLUNTLEAF BEDSTRAW. **Hab:** Marshes, swamps. **Dist:** NS west to SD, south to FL and TX. **Phen:** Apr-Jul. **Tax:** "Ssp. *australe* Puff", cited in Kartesz (1999) and allegedly endemic to GA, was never published and is no longer considered a useful entity by its potential author (Puff, pers. comm. 2004). **Syn:** = C, F, RAB, W; = *Galium obtusum* ssp. *obtusum* – K3, K4, NE; = *Galium tinctorium* – S, misapplied; < *Galium obtusum* – Ar, GW2, Il, Mi, NcTx, Pa, Tn, Tx, Va, WV; > *Galium obtusum* ssp. "*australe*" – K1, Puff (1976), not validly published; > *Galium obtusum* ssp. *obtusum* – K1, NY, Puff (1976), Puff (1977); > *Galium obtusum* Bigelow var. *obtusum* – G, GrPl; > *Galium obtusum* var. *ramosum* Gleason – G, GrPl.

Galium orizabense Hemsley ssp. *laevicaule* (Weatherby & Blake) Dempster. BALD BEDSTRAW, SMOOTHSTEM BEDSTRAW. **Hab:** Mesic forests, maritime forests, swamp edges. **Dist:** Se. VA south to FL, west to se. TX; West Indies. **Phen:** May-Aug. **Tax:** The typic subspecies, ssp. *orizabense*, is distributed from Tamaulipas south through Mexico, Central America, to n. South America (Dempster 1981). Perhaps warranting specific status separate from *G. orizabense*. **Syn:** = K1, K3, K4, Tn, Va, Dempster (1981); = *Galium pilosum* Aiton var. *laevicaule* Weatherby & Blake – F, Tx; < *Galium orizabense* – Meso4.2; < *Galium pilosum* Aiton – FI5, RAB, S, WH3, WI.

* **Galium parisiense** Linnaeus. WALL BEDSTRAW. **Hab:** Disturbed areas. **Dist:** Native of s., w., and c. Europe. **Phen:** Jun-Jul. **Syn:** = Ar, K1, K3, K4, Tn, Lipscomb & Nesom (2007); = *Galium parisiense* ssp. *parisiense*; < *Galium parisiense* Linnaeus – Stace (2010).

* **Galium pedemontanum** (Bellardi) Allioni. PIEDMONT BEDSTRAW, PIEDMONT CROSSWORT. **Hab:** Lawns, grassy roadsides, pastures. **Dist:** Native of s. Europe. The Piedmont referred to in the name is the 'original' Piedmont of southern Europe. **Phen:** Apr-Jul. **Comm:** In GA Mountains and Piedmont (T. Govus, pers. comm. 2005). Reported for DE and MD by Longbottom, Naczi, & Knapp (2016). **Syn:** = C, F, Il, NY, Pa, RAB, Tn, Va, W, WV; = *Cruciata pedemontana* (Bellardi) Ehrendorfer – Ar, K1, K3, K4, Puff (1976), Puff (1977). **NatureServe GNR** (Not Yet Ranked).

Galium pilosum Aiton. HAIRY BEDSTRAW. **Hab:** Forests, woodland borders, longleaf pine sandhills, prairies, coastal prairies, clearings. **Dist:** S. NH west to MI, n. IL, MO, and KS, south to c. peninsular FL and TX. **Phen:** May-Aug. **Tax:** Two varieties have often been distinguished (see synonymy). Var. *pilosum* has stems and leaves pubescent with spreading, straight hairs and has a wider distribution; var. *punctulosum* has stems and leaves with short, upwardly curved hairs, and is more restricted to the south and east. These varieties need additional study. **Syn:** = Ar, GrPl, Il, K3, K4, Mi, NcTx, Pa, RAB, S, Tn, Va, W, WV; = *Galium pilosum* var. *pilosum* – Tx; < *Galium pilosum* Aiton – FI5, WH3; >? *Galium pilosum* ssp. *pilosum* – NY; > *Galium pilosum* var. *pilosum* – C, F, G, K1, NE; > *Galium pilosum* var. *punctulosum* – C, F, G, K1, NE.

* **Galium sherardia** E.H.L. Krause. BLUE FIELD-MADDER. **Hab:** Lawns, roadsides, other disturbed areas. **Dist:** Native of Europe. **Phen:** Feb-Aug. **Tax:** Differing from *Galium* in its involucre inflorescence and the more tubular, pink to purple flowers, and usually treated as a monotypic genus, *Sherardia*, but Soza & Olmstead (2010) show *Sherardia* to be deeply embedded within a paraphyletic *Galium*. **Syn:** = K3, K4, NY, Va, Stace (2010); = *Sherardia arvensis* Linnaeus – Ar, C, F, FI5, G, GrPl, Il, K1, Meso4.2, Mi, NcTx, NE, Pa, RAB, S, Tn, Tx, W, WH3, WV. **NatureServe GNR** (Not Yet Ranked).

Galium tinctorium Linnaeus var. *floridanum* Wiegand. FLORIDA THREE-LOBED BEDSTRAW, STIFF MARSH BEDSTRAW. **Hab:** Swamps, marshes, and ditches. **Dist:** MA south to FL, west to e. TX, mostly on the Coastal Plain, but extending inland to w. VA, w. NC, se. KY, s. IL, and se. MO. **Phen:** Apr-Jun. **Tax:** See Puff (1976) for additional information. **Syn:** = F, NE; = *Galium obtusum* var. *floridanum* (Wiegand) Fernald – G; = *Galium tinctorium* ssp. *floridanum* – Puff (1977); < *Galium claytonii* Michaux – S; < *Galium tinctorium* – Ar, C, FI5, Il, K1, K3, K4, Pa, RAB, Tn, Tx, Va, W, WH3.

Galium triflorum Michaux. SWEET-SCENTED BEDSTRAW. **Hab:** Mesic to dry upland forests, floodplain forests, seepage swamps, old fields, disturbed areas, usually on base-rich soils. **Dist:** Circumboreal, south in North America to FL and Mexico (Veracruz). **Phen:** May-Sep. **Syn:** = FI5, GrPl, Il, K1, K3, K4, Mi, NcTx, NE, NY, Pa, RAB, S, Tn, Va, W, WH3; > *Galium triflorum* var. *asprelliforme* Fernald – C, F, G, WV; > *Galium triflorum* var. *triflorum* – C, F, G, WV.

Galium uniflorum Michaux. ONE-FLOWERED BEDSTRAW. **Hab:** Moist slope forests and alluvial forests. **Dist:** Se. VA south to FL, west to AR and e. TX. **Phen:** Apr-Oct. **Syn:** = Ar, C, F, FI5, G, K1, K3, K4, RAB, S, Tn, Tx, Va, WH3. **NatureServe G4G5** (Apparently Secure).

(see introduction for more)

Galium virgatum Nuttall. OZARK BEDSTRAW. **Hab:** Glades, ledgetops, rocky prairies, open blackland prairies (GA), waif around wool-combing mill (SC), other disturbed areas. **Dist:** Native from TN, c. GA (Houston County), and AL west to KS, OK, and TX. **Phen:** Mar-Jun. **Syn:** = Ar, C, F, G, II, K1, K3, K4, NcTx, Tn, Tx; > *Galium virgatum* var. *leiocarpum* Torrey & A. Gray – GrPl, S, Tx; > *Galium virgatum* var. *virgatum* – GrPl, S, Tx. NatureServe G4G5 (Apparently Secure).

Gardenia J. Ellis 1761 (GARDENIA)

A genus of ca. 200 species, shrubs and trees, of the Old World tropics and warm temperate areas.

* **Gardenia jasminoides** J. Ellis. GARDENIA. **Hab:** Persistent from horticultural plantings, perhaps spreading (H. Horne, pers. comm., 2014). **Dist:** Native of China and Japan. **Syn:** = K3, K4, Meso4.2.

Hexasepalum Bartling ex A.P. de Candolle 1830

A genus of ca. 15 species, herbs, of tropical, subtropical, and warm-temperate America. Bacigalupo & Cabral (1999) suggested that *Hexasepalum* (as *Diodella*) should be recognized as distinct from *Diodia*. Kirkbride & Delprete (2015) explained the reason for the acceptance of *Hexasepalum* over *Diodella*. References: Bacigalupo & Cabral (1999); Cabaña Fader et al (2019); Kirkbride & Delprete (2015); Rogers (2005).

Hexasepalum teres (Walter) J.H. Kirkbride. POORJOE. **Hab:** Dunes, sandy roadsides, glades, hardpans, other dry habitats. **Dist:** MA, NY and WI, south to FL, TX, and CA, south through Mexico and Central America. **Phen:** Jun-Dec. **Tax:** Very variable (as reflected in the infrataxa that have been sometimes been recognized) and needing additional, careful taxonomic assessment. **Syn:** = K4, Cabaña Fader et al (2019), Kirkbride & Delprete (2015); = *Diodella teres* (Walter) Small – S, Bacigalupo & Cabral (1999); = *Diodia teres* Walter – Ar, C, Fl5, GrPl, GW2, K3, Meso4.2, Mi, NcTx, NY, Pa, RAB, Tn, Va, W, WH3, WV; > *Diodia teres* var. *hirsutior* Fernald & Griscom – F, K1; > *Diodia teres* var. *hystricina* Fernald & Griscom – F, G, K1; > *Diodia teres* var. *oblongifolia* Fernald – F, K1; > *Diodia teres* Walter var. *setifera* Fernald & Griscom – F, II, Tx; > *Diodia teres* var. *teres* – F, G, II, K1, NE, Tx.

Houstonia Linnaeus 1753 (BLUET, DIAMOND-FLOWER)

The generic limits of *Houstonia*, *Hedyotis*, *Oldenlandia*, and *Stenaria* have been controversial, with much shuffling of generic configuration. It now appears that *Houstonia* should be recognized as a genus separate from *Hedyotis* and *Oldenlandia*, with *Stenaria* included in *Houstonia* (Guo et al. 2013; Wikström et al. 2013; and other references). References: Church & Taylor (2005); Church (2003); Guo et al (2013); Pease & Moore (1907); Rogers (1987); Rogers (2005); Shanks (2015); Terrell (1959); Terrell (1986); Terrell (1991); Terrell (1996); Terrell (2001); Terrell (2007); Turner (1995b); Turner (1997); Ward (2004c); Wikström et al (2013).

Identification Notes: In the key below, all leaf measurements and length/width ratios are based on mid-cauline leaves.

- 1 Flowers solitary, on terminal or axillary pedicels (2-) 6-50 (-70) mm long; corolla salverform; leaves 2-15 mm long; [subgenus *Houstonia*].
 - 2 Stems prostrate and creeping..... ***Houstonia procumbens***
 - 2 Stems erect or spreading.
 - 4 Stems 1-4 (-7) cm tall; leaves mostly oblanceolate, 0.3-3.0 mm wide; corolla 5-12 mm long, white to pale pink; seeds with a hilar ridge in an elliptical depression; [section *Mullera*]..... ***Houstonia rosea***
 - 4 Stems 1-26 cm tall; leaves elliptic, ovate or spatulate, 0.3-9.0 mm wide (at least some on a plant generally > 3 mm wide); corolla 2-21 mm long, purple, pale blue, pink, or white; seeds subglobose with a ventral cavity; [section *Houstonia*].
 - 5 Plants perennial, with a well-developed, persistent basal rosette; corolla 5.8-16 (-21) mm long, the tube (2-) 4-11 (-12) mm long..... ***Houstonia caerulea***
 - 5 Plants annual, with at most a few short-lived basal leaves; corolla 2-10 (-12) mm long, the tube 0.8-5.5 mm long.
 - 6 Calyx lobes slightly shorter than to slightly longer than the corolla tube; corollas white, 2.0-5.5 mm long, the tube 0.8-2.5 mm long..... ***Houstonia micrantha***
 - 6 Calyx lobes 1/5 as long as to slightly longer than the corolla tube; corollas purple or violet (rarely white), 3.5-10 (-12.5) mm long, the tube 2.0-5.5 mm long..... ***Houstonia pusilla***
 - 1 Flowers several to many, in terminal cymes; corolla funnelform; leaves (8-) 10-60 mm long; [subgenus *Chamisme*, section *Amphiotis*].
 - 7 Stipules of mid-cauline leaves ciliate or fringed, and also often bristle-tipped; largest mid-cauline leaves 0.5-3 mm wide; capsule either obovoid-cylindric, longer than wide, the free calyx lobes distinctly shorter than the capsule, or (in var. *floridana*) globose or subglobose; [of calcareous glades and barrens or in FL of calcareous sands]..... ***Houstonia nigricans* var. *nigricans***

N : no
P : planted
? : questionable

- 7 Capsule as long as wide or wider, depressed globose, the free calyx lobes about as long as the capsule; stipules of mid-cauline leaves not ciliate, fringed, or bristle-tipped; leaves 0.5-34 mm wide; [of various habitats, including calcareous glades and barrens]

14 Calyx lobes 4-7 mm long; leaves mostly lanceolate (varying from narrowly lanceolate to broadly ovate), 17-33 mm long, 4-10 mm wide, 3.3-6× as long as wide *Houstonia lanceolata*

14 Calyx lobes 1-4 mm long; leaves mostly ovate (varying from broadly ovate to ovate-lanceolate), 8-63 mm long, 6-34 mm wide, 1-3.2× as long as wide. *Houstonia purpurea*

Houstonia caerulea Linnaeus. QUAKER LADIES, INNOCENCE, COMMON BLUET, PISSABED. **Hab:** Forests, woodlands, openings, lawns, a wide variety of disturbed sites. **Dist:** ME, ON, and WI south to s. GA, s. AL, w. LA, and OK. **Phen:** (Late Jan-) Apr-Jul; May-Aug. **ID Notes:** The flowers of this species and *Houstonia serpyllifolia* are very similar; *H. caerulea* is a somewhat duller blue. **Syn:** = Ar, G, II, Mi, NY, Pa, RAB, S, Tn, Va, W, WV, Terrell (1991), Terrell (1996); = *Hedyotis caerulea* (Linnaeus) Hooker – C, GW2; = *Houstonia caerulea* var. *caerulea* – F, Pease & Moore (1907); < *Hedyotis caerulea* (Linnaeus) Hooker – Rogers (1987); < *Houstonia caerulea* Linnaeus – K1, K3, K4, NE.

Houstonia lanceolata (Poiret) Britton. MIDWESTERN SUMMER BLUET, LANCELEAF BLUET, GLADE MOUNTAIN HOUSTONIA. **Hab:** Calcareous prairies and barrens, dry woodlands, banks, rock outcrops, shallow soils around mafic and calcareous rock outcrops. **Dist:** *H. lanceolata* ranges from s. ME and w. NY west to s. OH, and sw. MO, south to w. NC, n. GA, AL, MS, AR, and e. OK. The distribution and ecology of *H. lanceolata* in our area are poorly known; it apparently occupies drier and typically more circumneutral sites than *H. purpurea*. **Phen:** May-Jul; Jul-Aug. **Tax:** This taxon is clearly distinct at specific rank from *Houstonia purpurea*. **Syn:** = F, II, S; = *Hedyotis purpurea* (Linnaeus) Torrey & A. Gray var. *calycosa* (Shuttleworth ex A. Gray) Fosberg; = *Houstonia purpurea* Linnaeus var. *calycosa* Shuttleworth ex A. Gray – Ar, G, K1, K3, K4, NE, NY, Tn, WV, Terrell (1959), Terrell (1991), Terrell (1996); < *Hedyotis purpurea* (Linnaeus) Torrey & A. Gray – C, Rogers (1987); < *Houstonia purpurea* Linnaeus – Pa, RAB, W. NatureServe G5T5 (Secure).

Houstonia micrantha (Shinners) Terrell. SOUTHERN BLUET. **Hab:** Dunes, sandy soils, granitic flatrocks, disturbed areas, roadsides. **Dist:** E. and c. GA west to sc. KY, sw. TN, s. MO, nw. AR, south to w. FL Panhandle, s. MS, s. LA, and e. TX. In 2017-2018, found eastwards of its known native distribution on roadsides and other disturbed areas in Wake County, NC (B. England, pers. comm., 2017, 2018). Reported for Barren County, KY (Brock 2020). **Phen:** Feb-Apr. **Syn:** = Ar, FI5, K1, K3, K4, NcTx, Tn, WH3, Terrell (1996); = *Hedyotis australis* W.H. Lewis & D.M. Moore – Tx, Rogers (1987); = *Houstonia pusilla* Schöpfung – S, misapplied.

Houstonia nigricans (Lamarck) Fernald var. *nigricans*. DIAMOND-FLOWER, GLADE BLUET, PRAIRIE BLUET. **Hab:** Limestone barrens, limestone glades, limestone rocky bluffs, blackland prairies, longleaf pine sandhills, coastal dunes, coastal grasslands, scrubby pine flatwoods. **Dist:** Sw. VA (Ludwig 1999), s. MI, IA, NE, and e. CO, south to s. FL, TX, e. NM, and along the Sierra Madre Oriental to Hidalgo, Mexico. **Phen:** May-Oct. **Tax:** This species has been variously placed in *Houstonia*, *Hedyotis*, and *Stenaria*. As interpreted by Terrell (1991, 2001) and Turner (1995b), *Houstonia nigricans* is a polymorphic species, with *Houstonia nigricans* var. *nigricans* as a widespread "matrix variety", and other, much more local varieties warranting recognition. Turner (1995b) reports *Houstonia nigricans* var. *nigricans* (as *Hedyotis nigricans* var. *nigricans*) from Pickens County, SC; the documentation is not known to me, and suitable habitats there are unlikely. **Syn:** = Ar, Va, Terrell (1986); = *Houstonia angustifolia* Michaux – S; < *Hedyotis nigricans* – C, GrPl, II, NcTx, Rogers (1987); > *Hedyotis nigricans* var. *filifolia* (Chapman) Shinners – Tx, misapplied; < *Hedyotis nigricans* (Lamarck) Fosberg var. *nigricans* – K1, Tn, Terrell (1991), Turner (1995b); < *Houstonia nigricans* (Lamarck) Fernald – F, G; < *Stenaria nigricans* – Mi; < *Stenaria nigricans* (Lamarck) Terrell var. *nigricans* – FI5, K3, WH3, Terrell (2001).

Houstonia procumbens (Walter ex J.F. Gmelin) Standley. CREEPING BLUET, FAIRY-FOOTPRINTS, ROUNDLEAF BLUET, INNOCENCE. **Hab:** Beach dunes, moist to wet sandy pinelands. **Dist:** Se. NC south to s. FL, west to se. LA. **Phen:** Oct-Apr. **Comm:** Gaddy & Rayner (1980) note that this plant is fairly common on SC barrier islands, but flowers in the winter and is easily overlooked in other seasons (when botanists are more likely to be afield). See Wilbur (1968) and Ward (2004c) for differing opinions about the merits of the taxonomic recognition of the glabrous and pubescent plants. **Syn:** = FI5, K1, K3, RAB, S, WH3, Terrell (1991), Terrell (1996); = *Hedyotis procumbens* (Walter ex J.F. Gmelin) Fosberg – Rogers (1987); = *Houstonia rotundifolia* Michaux; > *Houstonia procumbens* var. *hirsuta* (W.H. Lewis) D.B. Ward – Ward (2004c); > *Houstonia procumbens* var. *procumbens* – Ward (2004c). NatureServe G5 (Secure).

Houstonia purpurea Linnaeus. SUMMER BLUET, MOUNTAIN BLUET. **Hab:** Moist and dry woodlands and forests, thinner soils around rock outcrops, and in a variety of disturbed sites, such as paths, old roads, and roadbanks. **Dist:** DE, MD, and s. PA west to s. OH, s. IL, and sw. MO south to SC, sw. GA, Panhandle FL, MS, s. LA, e. TX, and e. OK. **Phen:** May-Jul; Jul-Aug. **ID Notes:** Plants growing in high elevation and exposed sites are sometimes somewhat dwarfed, and in that respect only, superficially resemble *H. montana*. **Syn:** = F, Mi, S; = *Hedyotis purpurea* (Linnaeus) Torrey & A. Gray var. *purpurea*; = *Houstonia purpurea* Linnaeus var. *purpurea* – Ar, G, K1, K3, K4, NY, Pa, Tn, Va, WV, Terrell (1959), Terrell (1991), Terrell (1996); < *Hedyotis purpurea* (Linnaeus) Torrey & A. Gray – C, Rogers (1987); < *Houstonia purpurea* Linnaeus – FI5, II, RAB, Tx, W, WH3. NatureServe G5T5 (Secure).

Houstonia pusilla Schöpfung. TINY BLUET. **Hab:** Woodlands, prairies, lawns, cemeteries, and other disturbed sites. **Dist:** MD south to Panhandle FL, west to TX, and inland from IL west to NE, south to TN and TX. The natural habitats and original distribution of this species are obscure. **Phen:** Mar-Apr. **Syn:** = Ar, FI5, G, K1, K3, K4, NcTx, NY, RAB, Tn, Va, W, WH3, Terrell (1991), Terrell (1996); = *Hedyotis crassifolia* Rafinesque – C, GrPl, GW2, Tx; = *Houstonia minima* L.C. Beck – S; = *Houstonia patens* Elliott – F; < *Hedyotis caerulea* (Linnaeus) Hooker – Rogers (1987); > *Houstonia crassifolia* Rafinesque – II; < *Houstonia pusilla* Schöpfung – S; > *Houstonia pusilla* Schöpfung – II.

Houstonia rosea (Rafinesque) Terrell. ROSE BLUET. **Hab:** Bottomlands. **Dist:** AL west to se. MO, OK, and TX. **Phen:** (Feb-) Mar-Apr. **Syn:** = Ar, K1, K3, K4, NcTx, Terrell (1996); = *Hedyotis rosea* Rafinesque – Tx. NatureServe G5 (Secure).

352. RUBIACEAE

*Mitchella* Linnaeus 1753 (PARTRIDGE-BERRY)

A genus of 2 species, trailing "woody" vines, ours and 1 in e. Asia. *Mitchella* is sister to *Damnacanthus* of e. Asia (Huang et al. 2013). References: Huang et al (2013); Rogers (2005).

Mitchella repens Linnaeus. PARTRIDGE-BERRY, TWO-EYED-BERRY, RUNNING BOX. **Hab:** Deciduous and coniferous forests, stream-banks, heath balds, maritime forests, on rotten logs and hummocks in bottomlands and other wetter habitats. **Dist:** NS west to MN, south to c. peninsular FL and TX; disjunct in montane Mexico (CAM, CHP, GRO, HGO, NLE, OAX, PUE, QRO, SLP, TAM, VER) and Guatemala. **Phen:** May-Jul; Jun-Jul. **Comm:** Plants in maritime forests are more robust than others and often have an ascending habit, the stems sometimes 20-30 cm tall. **Syn:** = Ar, C, F, Fl5, G, GW2, Il, K1, K3, K4, Meso4.2, Mi, NE, NY, Pa, RAB, S, Tn, Tx, Va, W, WH3, WV, Huang et al (2013), Rogers (2005). NatureServe G5 (Secure).

*Mitracarpus* Zuccarini 1827 (GIRDLE-POD)

A genus of about 30-40 species, of tropical America. References: Rogers (2005).

* *Mitracarpus hirtus* (Linnaeus) A.P. de Candolle. GIRDLE-POD. **Hab:** Disturbed areas, roadsides. **Dist:** Native of tropical America. Reported for GA Coastal Plain (Charlton County) (Carter, Baker, & Morris 2009) and SC Coastal Plain (Jasper County) (Bradley et al. [in prep.]). **Syn:** = Fl5, K1, K3, K4, Meso4.2, WH3, Rogers (2005); = *Mitracarpus hirtum* – Tx, orthographic variant; ? *Mitracarpus villosus* (Swartz) Chamisso & Schlechtendal ex A.P. de Candolle.

*Oldenlandia* Linnaeus 1753 (OLDENLANDIA)

A genus of about 100 species, pantropical, but the circumscription is controversial and very uncertain. Wikström et al. (2013), Guo et al. (2013), and Kårehed et al. (2008) presage the split-up of *Oldenlandia* into monophyletic units. *O. uniflora* (and possibly *O. boscii*) will probably end up in *Edrastima* Rafinesque and *O. salzmännii* returned to the genus in which it was first described, as *Anotis salzmännii* A.P. de Candolle. References: GW1; Guo et al (2013); Kårehed et al (2008); Rogers (1987); Rogers (2005); Terrell & Robinson (2006); Terrell (1991); Wikström et al (2013).

- 1 Creeping, mat-forming perennial, rooting at nodes; leaves 1.5-5.2 mm long; flowers solitary on slender axillary pedicels; seeds 4-14 per capsule; [genus indet., possibly *Anotis*, or perhaps more broadly in *Spermacoce*]..... *Oldenlandia salzmännii*
- 1 Erect, spreading, decumbent, or prostrate annual or perennial, not rooting at nodes; leaves 3-40 mm long; flowers 1-10, in axillary clusters or pedunculate umbels; seeds > 50 per capsule.
- 2 Flowers (1) 2-5 in pedunculate axillary umbels, the filiform peduncle 5-10 mm long, the filiform pedicels 3-5 mm long; [genus *Oldenlandia*]..... *Oldenlandia corymbosa*
- 2 Flowers 1-10 in sessile or subsessile axillary clusters.
- 3 Stem glabrous or nearly so; leaves mostly linear or linear-oblongate, 1-3 mm wide, generally 5-10× as long as wide; flowers solitary or (rarely) in 2-3-flowered clusters; plant a perennial; [genus indet.]..... *Oldenlandia boscii*
- 3 Stem pilose or villous (rarely glabrous); leaves mostly ovate or broadly lanceolate, 4-10 mm wide, generally 2-3× as long as wide; flowers in compact clusters of 3-10, rarely solitary; plant an annual..... *Edrastima uniflora*

Oldenlandia boscii (A.P. de Candolle) Chapman. BOSC'S BLUET, BOSC'S MILLE-GRAINES. **Hab:** Clay-based Carolina bays, rivershore and millpond drawdown shores, sagponds, other seasonally saturated habitats. **Dist:** A Southeastern Coastal Plain endemic: se. VA south to FL and west to TX. **Phen:** May-Oct. **ID Notes:** Reminiscent in vegetative condition of *Polypremum procumbens*. **Syn:** = Ar, Fl5, G, K1, K3, K4, NcTx, RAB, S, Tn, Va, WH3, Terrell & Robinson (2006), Terrell (1991); = *Hedyotis boscii* A.P. de Candolle – C, F, GW2, Tx, Rogers (1987). NatureServe G5 (Secure).

* *Oldenlandia corymbosa* Linnaeus. DIAMOND-FLOWER. **Hab:** Moist lawns, gardens. **Dist:** Native of Africa or possibly South America. Reported for NC by Nesom (2000e). **Phen:** Jul-Oct. **Tax:** In the impending splitting of *Oldenlandia* into monophyletic units, this species is likely to remain in *Oldenlandia*. **Comm:** "A tropical and subtropical weed; found new to the state in Norfolk by personnel from the Old Dominion University Herbarium in 2005... growing between cinder block pavers in parking lot" (Virginia Botanical Associates 2019). **Syn:** = Ar, Fl5, K1, K3, K4, Meso4.2, RAB, S, WH3, Terrell & Robinson (2006), Terrell (1991); = *Hedyotis corymbosa* (Linnaeus) Lamarck – Bah, GW2, Tx, Rogers (1987). NatureServe GNR (Not Yet Ranked).

* *Oldenlandia salzmännii* (A.P. de Candolle) Benth & Hooker f. ex B.D. Jackson. **Hab:** Roadside ditches, marshes. **Dist:** Native of South America. Introduced in s. AL and w. Panhandle FL. **Tax:** In the impending splitting of *Oldenlandia* into monophyletic genera, this species will be removed, perhaps to *Panetos* Rafinesque. **Syn:** = K1, K3, K4, WH3, Terrell & Robinson (2006); = *Anotis salzmännii* A.P. de Candolle. NatureServe GNR (Not Yet Ranked).

352. RUBIACEAE

*Pentodon* Hochstetter in Krauss 1844

A genus of 2 species, herbs, of tropical and warm temperate America and Africa. References: Guo et al (2013); Rogers (1987); Rogers (2005); Terrell (1991).

* *Pentodon pentandrus* Vatke. PENTODON. **Hab:** Pond edges, drawdowns, sloughs, wet meadows, moist ground. **Dist:** Apparently native of sub-Saharan Africa, now distributed in e. SC south to s. FL, west to se. TX; West Indies. **Phen:** Jul-Sep. **Syn:** = Ar, Bah, FI5, GW2, K1, K3, K4, Meso4.2, Tx, WH3, WI, Rogers (1987), Rogers (2005), Terrell (1991); ? *Oldenlandia halei* (Torrey & A. Gray) Chapman; ? *Pentodon halei* (Torrey & A. Gray) A. Gray – S. NatureServe G5? (Secure).

*Richardia* Linnaeus 1753 (RICHARDIA)

A genus of about 15 species, of subtropical and tropical America, and introduced in the Old World. References: Krings (2002); Lewis & Oliver (1974); Rogers (2005).

- 1 Mericarps smooth; corolla 4-lobed; [section *Asterophyton*]..... *Richardia humistrata*
- 1 Mericarps either conspicuously and densely hispidulous to strigose or papillose to tuberculate; corolla 6-lobed; [section *Richardia*].
 - 2 Stems hirsute, generally densely and evenly so from tip to base; adaxial leaf surface evenly strigose; mericarps conspicuously and densely hispidulous to strigose, the adaxial face broad, with a pronounced median keel; perennial from a woody rhizome (or annual)..... *Richardia brasiliensis*
 - 2 Stems hirsute or villous near the tips, but progressively more sparsely so to glabrate toward the base; adaxial leaf surface glabrous to strigillose near the margins only, the median portion of the leaf blade glabrous; mericarps papillose to tuberculate, the adaxial surface closed to a narrow groove; annual. *Richardia scabra*

* *Richardia brasiliensis* Gomes. TROPICAL RICHARDIA. **Hab:** Roadsides, fields, vacant lots, urban areas, disturbed areas. **Dist:** Native of South America. **Phen:** May-Nov. **Syn:** = C, F, FI5, K1, K3, K4, Meso4.2, RAB, S, Tx, Va, WH3, Lewis & Oliver (1974), Rogers (2005). NatureServe G5 (Secure).

* *Richardia humistrata* (Chamisso & Schlechtendal) J.A. Schultes & J.H. Schultes. **Hab:** Disturbed areas, pine savannas, pine flatwoods. **Dist:** Native of South America. Also collected in 1886 as a ballast waif in Camden County, NJ; first noted on the Gulf Coast only in 1941, but perhaps early introduced there on ballast as well, such as at Pensacola. **Syn:** = FI5, K1, K3, K4, Tx, WH3, Lewis & Oliver (1974), Rogers (2005). NatureServe GNR (Not Yet Ranked).

* *Richardia scabra* Linnaeus. ROUGH MEXICAN-CLOVER. **Hab:** Roadsides, fields, vacant lots, urban areas, disturbed areas. **Dist:** Native of South America. Lewis & Oliver (1974) consider this species to be native from our area south through Central America into northern South America, based on the semi-contiguous distribution, but occurrences in our region seem to be in altered habitats. **Phen:** Jun -Dec. **Syn:** = C, F, FI5, G, K1, K3, K4, Meso4.2, NcTx, RAB, S, Tx, Va, WH3, Lewis & Oliver (1974), Rogers (2005). NatureServe G5 (Secure).

*Spermacoce* Linnaeus 1753 (BUTTONWEED)

A genus of about 150-250 species, herbs, of tropical and warm-temperate Old and New World. Here circumscribed to include *Borreria* G.F.W. Meyer; additional changes in circumscription seem likely as genera in the Spermacoceae are recircumscribed. References: Bacigalupo (1972); Florentin, Florentin, & Salas (2020); Franck et al (2021); Rogers (2005); Ward (2011b).

- 1 Calyx with 4 lobes of nearly equal length. *Spermacoce glabra*
- 1 Calyx with 2 long lobes, the other 2 absent or vestigial (much shorter than the 2 long lobes). *Spermacoce ocymoides*

Spermacoce glabra Michaux. SMOOTH BUTTONWEED. **Hab:** Moist shores, bottomlands, riverside drawdowns, rocky riversides in the mountains, disturbed areas in the Coastal Plain. **Dist:** C. MD, s. OH, c. IN, c. IL, MO, and e. KS south to s. SC, Panhandle FL, s. AL, s. MS, LA, and e. TX. Perhaps only introduced in some parts of our area; see Wieboldt et al. (1998) for discussion. **Phen:** May-Oct. **Syn:** = Ar, C, F, FI5, G, GrPl, GW2, IL, K1, K3, K4, NcTx, RAB, S, Tn, Tx, Va, WH3, Florentin, Florentin, & Salas (2020), Rogers (2005), Ward (2011b); > *Spermacoceodes glabra* (Michaux) Kuntze – Bacigalupo (1972). NatureServe G4G5 (Apparently Secure).

Spermacoce ocymoides Burman f. **Hab:** Wet pine flatwoods, floodplain forests. **Dist:** FL, AL, MS, south through the New World tropics. **Phen:** Jul-Sep. **Tax:** I follow Ward (2011a) in provisionally accepting *S. ocymoides* as the correct name for our plant, until a more definitive rationale for its rejection in favor of *S. prostrata* is made. **Syn:** = Ward (2011b); = *Borreria ocymoides* (Burman f.) A.P. de Candolle – Bah, S; ? *Spermacoce prostrata* Aublet – FI5, K1, K3, K4, WH3, Florentin, Florentin, & Salas (2020).

353. GELSEMIACEAE Struwe & V.A. Albert 1994 [1995] (JESSAMINE FAMILY) [in GENTIANALES]

A family of 3 genera and about 13 species, shrubs and vines, of tropical and warm temperate America, Africa, and Asia (Struwe 2018). There is persuasive evidence that *Gelsemium*, *Mostuea* Didrichsen, and *Pteleocarpa* Oliver, traditionally treated as part of a heterogeneous Loganiaceae, should be accorded family status as Gelsemiaceae (Backlund, Oxelman, & Bremer 2000; Struwe, Albert, & Bremer 1994; Sennblad & Bremer 1996; Struwe et al. (2015). The Gelsemiaceae form a clade most closely related to the Apocynaceae (Backlund, Oxelman, & Bremer 2000). References: Backlund, Oxelman, Bremer (2000); Rogers (1986); Sennblad & Bremer (1996); Struwe (2018) in Kadereit & Bittrich (2018); Struwe et al (2015); Struwe, Albert, & Bremer (1994).

Gelsemium A.L. de Jussieu 1789 (YELLOW JESSAMINE)

A genus of 3 species, lianas, our 2 species in se. North America (and also Central America) and 1 species in e. Asia. See Wyatt et al. (1993) and Duncan & DeJong (1964) for extensive discussions of morphology, habitat, pollination, genetics, distribution, and evolutionary relationships of our two species of *Gelsemium*. References: Duncan & DeJong (1964); GW2; Godfrey (1988); Krings in FNA () (in prep); Rogers (1986); Struwe (2018) in Kadereit & Bittrich (2018); Wyatt et al (1993).

- 1 Sepals acuminate apically, persistent on the fruit; capsule elliptical, 1.0-1.6 cm long, 6-8 mm broad, the tapering tip bearing a definite beak 2.4-4.2 3 mm long; seeds wingless; flowers odorless (rarely fragrant), usually golden-yellow; leaf with small patch of spreading trichomes at extreme base on the lower surface *Gelsemium rankinii*
- 1 Sepals obtuse to broadly acute, not persistent on the fruit; capsule oblong, 1.5-2.5 cm long, 8-12 mm broad, very abruptly narrowed to a beak 1.5-2 mm long; seeds with a prominent membranous wing sharply differentiated from the body of the seed; flowers fragrant, usually lemon-yellow; leaf glabrous on the lower surface *Gelsemium sempervirens*

Gelsemium rankinii Small. SWAMP JESSAMINE. **Hab:** Swamps of blackwater rivers. **Dist:** Se. NC (notably in the systems of the Waccamaw and Black rivers) south through SC and GA to the FL Panhandle, and west to e. LA. **Phen:** Feb-Apr; Sep-Oct. **Syn:** = FI5, FNA, GW2, K1, K3, K4, RAB, S, WH3, Rogers (1986). NatureServe G5 (Secure).

Gelsemium sempervirens (Linnaeus) J. Saint-Hilaire. CAROLINA JESSAMINE. **Hab:** In a wide range of habitats, from swamp forests to dry uplands and thickets, also commonly planted as an ornamental. **Dist:** VA, se. TN, and AR south to c. peninsular FL and e. TX; disjunct in Guatemala and Mexico (many states). **Phen:** (Jan-) Feb-early May; Sep-Nov. **Comm:** Jessamine climbs to the tops of trees. **Syn:** = F, FI5, FNA, G, GW2, K1, K3, K4, Meso4.1, NcTx, RAB, S, Tn, Tx, Va, W, WH3, Rogers (1986). NatureServe G5 (Secure).

353. GENTIANACEAE A.L. de Jussieu 1789 (GENTIAN FAMILY) [in GENTIANALES]

A family of about 102 genera and about 1750 species, herbs, shrubs, and trees, cosmopolitan (Struwe & Pringle 2018). References: Drake (2011); Ho & Liu (1990); Struwe & Pringle (2018) in Kadereit & Bittrich (2018); Struwe et al (2002) in Struwe & Albert (2002); Wood & Weaver (1982).

- 1 Leaves all scale-like, 1-3 (-5) mm long, appressed to the stem. *Bartonia*
- 1 Leaves larger, spreading or ascending.
- 3 Stem leaves whorled; plants robust, 1-3 m tall; [tribe *Gentianeae*, subtribe *Swertiinae*]..... *Frasera*
- 3 Stem leaves opposite; plants generally < 1 m tall.
- 4 Calyx lobes 2; stem leaves obovate, widest near the rounded tip), 0.5-1.5 cm long, crowded near the tip of the stem, basal rosette never present; [of nutrient-rich, mesic forests]; [tribe *Gentianeae*, subtribe *Swertiinae*]..... *Obolaria*
- 4 Calyx lobes 4-5; stem leaves lanceolate, ovate, elliptic or narrowly elliptic (widest near the middle or toward the base, the tip acute or acuminate), mostly > 1.5 cm long, distributed fairly evenly along the stem, basal rosettes sometimes present; [of various more-or-less open habitats (except some species of *Gentiana*, which can occur in nutrient-rich, mesic forests)].
- 5 Corolla lobes 5-14, longer than the corolla tube, pink or white; [common natives]; [tribe *Chironieae*, subtribe *Chironiinae*]..... *Eustoma*
- 6 Stigmas shorter than the style..... *Sabatia*
- 6 Stigmas equaling or longer than the style..... *Sabatia*
- 5 Corolla lobes 4-5, shorter than the corolla tube, blue, lavender, pink or white.
- 7 Corolla tube < 2 mm wide; [rare to uncommon aliens, naturalized in disturbed areas]; [tribe *Chironieae*, subtribe *Chironiinae*]..... *Centaureium*
- 7 Corolla tube > 3 mm wide.
- 9 Corolla lobes alternating with corolla appendages (appearing as plaits or lobes, these often toothed, notched, or lacerate, sometimes as long as or longer than the true corolla lobes); main stem leaves cuneate at the base; perennial; [tribe *Gentianeae*, subtribe *Gentianinae*]..... *Gentiana*
- 9 Corolla lobes not alternating with corolla appendages; main stem leaves rounded to cordate at the base; biennial or annual; [tribe *Gentianeae*, subtribe *Swertiinae*]..... *Gentianella*

***Bartonia* Muhlenberg ex Willdenow 1801 (BARTONIA)**

A genus of 3 species, annual herbs, of e. North America (Struwe & Pringle 2018). The genus has coralloid mycorrhizae and lacks root hairs and has been shown to be partially mycoheterotrophic (Cameron & Bolin 2010). References: Correll (1966); Drake (2011); Gillett (1959); Mathews et al (2009); Struwe & Pringle (2018) in Kadereit & Bittrich (2018).

- 1 Corolla lobes white, 4-10 mm long, spreading, spatulate to obovate, rounded at the apex; flowering in early spring (rarely to early summer) *Bartonia verna*
- 1 Corolla lobes green to creamy white, 2-3 (-5.2) mm long, ascending or erect, oblong to ovate or lance-ovate, acuminate or rounded-mucronate at the apex; flowering in summer or fall (Jul-Oct).
- 2 Mid-cauline scale leaves opposite; corolla lobes rounded at the apex, abruptly narrowed to a mucro, their margins erose (uncommonly entire); anthers 0.5-1.1 mm long; style slender with stigmas connivent; capsule dehiscent medially..... *Bartonia virginica*
- 2 Mid-cauline scale leaves alternate; corolla lobes acuminate at the apex, their margins entire; anthers 0.3-0.5 mm long; style stout with stigmas spreading; capsule dehiscent from the apex.
- *Bartonia paniculata* ssp. *paniculata*

***Bartonia paniculata* (Michaux) Muhlenberg ssp. *paniculata*. SCREWSTEM BARTONIA. **Hab:** Swamps, bogs, pocosins, pocosin ecotones, sphagnum seepages, sinkhole ponds. **Dist:** Ssp. *paniculata* ranges from MA south to c. peninsular FL and west to e. TX, chiefly on the Coastal Plain, but with scattered occurrences inland, to c. VA, e. WV (Vanderhorst et al. 2013), w. NC, KY, and AR. **Phen:** Aug-Oct; Sep-Oct. **Comm:** Ssp. *iodandra* (B.L. Robinson) J. Gillett is more northern, ranging from NL (Newfoundland) south to MA. **Syn:** = Ar, K1, K3, K4, Va, Drake (2011), Gillett (1959), Mathews et al (2009); = *Bartonia paniculata* – G, NE, Correll (1966); = *Bartonia paniculata* var. *paniculata* – C, F; > *Bartonia lanceolata* Small – S; < *Bartonia paniculata* – Fl5, GW2, Il, Mi, Pa, RAB, Tn, Tx, WH3; < *Bartonia paniculata* (Michaux) Muhlenberg ssp. *paniculata* – NY. **NatureServe G5T5** (Secure).**

***Bartonia verna* (Michaux) Rafinesque ex Barton. SPRING BARTONIA, WHITE BARTONIA. **Hab:** Wet pine savannas, shores of Coastal Plain depression ponds, interdune swales, other moist sands. **Dist:** VA (one site known from City of Virginia Beach) (Belden et al. 2004) and se. NC (Carteret County) south to s. FL, west to se. TX. **Phen:** (Nov-) Jan-Apr (-Jun); Apr-Jun. **Tax:** Wood & Weaver's (1982) speculation that *B. verna* is an outlier relative to the other species appears not to be true, with the deeper division being between *B. verna* / *virginica* on the one hand and the *B. paniculata* subspecies on the other (Mathews et al. 2009). **Syn:** = Fl5, GW2, K1, K3, K4, RAB, S, Va, WH3, Drake (2011), Gillett (1959), Mathews et al (2009). **NatureServe G5?** (Secure).**

***Bartonia virginica* (Linnaeus) Britton, Sterns, & Poggenburg. VIRGINIA BARTONIA, YELLOW BARTONIA. **Hab:** Bogs, swamps, savannas, pocosin ecotones, pocosins, dune swales. **Dist:** NS and QC west to WI, south to n. FL and LA. **Phen:** Jul-Oct; Sep-Oct. **Syn:** = C, F, Fl5, G, GW2, Il, K1, K3, K4, Mi, NE, NY, Pa, RAB, S, Tn, Va, WH3, Drake (2011), Gillett (1959), Mathews et al (2009). **NatureServe G5** (Secure).**

Centaurium Hill 1756 (CENTAURY)

A genus of about 20 species, herbs, mainly north temperate (Struwe & Pringle 2018). References: Drake (2011); Mansion (2004); Struwe & Pringle (2018) in Kadereit & Bittrich (2018).

- 1 Flowers pedicellate, the pedicels (1-) 3-5 (-11) mm long..... *Centaurium pulchellum*
 1 Flowers sessile or nearly so (sometimes appearing stalked but with bracteal leaves immediately below the calyx)..... *Centaurium tenuiflorum*

* ***Centaurium pulchellum*** (Swartz) Hayek ex Handel-Mazzetti, Stadlmann, Janchen & Faltis. LESSER CENTAURY, BRANCHED CENTAURY. **Hab:** Disturbed areas. **Dist:** Native of Europe. Reported as naturalizing in WV (Vanderhorst et al. (2019). **Phen:** Jun-Oct. **Syn:** = C, F, G, GrPl, Il, K1, K3, K4, Mi, NE, NY, Pa, S, Drake (2011), Mansion (2004); > *Centaurium floribundum* (Benth) B.L. Robinson – NcTx; > *Centaurium pulchellum* (Swartz) Hayek ex Handel-Mazzetti, Stadlmann, Janchen & Faltis – NcTx.

* ***Centaurium tenuiflorum*** (Hoffmansegg & Link) Fritsch ex Janchen. SLENDER CENTAURY. **Hab:** Drawdown pond in blackland prairie. **Dist:** Native of Eurasia. **Phen:** Jun. **Comm:** See Keener (2013) for additional, detailed information. **Syn:** = K3, K4, Drake (2011).

*Eustoma* Salisbury ex G. Don 1805 [1806] (PRAIRIE-GENTIAN)

A genus of ca. 2 species, annual or perennial herbs, of se., c., and sw. North America south to Mexico and Belize and in the West Indies (Struwe & Pringle 2018). References: Drake (2011); Shinnars (1957); Struwe & Pringle (2018) in Kadereit & Bittrich (2018); Turner (2014); Wood & Weaver (1982).

Eustoma exaltatum (Linnaeus) Salisbury ex G. Don. PRAIRIE-GENTIAN. **Hab:** Alkaline prairies, saline coastal areas. **Dist:** AL and peninsular FL west to s. CA, south to Mexico and Belize; West Indies. **Phen:** Jun-Nov. **Syn:** = Ar, Bah, Fl5, GW2, Meso4.1, S, Tx, WH3, Shinnars (1957), Turner (2014), Wood & Weaver (1982); = *Eustoma exaltatum* ssp. *exaltatum* – K1, K3, K4, Drake (2011). NatureServe G5T4T5 (Apparently Secure).

*Frasera* Walter 1788 (COLUMBO)

A genus of 15 species, annual, perennial, or monocarpic herbs, primarily of w. North America (Struwe & Pringle 2018). References: Drake (2011); Horn (1997); Struwe & Pringle (2018) in Kadereit & Bittrich (2018); Threadgill & Baskin (1978).

Frasera caroliniensis Walter. AMERICAN COLUMBO. **Hab:** Rich forests and woodlands over mafic or calcareous rocks, upper slopes of cove forests, floodplain forests. **Dist:** W. NY, nw. PA, and s. ON west to IL, MI, MO, and e. OK, south to w. SC, n. GA, and LA, primarily west of the Blue Ridge. **Phen:** Late May-Jul; Sep-Oct. **Comm:** Horn (1997) studied the ecology of this species in the Piedmont of SC. **Syn:** = Ar, C, Il, K1, K3, K4, Mi, NY, S, Tn, W, Drake (2011), Threadgill & Baskin (1978); = *Swertia caroliniensis* (Walter) Kuntze – F, G, Pa, RAB. NatureServe G5 (Secure).

*Gentiana* Linnaeus 1753 (GENTIAN)

A genus of about 350-400 species, annual, biennial, and perennial herbs, primarily temperate and arctic. Even following the removal of *Gentianopsis* and *Gentianella* (to separate genera and a different subtribe), *Gentiana* is a large and apparently heterogeneous group, perhaps not monophyletic. No satisfactory comprehensive treatment is available, however. All of the species treated here as *Gentiana* are in the distinctive group treated here as section *Pneumonanthe* (Favre et al. 2020). References: Drake (2011); Favre et al (2020); Halda (1996); Ho & Liu (1990); Ho & Liu (2001); Pringle & Weakley (2009); Pringle (1967a); Pringle (1977); Struwe & Pringle (2018) in Kadereit & Bittrich (2018); Yuan, Küpfer, & Doyle (1996).

Key adapted from Pringle (1967).

Identification Notes: In some species it may be somewhat difficult to interpret the corolla lobes and the corolla appendages. The filaments are alternate to the corolla lobes, and are therefore attached to the lower portion of the corolla appendages.

- 4 Corolla greenish-white (sometimes somewhat purplish); seeds wingless; lower leaves spatulate to obovate..... *Gentiana villosa*
 4 Corolla blue, purplish, pale blue, or nearly white; seeds winged; lower leaves linear, lanceolate, elliptic, or ovate.

- 9 Leaves ovate, widest near the base, bright green; calyx lobes longer than the calyx tube; corolla lobes spreading, usually 2-4 mm longer than the appendages..... *Gentiana catesbyi*
- 9 Leaves linear to elliptic, widest near the middle, dark green; calyx lobes shorter than or about equal to the calyx tube; corolla lobes usually incurved, rarely exceeding the appendages by > 2 mm..... *Gentiana saponaria*

Gentiana catesbyi Walter. COASTAL PLAIN GENTIAN. **Hab:** Pocosins, moist longleaf pine savanna edges, edges of moist hardwood forests, bluff seepages. **Dist:** S. NJ south to ne. FL and e. Panhandle FL, on the Coastal Plain. **Phen:** Late Sep-Nov. **Tax:** Traditionally spelled '*catesbaei*', this is necessarily corrected to '*catesbyi*' under provisions of the Code. **Syn:** =; = *Gentiana catesbaei* Walter – C, Fl5, G, GW2, K1, K3, K4, Pa, RAB, Va, WH3, Halda (1996), Ho & Liu (2001), Pringle (1967a); = *Pneumonanthe catesbaei* (Walter) F.W. Schmidt; > *Dasystephana latifolia* (Chapman) Small – S; > *Dasystephana parvifolia* (Chapman) Small – S; > *Gentiana catesbaei* var. *catesbaei* – F; > *Gentiana catesbaei* var. *nummulariifolia* Fernald – F. **NatureServe G5** (Secure).

Gentiana saponaria Linnaeus. SOAPWORT GENTIAN, HARVESTBELLS. **Hab:** Bogs, marshes, wet hardwood forests, other moist to wet habitats. **Dist:** NY west to n. IL, south to Panhandle FL and e. TX. **Phen:** Aug-Nov. **Tax:** A peculiar form with very narrow leaves has been found at several localities in Ashe and Watauga counties, NC and in the South Mountains, NC; it may warrant taxonomic recognition after further study. **Syn:** = C, Fl5, GW2, Il, K3, K4, Mi, NY, Pa, RAB, Tn, Tx, Va, W, WH3, Halda (1996), Ho & Liu (2001), Pringle & Weakley (2009), Pringle (1967a); = *Dasystephana saponaria* (Linnaeus) Small – S; = *Gentiana saponaria* var. *saponaria* – K1; = *Pneumonanthe saponaria* (Linnaeus) F.W. Schmidt; > *Dasystephana cherokeensis* W.P. Lemmon; > *Gentiana cherokeensis* (W.P. Lemmon) Fernald – F, G; > *Gentiana saponaria* Linnaeus – F, G, WV. **NatureServe G5T5** (Secure).

Gentiana villosa Linnaeus. STRIPED GENTIAN. **Hab:** Upland forests, sandhill/pocosin ecotones. **Dist:** Se. PA west to n. KY and w. TN, south to Panhandle FL and e. LA. **Phen:** Late Aug-Nov. **Syn:** = C, F, Fl5, G, K1, K3, K4, Pa, RAB, Tn, Va, W, WH3, Halda (1996), Ho & Liu (2001), Pringle (1967a); = *Dasystephana villosa* (Linnaeus) Small – S; = *Pneumonanthe villosa* (Linnaeus) F.W. Schmidt. **NatureServe G4** (Apparently Secure).

Gentianella Moench 1794 (GENTIANELLA, AGUEWEED)

A genus of about 150-250 species, annual and perennial herbs, temperate (Struwe & Pringle 2018). The separation of *Gentianella* from *Gentiana* appears to be well warranted; some characters suggest that *Gentianella* is more closely allied to *Swertia*, *Halenia*, and *Lomatogonium* than to *Gentiana* (Wood & Weaver 1982). A molecular analysis has confirmed this (Yuan & Küpfer 1995). References: Gillett (1957); Struwe & Pringle (2018) in Kadereit & Bittrich (2018).

Gentianella occidentalis (A. Gray) Small. MIDWESTERN GENTIANELLA, WESTERN AGUEWEED. **Hab:** Calcareous barrens, prairies, meadows, dry and dry-mesic limestone woodlands. **Dist:** OH and s. ON west to MN, east and south to w. VA, sc. KY, AR, and se. KS. **Phen:** Late Aug-Nov. **Tax:** Gillett (1957) describes *Gentianella quinquefolia* as "a polymorphic species with two clearly distinct allopatric subspecies distinguished chiefly by flower and calyx size"; the morphological distinctions, largely allopatric distributions, and differences in habitat warrant specific rank by modern taxonomic standards. **Syn:** = S; = *Gentiana quinquefolia* var. *occidentalis* (A. Gray) A.S. Hitchcock – F; = *Gentianella quinquefolia* ssp. *occidentalis* (A. Gray) J. Gillett – GrPl, Il, K1, K3, K4, Mi, Gillett (1957); = *Gentianella quinquefolia* (Linnaeus) Small var. *occidentalis* A. Gray – Ar, C, G, Va; < *Gentiana quinquefolia* Linnaeus – W. **NatureServe G5T4T5** (Apparently Secure).

Obolaria Linnaeus 1753 (PENNYWORT)

A monotypic genus, a perennial herb (partly mycoheterotrophic), of e. North America. References: Gillett (1959); Struwe & Pringle (2018) in Kadereit & Bittrich (2018).

Obolaria virginica Linnaeus. PENNYWORT. **Hab:** Nutrient-rich, moist to dry forests, mesic hammocks. **Dist:** NJ west to OH, s. IN, and s. IL, south to Panhandle FL (Jefferson County) and se. LA (reported from TX). **Phen:** (Late Feb-) Mar-Jun; May-Jul. **Comm:** *Obolaria* has well-developed mycorrhizae and is substantially mycoheterotrophic (Cameron & Bolin 2010). **ID Notes:** The small purplish-green plants are inconspicuous, often nearly hidden under fallen leaves. **Syn:** = Ar, C, F, Fl5, G, Il, K1, K3, K4, Pa, RAB, S, Tn, Tx, Va, W, WH3, WV, Gillett (1959). **NatureServe G5** (Secure).

Sabatia Adanson 1763 (SABATIA, ROSE-GENTIAN, ROSE-PINK, MARSH-PINK, SEA-PINK)

Contributed by B.A. Sorrie and A.S. Weakley

A genus of about 20 species, of North America and the West Indies (Struwe & Pringle 2018). References: Bell & Lester (1980); Pringle & Witsell (2004); Struwe & Pringle (2018) in Kadereit & Bittrich (2018); Suarez-Gonzalez et al (2015); Ward (2007e); Wilbur (1955).

- 1 Flowers with (7-) 8-12 (-14) corolla lobes.

- 2 Pedicels < 5 mm long; calyx subtended by linear bracts that usually exceed the corolla lobes; terminal flowers in capitate clusters (less commonly single). *Sabatia gentianoides*
- 2 Pedicels > 10 mm long; calyx not subtended by long bracts; terminal flower single.
- 4 Upper stem leaves about as wide as the diameter of the stem, or narrower; calyx lobes terete or semi-terete; stems 6-12 dm tall; [*Taxodium ascendens*-*Nyssa biflora* depressions and wet pine flatwoods in se. SC and southwards]..... *Sabatia decandra*
- 4 Upper stem leaves much wider than the diameter of the stem; calyx lobes flat, linear to narrowly oblanceolate; stems 3-12 dm tall; [various habitats, primarily along the shores of blackwater rivers or ponds, or in tidal marshes]..... *Sabatia foliosa*
- 1 Flowers with 5-6 (-7) corolla lobes.
- 7 Upper branches of main stem alternate.
- 8 Calyx tube strongly winged; corolla lobes pink (rarely white); [w. KY, MS, and se. LA westward, and very rarely introduced farther east]; [section *Campestris*]..... *Sabatia campestris*
- 8 Calyx tube not winged; corolla lobes pink or white; [more widespread, primarily Coastal Plain].
- 12 Calyx lobes foliaceous, 5-8 mm wide, oblong to oblanceolate, mostly exceeding the corolla lobes *Sabatia calycina*
- 12 Calyx lobes linear-setaceous, 0.5-2 mm wide, if equaling the corolla lobes then very narrow and not foliaceous.
- 13 Calyx lobes (3-) 4-7 (-8) mm long; corolla lobes white..... *Sabatia brevifolia*
- 13 Calyx lobes (4-) 6-17 (-23) mm long; corolla lobes pink (rarely white in individual plants).
- 14 Plants perennial, often with several stems from a caudex; calyx lobes > 3/4× as long as the corolla lobes, and sometimes exceeding them; [saturated soils from Coastal Plain savannas to Mountain bogs] *Sabatia campanulata*
- 14 Plants annual, solitary; calyx lobes up to 3/4× as long as the corolla lobes *Sabatia stellaris*
- 7 Upper branches of main stem opposite.
- 16 Corolla lobes pink (rarely white); pedicels at least in part > 5 mm long.
- 17 Lower half of stem winged; leaves ovate, clasping, < 2× as long as wide; [widespread in our area] *Sabatia angularis*
- 17 Lower half of stem not winged; leaves elliptic to lanceolate, more or less tapered to the base, mostly > 3× as long as wide; [Coastal Plain or very rarely Piedmont] *Sabatia brachiata*
- 16 Corolla lobes white or creamy white; pedicels (above the uppermost bracts or branches) ca. 1-2 (-5) mm long.
- 19 Leaves and upper stem not glaucous; stem terete below, becoming quadrangular or quadrangular-angled above; corolla lobes (5-) 7-15 (-21) mm long; [widespread in our area] *Sabatia difformis*
- 19 Leaves and upper stem glaucous; stem terete throughout; corolla lobes (4-) 5-7 (-8) mm long; [GA southward and westward]. *Sabatia macrophylla* var. *macrophylla*

Sabatia angularis (Linnaeus) Pursh. BITTER-BLOOM, COMMON MARSH-PINK, AMERICAN CENTAURY. **Hab:** Forests, woodlands, marshes, fields, calcareous hammocks (in FL), especially in base-rich situations. **Dist:** NY west to s. MI, IL, and e. KS, south to Panhandle FL and e. TX. **Phen:** Jun-Sep; Sep-Oct. **Syn:** = C, F, FI5, GW2, K1, K3, K4, Mi, NcTx, NE, NY, Pa, RAB, Tn, Tx, Va, W, WH3, WV, Wilbur (1955); = *Sabatia angulatus* – Il, misspelling; = *Sabbatia angularis* – S. NatureServe G5 (Secure).

Sabatia brachiata Elliott. NARROWLEAF ROSE-PINK. **Hab:** Mesic pinelands, longleaf pine sandhills, pine savannas, pine flatwoods. **Dist:** Se. VA south to s. GA, west to LA, north in the interior to c. TN and se. MO. **Phen:** Late May-Aug; Aug-Sep. **Syn:** = Ar, C, F, GW2, K1, K3, K4, RAB, Tn, Va, W, Wilbur (1955); = *Sabatia angustifolia* (Michaux) Britton; = *Sabbatia brachiata* – S. NatureServe G5? Sabatia brevifolia Rafinesque. SAVANNA WHITE ROSE-GENTIAN. **Hab:** Pine savannas and flatwoods. **Dist:** E. SC south to peninsular FL, west to s. AL and s. MS. **Phen:** Sep-Oct; Oct-Nov. **Syn:** = FI5, GW2, K1, K3, K4, RAB, WH3, Wilbur (1955); = *Sabbatia elliotii* Steudel – S. NatureServe G3G4 (Vulnerable).

Sabatia calycina (Lamarck) A. Heller. COASTAL ROSE-PINK. **Hab:** Swamp forests, river banks. **Dist:** Se. VA south to s. FL, west to se. TX; e. Cuba and Hispaniola. **Phen:** Jun-Oct; Jul-Oct. **Syn:** = C, F, FI5, GW2, K1, K3, K4, RAB, Tx, Va, WH3, Wilbur (1955); = *Sabbatia calycina* – S. NatureServe G5? (Secure).

Sabatia campanulata (Linnaeus) Torrey. SLENDER MARSH-PINK. **Hab:** Pine savannas, bogs, seeps, fens. **Dist:** MA south to ne. FL, Panhandle FL, west to LA and AR; scattered inland as in w. VA, w. NC, c. TN, and KY. **Phen:** Jun-Aug; Sep-Oct. **Syn:** = Ar, C, FI5, GW2, K1, K3, K4, NE, NY, Pa, RAB, Tn, Va, W, WH3, Pringle & Witsell (2004), Wilbur (1955); = *Chironia campanulata* Linnaeus; > *Sabatia campanulata* var. *campanulata* – F; > *Sabatia campanulata* var. *gracilis* (Michaux) Fernald – F; < *Sabbatia campanulata* (Linnaeus) Torrey – S. NatureServe G5 (Secure).

Sabatia campestris Nuttall. WESTERN MARSH-PINK, PRAIRIE ROSE-GENTIAN, PRAIRIE SABATIA. **Hab:** Glades, upland prairies, also disturbed areas, roadsides, and woodland edges. **Dist:** IL and IA south to s. MS, s. LA, and s. TX. **Phen:** Jul-Sep; Sep-Oct. **Syn:** = Ar, C, F, GW2, IL, K1, K3, K4, NcTx, NE, RAB, Tx, Bell & Lester (1980), Pringle & Witsell (2004); < *Sabatia campestris* Nuttall – Tx, Wilbur (1955).

Sabatia decandra (Walter) R.M. Harper. BARTRAM'S ROSE-GENTIAN. **Hab:** Margins of *Taxodium ascendens*-*Nyssa* depressions, wet pine flatwoods. **Dist:** Ne. SC south to s. FL, west to s. AL and se. MS. **Phen:** Jun-Aug; Aug-Oct. **Tax:** Walter's ((1788) name *S. decandra* was rejected by Wilbur (1955) as being too uncertain as to the intended species, leading to his giving this species the new name *S. bartramii*. Ward (2007e) argued for retention of the older name and neotypified it. We agree with Ward (2007e) and reinstate *S. decandra*, particularly as a major part of Wilbur's argument is based on the non-overlap of the range of *S. decandra* and the stated area covered by Walter, yet we have gradually appreciated that a considerable number of species in Walter (1788) are not plausibly from the vicinity of his plantation. **Syn:** = FI5, K4, WH3, Ward (2007e); = *Sabatia*

353. GENTIANACEAE

bartramii Wilbur – GW2, K1, K3, Wilbur (1955); = *Sabatia dodecandra* var. *coriacea* (Elliott) H.E. Ahles – RAB; = *Sabatia decandra* (Walter) R.M. Harper – S. NatureServe G4G5 (Apparently Secure).

Sabatia difformis (Linnaeus) Druce. LANCELEAF ROSE-GENTIAN, WHITE SABATIA. **Hab:** Pine savannas, bogs, pocosins. **Dist:** S. NJ south to c. peninsular FL, west to s. AL and s. MS. **Phen:** May-Sep; Sep-Dec. **Syn:** = C, F, FI5, GW2, K1, K3, K4, RAB, Va, WH3, Wilbur (1955); = *Sabatia difformis* – S. NatureServe G4G5 (Apparently Secure).

Sabatia foliosa Fernald. BLACKWATER ROSE-PINK. **Hab:** Openings along blackwater rivers, cypress ponds. **Dist:** E. SC south to ne. FL and Panhandle FL, west to se. TX. **Phen:** Jun-Aug; Aug-Oct. **Syn:** = *Sabatia dodecandra* (Linnaeus) Britton, Sterns, & Poggenburg var. *foliosa* (Fernald) Wilbur – GW2, K1, K3, K4, Tx, Wilbur (1955); < *Sabatia dodecandra* (Linnaeus) Britton, Sterns, & Poggenburg – FI5, WH3; < *Sabatia dodecandra* var. *dodecandra* – RAB; > *Sabatia foliosa* – S; > *Sabatia harperi* Small – S.

Sabatia gentianoides Elliott. **Hab:** Pine savannas, bogs. **Dist:** NC south to ne. FL and Panhandle FL, west to se. TX. **Phen:** Jul-Aug; Sep-Oct. **Syn:** = Ar, FI5, GW2, K1, K3, K4, RAB, Tx, WH3, Wilbur (1955); = *Lapitheia gentianoides* (Elliott) Grisebach – S. NatureServe G4G5 (Apparently Secure).

Sabatia macrophylla Hooker var. *macrophylla*. LARGE-LEAF ROSE-GENTIAN. **Hab:** Wet savannas. **Dist:** Sw. GA west to e. LA. **Syn:** = K1, K3, K4, Wilbur (1955); = *Sabatia macrophylla* Hooker – S; < *Sabatia macrophylla* – FI5, GW2, WH3. NatureServe G4G5TNR (Not Yet Ranked).

Sabatia stellaris Pursh. ANNUAL SEA-PINK. **Hab:** Brackish marshes, maritime wet grasslands. **Dist:** S. MA south to s. FL, west to LA; Bahamas; Cuba; c. Mexico. **Phen:** Jul-Oct; Aug-late Nov. **Syn:** = Bah, C, F, FI5, GW2, K1, K3, K4, NE, NY, RAB, Va, WH3, Wilbur (1955); < *Sabatia campanulata* (Linnaeus) Torrey – S. NatureServe G5 (Secure).

354. LOGANIACEAE R. Brown ex Martius 1827 (STRYCHNINE FAMILY) [in GENTIANALES]

As here rather narrowly interpreted, Loganiaceae consists of about 16 genera and about 460 species, herbs, shrubs, and trees, of tropical, subtropical, and warm temperate areas of the Old and New Worlds (Struwe et al. 2018). Other genera in our area which have traditionally been considered components of the Loganiaceae now are clearly better placed in the small families Tetrachondraceae (*Polypremum*), Gelsemiaceae (*Gelsemium*), and Scrophulariaceae (*Buddleja*), more closely related to other families (such as Rubiaceae) than to Loganiaceae sensu stricto (Struwe, Albert, & Bremer 1994). The affinities of *Spigelia* appear to be with a small group of tropical and subtropical genera, the largest of which is *Strychnos*. Struwe, Albert, & Bremer (1994) treated this group as the family Strychnaceae, based on a cladistic analysis of data. A later, more thorough analysis suggested that Strychnaceae is best recombined with Loganiaceae (Backlund, Oxelman, & Bremer 2000). References: Rogers (1986); Struwe et al (2018) in Kadereit & Bittrich (2018).

- 2 Corolla funnelform, 0.1-0.2 cm long, white; [tribe Loganieae]..... *Mitreola*
2 Corolla tubular, 3-6 cm long, red and yellow; [tribe Spigeliaceae]..... *Spigelia*

Mitreola Linnaeus 1758 (MITERWORT)

A genus of about 6 species, annual and perennial herbs, tropical, subtropical, and warm temperate (Struwe et al. 2018). References: Nelson (1980); Rogers (1986); Struwe et al (2018) in Kadereit & Bittrich (2018).

- 1 Leaves 2-8 cm long, petiolate or subsessile and tapering to a cuneate base..... *Mitreola petiolata*
1 Leaves 1-4 cm long, sessile, the base rounded.
2 Mature seed reticulate and iridescent; mature capsule smooth to slightly and finely tuberculate; larger leaves ca. 4× as long as wide..... *Mitreola angustifolia*
2 Mature seed smooth and shiny; mature capsule markedly papillose-warty; larger leaves 1-2× as long as wide..... *Mitreola sessilifolia*

Mitreola angustifolia (Torrey & A. Gray) J.B. Nelson. NARROW-LEAVED MITERWORT. **Hab:** Clay-based Carolina bays, other Coastal Plain depressional wetlands. **Dist:** Se. SC south to s. FL, and west to s. AL and se. MS (Sorrie & Leonard 1999). **Phen:** Jun-Aug. **Syn:** = FI5, GW2, K3, K4, WH3, Nelson (1980); = *Cynoctonum angustifolium* (Torrey & A. Gray) Small – S; < *Mitreola sessilifolia* (J.F. Gmelin) G. Don – K1, Rogers (1986).

Mitreola petiolata (J.F. Gmelin) Torrey & A. Gray. CARIBBEAN MITERWORT. **Hab:** Swamps, marshes, ditches, seepage areas on calcareous glades, other wet habitats. **Dist:** Se. VA south to s. FL and west to AR and c. TX, north in the interior to nw. GA and c. and se. TN; Mexico; the West

354. **LOGANIACEAE**

Indies; n. South America. **Phen:** (May-) Jul-Sep; Sep-Nov. **Syn:** = Bah, Fl5, GW2, K1, K3, K4, NcTx, Tn, Va, WH3, Nelson (1980); = *Cynoconum mitreola* (Linnaeus) Britton – C, F, G, GrPl, RAB, S, Tx. **NatureServe G5** (Secure).

Mitreola sessilifolia (J.F. Gmelin) G. Don. SMALL-LEAVED MITERWORT. **Hab:** Wet pine savannas, pocosins, ditches, margins of limesink depressions (dolines). **Dist:** Se. VA south to s. FL, west to e. TX; Bahamas. **Phen:** Late Jun-Aug; Sep-Oct. **Syn:** = Bah, Fl5, GW2, K3, K4, Va, WH3, Nelson (1980); = *Cynoconum sessilifolium* J.F. Gmelin – C, F, G, RAB, S, Tx; < *Mitreola sessilifolia* (J.F. Gmelin) G. Don – K1, Rogers (1986).

**Spigelia** Linnaeus 1753 (PINKROOT)

A genus of about 60-85 species, annual and perennial herbs, of tropical and warm temperate America (Struwe et al. 2018). References: Gould & Jansen (1999); Gould (1996); Rogers (1986); Struwe et al (2018) in Kadereit & Bittrich (2018); Weakley et al (2011).

Spigelia marilandica (Linnaeus) Linnaeus. PINKROOT, WORMGRASS, INDIAN-PINK. **Hab:** Moist to dry woodlands and forests, usually on circumneutral soils. **Dist:** SC, sw. NC (Cherokee Co. and Macon Co.), and TN west to s. IN and OK, south to Panhandle FL and TX; some floras allege its occurrence north to VA, MD, NJ, and PA (its recent use as a native ornamental is spreading its distribution, at least as a garden waif, beyond its native distribution). *S. marilandica* will likely be found in sw. VA. **Phen:** May-Jun; late Jun-Jul. **Syn:** = Ar, C, F, Fl5, G, Il, K1, K3, K4, NcTx, RAB, Tn, Tx, W, WH3, Rogers (1986); = *Spigelia marylandica* – S, orthographic variant. **NatureServe G4** (Apparently Secure).

356. **APOCYNACEAE** A.L. de Jussieu 1789 (DOGBANE FAMILY) [in GENTIANALES]

As here circumscribed including the Asclepiadaceae, a family of about 378-480 genera and about 4800-5350 species, lianas, shrubs, perennial herbs, and trees, widespread in tropical and temperate areas (Endress et al. 2018). There appears to be overwhelming evidence favoring the combination of the Asclepiadaceae into the Apocynaceae; see, for instance, Rosatti (1989), Sennblad & Bremer (1996), and many others. References: Endress et al (2018) in Kadereit & Bittrich (2018); Endress, Liede-Schumann, & Meve (2014); Liede (1997a); Rosatti (1989); Woodson (1938).

- 1 Plant erect or trailing (but not twining), herbaceous or woody.
 - 2 Plant a woody shrub or trailing woody vine.
 - 3 Plant rhizomatous, suffrutescent, < 4 dm tall; leaves narrowly to broadly ovate; flowers blue, lavender, or white..... *Vinca*
 - 3 Plant erect, > 4 dm tall; leaves either lanceolate or elliptic; flowers yellow, white, pink, or red. *Nerium oleander*
 - 2 Plant an herb or trailing herbaceous vine.
 - 5 Flowers with conspicuous or less conspicuous corona; follicles not paired; seeds with coma present *Asclepias*
 - 5 Flowers lacking corona; follicles paired (occasionally single by abortion); seeds with coma absent (*Catharanthus*, *Amsonia*) or present (*Apocynum*).
 - 7 Leaves alternate (rarely a few on a plant subopposite)..... *Amsonia*
 - 7 Leaves opposite.
 - 8 Flower < 8 mm across; paired follicles pendent, 10-22 cm long; seeds with coma; mature plants normally > 7 dm tall..... *Apocynum*
 - 8 Flower > 20 mm across; paired follicles erect, 1.5-2.5 cm long; seeds lacking coma; mature plants 2-6 dm tall..... *Catharanthus roseus*
- 1 Plant twining, herbaceous or woody.
 - 9 Leaves cordate at base, ovate to broadly lanceolate, < 4× as long as wide.
 - 10 Plants in flower.
 - 11 Petals white; gynostegial corona > ¾ as long as the corolla lobes *Cynanchum*
 - 11 Petals purple-black, brown, yellow, yellow-green, cream, or maroon (white in *Matelea baldwyniana*); gynostegial corona < ½ as long as the corolla lobes.
 - 12 Corolla lobes glabrous on the outer surface; dorsal anther appendages laminar; carpels smooth and angled *Gonolobus*
 - 12 Corolla lobes glandular-puberulent or puberulent on the outer surface; dorsal anther appendages absent; carpels muricate (*Matelea*) or smooth (*Vincetoxicum*). *Matelea*
 - 10 Plants in fruit.
 - 14 Follicles muricate *Matelea*
 - 14 Follicles smooth and angled.
 - 15 Leaves cordate, broadly rounded, tapering abruptly to an acute, obtuse, or apiculate apex *Gonolobus*
 - 15 Leaves deeply cordate, tapering steadily to an acuminate apex. *Cynanchum*
 - 9 Leaves not cordate at base (cuneate, rounded, or truncate); leaves ovate, lanceolate, or linear, > 1.5× as long as wide.
 - 17 Leaves linear, the margins parallel. *Patalias paluster*
 - 17 Leaves not linear, instead ovate or lanceolate (rarely deltoid/rhomboid shaped).

Amsonia Walter 1788 (BLUESTARS)

[by Bruce A. Sorrie and Alan. S. Weakley]. References: Doffett et al (2014); Williams (2019a); Woodson (1928); Woodson (1929); Woodson (1936b); Woodson (1938); Woodson (1943); Woodson (1943).

A genus of about 20 species, herbs, of temperate North America and Japan.

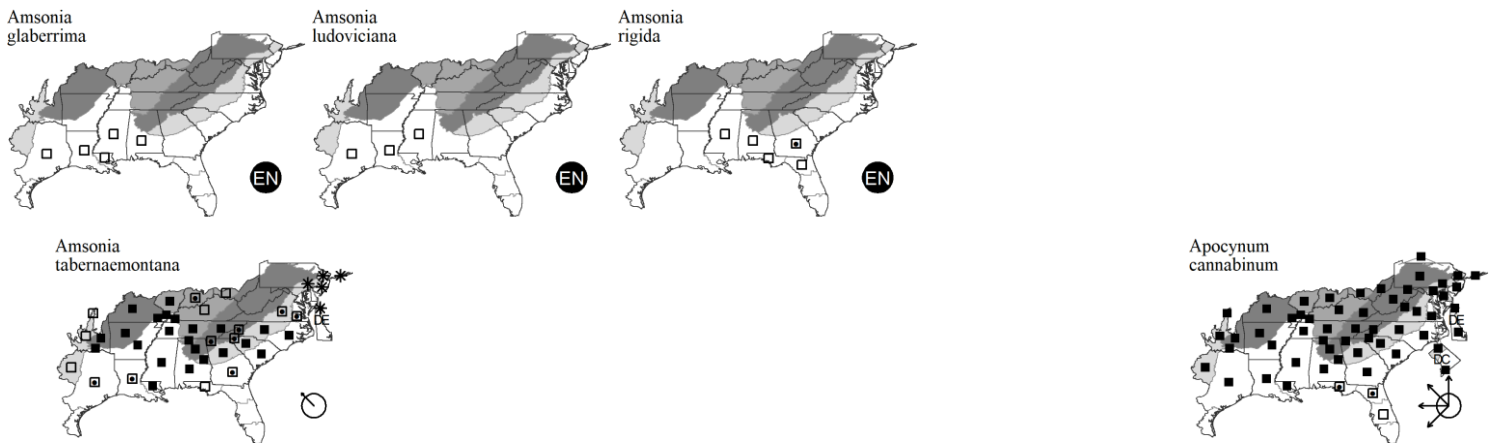

- 2 Corolla glabrous on the outer surface; stem pubescent (*A. ciliata*) or glabrous (*A. rigida*); [of the Coastal Plain from se. and sc. NC southward and westward to the Interior Highlands and TX].
 4 Leaves 6.0-10.0 cm long (mean 7.1); corolla lobes 6.5-8.5 mm long (mean 7.3); [of se. LA to e. TX].....*Amsonia glaberrima*
 4 Leaves 3.5-7.5 cm long (mean 5.1); corolla lobes 7-11 mm long (mean 8.2); [of se. GA and se. AL to n. FL].....*Amsonia rigida*
 2 Corolla pubescent on the outer surface; stem glabrous (or sometimes pubescent when young in *A. ludoviciana*); [more widespread in our area].
 7 Leaf blades densely tomentose below; foliicles pubescent; [s. MS west to w. LA, or c. GA]*Amsonia ludoviciana*
 7 Leaf blades glabrous abaxially or pubescent along midrib and margins (never densely tomentose); foliicles glabrous; [collectively widespread].
*Amsonia tabernaemontana*

Amsonia glaberrima Woodson. GULF BLUESTAR, POND BLUESTAR. **Hab:** Seasonally flooded depression wetlands and moist pinelands. **Dist:** S. AL, s. MS, s. LA, and se. TX. **Syn:** = Tx, Woodson (1936b), Woodson (1938); < *Amsonia amsonia* (Linnaeus) Britton – S; < *Amsonia tabernaemontana* Walter var. *tabernaemontana* – K1, K3, K4, Woodson (1928).

Amsonia ludoviciana Vail. LOUISIANA BLUESTAR. **Hab:** Mesic forests and woodlands. **Dist:** So far as is known, endemic to LA, MS, and e. TX (Doffett et al. 2014); not native or naturalized in SC, contrary to Kartesz (1999). **Tax:** Material from granite outcrops in GA has been reassigned to *Amsonia* species 2. **Syn:** = GW2, S, Woodson (1928), Woodson (1938); < *Amsonia ludoviciana* Vail – K1, K3, K4.

Amsonia rigida Shuttleworth ex Small. STIFF BLUESTAR, POND BLUESTAR. **Hab:** Seasonally flooded depression wetlands and moist pinelands. **Dist:** S. GA to n. peninsular FL, west to s. MS. **Syn:** = GW2, K1, K3, K4, S, Woodson (1928), Woodson (1938); < *Amsonia tabernaemontana* Walter – FL5, WH3.

Amsonia tabernaemontana Walter. WIDELEAF BLUE-STAR. **Hab:** Floodplain forests, moist, rich slope forests. **Dist:** Se. VA west to s. IL, MO, and KS, south to GA, LA, e. OK, and TX. **Phen:** Apr; Aug-Sep. **Syn:** =; = *Amsonia amsonia* (Linnaeus) Britton – S; = *Amsonia tabernaemontana* Walter var. *tabernaemontana* – Mo2, RAB, Tn, Tx, Tx, Va, W, Woodson (1928), Woodson (1938); < *Amsonia tabernaemontana* Walter – Ar, C, FL5, GrPl, GW2, NcTx, NY, Pa, WH3; > *Amsonia tabernaemontana* var. *salicifolia* – G; > *Amsonia tabernaemontana* Walter var. *tabernaemontana* – G, IL, K1, K3.

Apocynum Linnaeus 1753 (DOGBANE, INDIAN-HEMP)

A genus of about 10-12 species, perennial herbs, of temperate e. and c. Asia and North America (Endress et al. 2018). References: Endress et al (2018) in Kadereit & Bittrich (2018); Woodson (1930).

Apocynum cannabinum Linnaeus. HEMP DOGBANE, INDIAN-HEMP. **Hab:** Forests, woodlands, roadsides, pastures. **Dist:** QC, MB, and WA south to FL, TX, CA. **Phen:** May-Jul; Sep-Oct. **Syn:** = Ar, C, FL5, IL, NE, NY, RAB, S, Tn, Va, W, WH3; = *Apocynum cannabinum* var. *cannabinum* – Mi; < *Apocynum cannabinum* Linnaeus – GrPl, K1, K3, K4, Mo2, NcTx, Pa; > *Apocynum cannabinum* var. *cannabinum* – F, G, Tx; > *Apocynum cannabinum* var. *glaberrimum* A.L.P.P. de Candolle – G, Tx, Woodson (1930); > *Apocynum cannabinum* var. *greeneanum* (Béguinot & Belosersky) Woodson – Woodson (1930); > *Apocynum cannabinum* var. *memorale* (G.S. Asclepias Linnaeus 1753 (MILKWEED)

A genus of about 100 species, herbs (mostly perennial) and shrubs, temperate and tropical, of North and Central America (Endress et al. 2018).
References: Endress et al (2018) in Kadereit & Bittrich (2018); Farmer & Bell (1985); Fishbein et al (2011); Turner (2009b); Woodson (1954).

Identification Notes: The flowers of *Asclepias* have an unusual structure and associated terminology that is necessary for successful interpretation of the key. From the bottom of each flower, there is first a whorl of 5 sepals, almost always green or greenish. Next is a whorl of separate petals, in most species recurved, and variously colored (brightly, or in quite a few species green, greenish white, yellowish green, or green flushed with rose or purple). Next inmost is the corona, a pentamerous structure of 5 hoods and 5 horns (these are petaloid appendages attached to the stamens). At the center is the gynostegium, a fusion of the stigmatic disc (innermost of all) and the 5 anthers. An insect leg passes through the stigmatic slit between two adjacent anthers, and can pick up the two pollinia, attached to one another by two translater arms, fused at the corpusculum.

- 1 Sap clear; leaves alternate; corolla orange to yellow **Key A**
 1 Sap milky (the milkiness often difficult to show in *A. verticillata*, which has numerous, whorled, linear leaves); leaves strictly or primarily opposite, subopposite, or whorled; corolla orange, red, white, cream, green, pink, or purple.
 2 Leaves linear, > 10× as long as wide **Key B**
 2 Leaves lanceolate, ovate, or elliptic, 1-5 (-10)× as long as wide.
 3 Leaves sessile, subsessile, or with petioles to 3 mm long **Key C**
 3 Leaves with petioles (3-) 4-20 mm long.
 4 Plants in flower **Key D**
 4 Plants in fruit or sterile **Key E**

Key A - milkweeds with clear sap and alternate leaves

- 3 Leaves widest near the base; leaf base cordate, subcordate, or truncate, with well-developed basal lobes broader than a 'waist' above; [PA, WV, KY, TN, and AL westwards] *Asclepias tuberosa* var. *cordata*
 3 Leaves widest above the midpoint, near the midpoint, or with margins nearly parallel for > 3/4 of the leaf length; leaf base subcordate, truncate, rounded, or cuneate; [IN, s. IL, AR, and e. TX eastwards].
 4 Leaf base cuneate, rounded, or truncate; leaves widest above the middle or near the midpoint; [s. NH west to OH, south to Panhandle FL and e. TX widespread eastwards] *Asclepias tuberosa* var. *tuberosa*
 4 Leaf base truncate or subcordate; leaves either widest above the midpoint, above a waist created by hastate basal lobes, or with margins nearly parallel for > 3/4 of the leaf length; [of se. Coastal Plain, se. VA south to s. FL, west to s. MS] *Asclepias tuberosa* var. *rolfsii*

Key B - milkweeds with milky sap, with linear leaves opposite, subopposite, or whorled

- 1 Leaves either mostly in whorls of 3-6 (sometimes some nodes with merely opposite leaves), or subopposite (the leaves more-or-less paired but separated by 0.5-3 mm); corolla whitish or greenish, usually suffused with rose-purple (especially at the tips of the corolla lobes).
 2 Leaves mostly in whorls of 3-6 (sometimes some nodes with merely opposite leaves); leaves 1.5-7 cm long, 1-2 mm wide; seeds ca. 5 mm long, the coma ca. 2.5 cm long; milky sap often difficult to show *Asclepias verticillata*
 2 Leaves subopposite (the leaves more-or-less paired but separated by 0.5-3 mm); leaves (3-) 5-18 cm long, (1-) 2-10 mm wide; seeds ca. 7-11 mm long, the coma 3-5 cm long; milky sap obvious and profuse.
 3 Umbel 1, terminal; corona 5-7 mm in diameter; horns present, about as long as the hood; hoods ca. 2-4 mm long, surpassing the anther heads; [dry pinelands of the Coastal Plain] *Asclepias michauxii*
 3 Umbels 1-4, terminal and from upper nodes; corona 2-3 mm in diameter; horns absent; hoods ca. 2 mm long, surpassed by the anther heads; [either wet pinelands of the Coastal Plain or dry glades or woodlands].
 4 Pedicels with spreading hairs; umbels 2-10, each with up to 30-100 flowers; leaves minutely scabrous; [dry glades or woodlands, known from the Mountains of nw. GA, e. TN, w. WV westward] *Asclepias hirtella*
 4 Pedicels with incurved hairs; umbels 1-6, each with 10-30 flowers; leaves glabrous or nearly so; [wet pinelands of the Coastal Plain] *Asclepias longifolia*
 1 Leaves opposite; corolla white, whitish, or greenish, usually suffused with rose-purple (especially at the tips of the corolla lobes), or creamy yellow, purple, or orange-red.
 6 Leaves with petioles 1-10 mm long; leaves 5-15 mm wide; plants 5-15 dm tall. *Asclepias lanceolata*
 6 Leaves sessile, subsessile (with petioles 0-1 mm long); leaves 1-7 mm wide; plants 1-7 dm tall.
 8 Leaves 1-2 mm wide. *Asclepias cinerea*
 8 Leaves 3-7 mm wide.
 11 Umbel 1, terminal; corona 5-7 mm in diameter; horns present, about as long as the hood; hoods ca. 2-4 mm long, surpassing the anther heads; [dry pinelands] *Asclepias michauxii*
 11 Umbels 1-10, terminal and from upper nodes; corona 2-3 mm in diameter; horns absent; hoods ca. 2 mm long, surpassed by the anther heads; [either of wet pinelands of the Coastal Plain or dry glades or woodlands].
 12 Pedicels with spreading hairs; umbels 2-10, each with up to 30-100 flowers; leaves minutely scabrous; [dry glades or woodlands, east to nw. GA, TN, and WV] *Asclepias hirtella*
 12 Pedicels with incurved hairs; umbels 1-6, each with 10-30 flowers; leaves glabrous or nearly so; [wet pinelands of the Coastal Plain] *Asclepias longifolia*

Key C - milkweeds with milky sap, with sessile, nonlinear leaves

- 2 Leaves cordate-clasping at base, 3-10 cm wide, 1-2× as long as wide; stem and leaves glabrous and usually also glaucous.

Key to Map
Symbology:

←rare ←uncommon ←common
(see introduction for more)

* : waif
EN : endemic
H : historic

N : no X : extirpated
P : planted
? : questionable

- 3 Plant erect, the stems 4-10 dm long, the leaves perpendicular to the stem thus in a plane parallel to the ground; leaf blades with margins usually strongly undulate; corolla lobes 7-11 mm long; inflorescence solitary, terminal (rarely a second from an upper node); corona 5-8 mm across; [widespread] *Asclepias amplexicaulis*
- 3 Plant prostrate or decumbent, the stems 2-7 dm long, the leaves perpendicular to the stem and thus perpendicular to the ground as well; leaf blades planar; corolla lobes 5-6.5 mm long; inflorescences 2-6 from upper nodes; corona 3-5 mm across; [of dry pinelands of the Coastal Plain]..... *Asclepias humistrata*
- 2 Leaves cuneate, rounded, or cordate-clasping at base, 1-6 cm wide, (1-) 1.5-6× as long as wide; stem and leaves pubescent to glabrate.
- 5 Leaves lanceolate, acuminate at the apex; corolla reddish purple to pink, the lobes 7-9 mm long; [of wetlands, Coastal Plain and very rarely inland] *Asclepias rubra*
- 5 Leaves orbicular to oblong, rounded at the apex; corolla pale green (sometimes suffused with some purple), the lobes 6-7 mm long; [of dry habitats, widespread]
- 6 xxx *Asclepias obovata*
- 6 xxx' *Asclepias viridiflora*

Key D - milkweeds with milky sap, with petiolate, nonlinear leaves, in flower

- 1 Corolla (not the corona) greenish, either pale green or yellowish green.
- 2 Leaves subopposite (to alternate upwards); corolla lobes 7-17 mm long. *Asclepias viridis*
- 2 Leaves opposite; corolla lobes 6-10 mm long.
- 4 Corona 2-3 mm across; corolla lobes pale green, 5-7 mm long; [of various provinces, Coastal Plain and also especially inland] *Asclepias viridiflora*
- 4 Corona 5-9 mm across; corolla lobes yellowish green, 9-10 mm long; [strictly of the Coastal Plain, of NC and SC, and southward]. *Asclepias obovata*
- 1 Corolla (NOT the corona) pink, purple, crimson, orange, or white.
- 7 Hoods about as long as the anther heads; horns 1-2× as long as the hood, exerted slightly to well beyond the hood.
- 9 Corolla bright orangey red, the lobes 5-10 mm long; corona orangey yellow; gynostegium orangey yellow *Asclepias curassavica*
- 9 Corolla white, pink, rose, or purple, the lobes 2.5-6 mm long; corona white, pink, or rose; gynostegium white or pale pink. *Asclepias perennis*
- 7 Hoods distinctly longer than the anther heads; horns 0.5-1× as long as the hood, not conspicuously exerted beyond the hood.
- 12 Lower leaf surface pubescent over the surface.
- 13 Hood margin irregular but not with a sharp tooth; corolla purplish-rose; plants 4-10 dm tall. *Asclepias purpurascens*
- 13 Hood margin with a single, ascending, triangular tooth; corolla rose or greenish-white; plants (5-) 8-20 dm tall. *Asclepias syriaca*
- 12 Lower leaf surface glabrous to sparsely pubescent along the midvein only. *Asclepias variegata*

Key E - milkweeds with milky sap, with petiolate, nonlinear leaves, in fruit (or sterile)

- 1 Leaves subopposite. *Asclepias viridis*
- 1 Leaves opposite (or apparently whorled in *A. quadrifolia*).
- 2 Follicle pendant; seeds without a coma; [of swamp forests of SC and southward]..... *Asclepias perennis*
- 2 Follicle erect; seeds with a coma; [collectively widespread].
- 4 Follicle slightly to strongly muricate. *Asclepias syriaca*
- 4 Follicle smooth.
- 5 Lower leaf surface glabrous, or pubescent on the midrib only *Asclepias curassavica*
- 5 Lower leaf surface pubescent.
- 7 Leaves lanceolate, 4-10× as long as wide. *Asclepias viridiflora*
- 7 Leaves ovate to elliptic, 1.5-4× as long as wide.
- 10 Stem moderately to densely pubescent; plants 1.5-5 (-7) dm tall; [of xeric pinelands of the Coastal Plain of from NC to s. FL, west to OK, AR, and TX]. *Asclepias obovata*
- 10 Stem glabrous to pubescent in lines only; plants 2-12 dm tall; [collectively of various habitats throughout our area].
- 12 Lower leaf surface densely puberulent; [primarily of moist to wet habitats]..... *Asclepias purpurascens*
- 12 Lower leaf surface glabrous or slightly pubescent; [of moist or dry habitats].
- 13 Leaves 4-9 cm wide, acuminate at the apex..... *Asclepias variegata*
- 13 Leaves 1-6 cm wide, mostly obtuse at the apex. *Asclepias viridiflora*

Asclepias amplexicaulis J.E. Smith. CLASPING MILKWEED, SAND MILKWEED. **Hab:** Longleaf pine sandhills, barrens, sandy prairies, other dry woodlands of various types. **Dist:** NH and NY west to MN, IA, and KS, south to c. peninsular FL, west to e. TX. **Phen:** (Apr-) May-Jul; Jun-Aug. **ID Notes:** The flowers have a fragrance of cloves and roses. **Syn:** = Ar, C, F, Fl5, G, GrPl, Il, K1, K3, K4, Mi, Mo2, NcTx, NE, NY, Pa, RAB, S, Tn, Tx, Va, W, WH3, Woodson (1954). [NatureServe G5](#) (Secure).

Asclepias cinerea Walter. CAROLINA MILKWEED, ASHY MILKWEED. **Hab:** Pine savannas. **Dist:** Se. NC south to n. peninsular FL, west to Panhandle FL. **Phen:** Late May-Jul; Aug-Sep. **Syn:** = Fl5, K1, K3, K4, RAB, S, WH3, Woodson (1954). [NatureServe G4?](#) (Apparently Secure).

* ***Asclepias curassavica*** Linnaeus. SCARLET MILKWEED, BLOODFLOWER. **Hab:** Ditches, disturbed areas; often cultivated, naturalizing (southwards in our region) and persistent as short-lived strays (northwards). **Dist:** Native of tropical America, cultivated as an ornamental, naturalized in FL and persistent and naturalizing northwards (see, e.g., Bradley et al. [in prep.]). Kartesz (2020) reports it for e. TN; this and other northern reports far inland and off the Coastal Plain are likely of plants only shortly persistent from cultivation. **Phen:** Jan-Dec. **Syn:** = Bah, Fl5, K1, K3, K4, Meso4.1, Tx, WH3, Woodson (1954). [NatureServe G5](#) (Secure).

Asclepias hirtella (Pennell) Woodson. GREEN MILKWEED, BARRENS MILKWEED, PRAIRIE MILKWEED. **Hab:** Limestone glades, prairies. **Dist:** MI, WI, and MN south to w. WV (Mason County), KY, e. TN (Bradley County) (Chester, Wofford, & Kral 1997), nw. GA (Jones & Coile 1988), AR, w. LA, and e. TX. **Phen:** May-Aug. **Tax:** This species of midwestern prairies and barrens closely resembles *A. longifolia*. The two taxa have sometimes been treated as distinct only at the rank of subspecies (see synonymy) or as "very distinct varieties" (Turner 2009). **Syn:** = Ar, C, F, GrPl, Il, K1, K4, Mi, Mo2, Tn, Woodson (1954); = *Acerates hirtella* Pennell – S; = *Asclepias longifolia* Michaux ssp. *hirtella* (Pennell) J. Farmer & C.R. Bell – Farmer & Bell (1985); = *Asclepias longifolia* var. *hirtella* (Pennell) B.L. Turner – K3, Turner (2009b). **NatureServe G5** (Secure).

Asclepias humistrata Walter. FLESHY MILKWEED, SANDHILL MILKWEED. **Hab:** Longleaf pine sandhills and Florida scrub. **Dist:** E. NC south to s. FL, west to e. LA. **Phen:** Apr-Jun; Jun-Jul. **ID Notes:** A striking plant, with its prostrate stems, somewhat fleshy leaves borne in a vertical plain, and cream, pink, or red main leaf veins standing out against the blue-green color of the leaf blade. **Syn:** = K1, K3, K4, RAB, S, WH3, Woodson (1954). **NatureServe G4G5** (Apparently Secure).

Asclepias lanceolata Walter. FEW-FLOWER MILKWEED. **Hab:** Swamps, fresh to slightly brackish marshes, wet pine savannas. **Dist:** NJ south to s. FL, west to e. TX. **Phen:** Jun-Aug; Aug-Sep. **Syn:** = C, F15, GW2, K1, K3, K4, RAB, S, Tx, Va, WH3, Woodson (1954); > *Asclepias lanceolata* var. *lanceolata* – F, G; > *Asclepias lanceolata* var. *paupercula* (Michaux) Fernald – F, G. **NatureServe G5** (Secure).

Asclepias longifolia Michaux. LONGLEAF MILKWEED, SAVANNA MILKWEED. **Hab:** Wet pine savannas. **Dist:** DE (formerly) south to s. FL, west to e. TX. **Phen:** (Apr-) May-Jun; Jun-Jul. **Comm:** *A. longifolia* and *A. hirtella* are closely related; the two taxa have sometimes been treated as distinct only at the rank of subspecies (see synonymy) or as "very distinct varieties" (Turner 2009). **Syn:** = C, F, F15, GW2, K1, K4, RAB, Tx, Va, WH3, Woodson (1954); = *Acerates longifolia* (Michaux) Elliott – G; = *Asclepias longifolia* ssp. *longifolia* – Farmer & Bell (1985); = *Asclepias longifolia* var. *longifolia* – K3, Turner (2009b); ? *Acerates floridana* (Lamarck) A.S. Hitchcock – S. **NatureServe G4G5** (Apparently Secure).

Asclepias michauxii Decaisne. MICHAUX'S MILKWEED. **Hab:** Pine savannas. **Dist:** E. SC south to peninsular FL, west to e. LA. **Phen:** May. **Syn:** = F15, K1, K3, K4, RAB, S, WH3, Woodson (1954). **NatureServe G4G5** (Apparently Secure).

Asclepias obovata Elliott. PINELAND MILKWEED. **Hab:** Longleaf pine sandhills, other woodlands and savannas. **Dist:** E. SC south to Panhandle FL, west to AR, e. OK, and e. TX. **Phen:** Jun-Sep. **Syn:** = Ar, F15, K1, K3, K4, RAB, S, Tx, WH3, Woodson (1954). **NatureServe G5?** (Secure).

Asclepias perennis Walter. SMOOTHSEED MILKWEED, SWAMP-FOREST MILKWEED. **Hab:** Cypress-gum swamps, bottomland hardwood forests, marshes. **Dist:** Se. NC south to c. peninsular FL, west to e. TX, north in the interior to s. IN and s. IL. **Phen:** (Apr-) Jun-Aug; Aug-Sep. **Syn:** = Ar, C, F, F15, G, GW2, Il, K1, K3, K4, Mo2, NcTx, RAB, S, Tn, Tx, WH3, Woodson (1954). **NatureServe G5** (Secure).

Asclepias purpurascens Linnaeus. PURPLE MILKWEED. **Hab:** Openings in moist bottomlands and swamp forests, prairies and meadows (rich, wet to mesic), woodlands, perhaps mostly on soils derived from mafic or calcareous rocks. **Dist:** NH and s. ON west to WI, IA, and KS, south to NC, nw. TN (Chester, Wofford, & Kral 1997), KY, AR, and OK. **Phen:** (Apr-) May-Jul. **Syn:** = Ar, C, F, G, GrPl, Il, K1, K3, K4, Mi, Mo2, NE, NY, Pa, RAB, S, Tn, Tx, Va, W, Woodson (1954). **NatureServe G5?** (Secure).

Asclepias rubra Linnaeus. PURPLE SAVANNA MILKWEED, "RED MILKWEED". **Hab:** Pocosin ecotones, wet pine savannas, seepage bogs in longleaf pine sandhills, seepage swamps. **Dist:** Se. NY (Long Island), se. PA, and NJ south to wc. GA and w. Panhandle FL, west to e. TX. **Phen:** (May-) Jun-Jul (-Aug); Jul-Sep. **Tax:** *A. laurifolia* is alleged to differ in sessile, cordate-clasping leaf bases (vs. petioled and rounded), and other characters (see Small 1933); it may warrant recognition and needs additional study. **Syn:** = C, F, F15, G, GW2, K1, K3, K4, NY, Pa, RAB, Tx, Va, WH3, Woodson (1954); > *Asclepias laurifolia* Michaux – S; > *Asclepias rubra* Linnaeus – S; > *Asclepias rubra* var. *laurifolia* (Michaux) Harper; > *Asclepias rubra* var. *rubra*. **NatureServe G4G5** (Apparently Secure).

Asclepias syriaca Linnaeus. COMMON MILKWEED. **Hab:** Prairies, floodplains, pastures, roadsides, disturbed areas. **Dist:** NB and ME west to s. MB and ND, south to SC, GA, c. TN (Chester, Wofford, & Kral 1997), AR, OK, and KS, the southern range expansion recent. **Phen:** Jun-Aug; Jul-Sep. **Comm:** This species is apparently expanding its range southward; see Wyatt et al. (1993) and Wyatt (1996) for discussion. **Syn:** = Ar, C, GrPl, K1, K3, K4, Mi, Mo2, NE, NY, Pa, RAB, S, Tn, Va, W, Woodson (1954); > *Asclepias syriaca* var. *syriaca* – F, G, Il. **NatureServe G5** (Secure).

Asclepias tuberosa Linnaeus var. *cordata* Beck. MIDWESTERN BUTTERFLYWEED. **Hab:** Dry forests, roadbanks. **Dist:** QC, ON, MN, SD, CO, UT, and CA south to PA, WV, KY, TN, and AL. **Phen:** (Apr-) May-Sep. **Tax:** Woodson (1954) called this *A. tuberosa* var. *interior*, and Shinnars made a combination at varietal rank (see synonymy), but the much earlier name *A. tuberosa* var. *cordata* Beck clearly applies here. **Syn:** = ; = *Asclepias tuberosa* ssp. *interior* Woodson – G, Il, Mo2, NcTx, NE, Tx, Woodson (1954); = *Asclepias tuberosa* Linnaeus var. *interior* (Woodson) Shinnars – C, Tn; < *Asclepias tuberosa* – F, Mi, NY, Pa, S; < *Asclepias tuberosa* ssp. *interior* Woodson – Ar, GrPl, K1, K3, K4. **NatureServe G5T5?** (Secure).

Asclepias tuberosa Linnaeus var. *rolfsii* (Britton ex Vail) Shinnars. SANDHILL BUTTERFLYWEED. **Hab:** Longleaf pine sandhills, other dry, sandy habitats. **Dist:** Se. VA south to s. FL, west to s. MS. **Phen:** Feb-Aug; May-Sep. **Comm:** The flowers are typically lighter in color than those of var. *tuberosa*, yellow or yellowish-orange rather than deep orange to reddish. The first reported occurrence in Virginia is discussed by Belden et al.

Asclepias variegata Linnaeus. WHITE MILKWEED, REDRING MILKWEED. **Hab:** Upland forests and woodlands. **Dist:** CT west to OH, s. IN, s. IL, se. MO, and se. OK, south to Panhandle FL, LA, and e. TX. **Phen:** (Apr-) May-Jul; Jul-Sep. **Syn:** = Ar, C, F, Fl5, G, IL, K1, K3, K4, Mo2, NcTx, NE, NY, Pa, RAB, Tn, Tx, Va, W, WH3, Woodson (1954); = *Biventraria variegata* (Linnaeus) Small – S. NatureServe G5 (Secure).

Asclepias verticillata Linnaeus. WHORLED MILKWEED. **Hab:** Barrens, thin soils of rock outcrops (especially mafic or calcareous rocks), open woodlands, longleaf pine sandhills, pine flatwoods, road and powerline rights-of-way. **Dist:** E. MA west to ND and MB, south to s. FL, TX, NM, and AZ. **Phen:** (Apr-) May-Sep; Sep-Oct. **Tax:** Southern Florida material needs study. **Syn:** = Ar, C, F, Fl5, G, GrPl, IL, K1, K3, K4, Mi, Mo2, NcTx, NE, NY, Pa, RAB, S, Tn, Tx, Va, W, WH3, Woodson (1954). NatureServe G5 (Secure).

Asclepias viridiflora Rafinesque. GLADE MILKWEED, GREEN MILKWEED. **Hab:** Open woodlands, woodland edges, barrens, glades, especially over mafic or calcareous rocks, and also in disturbed areas. **Dist:** CT west to s. ON, MB, ND, and MT, south to NC, SC, GA, Panhandle FL, AL, LA, TX, n. Mexico, NM, and AZ. **Phen:** (Apr-) May-Aug; Aug-Sep. **Syn:** = Ar, C, Fl5, GrPl, IL, K1, K3, K4, Mi, Mo2, NcTx, NE, NY, Pa, RAB, Tn, Tx, Va, W, WH3, Woodson (1954); = *Acerates viridiflora* (Rafinesque) Pursh ex Eaton – G, S; > *Asclepias viridiflora* var. *lanceolata* (Ives) Torrey – F; > *Asclepias viridiflora* var. *viridiflora* – F. NatureServe G5 (Secure).

Asclepias viridis Walter. GREEN ANTELOPE-HORN, SPIDER MILKWEED. **Hab:** Prairies, dry woodlands, calcareous hammocks, pine rocklands. **Dist:** S. SC south to s. FL, west to TX; and from OH, w. WV, and KY west to NE, south to se. TN, c. TN (Chester, Wofford, & Kral 1997), nw. GA, c. AL, c. MS, AR, TX, and OK. **Phen:** (Feb-) May-Jul (-Sep). **Syn:** = Ar, Fl5, GrPl, IL, K1, K3, K4, Mo2, NcTx, Tn, Tx, WH3, Woodson (1954); = *Asclepiodora viridis* (Walter) A. Gray – S. NatureServe G4G5 (Apparently Secure).

Catharanthus G. Don 1836 (ROSY-PERIWINKLE)

A genus of about 9 species, herbs, 7 endemic to Madagascar and 1 endemic to India (Endress et al. 2018). References: Endress et al (2018) in Kadereit & Bittrich (2018); Snoeijer (1996); van Bergen (1996).

* **Catharanthus roseus** (Linnaeus) G. Don. ROSY-PERIWINKLE, MADAGASCAR PERIWINKLE, CAYENNE JASMINE.

Hab: Disturbed areas, northwards only persistent after cultivation or as a waif or "throw-out" after cultivation.

Dist: Native of Madagascar, now a pantropical weed. **Phen:** May-Oct. **Comm:** *C. roseus* is the source of a powerful anti-leukemia drug. **Syn:** = Bah, Fl5, K1, K3, K4, Meso4.1, NcTx, S, WH3, van Bergen (1996); = *Vinca rosea* Linnaeus – RAB. NatureServe GNR (Not Yet Ranked).

Subsaharan Africa

Cynanchum Linnaeus 1753 (SWALLOW-WORT)

A genus of about 200-300 species, herbaceous vines and lianas, primarily of tropical and warm temperate portions of the New World and Old World (Endress et al. 2018). *Ampelamus* was retained as a genus by Liede (1997a), but later results suggest that it is not distinct from some other portions of *Cynanchum* (Liede & Täuber 2002). However, *Cynanchum* itself is strongly polyphyletic and is being broken up; further taxonomic and nomenclatural changes are likely. *C. laeve* will probably remain in *Cynanchum* s.s. (which is primarily Old World in distribution). References: Endress et al (2018) in Kadereit & Bittrich (2018); Krings (2001); Liede & Meve (1997); Liede & Täuber (2002); Liede (1997a); Liede (1997b).

1 Leaves oblong or ovate, cordate, subcordate, or rounded at the base.

1 Leaves linear, cuneate at the base.

Cynanchum laeve (Michaux) Persoon. SANDVINE, HONEYVINE, BLUEVINE. **Hab:** Bottomlands and disturbed areas. **Dist:** Se. PA and KS south to sw. GA, Panhandle FL, and c. TX. **Phen:** Jul-Sep; Aug-Oct. **Syn:** = Fl5, GrPl, GW2, K1, K3, K4, Mo2, NcTx, NY, Pa, RAB, Tn, Tx, Va, W, WV; = *Ampelamus albidus* (Nuttall) Britton – C, F, G, Il; = *Ampelamus laevis* (Michaux) Krings – WH3, Krings (2001); = *Gonolobus laevis* Michaux – S. NatureServe G5 (Secure).

***Gonolobus* Michaux 1803 (ANGLEPOD)**

A genus of about 120-140 species, herbaceous vines and lianas, primarily tropical. Liede (1997a), Lipow & Wyatt (1998), and others recognize *Gonolobus* as separate from *Matelea*. References: Drapalik (1969); Endress et al (2018) in Kadereit & Bittrich (2018); Krings & Xiang (2004); Krings & Xiang (2005); Krings (2008); Krings et al (2019); Lipow & Wyatt (1998); Reveal & Barrie (1992); Rosatti (1989).

- 2 Upper surface of corolla lobes uniformly colored, olive green at anthesis, glabrous; laminar dorsal anther appendage yellow, apex rounded or truncate; [c. KY, e. TN, nw. AL westward] ***Gonolobus suberosus* var. *granulatus***
- 2 Upper surface of corolla lobes multi-colored, generally dark maroon to brownish near the base and green to yellowish near the tips at anthesis (or uniformly yellowish-green to neon green in rare mutants), pubescent or glabrous; laminar dorsal anther appendage darkly purplish or maroonish tinted, apex bilobed to emarginate; [se. VA south to c. peninsular FL, west to s. MS and inland to nw. GA; very rarely west of the Mississippi River (in AR)] ***Gonolobus suberosus* var. *suberosus***

Gonolobus suberosus (Linnaeus) R. Brown var. ***granulatus*** (Scheele) Krings & Q.Y. Xiang. WESTERN ANGLEPOD. **Hab:** Streambanks, bottomlands. **Dist:** C. KY, e. TN, nw. AL, and MS west to se. KS, c. OK, and c. TX. **Phen:** (May-) Jun-Aug. **Syn:** = K3, K4, Krings & Xiang (2005), Krings (2008); >> *Gonolobus gonocarpus* (Walter) Perry – Rosatti (1989); < *Gonolobus suberosus* (Linnaeus) R. Brown – Ar, Mo2, Tn; > *Gonolobus suberosus* (Linnaeus) R. Brown – Lipow & Wyatt (1998); >> *Matelea gonocarpa* (Walter) Shinnars – GrPl, Tx, Drapalik (1969); < *Matelea gonocarpos* (Walter) Shinnars – Il, K1, NcTx; >> *Vincetoxicum gonocarpos* Walter – S; >> *Vincetoxicum suberosum* (Linnaeus) Britton – S.

Gonolobus suberosus (Linnaeus) R. Brown var. ***suberosus***. EASTERN ANGLEPOD. **Hab:** Mesic to wet forests and thickets. **Dist:** E. MD south to s. peninsular FL, west to s. MS, inland to nw. GA and c. KY; disjunct in c. AR (Saline County). **Phen:** Jun-Aug; Sep-Nov. **Tax:** Rosatti (1989) and Drapalik (1969) expressed considerable doubt about whether two species should be recognized; their view, supporting the recognition of a single species in our area, is followed here for now. However, studies by Krings & Xiang (2004, 2005) suggested that two entities should be circumscribed at the varietal level. Drapalik (1969) considered the basionym "*suberosa*" as not applicable to *Matelea* of North America; Reveal & Barrie (1992) lectotypified the name, resulting in it applying to our material. The epithet "*suberosus*" has priority over "*gonocarpus*". **Syn:** = K3, K4, Va, Krings & Xiang (2005), Krings (2008); = *Gonolobus gonocarpus* (Walter) Perry – Rosatti (1989); = *Matelea gonocarpa* (Walter) Shinnars – Drapalik (1969); > *Gonolobus gonocarpus* (Walter) Perry – F, G; < *Gonolobus suberosus* (Linnaeus) R. Brown – Fl5, Tn, WH3; > *Gonolobus suberosus* (Linnaeus) R. Brown – F, Lipow & Wyatt (1998); > *Matelea gonocarpa* (Walter) Shinnars – C, RAB, W; < *Matelea gonocarpos* (Walter) Shinnars – K1; > *Matelea suberosa* (Linnaeus) Shinnars – C, RAB, W; < *Vincetoxicum gonocarpos* Walter – S; > *Vincetoxicum suberosum* (Linnaeus) Britton – S.

***Matelea* Aublet 1775 (SPINYPOD)**

A genus of about 75-160 species (by current overly broad circumscription), herbs and herbaceous vines, primarily tropical and restricted to the New World. The genus as generally circumscribed since Woodson (1941) is polyphyletic and very diverse. Woodson (1941) created this broad circumscription of *Matelea* by merging dozens of previously recognized genera, stating "I should like to lay a curse on the man who revives them without at least as much study as I have devoted". *Gonolobus* and *Chthamalia* are here removed, and at least *Matelea alabamensis* will also be removed from *Matelea*. Endress et al. (2018) retain *Odontostephana*, *Edisonia*, and *Cyclodon* for our remaining species, excluding *Matelea* from the southeastern United States flora. References: Drapalik (1969); Endress et al (2018) in Kadereit & Bittrich (2018); Fishbein & McDonnell () (in prep) in FNA14; McDonnell & Fishbein (2016); Woodson (1941).

Identification Notes: *Matelea* and *Gonolobus* are difficult to distinguish without flowers or fruits. Fresh *Matelea* leaves do not have a strong odor when crushed; *Gonolobus* has a disagreeable odor of peanut butter/burnt/buttered popcorn. *Gonolobus* typically exhibits (at least some) leaves more drawn out in length with margins more or less parallel for some length before curving toward the tip (vs. in *Matelea* usually more rounded/ovate, curved throughout, and Ipomoea-like in *Matelea*, at least to me).

- 4 Corolla lobes in a horizontal plane or reflexed; flower buds ovoid to broadly conical, < 1.5× as long as wide; corolla lobes 1.5-5× as long as wide. ***Matelea carolinensis***
- 4 Corolla lobes ascending; flower buds conical, > 2× as long as wide; corolla lobes 2.4-6.2× as long as wide.
- 6 Corolla white (or fading or drying cream); corona 2.2-2.7 mm in diameter, cream or creamy-yellow; [Panhandle FL and sw. GA westward] ***Matelea baldwiniana***

- 6 Corolla rose or maroon (rarely cream); corona 2.6-4.0 mm in diameter, rose to dark maroon (rarely green, cream, or orange); [primarily Mountains and Piedmont].
- 7 Corolla lobes 2.4-3.6 (-4.0)× as long as wide, the widest part above the sinus; corolla dark maroon.....*Matelea decipiens*
- 7 Corolla lobes (3.2-) 4.0-6.2× as long as wide, the widest part at the sinus; corolla rose to light maroon (rarely dark maroon, green, or cream)*Matelea obliqua*

Matelea baldwiniana (Sweet) Woodson. WHITE SPINPOD. **Hab:** Dry to mesic bluffs over calcareous rocks. **Dist:** Panhandle FL and sw. GA west to MO, AR, and OK. **Phen:** May-early Jul. **Tax:** Drapalik (1969) discussed the probability that the name *M. baldwiniana* is based on material of *M. flavidula*; this problem remains unaddressed. **Syn:** = *Matelea baldwyniana* (Sweet) Woodson – Ar, GrPl, K1, K3, K4, Mo2, WH3, Drapalik (1969), McDonnell & Fishbein (2016), orthographic variant; = *Odontostephana baldwiniana* (Sweet) Alexander – S; = *Vincetoxicum baldwynianum* (Sweet) Britton, orthographic variant. **NatureServe G3** (Vulnerable).

Matelea carolinensis (Jacquin) Woodson. CAROLINA SPINPOD. **Hab:** Moist to dry, nutrient-rich forests. **Dist:** DE, MD, KY, and s. MO south to GA and MS (and w. LA and e. TX?). **Phen:** Apr-Jun; Jul-Oct. **Syn:** = C, K1, K3, K4, RAB, Tn, Va, W; = *Gonolobus carolinensis* (Jacquin) R. Brown ex J.A. Schultes – F, G; = *Odontostephana carolinensis* (Jacquin) Alexander – S; = *Vincetoxicum carolinensis* (Jacquin) Britton. **NatureServe G4** (Apparently Secure).

Matelea decipiens (Alexander) Woodson. DECEPTIVE SPINPOD. **Hab:** Woodlands and thickets, generally over calcareous substrates. **Dist:** S. IL, c. MO, and se. KS south to LA and e. TX. Previous reported distribution eastwards in VA south to nc. GA and ne. MS appears to represent variability within *M. carolinensis* (Fishbein & McDonnell in FNA, in prep.). **Phen:** Apr-Jun; Aug-Oct. **Syn:** = Ar, GrPl, Il, Mo2, NcTx, McDonnell & Fishbein (2016); = *Odontostephana decipiens* Alexander – S; >> *Gonolobus decipiens* (Alexander) Perry – F, G; >> *Matelea decipiens* (Alexander) Woodson – C, K1, K3, K4, RAB, Tx, Va. **NatureServe G5** (Secure).

Matelea obliqua (Jacquin) Woodson. NORTHERN SPINPOD, LIMEROCK MILK VINE. **Hab:** In forests, woodlands, or thickets over calcareous rocks. **Dist:** PA west to OH, IN, and MO, south to w. NC, nw. GA (Jones & Coile 1988), nw. AL, and ne. MS. **Phen:** Jun-Jul; Aug-Nov. **Syn:** = C, Il, K1, K3, K4, Pa, RAB, Tn, Va, W; = *Gonolobus obliquus* (Jacquin) R. Brown ex J.A. Schultes – G; = *Matelea carolinensis* – WV, misapplied; > *Gonolobus obliquus* (Jacquin) R. Brown ex J.A. Schultes – F; > *Gonolobus shortii* A. Gray – F; > *Odontostephana obliqua* (Jacquin) Alexander – S; > *Odontostephana shortii* (A. Gray) Alexander – S; > *Vincetoxicum obliquum* (Jacquin) Britton; > *Vincetoxicum shortii* (A. Gray) Britton. **NatureServe G4?** (Apparently Secure).

Nerium Linnaeus 1753 (OLEANDER)

A monotypic genus, a shrub or small tree, of Mediterranean Europe (Endress et al. 2018). References: Endress et al (2018) in Kadereit & Bittrich (2018).

* ***Nerium oleander*** Linnaeus. OLEANDER. **Hab:** Frequently cultivated, especially on barrier islands (because of its salt resistance), sometimes persistent or weakly naturalizing. **Dist:** Native of Mediterranean Europe. **Syn:** = Bah, Fl5, K1, K3, K4, Meso4.1, S, Tx, WH3. **NatureServe GNR** (Not Yet Ranked).

Pattalias S. Watson 1889 (SWALLOW-WORT)

A genus of 2-3 species (as circumscribed by Fishbein & Stevens 2005), of tropical and subtropical se. United States, West Indies, and Baja California. Liede & Meve (2002) followed a broader circumscription, including *Pattalias* in *Funastrum*, but Fishbein & Stevens (2005) argued that *Seutera* (now *Pattalias* on nomenclatural grounds) is discordant as a component of *Funastrum*. References: Fishbein & Stevens (2005); Fishbein (2017); Liede & Meve (1997); Liede & Meve (2002); Liede-Schumann et al (2014).

Pattalias palustris (Pursh) Fishbein. SWALLOW-WORT, MARSH CYNANCHUM. **Hab:** Coastal hammocks, edges of marshes, generally or always on barrier islands. **Dist:** E. NC (Dare County) south to s. FL, west to s. TX; Bahamas and West Indies; Mexico (Yucatán) and Belize. **Phen:** Jun-Jul; Jul-Oct. **Tax:** See Krings (2005) for a discussion of typification. See Fishbein (2017) for a discussion of the nomenclature and taxonomy of this species. **Comm:** Pursh's original description (as *Ceropegia palustris*) succinctly captures the habit and habitat of this species: "in salt marshes, winding around Scirpi and Junci: Carolina" (Pursh 1814 [1813]). **Syn:** = FNA; = *Cynanchum angustifolium* Persoon – Bah, GW2, K1, Tx, Tx, WH3; = *Cynanchum palustre* (Pursh) Heller – RAB; = *Funastrum angustifolium* (Persoon) Liede & Meve – K3, Liede & Meve (2002); = *Lyonia palustris* (Pursh) Small – S; = *Pattalias palustre* (Pursh) Fishbein – Fishbein (2017), orthographic variant; = *Seutera angustifolia* (Persoon) Fishbein & W.D. Stevens – Fl5, Meso4.1, WI, Fishbein & Stevens (2005). **NatureServe G5** (Secure).

Thysanthea (Baillon) Pichon 1948 (CLIMBING DOGBANE)

A monotypic genus, a liana, of se. North America (Endress et al. 2018). This species has been traditionally treated as the only North American taxon of *Trachelospermum*, an otherwise se. Asian genus of about 15-20 species. Such a treatment is untenable, however, as morphological and molecular evidence clearly show that our native

 (see introduction for more)

356. APOCYNACEAE

taxon is only distantly related to Asian *Trachelospermum* (Livshultz et al. 2007); it is most closely related to the small genus *Pinochia* M.E. Endress & B.F. Hansen, of the Greater Antilles, Mexico, and Central America (Endress & Hansen 2007). References: Endress & Hansen (2007); Endress et al (2018) in Kadereit & Bittrich (2018); Livshultz et al (2007).

Identification Notes: Sterile *Thyrsanthella difformis* is sometimes mistaken at a glance for *Gelsemium* (both woody vines with opposite lanceolate leaves), but in the field the milky sap of *Thyrsanthella* provides an immediate identifying characteristic.

Thyrsanthella difformis (Walter) Pichon. CLIMBING DOGBANE. **Hab:** Dry-mesic to mesic upland forests and woodlands, bottomland and riparian forests, moist prairies, flatwoods, swamps, marshes, old fields, roadsides. **Dist:** DE south to n. peninsular FL, west to e. TX, north in the interior to MO and IN. **Phen:** May-Jul; Jul-Sep. **Comm:** See Krings (2003) for a discussion of nomenclature. **ID Notes:** Very variable in leaf size, with leaves up to 14 cm long and 8 cm wide, but usually much smaller and proportionally narrower than that. The leaves are often about the size and shape of *Gelsemium* leaves; fresh material is easily distinguished by its milky sap. **Syn:** = Fl5, K4, WH3, Livshultz et al (2007); = *Forsteronia difformis* (Walter) A.P. de Candolle; = *Trachelospermum difforme* (Walter) A. Gray – Ar, C, F, G, GW2, Il, K1, K2, Mo2, RAB, S, Tn, Tx, Va. NatureServe G4G5 (Apparently Secure).

Trachelospermum Lemaire 1851 (CLIMBING DOGBANE)

A genus of 6-10 species, lianas, of se. Asia (Endress et al. 2018). References: Endress et al (2018) in Kadereit & Bittrich (2018); Livshultz et al (2007).

* ***Trachelospermum jasminoides*** (Lindley) Lemaire. CONFEDERATE JASMINE, STAR JASMINE. **Hab:** Disturbed areas. **Dist:** Native of se. Asia. Cultivated and sometimes persistent or spreading. Reported for e. LA and AL (Diamond 2013). **Phen:** Apr-Oct. **Syn:** = Ar, Fl5, K1, K3, K4, NcTx, WH3. NatureServe GNR (Not Yet Ranked).

Vinca Linnaeus 1753 (VINCA, PERIWINKLE)

A genus of 5-7 species, perennial herbs, of Europe, n. Africa, and c. Asia (Endress et al. 2018). References: Endress et al (2018) in Kadereit & Bittrich (2018).

- 1 Leaves ovate, broadest near the base, cordate or subcordate-rounded at the base, 2-6 cm wide, thin in texture and deciduous to semi-evergreen; leaf margins ciliate; flowers 3-5 cm across, on a pedicel 3-5 cm long..... ***Vinca major***
- 1 Leaves lanceolate or elliptic, broadest near the middle, rounded to cuneate at the base, 1-2 cm wide, thick in texture and evergreen; leaf margins not ciliate; flowers 2-3 cm across, on a pedicel 1-1.5 cm long..... ***Vinca minor***

* ***Vinca major*** Linnaeus. GREATER PERIWINKLE. **Hab:** Disturbed areas, suburban woodlands, around old house sites, persistent and spreading from cultivation. **Dist:** Native of Europe. **Phen:** Late Feb-May; Jun-Jul. **Syn:** = Ar, C, F, Fl5, G, Il, K1, K3, K4, Meso4.1, Mi, Mo2, NcTx, NE, NY, RAB, S, Tn, Tx, Va, W. NatureServe GNR (Not Yet Ranked).

* ***Vinca minor*** Linnaeus. COMMON PERIWINKLE, MYRTLE. **Hab:** Disturbed areas, around old house sites and especially old cemeteries, persistent and spreading from cultivation. **Dist:** Native of Europe. **Phen:** Apr-Jun; Jun-Jul. **Syn:** = Ar, C, F, Fl5, G, GrPl, Il, K1, K3, K4, Mi, Mo2, NcTx, NE, NY, Pa, RAB, S, Tn, Tx, Va, W, WH3, WV. NatureServe GNR (Not Yet Ranked).

357a. BORAGINACEAE A.L. de Jussieu 1789 (BORAGE FAMILY) [in BORAGINALES]

As here more narrowly circumscribed, a family of about 85 genera and 1600-1700 species, herbs (and a few shrubs), nearly cosmopolitan (Weigend et al. in Kadereit & Bittrich 2016). References: Al-Shehbaz (1991); Constance (1963); Diane, Förther, & Hilger (2002); Ferguson (1998); Hilger & Diane (2003); Khoshosokhan-Mozaffar, Sherafati, & Kazempour-Osaloo (2018); Nazaire & Hufford (2012); Weigend et al. in Kadereit & Bittrich (2016); Wilson (1960a).

- 1 Leaves dissected, lobed, or toothed (sometimes the basalmost leaves simple); style fused for a portion of its length, 2-cleft toward the tip; ovary with 1 locule..... ***Hydrophyllaceae***
- 1 Leaves entire, simple; style various.
 - 2 Styles 2, distinct to the summit of the ovary..... ***Hydroleaceae***
 - 2 Styles absent (the stigma sessile and terminal), single, or with 2 branches.
 - 4 Ovary slightly 2-4-lobed, or not at all lobed; style terminal or reduced to a sessile terminal stigma..... ***Heliotropiaceae***
 - 4 Ovary deeply 4-parted; style gynobasic.
 - 5 Mericarps with glochidiate prickles (like grappling hooks), these visible early in development.

- 6 Mericarps spreading or divergent, attached to the gynobase on the upper third of the mericarp.
 7 Flowering stem leafless above the first branch; corolla blue or white; [plant a perennial native, not weedy]; [subfamily *Cynoglossoideae*; tribe *Cynoglosseae*; subtribe *Amsinckiiinae*] *Andersonglossum*
 7 Flowering stem with leaves above the first inflorescence branch; corolla reddish-purple; [plant a biennial alien, weedy]; [subfamily *Cynoglossoideae*; tribe *Cynoglosseae*; subtribe *Cynoglossinae*] *Cynoglossum*
 6 Mericarps erect, attached to the gynobase near the middle of the mericarp; [subfamily *Cynoglossoideae*; tribe *Rochelieae*; subtribe *Eritrichiinae*] *Hackelia*
 5 Mericarps smooth, rugose, or pitted, lacking glochidiate prickles.
 10 Corolla lobes distinctly unequal, pink to blue; [subfamily *Boraginoideae*] *Echium*
 10 Corolla lobes equal, of various colors (including pink to blue); [subfamily *Cynoglossoideae*].
 13 Mericarps attached laterally to a pyramidal gynobase.
 14 Corolla yellow, the tube 4-5 mm long; corolla throat lacking appendages; [subfamily *Cynoglossoideae*; tribe *Cynoglosseae*; subtribe *Amsinckiiinae*] *Amsinckia*
 14 Corolla white (with a yellow eye), or pink to blue, the tube 6-20 mm long; corolla throat with appendages. *Mertensia*
 13 Mericarps attached basally to a flat or broadly convex gynobase.
 16 Mericarps laterally compressed, with an evident raised margin; [subfamily *Cynoglossoideae*; tribe *Myosotideae*] *Myosotis*
 16 Mericarps neither laterally compressed nor with an evident thickened margin.
 18 Corolla whitish or bluish white; plant annual from a slender taproot; leaves without evident lateral veins; mericarps brown, dull, wrinkled and pitted; [plant a weedy alien] *Buglossoides*
 18 Corolla bright yellow-orange, or greenish-white; plant perennial from a thickened, woody rhizome; mericarps white, shining, smooth or pitted; [plant a native] *Lithospermum*

Amsinckia Lehmann 1831 (FIDDLENECK)

A genus of about 15 species, winter-annual herbs, of western North America and western South America. References: Al-Shehbaz (1991); Weigend et al (2016) in Kadereit & Bittrich (2016).

Amsinckia lycopsoides Lehmann. TARWEED. **Hab:** Disturbed areas, probably only a waif. **Dist:** Native of w. United States. **Phen:** Jun-Jul. **Syn:** = GrPl, Il, K1, K3, K4, NE, NY, Tx.

* *Amsinckia menziesii* (Lehmann) A. Nelson & J.F. Macbride. MENZIES'S FIDDLENECK. **Hab:** Disturbed areas, waste areas near wool-combing mill. **Dist:** Native of w. United States. **Phen:** May-Sep. **Syn:** = Il, K3, K4, NeTx, NY, Al-Shehbaz (1991); < *Amsinckia hispida* (Ruiz & Pavón) I.M. Johnston – RAB, misidentification; > *Amsinckia lycopsoides* Lehmann, misidentification; > *Amsinckia menziesii* var. *menziesii* – K1; > *Amsinckia parviflora* Heller – S, misidentification.

*Andersonglossum* J.I. Cohen 2015 (AMERICAN COMFREY)

A genus of 3 species, perennial herbs, of e. North America and w. North America. These North American species previously assigned to *Cynoglossum* are in a strictly New World clade also including *Cryptantha*, *Amsinckia*, *Plagiobothrys*, and other genera, not closely related to *Cynoglossum officinale*, the type of the genus *Cynoglossum*. See Weigend et al. (2013) and Cohen (2015) for additional information. References: Al-Shehbaz (1991); Cohen (2015); Haines (2010); Hilger, Greuter, & Stier (2015); Jiménez-Mejías, Cohen, & Naczi (2017); Weigend et al (2013); Weigend et al (2016) in Kadereit & Bittrich (2016).

Andersonglossum virginianum (Linnaeus) J.I. Cohen. SOUTHERN HOUND'S-TONGUE, SOUTHERN WILD COMFREY. **Hab:** Moist deciduous forests. **Dist:** CT west to OK, south to FL and LA. **Phen:** Apr-Jun. **Syn:** = Fl5, NY, Cohen (2015), Jiménez-Mejías, Cohen, & Naczi (2017); = *Cynoglossum virginianum* – Ar, F, G, GrPl, Il, K3, Mo2, NeTx, Pa, Tx, Al-Shehbaz (1991); = *Cynoglossum virginianum* ssp. *virginianum* – NE, Haines (2010); = *Cynoglossum virginianum* Linnaeus var. *virginianum* – C, K1, Va; = *Cynoglossum virginicum* – S, orthographic variant; < *Andersonglossum virginianum* (Linnaeus) J.I. Cohen – K4; < *Cynoglossum virginianum* – RAB, Tn, W, WH3, WV. [NatureServe G5T5](#) (Secure).

Buglossoides Moench 1794 (CORN-GROMWELL)

A genus of about 7-10 species, herbs or shrubs, of temperate Eurasia. References: Al-Shehbaz (1991); Weigend et al (2016) in Kadereit & Bittrich (2016).

Key to Map

357a. **BORAGINACEAE**

* ***Buglossoides arvensis*** (Linnaeus) I.M. Johnston *ssp. arvensis*. CORN-GROMWELL. **Hab:** Roadsides, dry disturbed areas, sandy fields. **Dist:** Native of Eurasia. Other subspecies are not known to be naturalized in our area. **Phen:** Mar-Jun. **Syn:** = NE, Va, WH3, Al-Shehbaz (1991); < *Buglossoides arvensis* – Il, Pa, Tx, orthographic variant; < *Buglossoides arvensis* – Ar, Fl5, K1, K3, K4, Mi, NcTx, NY, Tn; < *Lithospermum arvense* Linnaeus – C, F, G, GrPl, RAB, S, W. NatureServe GNRTNR (Not Yet Ranked).

Cynoglossum Linnaeus 1753 (COMFREY)

A genus of about 75 species, herbs, of the temperate Old World (but circumscription uncertain). References: Al-Shehbaz (1991); Haines (2010); Hilger, Greuter, & Stier (2015); Weigend et al (2013); Weigend et al (2016) in Kadereit & Bittrich (2016).

Unkeyed taxa: *Cynoglossum zeylanicum*

* ***Cynoglossum zeylanicum*** (Lehmann) Brand. CEYLON HOUND'S-TONGUE. **Hab:** Disturbed areas. **Dist:** Native of s. Asia. **Phen:** May. **Syn:** = Ar, Fl5, Tx, WH3; >> *Cynoglossum furcatum* Wallich ex Roxburgh – K3, K4. NatureServe GNR (Not Yet Ranked).

Echium Linnaeus 1753 (VIPER'S-BUGLOSS, BLUEWEED)

A genus of about 60 species, herbs, widespread in the Old World. The common name is pronounced 'bew-gloss', not 'bug-loss', as it refers to an ox's tongue rather than to the departure of insects. References: Al-Shehbaz (1991); Weigend et al (2016) in Kadereit & Bittrich (2016).

* ***Echium vulgare*** Linnaeus. VIPER'S-BUGLOSS, BLUEWEED. **Hab:** Roadsides, dry pastures, disturbed areas.

Dist: Native of Mediterranean Europe. Reported for Cook County, GA (Carter, Baker, & Morris 2009). **Phen:** Jun-Sep. **Syn:** = Ar, C, GrPl, Il, K1, K3, Mi, NcTx, NE, Pa, RAB, Tn, Tx, Va, W, WV; = *Echium vulgare* var. *vulgare* – F, G; < *Echium vulgare* Linnaeus – K4, NY, Al-Shehbaz (1991).

Hackelia Opiz 1839 (STICKSEED)

A genus of ca. 45 species, herbs (mainly perennial), of north temperate regions, Central America, and South America, especially diverse in w. North America. References: Al-Shehbaz (1991); Weigend et al (2016) in Kadereit & Bittrich (2016).

Hackelia virginiana (Linnaeus) I.M. Johnston. VIRGINIA STICKSEED. **Hab:** Rich forests and woodlands. **Dist:** S. QC west to ND, south to ne. GA (Jones & Coile 1988), LA, and TX. **Phen:** Jun-Sep. **Syn:** = Ar, C, F, G, GrPl, Il, K1, K3, K4, Mi, NE, NY, Pa, RAB, Tn, Tx, Va, W, WV, Al-Shehbaz (1991); = *Lappula virginiana* (Linnaeus) Greene – S. NatureServe G5 (Secure).

Lithospermum Linnaeus 1753 (GROMWELL, PUCCOON, STONESEED)

A genus of about 80 species, herbs (mostly perennials), nearly cosmopolitan. Studies strongly suggest that *Onosmodium* is better included in a broadened *Lithospermum* (Cohen & Davis 2009; Weigend et al. 2009), as *Onosmodium* is embedded within *Lithospermum* in a subclade also including *L. tuberosum*; morphologically, *Onosmodium* shows a subset of the characteristics in a broader and more diverse *Lithospermum*. References: Al-Shehbaz (1991); Cochrane (1976); Cohen & Davis (2009); Cusick (1985); Turner (1995a); Weakley et al (2011); Weigend et al (2009); Weigend et al (2016) in Kadereit & Bittrich (2016).

- 1 Corolla lobes acute to acuminate, erect (continuing the plane of the corolla tube); style exserted.
 - 2 Corolla lobes yellow to orange; nutlet 2.0-2.8 mm long; corolla lobes either 2.5-4× as long as wide and acuminate (*L. virginianum*) or 1.5-2× as long as wide, acute (*O. decipiens*).

..... *Lithospermum virginianum*
 - 2 Corolla lobes dull greenish-white; nutlet 2.5-3.0 mm long; corolla lobes 1.5-2× as long as wide, acute.

..... *Lithospermum parviflorum*
- 1 Corolla lobes rounded, spreading; style included.
 - 8 Corolla white or yellowish-white, the tube 4-8 mm long.
 - 9 Plant with basal rosette; lower cauline leaves about equal in size to the upper cauline leaves; leaves acute to obtuse..... *Lithospermum tuberosum*
 - 9 Plant lacking basal rosette; lower cauline leaves smaller than the upper cauline leaves; leaves acuminate or acute.

..... *Lithospermum latifolium*
 - 8 Corolla yellow-orange, the tube 7-30 mm long.
 - 12 Plant with dense, soft, appressed pubescence, the hairs usually without pustular bases; calyx lobes 6-8 mm long at maturity; nutlets 2-3 mm long; [mostly of rocky or clayey circumneutral soils of inland physiographic provinces]..... *Lithospermum canescens*
 - 12 Plant with scattered, stiff, spreading pubescence, the hairs with or without pustular bases; calyx lobes 10-15 mm long at maturity; nutlets 3.5-4.5 mm long; [variously of sandy acidic soils of the Coastal Plain or inland].

..... *Lithospermum carolinense*

Lithospermum canescens (Michaux) Lehmann. HOARY PUCCOON, INDIAN-PAINT. **Hab:** Dry woodlands and glades over calcareous rocks (such as limestone, dolostone) or mafic rocks (such as diabase). **Dist:** ON west to SK, south to c. NC, nw. GA, AL, and TX. **Phen:** Apr-May. **Syn:** = Ar, C, F, G, GrPl, Il, K1, K3, K4, Mi, Pa, RAB, Va, W, WV, Al-Shehbaz (1991), Cusick (1985); = *Batschia canescens* Michaux – S. Lithospermum carolinense (Walter ex J.F. Gmelin) MacMillan. COASTAL PLAIN PUCCOON. **Hab:** Longleaf pine sandhills, other dry sandy soils. **Dist:** A Southeastern Coastal Plain endemic: se. SC south to Panhandle FL, and west to AR and TX; disjunct in se. VA. The disjunction from SC to se. VA, skipping over large amounts of apparently suitable sandhill habitat in NC, is surprising. **Phen:** Apr-Jun. **Tax:** The sibling taxa *L. carolinense* and *L. croceum* have been variously treated as distinct species, subspecies, or varieties, or as mere forms (see synonymy). Cusick (1985) discusses them and concludes that "the two taxa are similar, but distinctive, and their geographic distributions are almost exclusive". They appear to be as clearly separable as *L. carolinense* is from *L. canescens*; I regard them as allopatric species. **Syn:** = Ar, F, NcTx, Tx, Va; = *Batschia carolinensis* Walter ex J.F. Gmelin – S; = *Lithospermum carolinense* ssp. *carolinense* – Cusick (1985); = *Lithospermum carolinense* var. *carolinense* – C, K1, K3, K4; < *Lithospermum carolinense* – GrPl, orthographic error; < *Lithospermum carolinense* (Walter ex J.F. Gmelin) MacMillan – Fl5, G, RAB, WH3, Al-Shehbaz (1991). **NatureServe G4G5T3T5** (Apparently Secure).

Lithospermum latifolium Michaux. AMERICAN GROMWELL, BROADLEAF GROMWELL, BROADLEAF PUCCOON. **Hab:** Dry to moist woodlands over calcareous rocks. **Dist:** NY west to MN, south to nw. GA, s. TN and AR. **Phen:** May-Jun. **Syn:** = Ar, C, F, G, GrPl, Il, K1, K3, K4, Mi, NY, Pa, S, Tn, Va, W, WV, Al-Shehbaz (1991), Cusick (1985). **NatureServe G4** (Apparently Secure).

Lithospermum parviflorum Weakley, Witsell, & D. Estes. EASTERN PRAIRIE MARBLESEED, SHAGGY MARBLESEED. **Hab:** Calcareous woodlands, barrens, and glades, and nearby in disturbed areas, such as older pasture edges. **Dist:** W. NY and ON west to MN, south to sc. PA (Rhoads & Klein 1993), w. VA, e. TN (Chester, Wofford, & Kral 1997), LA, and TX. This species was attributed to NC by F and S; the documentation of these reports is not known. **Phen:** May-Jul. **Syn:** = K3, K4, NY, Tn, Va, Weakley et al (2011); = *Onosmodium bejariense* A.L.P.P. de Candolle ssp. *hispidissimum* (Mackenzie) B.L. Turner – K2, Turner (1995a); = *Onosmodium bejariense* var. *hispidissimum* – Ar; = *Onosmodium hispidissimum* Mackenzie – G, S, Tx, W, WV; = *Onosmodium molle* Michaux ssp. *hispidissimum* (Mackenzie) Boivin – K1, Al-Shehbaz (1991), Cochrane (1976); = *Onosmodium molle* Michaux var. *hispidissimum* (Mackenzie) Cronquist – C, GrPl, Pa; > *Onosmodium hispidissimum* var. *hispidissimum* – F; > *Onosmodium hispidissimum* var. *macrospermum* Mackenzie & Bush – F; < *Onosmodium molle* Michaux – Il, Mi. **NatureServe G4G5T4** (Apparently Secure).

Lithospermum tuberosum Rugel ex A.P. de Candolle. SOUTHERN STONESEED. **Hab:** Nutrient-rich forests, especially over calcareous rocks. **Dist:** Sw. VA, s. WV, KY, and TN, south to n. peninsular FL, FL Panhandle, and LA. **Phen:** Mar-Jun. **Syn:** = Ar, C, F, Fl5, G, K1, K3, K4, RAB, S, Tn, Tx, Va, WH3, Al-Shehbaz (1991). **NatureServe G4** (Apparently Secure).

Lithospermum virginianum Linnaeus. PINELAND MARBLESEED, VIRGINIA MARBLESEED. **Hab:** Longleaf pine sandhills, shell middens in the outer Coastal Plain, woodlands and barrens over diabase and other mafic rocks in the Piedmont and low Mountains, barrens, glades, or woodlands over calcareous rocks in the Mountains (the unifying ecological factor determining its distribution may be an open, woodland condition maintained by fire). **Dist:** LA to FL, north to NY and MA, primarily on the Coastal Plain; the species has become very rare north of NC. **Phen:** Apr-Sep; late May-Oct. **Comm:** In much of its distribution, the species seems characteristically to occur in very small populations, consisting often of fewer than five plants. **Syn:** = Fl5, K3, K4, NY, Va; = *Onosmodium virginianum* (Linnaeus) A.L.P.P. de Candolle – C, F, G, K1, NE, Pa, RAB, S, W, WH3, Al-Shehbaz (1991), Cusick (1985). **NatureServe G4** (Apparently Secure).

Mertensia Roth 1797 (BLUEBELL)

A genus of about 40-45 species, perennial herbs, north temperate (mainly e. Asia and North America). References: Al-Shehbaz (1991); Weigend et al (2016) in Kadereit & Bittrich (2016).

Mertensia virginica (Linnaeus) Persoon ex Link. VIRGINIA BLUEBELLS, VIRGINIA COWSLIP. **Hab:** Nutrient-rich, moist, alluvial soils of floodplain forests and thickets, also on rich slopes or bluffs over calcareous rocks. **Dist:** NY west to WI, and IA, south to n. NC, nw. GA, AL, and n. AR. **Phen:** Mar-May. **Tax:** Pringle (2004) discusses the nomenclatural reasons for retaining the name *M. virginica*. **Syn:** = Ar, C, F, G, GrPl, Il, K1, K3, K4, Mi, NE, NY, Pa, RAB, S, Tn, Va, W, WV, Al-Shehbaz (1991); = *Mertensia pulmonarioides* Roth. **NatureServe G5** (Secure).

Myosotis Linnaeus 1753 (FORGET-ME-NOT, SCORPION-GRASS)

A genus of about 80-100 species, herbs, temperate and montane tropical. References: Al-Shehbaz (1991); Weigend et al (2016) in Kadereit & Bittrich (2016).

- 4 Calyx lobes unequal, 3 lobes shorter than the other 2; corolla white; [native, of dry or moist habitats].
 5 Fruiting pedicels divergent; fruiting calyx deciduous, 3-10 mm long; inflorescence internodes usually longer than 10 mm; mericarps 1.4-2.2 mm long *Myosotis macrosperma*
 5 Fruiting pedicels more-or-less erect; fruiting calyx persistent, 3-5.5 mm long; inflorescence internodes usually shorter than 10 mm; mericarps 1.2-1.5 mm long *Myosotis verna*
 4 Calyx lobes equal, all 5 the same size; corolla blue (occasionally yellow or white); [alien, mostly of dry disturbed habitats].
 6 Fruiting pedicels equaling or generally longer than the calyx *Myosotis arvensis*

Smith – F, G. *NatureServe G5* (Secure).

Myosotis macrosperma Engelman. BIGSEED FORGET-ME-NOT. **Hab:** Bottomland forests and alluvial fields, probably associated with nutrient-rich soils. **Dist:** MD west to MO, south to FL and TX. **Phen:** Apr-May. **Syn:** = Ar, C, F, Fl5, G, GW2, Il, K1, K3, K4, NcTx, Pa, RAB, S, Tn, Tx, Va, W, WH3, WV, Al-Shehbaz (1991); < *Myosotis verna* Nuttall – GrPl.

Myosotis verna Nuttall. EARLY FORGET-ME-NOT, SPRING FORGET-ME-NOT. **Hab:** Dry woodlands, roadsides, disturbed areas, dry fields. **Dist:** ME west to SD, south to GA and TX; also from ID and BC south to OR. **Phen:** Mar-Jul. **Syn:** = Ar, C, F, G, GrPl, Il, K1, K3, K4, Mi, NcTx, NE, NY, Pa, RAB, Tn, Tx, Va, W, WV, Al-Shehbaz (1991); = *Myosotis virginica* – S, misapplied; < *Myosotis verna* Nuttall – GrPl.

357b. HYDROPHYLLACEAE R. Brown 1817 (WATERLEAF FAMILY) [in BORAGINALES]

A family of about 12 genera and 250 species, herbs, of temperate (and tropical) America. References: Constance (1963); Ferguson (1998); Hofmann et al. in Kadereit & Bittrich (2016).

- 1 Leaves entire, simple; styles 2, distinct to the ovary.

.....*Hydrolea*

- 1 Leaves dissected, lobed, pinnatifid, or toothed (sometimes the basalmost leaves simple); style fused for a portion of its length, 2-cleft toward the tip.

- 3 Flowers solitary on pedicels either axillary to or opposite the leaves on the upper portion of the stem, and sometimes also terminal in a lax, (1-) 2-6-flowered cyme; [tribe *Hydrophyllae*].

.....*Nemophila*

- 3 Flowers all terminal in 3-many-flowered cymes.

- 5 Inflorescence repeatedly branched subdichotomously; larger leaf blades > 8 cm wide; stamens well exserted from the corolla (3 mm or more beyond the corolla); plants perennial from fibrous roots; [tribe *Hydrophyllae*].

.....*Hydrophyllum*

- 5 Inflorescence with a strong central axis (some secondary branching in *P. bipinnatifida*, but not as above); larger leaf blades < 5 cm wide (except *P. bipinnatifida*); stamens slightly exserted from the corolla (< 3 mm beyond the corolla) (except well-exserted in *P. bipinnatifida*, included in *P. covillei*); plants annual (biennial in *P. bipinnatifida*) from a taproot; [tribe *Romanzoffiae*].

.....*Phacelia*

Hydrophyllum Linnaeus 1753 (WATERLEAF)

A genus of 8-10 species, herbs, of e. and w. North America. References: Alexander (1941); Beckmann (1979); Constance (1942); Karlsson, Weakley, & Poindexter (2017) in Weakley et al (2017); Kral & Bates (1991).

- 1 Principal cauline leaves palmately lobed, maple-like, differing from the pinnately divided basal leaves.

.....*Hydrophyllum appendiculatum*

- 1 Principal cauline leaves pinnately divided, similar to the basal leaves.

.....*Hydrophyllum macrophyllum*

Hydrophyllum appendiculatum Michaux. GREAT WATERLEAF, BIENNIAL WATERLEAF. **Hab:** Rich mesic forests. **Dist:** S. ON and MN, south to sw. PA, a. and sc. WV, e. TN, n. AL (Jackson Co.), MO, and e. KS. It was attributed to NC by Small (1933) on unknown grounds. **Phen:** Apr-Jul.

Syn: = Ar, C, F, G, GrPl, Il, K1, K3, K4, Mi, Mi, Mo2, Pa, Tn, WV, Beckmann (1979), Constance (1942); = *Decemium appendiculatum* (Michaux) Small – S. *NatureServe G5* (Secure).

Hydrophyllum macrophyllum Nuttall. HAIRY WATERLEAF. **Hab:** Cove forests and other moist rocky forests, especially over calcareous or mafic rocks. **Dist:** WV west to OH, and IL, south to sw. VA, w. NC, n. GA, and n. AL; disjunct in the lower Piedmont of SC (Kershaw County; L.L. Gaddy, pers. comm. 2013). **Phen:** May-Jun; Jul-Aug. **Comm:** Reports from AR are erroneous, and are based on material of *Hydrophyllum brownei* Kral & Bates (Peck 2003). The w. North American *H. occidentale* (S. Watson) A. Gray is rather closely related. **Syn:** = C, F, G, Il, K3, K4, Pa, RAB, S, Tn, Va, W, WV, Beckmann (1979), Constance (1942), Kral & Bates (1991); >> *Hydrophyllum macrophyllum* Nuttall – K1.

357b. HYDROPHYLLACEAE

Hydrophyllum
appendiculatumHydrophyllum
macrophyllum*Nemophila* Nuttall 1822 (BABY-BLUE-EYES)

A genus of 11 species, herbs, of North America (mostly w. North America). References: Constance (1941).

Identification Notes: *Nemophila aphylla* is superficially similar to *Phacelia covillei* and *P. ranunculacea*, with which it often co-occurs. *Nemophila aphylla* has solitary flowers (and later fruits) borne on pedicels opposite the leaves, the pedicels mostly > 12 mm long; vs. *Phacelia* with flowers (and later fruits) in 2-6-flowered terminal cymes, the pedicels mostly < 12 mm long).

- 1 Stem leaves opposite; [aliens from w. North America].
 2 Seeds smooth or shallowly pitted; corolla with a purple spot at each lobe tip *Nemophila maculata*
 2 Seeds wrinkled and tubercled; corolla whitish near the petal base, grading to pale to medium blue in the upper portion (without a purple spot at each lobe tip) *Nemophila menziesii* var. *menziesii*
 1 Stem leaves alternate; [natives in our area].
 *Nemophila aphylla*

Nemophila aphylla (Linnaeus) Brummitt. WHITE NEMOPHILA, EASTERN BABY-BLUE-EYES, SMALL-FLOWER BABY-BLUE-EYES. **Hab:** Moist, nutrient-rich floodplain forests, often locally abundant. **Dist:** MD south to Panhandle FL and west to TX, north in the interior to e. TN, w. KY, and se. MO. **Phen:** Mar-Apr. **Syn:** = Ar, Fl5, GW2, K3, K4, Tn, Va, WH3; = *Nemophila microcalyx* (Nuttall) Fischer & C.A. Meyer – F, G, RAB, S, Tx, Constance (1941); = *Nemophila triloba* (Rafinesque) Thieret – C, Il.

* ***Nemophila maculata*** Bentham ex Lindley. FIVESPOT. **Hab:** Disturbed areas, apparently spreading from "wildflower seed mixes". **Dist:** Native of California. **Syn:** = Ar, K3, K4, Constance (1941). **NatureServe G4** (Apparently Secure).

* ***Nemophila menziesii*** Hooker & Arnott var. *menziesii*. MENZIES'S BABY-BLUE-EYES. **Hab:** Roadsides, waif from "wildflower seed mixes". **Dist:** Native of CA and OR. Reported for GA (Zomlefer et al. 2018). **Phen:** Mar-Apr. **Syn:** = K3, K4, Constance (1941). **NatureServe G5T4T5** (Apparently Secure).

*Phacelia* A.L. de Jussieu 1789 (PHACELIA)

A genus of about 100-200 species, of North America and South America, concentrated in w. North America. References: Constance (1949); Gillett (1964); Gillett (1968); Hofmann et al. in Kadereit & Bittrich (2016); Levy & Malone (2001); Levy (1991a); Levy, Hou, & Taylor-Bennetts (2021); Murdy (1966); Sewell & Vincent (2006).

Identification Notes: 1. *Phacelia bipinnatifida* and *Hydrophyllum virginianum* are sometimes confused. *P. bipinnatifida* has the larger and more basal leaves distinctly bipinnatifid, the lower pinnae often stalked (vs. pinnatifid, the basal or terminal pinnae sometimes 2-lobed, all the pinnae more-or-less sessile), pubescence of the upper stem and inflorescence in part glandular (pubescence nonglandular), and seeds 4 per capsule, black (vs. 2 per capsule, light brown). 2. *Phacelia covillei* and *P. ranunculacea* are superficially similar to and sometimes confused with *Nemophila aphylla*, which see for discussion.

- 4 Stamens 1.5-2 mm long; style 1.5-2 mm long; corolla tubular; seeds globose-ovoid, nearly spherical, 4 per capsule. *Phacelia ranunculacea*
 4 Stamens 3-10 mm long; style 3-15 mm long; corolla rotate to broadly campanulate; seeds ovoid-angled, 4-15 per capsule.
 6 Corolla 10-15 mm across, blue; plant 10-60 cm tall; seeds 2.5-4 mm long, black; ultimate segments of the leaf 15-45 mm long, 10-25 mm wide; pedicels recurved in fruit; branches of the inflorescence glandular-pubescent *Phacelia bipinnatifida*
 6 Corolla 5-11 mm across, white to blue; plant 5-40 cm tall; seeds 1.5-2.2 mm long, brown; ultimate segments of the leaf 5-15 mm long, 5-9 mm wide; pedicels ascending to spreading in fruit; inflorescence branches variously pubescent, but not glandular.
 7 Basal leaves shallowly toothed or lobed; fruiting pedicels strictly erect, usually shorter than the fruiting calyx *Phacelia strictiflora* var. *robbinsii*
 7 Basal leaves pinnate or deeply pinnatifid; fruiting pedicels ascending or divergent, usually as long as or longer than the fruiting calyx. *Phacelia dubia* var. *dubia*

Phacelia bipinnatifida Michaux. FERNLEAF PHACELIA, FOREST PHACELIA, PURPLE PHACELIA. **Hab:** Cove forests, especially where rocky; also popular as a native plant for horticultural use, and sometimes found as a persistent or spreading from horticultural use. **Dist:** W. VA west to s. OH, n. IN, n. IL, and c. MO, south to w. NC, nw. SC, n. GA, c. AL, and n. AR. **Phen:** Mar-May; Jun. **Tax:** *P. bipinnatifida* var. *plummeri* (= *P. brevistyla*) is "based on a variation with sparser pubescence, larger and less divided leaf segments, smaller flowers, and sub-included stamens and style. These variations are not concomitant, and the distribution of forms showing a complete or partial combination of them is sporadic" (Constance 1949). The matter deserves additional study. **Syn:** = Ar, C, G, Il, K1, K3, K4, RAB, Tn, Va, W, Constance (1949); > *Phacelia bipinnatifida* Michaux – S; > *Phacelia bipinnatifida* var. *bipinnatifida* – F; > *Phacelia bipinnatifida* var. *plummeri* Wood – F; > *Phacelia brevistyla* Buckley – S.

Phacelia dubia (Linnaeus) Trelease var. *dubia*. APPALACHIAN PHACELIA. **Hab:** Floodplain forests, other moist and rich forests, rocky forests, fields, roadsides, granitic flatrocks. **Dist:** Var. *dubia* ranges from NY and PA west to WV, south to nc. SC, sw. NC, and se. TN. **Phen:** Apr-May; Jun. **Tax:** The *Phacelia dubia* complex has been under detailed biosystematic study by Foster Levy and associates (Levy 1991a, 199b, 1997; Levy et al. 1996; Levy & Malone 2001; Levy & Neal 2001; Taylor & Levy 2002; del Castillo 1994, 1998). Male sterile cytotypic variants are common in some populations but formal taxonomic recognition is not warranted (Levy 1991a, 1991b; del Castillo 1994, 1998). Additionally, an incipient variety, informally termed 'imitator', occurs in c. SC (Levy 1991a; Levy & Malone 2001). These populations are morphologically variable, some more similar to var. *georgiana*, others more similar to var. *dubia*; see Levy (1991a) for further discussion. They may warrant taxonomic recognition, as they are allopatric from each of the 3 named varieties, and show degrees of sterility when bred with each of the three, but morphologic differences have not evolved (Levy & Malone 2001). **Syn:** = K1, K3, K4, Tn, Va, Levy & Malone (2001), Levy (1991a); < *Phacelia dubia* (Linnaeus) Trelease – C, F, NY, Pa, RAB, S, W, WV; < *Phacelia dubia* (Linnaeus) Trelease var. *dubia* – Constance (1949); > *Phacelia dubia* (Linnaeus) Trelease var. *dubia* – G; > *Phacelia dubia* var. *fallax* (Fernald) Gleason – G. NatureServe G5T5 (Secure).

Phacelia ranunculacea (Nuttall) Constance. WESTERN BUTTERCUP PHACELIA. **Hab:** Bottomland forests. **Dist:** In the Mississippi and Ohio river drainages, centered around St. Louis, MO (w. KY, w. TN, e. MO, ne. AR, se. MO, s. IL, and s. IN). **Comm:** See Sewell & Vincent (2006). Reported for sc. AL, apparently in error. **Syn:** = Ar, Il, K1, K3, K4, Tn, Sewell & Vincent (2006); < *Phacelia ranunculacea* (Nuttall) Constance – C, F, G, Constance (1949).

Phacelia strictiflora (Engelmann & A. Gray) A. Gray var. *robbinsii* Constance. PRAIRIE SCORPION-WEED. **Hab:** Dry sandy open areas and woodlands. **Dist:** W. AR and OK south to w. LA and ne. TX; disjunct eastwards in the Black Belt of e. MS and AL. **Phen:** Mar-May. **Syn:** = Ar, K1, K3, K4, NcTx, Constance (1949); < *Phacelia strictiflora* (Engelmann & A. Gray) A. Gray – GrPl. NatureServe G5T4 (Apparently Secure).

357d. HELIOTROPIACEAE Schrader 1819 (HELIOTROPE FAMILY) [in BORAGINALES]

A family of 4 genera and about 420 species, shrubs, small trees, and herbs, nearly cosmopolitan in tropical to temperate regions. References: Al-Shehbaz (1991); Boraginales Working Group (F. Luebert et al.) (2016); Diane et al. in Kadereit & Bittrich (2016); Diane, Förther, & Hilger (2002); Feuillet (2019); Luebert (2013); Refulio-Rodriguez & Olmstead (2014); Ward & Fantz (1977).

- 3 Stigmatic apex pubescent; anthers apically coherent; calyx lobed 1/3-1/2 to base; embryo curved..... *Euploca*
 3 Stigmatic apex glabrous; anthers rarely coherent apically; calyx lobed > 3/4 to base; embryo straight..... *Heliotropium*

Euploca Nuttall 1837 (HELIOTROPE)

A genus of ca. 100 species, annual and perennial herbs (rarely shrubs), cosmopolitan, but mainly tropical. References: Al-Shehbaz (1991); Diane et al. in Kadereit & Bittrich (2016); Feuillet & Halse (2016); Frohlich, Thulin, & Chase (2020); Hilger & Diane (2003); Melo & Semir (2009).

- 3 Leaves sessile or with a poorly differentiated petiole < 2 mm long; leaf blades 4-10× as long as wide. *Euploca tenella*
 3 Leaves with differentiated petioles 2-15 mm long; leaf blades 1.5-6× as long as wide. *Euploca procumbens*

Euploca procumbens (P. Miller) Diane & Hilger. FOUR-SPIKE HELIOTROPE. **Hab:** Riverbanks, exposed shores, tree farms (in s. FL), road edges (in s. FL). **Dist:** S. FL; Panhandle FL west to TX, south into Mexico, Central America, and South America. **Phen:** Apr-Nov. **Syn:** = Fl5, K4, W1; = *Heliotropium procumbens* P. Miller – Ar, Bah, GW2, Meso4.2, Tx, WH3, Al-Shehbaz (1991), Feuillet & Halse (2016); < *Heliotropium europaeum* Linnaeus – S, misapplied; > *Heliotropium procumbens* var. *procumbens* – K3.

Euploca tenella (Torrey) Feuillet & Halse. DELICATE HELIOTROPE. **Hab:** Limestone glades and barrens, other dry calcareous soils. **Dist:** WV, KY, IN, IL, IA, and KS, south to nw. GA, AL, MS, LA, and TX. **Phen:** Jul-Oct. **Syn:** = K4, Ward & Fantz (1977); = *Heliotropium tenellum* Torrey – Ar, C, F, G, GrPl, Il, K1, K3, NcTx, Tn, Tx, Al-Shehbaz (1991); = *Lithococca tenella* (Torrey) Small – S. NatureServe G5 (Secure).

357d. **HELIOTROPIACEAE****Heliotropium** Linnaeus 1753 (HELIOTROPE, TURNSOLE)

A genus of ca. 300 species, widespread in tropical and temperate regions. References: Al-Shehbaz (1991); Diane et al. in Kadereit & Bittrich (2016); Feuillet (2019); Feuillet (2020a); Feuillet (2020b); Frohlich, Thulin, & Chase (2020); Hilger & Diane (2003).

- 4 Leaves glabrous, succulent, 4-7 (-10) mm wide, the lateral veins not obvious; [of saline coastal situations, sometimes inland west of the Mississippi River in LA, AR, OK, and TX]; [section *Platygyne*].....**Heliotropium curassavicum** var. **curassavicum**
- 4 Leaves pubescent, not succulent, 4-60 (-100) mm wide, the midvein and lateral veins obvious, rugose-impressed; [of a variety of mostly inland situations].
- 5 Leaves sessile to subsessile, 0.4-2 cm wide, strongly undulate-margined; corolla purplish with a yellow eye; [section *Heliotrophytum*].....**Heliotropium amplexicaule**
- 5 Leaves with petioles 0.5-8 cm long, 1-6 (-10) cm wide, either undulate-margined or not; corolla white, blue or violet.
- 6 Petioles 2-8 cm long, winged; leaves 2-6 (-10) cm wide, the margins often undulate; corolla blue or violet (rarely white); [section *Tiaridium*].....**Heliotropium indicum**
- 6 Petioles 0.5-1.5 cm long, not winged; leaves 1-3.5 (-5) cm wide, the margins plane; corolla white.**Heliotropium europaeum**

* **Heliotropium amplexicaule** Vahl. CLASPING HELIOTROPE, VIOLET HELIOTROPE. **Hab:** Disturbed areas, roadsides, fields. **Dist:** Native of South America. **Phen:** Mar-Sep. **Syn:** = Ar, C, F, FI5, G, K3, K4, NcTx, NE, NY, RAB, Tx, Va, WH3, Al-Shehbaz (1991), Ward & Fantz (1977); > *Cochanea anchusaefolia* (Poiret) Gürke - S; > *Heliotropium anchusaefolia* Poiret. **NatureServe GNR** (Not Yet Ranked).

Heliotropium curassavicum Linnaeus var. **curassavicum**. SEASIDE HELIOTROPE, QUAILPLANT, COLA DE MICO. **Hab:** Edges of brackish and salt marshes, estuarine shores. **Dist:** Var. *curassavicum* ranges from DE (and farther north as an introduction) south to the New World tropics. **Phen:** Apr-Sep (-Mar). **Tax:** Other varieties occur inland in the w. United States. **Comm:** Considered by some authors to be introduced and naturalized in our area. **Syn:** = C, GrPl, K1, K3, K4, NE, Tx, Va, Al-Shehbaz (1991); = *Heliotropium curassavicum* - F, G, II, Meso4.2, Ward & Fantz (1977); = *Heliotropium curassavicum* ssp. *curassavicum*; < *Heliotropium curassavicum* - Ar, Bah, FI5, GW2, NcTx, RAB, S, SFla, WH3. **NatureServe G5T5** (Secure).

* **Heliotropium europaeum** Linnaeus. EUROPEAN HELIOTROPE. **Hab:** Roadsides, disturbed areas. **Dist:** Native of s. Europe. **Phen:** Jun-Oct. **Syn:** = C, F, G, II, K1, K3, K4, NE, NY, Pa, RAB, S, Tx, WH3, Al-Shehbaz (1991), Ward & Fantz (1977).

* **Heliotropium indicum** Linnaeus. TURNSOLE, ALACRANCILLO, INDIA HELIOTROPE. **Hab:** Roadsides, woodland borders, swamps, ditches. **Dist:** Native of tropical America. **Phen:** Jun-Nov. **Syn:** = Ar, Bah, C, F, FI5, G, GrPl, GW2, II, K1, K3, K4, Meso4.2, NcTx, NE, RAB, Tn, Tx, WH3, WV, Al-Shehbaz (1991), Ward & Fantz (1977); = *Tiaridium indicum* (Linnaeus) Lehmann - S. **NatureServe G5** (Secure).

359. **CONVOLVULACEAE** A.L. de Jussieu 1789 (MORNING GLORY FAMILY) [in SOLANALES]

A family of about 56 genera and 1600 species, nearly cosmopolitan, especially in tropical and subtropical areas. Tribes follow the classification of Stefanović, Austin, & Olmstead (2003). References: Austin (1979); Stefanović, Austin, & Olmstead (2003); Stefanović, Krueger, & Olmstead (2002); Wilson (1960b).

- 1 Plant parasitic; stems orange; [tribe *Cuscutae*].....**Cuscuta**
- 1 Plant photosynthetic; stems green.
- 2 Corolla 0.1-0.2 cm long; capsule deeply 2-lobed; leaves orbicular-reniform, 1-3 cm long and wide, not fleshy; [tribe *Dichondreae*].....**Dichondra**
- 2 Corolla 1-10 cm long; capsule entire; leaves various, but not as above (most similar vegetatively are *Calystegia soldanella*, *Ipomoea brasiliensis*, and *Ipomoea imperati*, all beach plants with fleshy, emarginate, and usually larger leaves).
- 3 Styles 2, free nearly to the ovary or fused most of their length (at least the terminal 1-2 mm free); corolla either 1-2.5 cm long (*Evolvulus*, *Stylisma*) or 7-10 cm long (*Bonamia*); leaves cuneate or rounded at the base, and narrowly ovate, lanceolate, or linear; [tribe *Cresseae*].....**Stylisma**
- 3 Styles 1 (sometimes with 2 stigmas, or a bilobed stigma); stigmas capitate, globose, elongate, flattened, or filiform; corolla > 2.5 cm long (except *Jacquemontia*, *Convolvulus*, and a few *Ipomoea* spp.); leaves cordate, sagittate, or truncate at the base, and (mostly) ovate in outline.
- 6 Calyx concealed by 2 large bracts; [tribe *Convolvuleae*].....**Convolvulus**
- 6 Calyx not concealed by bracts.

- 8 Stigmas 2, linear or elongate; leaves 2-4 cm long, truncate or weakly hastate at base; corolla white or pink
 9 Stigmas elongate but not linear; [tribe *Jacquemontiae*]..... *Jacquemontia*
 9 Stigmas filiform; [tribe *Convolvuleae*]..... *Convolvulus*
 8 Stigma 1, capitate (or sometimes 2-lobed); leaves 3-15 cm long, mostly strongly hastate or cordate at base; corolla white, pink, lavender, blue, yellow, orange, or red.
 10 Anthers straight after dehiscence; fruits valvate-dehiscence; [tribe *Ipomoeae*]..... *Ipomoea*
 10 Anthers coiled after dehiscence (making 1-4 complete 360 degree turns); fruits longitudinally or irregularly dehiscence; [tribe *Merremieae*]..... *Distimake*

Convolvulus Linnaeus 1753 (FIELD-BINDWEED)

A genus of about 170 species, perennial herbaceous vines, cosmopolitan, especially in temperate areas. References: Austin in FNA () (in prep); Austin, Diggs, & Lipscomb (1997); Brummitt (1965); Brummitt (1980); Brummitt in FNA () (in prep); Spaulding (2013c); Stefanović, Austin, & Olmstead (2003); Stefanović, Krueger, & Olmstead (2002); Turner (2009c); Wilson (1960b).

- 3 Calyx not concealed by 2 large bracts (the bracts small and on the pedicel at a distance below the calyx); corollas < 3 cm long.
 *Convolvulus arvensis*
 3 Calyx concealed by 2 large bracts; corollas > 3 cm long.
 7 Stems mostly less than 1.5 m, erect at least in the lower part, but sometimes twining toward the apex, flowers mostly borne in lower leaf axils.
 *Convolvulus catesbyanus*
 7 Stems strongly twining, up to 4 m or more long; flowers borne along middle and upper stems.
 *Convolvulus limnophilus*

* *Convolvulus arvensis* Linnaeus. FIELD BINDWEED, CREEPING JENNY, POSSESSION-VINE, CORNBIND. **Hab:** Fields, roadsides, disturbed areas. **Dist:** Native of Europe. **Phen:** Late Apr-Nov. **Syn:** = Ar, C, F, Fl6, FNA, G, GrPl, Il, K1, K3, Mi, NcTx, NE, NY, Pa, RAB, Tn, Tx, Va, W, WH3, WV, Spaulding (2013c); = *Strophocaulos arvensis* (Linnaeus) Small – S. **NatureServe GNR** (Not Yet Ranked).

Convolvulus catesbyanus (Pursh) Elliott. CATESBY'S BINDWEED. **Hab:** Longleaf pine savannas, marsh edges, openings in dry to dry-mesic montane forests. **Tax:** The epithet spelling requires correction from the spelling of Pursh. **Syn:** =; = *Calystegia catesbeiana* – Fl6, orthographic variant; = *Calystegia catesbeiana* Pursh ssp. *catesbeiana* – K3, K4, Spaulding (2013c), Zhang, Zhang, & Endress (2003), orthographic variant; = *Convolvulus catesbianus* (Pursh) Elliott, orthographic variant; < *Calystegia catesbeiana* – K1, Tn, Va, WH3, orthographic variant; < *Calystegia sericata* (House) Bell – RAB, W; < *Calystegia spithamea* – C; < *Convolvulus sericatus* House – S, Wilson (1960b); < *Convolvulus spithameus* Linnaeus var. *pubescens* (Gray) Fernald – F.

Convolvulus limnophilus Greene. COASTAL PLAIN BINDWEED. **Hab:** Woodland edges. **Dist:** NC south to s. FL, west to e. TX. **Syn:** = *Calystegia sepium* (Linnaeus) R. Brown ssp. *limnophila* (Greene) Brummitt – FNA, K1, K3, K4, NcTx, WH3, Austin, Diggs, & Lipscomb (1997), Spaulding (2013c); < *Calystegia sepium* – C, GW2, RAB, Va, W; < *Calystegia sepium* ssp. *binghamiae* (Greene) Brummitt – Fl6; < *Convolvulus sepium* Linnaeus var. *sepium* – F, G, Wilson (1960b).

*Cuscuta* Linnaeus 1753 (DODDER)

A genus of about 100 species, parasitic, achlorophyllose herbs, nearly cosmopolitan. Various treated as a monogeneric family, or as a component of the Convolvulaceae; Neyland (2001) and Stefanović, Krueger, & Olmstead (2002) provide molecular evidence for the treatment of *Cuscuta* as a derived member of Convolvulaceae. Hadač & Chrtek (1970) suggest that *Cuscuta* should be separated into 4 genera based on chromosome number, morphology, and distribution; if followed, all our native species would be in *Grammica*, with *Cuscuta* s.s. and *Monogynella* represented by a few introduced species. References: Costea, Nesom, & Stefanović (2006a); Costea, Nesom, & Stefanović (2006b); Costea, Nesom, & Stefanović (2006c); Floden & Brant (2018); Gandhi, Thomas, & Hatch (1987); Musselman (1986); Neyland (2001); Spaulding (2013a); Stefanović, Krueger, & Olmstead (2002); Yuncker (1921); Yuncker (1965).

Identification Notes: Corolla measurements are from the base to the sinuses of the corolla. The infrastaminal scales are transparent structures at the base of the stamens.

- 5 Each flower subtended by 1-10 imbricate bracts; sepals distinct nearly to the base.
 6 Bracts lanceolate, the apices reflexed or spreading (squarrose)..... *Cuscuta glomerata*
 6 Bracts ovate or orbicular, the apices erect, appressed and imbricate.
 7 Pedicels absent, the flowers in compact clusters sessile on the stem; bracts tightly subtending the flower, orbicular with rounded apices; styles not exerted in flower, and only 1.5-1.8 mm long in fruit; corolla lobes 0.9-1.1 mm long..... *Cuscuta compacta*
 7 Pedicels 0.5-3 mm long, the flowers in loose panicles; bracts loosely subtending the flower, ovate with bluntly pointed apices; styles long-exserted, 2.5-3.5 mm long in flower and fruit; corolla lobes 1.8-2.0 mm long..... *Cuscuta cuspidata*
 5 Flowers not bracteate (rarely a single bract may be present towards the base of the pedicel); sepals various.
 8 Perianth surface granular (papillate); fresh flowers fleshy; corolla lobes acute, tips typically curved inward.

- 9 Corolla tubular; calyx > ½ as long as the corolla; flowers 4 (-5)-merous; infrastaminal scales reduced, merely bifid or shallowly toothed *Cuscuta coryli*
- 9 Corolla campanulate; calyx ca. ½ as long as the corolla; flowers 5-merous; infrastaminal scales profusely fringed..... *Cuscuta indecora*
- 8 Perianth surface not granular; fresh flowers not especially fleshy; corolla lobes various.
- 10 Stylopodium (a thickened ridge at the base of the style) present; flowers 5-merous. *Cuscuta gronovii*
- 10 Stylopodium absent; flowers 3-4-merous or 5-merous.
- 12 Flowers subsessile, therefore in globular inflorescences.
- 13 Flowers 5-merous..... *Cuscuta obtusiflora* var. *glandulosa*
- 13 Flowers mostly 3-4-merous. *Cuscuta polygonorum*
- 12 Flowers on pedicels slightly shorter than to longer than the flowers, therefore in loose inflorescences.
- 16 Flowers 1.5-3.0 mm long, at least some exceeding 2.5 mm long; calyx lobes not overlapping at the base in older flowers, and therefore the flowers not pronouncedly 5-angled..... *Cuscuta campestris*
- 16 Flowers 0.9-2.5 mm long; calyx lobes strongly overlapping and forming definite angles at the sinuses, thus the flower strongly 4-5-angled. *Cuscuta pentagona*

Cuscuta campestris Yuncker. FIELD DODDER, PRAIRIE DODDER. **Hab:** Roadsides, fields, open disturbed areas, especially (but not only) on herbaceous Fabaceae. **Dist:** Nearly cosmopolitan because of its common association with cultivated legumes, its original distribution unclear. **Phen:** Late May-Nov. **Syn:** = Ar, Bah, F, GW2, Il, K3, K4, Mi, NY, Pa, RAB, Tn, Tx, Va, W, Costea, Nesom, & Stefanović (2006a), Costea, Nesom, & Stefanović (2006b), Costea, Nesom, & Stefanović (2006c), Musselman (1986), Spaulding (2013a), Yuncker (1965); = *Grammica campestris* (Yuncker) Hadač & Chrték; < *Cuscuta pentagona* Engelm. – C, G; < *Cuscuta pentagona* var. *pentagona* – K1, Gandhi, Thomas, & Hatch (1987).

Cuscuta compacta A.L. de Jussieu ex Choisy. COMPACT DODDER. **Hab:** Bottomland forests, stream banks, marshes, swamps, pine savannas, calcareous seeps and streambanks, wet fields, other wet habitats, on herbaceous and especially on woody hosts. **Dist:** VT, QC, and NE south to s. FL and TX. **Phen:** Late Jul-Nov. **Syn:** = Ar, C, F, Fl6, G, GrPl, GW2, Il, NcTx, NY, Pa, RAB, S, Tn, Va, WH3, Gandhi, Thomas, & Hatch (1987), Spaulding (2013a); > *Cuscuta compacta* var. *compacta* – K3, K4, NE, W, Musselman (1986), Yuncker (1965); > *Cuscuta compacta* var. *efimbriata* Yuncker – K3, K4, Musselman (1986), Yuncker (1965).

Cuscuta coryli Engelm. HAZEL DODDER. **Hab:** Open woodlands and woodland borders, on a wide variety of woody and herbaceous hosts. **Dist:** MA, NY, and SK south to SC, AL, TX, and AZ. **Phen:** Jul-Nov. **Syn:** = C, F, G, GrPl, GW2, Il, K1, K3, K4, Mi, NcTx, NE, NY, S, Tn, Tx, Va, WV, Costea, Nesom, & Stefanović (2006a), Costea, Nesom, & Stefanović (2006b), Costea, Nesom, & Stefanović (2006c), Gandhi, Thomas, & Hatch (1987), Spaulding (2013a), Yuncker (1965); = *Cuscuta corylii* – Pa, RAB, W, orthographic variant; = *Grammica coryli* (Engelm.) Hadač & Chrték. **NatureServe G5?** (Secure).

Cuscuta cuspidata Engelm. CUSP DODDER. **Hab:** Bottomland forests and fields, especially on Asteraceae. **Dist:** IN, ND, and UT south to KY, MS, TX, and NM. **Phen:** Aug-Oct. **Syn:** = Ar, C, F, GrPl, Il, K1, K3, K4, NcTx, Tn, Tx, Gandhi, Thomas, & Hatch (1987), Spaulding (2013a), Yuncker (1965); = *Grammica cuspidata* (Engelm.) W. A. Weber. **NatureServe G5** (Secure).

Cuscuta glomerata Choisy. ROPE DODDER. **Hab:** Floodplains and other moist forests and thickets, primarily on Asteraceae. **Dist:** OH, MI, MN, and ND south to KY, TN, MS, and TX. **Phen:** Jul-Oct. **Syn:** = Ar, C, F, G, GrPl, GW2, Il, K1, K3, K4, Mi, NcTx, S, Tn, Tx, Gandhi, Thomas, & Hatch (1987), Spaulding (2013a), Yuncker (1965). **NatureServe G5** (Secure).

Cuscuta gronovii Willdenow ex Roemer & J.A. Schultes. SWAMP DODDER, COMMON DODDER. **Hab:** Stream banks, bottomland forests, bogs, marshes, swamps, wet fields, wet disturbed areas, on a very wide variety of herbaceous and woody plants. **Dist:** QC west to BC, south to s. FL and AZ. **Phen:** Late Jul-Nov. **Syn:** = Ar, C, F, Fl6, G, GrPl, GW2, K1, Mi, NcTx, Pa, RAB, S, Va, W, WH3, WV, Musselman (1986), Spaulding (2013a); = *Grammica gronovii* (Willdenow ex Roemer & J.A. Schultes) Hadač & Chrték; > *Cuscuta gronovii* var. *calyptrata* – K3, K4, Tx; > *Cuscuta gronovii* var. *gronovii* – Il, K1, K3, K4, NE, NY, Tn, Costea, Nesom, & Stefanović (2006a), Costea, Nesom, & Stefanović (2006b), Costea, Nesom, & Stefanović (2006c), Gandhi, Thomas, & Hatch (1987), Yuncker (1965); > *Cuscuta gronovii* var. *latiflora* Engelm. – K1, NE, NY, Tn, Tx, Costea, Nesom, & Stefanović (2006a), Costea, Nesom, & Stefanović (2006b), Costea, Nesom, & Stefanović (2006c), Yuncker (1965); > *Cuscuta gronovii* var. *latifolia* – Il, misspelling.

Cuscuta indecora Choisy. BIGSEED ALFALFA DODDER, PRETTY DODDER. **Hab:** Salt marshes (on *Iva frutescens*), pine savannas, bogs, roadsides, disturbed areas. **Dist:** NJ, MN, and ID, south to s. FL, TX, CA, Mexico, Central America, and South America. See Nelson (1993) for the first SC record. Silberhorn (1998) described an occurrence of this species in VA. **Phen:** Jul-Oct. **Syn:** = C, Fl6, GrPl, GW2, Mi, S, Va, WH3, WV, Gandhi, Thomas, & Hatch (1987), Musselman (1986), Spaulding (2013a); = *Grammica indecora* (Choisy) W.A. Weber; > *Cuscuta indecora* Choisy; > *Cuscuta indecora* var. *attenuata* – K3, K4; > *Cuscuta indecora* var. *indecora* – Ar, F, Il, K1, K3, K4, NcTx, NE, Tn, Tx, Costea, Nesom, & Stefanović (2006a), Yuncker (1965); > *Cuscuta indecora* var. *longisepala* – Ar, K3, K4, NcTx, Tx; > *Cuscuta indecora* var. *neuropetala* (Engelm.) A.S. Hitchcock – F, Il, K1, Yuncker (1965).

Cuscuta obtusiflora Kunth var. *glandulosa* Engelm. GLANDULAR DODDER. **Hab:** In calcareous glades, swampy thickets, and other habitats. **Dist:** GA and OK south to FL, TX, Mexico; West Indies. **Comm:** See Anderson (2007) for FL Panhandle record and Floden & Brant (2018) for the MO records. **Syn:** = Ar, Fl6, G, GW2, K1, K3, K4, NcTx, NY, Tx, WH3, Costea, Nesom, & Stefanović (2006b), Gandhi, Thomas, & Hatch (1987), Spaulding (2013a); = *Cuscuta glandulosa* Small – S. **NatureServe G5T4T5** (Apparently Secure).

Cuscuta pentagona Engelm. **Hab:** Roadsides, fields, open disturbed areas, on a wide variety of (mostly herbaceous) hosts, especially Fabaceae. **Dist:** Throughout the United States and s. Canada. **Phen:** May-Nov. **Syn:** = C, Fl6, G, GW2, Il, Mi, NE, NY, Pa, RAB, S, Tn, Tx, Va, W, WH3, Costea, Nesom, & Stefanović (2006a), Musselman (1986), Spaulding (2013a), Yuncker (1965); = *Grammica pentagona* (Engelm.) Cuscuta polygonorum Engelm. SMARTWEED DODDER. **Hab:** On *Polygonum* and other hosts. **Dist:** NY and ON west to ND, south to FL and TX. **Phen:** Jul-Oct. **Syn:** = Ar, C, F, G, GrPl, Il, K1, K3, K4, Mi, NE, NY, Pa, S, Tn, Tx, Va, W, Costea et al. (2006c), Gandhi, Thomas, & Hatch (1987), Musselman (1986), Spaulding (2013a), Yuncker (1965). NatureServe G5 (Secure).

Dichondra J.R. Forster & G. Forster 1775 (PONYFOOT, DICHONDRA)

A genus of about 9 species, of tropical, subtropical and warm temperate areas. References: Austin, Demissew, & Young (1998); Tharp & Johnston (1961); Wilson (1960b).

Dichondra carolinensis Michaux. CAROLINA PONYFOOT. **Hab:** Lawns, roadsides, moist pinelands, mesic hammocks, floodplain forests. **Dist:** Se. VA south to s. FL, west to AR and TX; also in Bermuda and reported for the Bahamas; sometimes adventive beyond that range. **Phen:** Mar- Jun(-Sep). **Comm:** This plant is rarely seen in a "natural" habitat, but is very common and weedy in lawns and other mowed grassy areas in the Southeastern Coastal Plain. **Syn:** = Ar, Bah, C, Fl6, GW2, Il, K1, K3, K4, NcTx, RAB, S, Tn, Tx, Va, WH3, Austin, Demissew, & Young (1998), Tharp & Johnston (1961); = *Dichondra repens* J.R. Forster var. *carolinensis* (Michaux) Choisy – F, G, Wilson (1960b). NatureServe G5 (Secure).

Distimake Rafinesque 1836 [1838] (WOODROSE)

A genus of about 35 species, herbaceous vines, of New World and Old World tropics and subtropics. See Simões & Staples (2017) for discussion of generic circumscription. References: Austin (2007); Simões & Staples (2017); Wilson (1960b).

Distimake dissectus (Jacquin) A.R. Simões & Staples. NOYAU VINE, ALAMO VINE, CORREHUELA DE LOS DOCE. **Hab:** Disturbed areas. **Dist:** Native of the neotropics, the original distribution unclear, but probably native in peninsular FL (Austin 2007) and s. TX. **Phen:** May-Sep. **Comm:** See Austin (2007) for a detailed discussion about many aspects of this species. **Syn:** = K4, Simões & Staples (2017); = *Ipomoea dissecta* Jacquin; = *Merremia dissecta* (Jacquin) Hallier f. – Bah, K1, K3, Meso4.2, NcTx, WH3, Wilson (1960b), Zhang, Zhang, & Endress (2003); = *Operculina dissecta* (Jacquin) House – S; > *Ipomoea sinuata* Ortega – Tx. NatureServe G5 (Secure).

Ipomoea Linnaeus 1753 (MORNING-GLORY)

A genus of about 650 species, herbs, vines, and shrubs, of tropical, subtropical, and warm temperate areas. References: Austin & Bianchini (1998); Austin & Huáman (1996); Austin (1976); Austin (1979); Austin (1984); Austin (1986); Campitelli & Stinchcombe (2014); Eserman et al (2020); Miryeganeh et al (2014); Muñoz-Rodríguez et al (2022); Wood et al (2020b).

Unkeyed taxa: *Ipomoea leucantha*

Unkeyed waifs: *Ipomoea setosa*

- 2 Corolla salverform, the long narrow tube cylindrical (with sides more-or-less parallel) for most of its length, the limb abruptly flaring at the summit of the tube.
 - 3 Corolla 3-14 cm long, lavender to white; flowers open from evening until early morning.
 - 4 Leaves tomentose beneath; corolla mostly white on the outer surface, lavender to purple on the inner surface, thus bicolored in-and-out; [of outer Coastal Plain dunes, hammocks, and shell middens from se. NC southward]..... *Ipomoea macrorrhiza*
 - 4 Leaves glabrous beneath; corolla either white on both surfaces or lavender on both surfaces, not bicolored in-and-out; [weedy, widespread, of disturbed habitats]..... *Ipomoea muricata*
 - 3 Corolla 2-4 cm long, scarlet, orange or yellow; flowers open from early morning to late morning or late afternoon.
 - 6 Leaf blade pinnately divided into 11-31 (or more) linear segments (with parallel sides)..... *Ipomoea quamoclit*
 - 6 Leaf blade entire, or angled, or lobed into 3-7 lanceolate or ovate segments (broadening towards their bases)..... *Ipomoea coccinea*
- 2 Corolla funnelliform to campanulate, the short to long tube expanding in diameter upwards from below the middle, the limb gradually to abruptly flaring at the summit of the tube.
 - 9 Pedicels and peduncles with spreading, ascending, or reflexed trichomes; gynoecium 3-parted; [*Pharbitis* clade]
 - 10 Sepals soft-pilose on the outer surface with slender trichomes..... *Ipomoea indica* var. *acuminata*
 - 10 Sepals hispid-pilose on the outer surface, with swollen-based trichomes.
 - 11 Sepals with slightly narrowed green tips shorter than to slightly longer than the body of the sepal; corolla pink (rarely white or blue); sepals oblong-lanceolate, obtuse or acute; leaves entire or 3-5-lobed..... *Ipomoea purpurea*
 - 11 Sepals with very narrow elongate green tips much longer than the body of the sepal; corolla blue with a white tube (drying pink); sepals ovate with an elongate apex, notably accrescent in fruit; leaves usually 3-lobed.

- 12 Sepals < 2 cm long at anthesis, abruptly narrowed upwards, the long subacute tips strongly spreading or recurved outwards; corolla < 3.5 cm long; peduncles very short..... *Ipomoea hederacea*
- 12 Sepals ca. 3 cm long at anthesis, gradually narrowed upwards, the long acute tips suberect, straight, scarcely spreading; corolla 4–4.5 cm long; peduncles long or short..... *Ipomoea nil*
- 9 Pedicels and peduncles glabrous or with short, appressed trichomes; gynoeceum 2-parted.
- 13 Stems trailing, rooting at the nodes; leaf apex emarginate, truncate, or obtuse; [of beaches from se. NC southward].
- 14 Corolla lavender; larger leaves not lobed (though notched at the apex on at least the larger, better-developed leaves)..... *Ipomoea brasiliensis*
- 14 Corolla white with a yellowish or purple eye; larger leaves 3-7-lobed..... *Ipomoea imperati*
- 13 Stems erect or twining, not rooting at the nodes (except sometimes in *I. batatas*); leaf apex acute to acuminate; [collectively of various habitats, not beaches, widespread].
- 15 Leaves palmately dissected with 5 (-7) lobes, the sinuses to within 2 mm of the petiole summit or the midvein..... *Ipomoea heptaphylla*
- 15 Leaves entire or pinnately lobed.
- 17 Leaf base sagittate..... *Ipomoea sagittata*
- 17 Leaf base cuneate to cordate.
- 18 Corolla 1.5-2.5 cm long, white or lavender..... *Ipomoea lacunosa*
- 18 Corolla 3-8 cm long, at least partly pink to lavender (sometimes entirely white in *I. batatas*).
- 20 Sepals ovate to oblong-elliptic; corolla usually white on the limb, the throat purple; anthers 5-7 mm long..... *Ipomoea pandurata*
- 20 Sepals oblong-ovate to oblong-lanceolate; corolla usually pink to lavender on the limb, the throat lavender to purple; anthers 1.5-3.2 mm long.
- 21 Sepals unequal in length, oblong-ovate, with acute to caudate apices; leaves mostly 10-15 cm wide..... *Ipomoea batatas*
- 21 Sepals more-or-less equal in length, oblong-lanceolate, with acuminate apices; leaves 2-5 cm wide..... *Ipomoea cordatotriloba* var. *cordatotriloba*

* *Ipomoea batatas* (Linnaeus) Lamarck. SWEET POTATO. **Hab:** Persistent in fields after cultivation, disturbed areas. **Dist:** Native of tropical America. **Tax:** Muñoz-Rodríguez et al. (2022) discuss the origin of *Ipomoea batatas* as a hexaploid allopolyploid derivative derived from the ancestors of autotetraploid *Ipomoea aequatoriensis* T. Wells & P. Muñoz (currently an Andean endemic) and diploid *Ipomoea trifida* (a widespread circum-Caribbean species). **Syn:** = Bah, Fl6, K1, K3, K4, Meso4.2, NcTx, NY, RAB, S, Tx, WH3, WI, Austin & Huáman (1996), Austin (1984). NatureServe G5 (Secure).

Ipomoea brasiliensis (Linnaeus) Sweet. RAILROAD VINE, GOAT'S-FOOT, BAY HOPS, BAY WINDERS. **Hab:** Ocean beaches, dunes. **Dist:** E. NC (Carteret County), SC (Beaufort, Horry, Charleston, Colleton, and Georgetown counties), south to s. FL, west to TX, and widespread on tropical and subtropical shores of the New World (se. United States, West Indies, Pacific and Atlantic coasts of Central America and South America), and Old World (Atlantic and Indian Ocean coasts of Africa). **Phen:** Jan-Dec. **Tax:** Our taxon, often treated as a variety or subspecies (see synonymy) of the Old World *I. pes-caprae*, is strongly genetically differentiated from *I. pes-caprae* (despite occurring widely in both the New World and the Old World and in proximity to *I. pes-caprae*); "the two subspecies are clearly differentiated genetically and the genetic differences between them were considerably high..., this suggests that the two subspecies may have cryptic ocean barriers that prevent migration by sea dispersal between the distribution ranges, and/or they have experienced historical differentiation that caused local adaptation to different environmental factors in each region" (Miryeganeh et al. 2014). The evidence supports species rank, which is used here. **Comm:** The records in the Carolinas may reflect the periodic arrival of sea-borne seeds. **Syn:** = *Ipomoea pes-caprae* ssp. *brasiliensis* (Linnaeus) van Oostroom – Fl6, K1, K4, WH3, Wood et al (2020a); = *Ipomoea pes-caprae* var. *emarginata* Hallier f. – Tx; < *Ipomoea pes-caprae* (Linnaeus) R. Brown – Bah, GW2, Meso4.2, Pa, S, WI. NatureServe G5T5 (Secure).

Ipomoea coccinea Linnaeus. SCARLET CREEPER, RED MORNING-GLORY. **Hab:** Fields, roadsides, thickets, streambanks. **Dist:** Native of the se. United States, though the details of the pre-Columbian distribution are uncertain. Wood et al. (2020b) stated "Endemic to southeastern USA, where it grows on waste ground, roadsides, stream sides and in ditches, apparently with a preference for seasonally moist habitats." **Phen:** Aug-Dec. **Syn:** = Ar, C, F, GrPl, GW2, Il, K1, K3, K4, NcTx, NE, NY, Pa, RAB, Tn, Tx, Va, W, WV, Austin & Huáman (1996), Austin (1984); = *Quamoclit coccinea* (Linnaeus) Moench – G, S; < *Ipomoea hederifolia* Linnaeus – WI.

Ipomoea cordatotriloba Dennstedt var. *cordatotriloba*. COASTAL MORNING-GLORY, TIE-VINE. **Hab:** Dunes, sandy areas on barrier islands, other sandy habitats. **Dist:** Se. NC south to s. FL, west to e. TX and AR; Mexico. Attribution of this species to South America are based on *Ipomoea australis* (Wood et al. 2020). **Phen:** Sep-Oct. **Tax:** The correct nomenclature was discussed by Manitz (1983). **Syn:** = Ar, K1, K3, K4, NcTx; = *Ipomoea trichocarpa* var. *trichocarpa* – Austin (1976), Austin et al. (1960b); ~ *Ipomoea carolina* (L.) Pursh; ? *Ipomoea cordatotriloba* Dennstedt – Austin & Huáman (1996); < *Ipomoea cordatotriloba* Dennstedt – Fl6, WH3, WI, Wood et al (2020a); ? *Ipomoea trichocarpa* Elliott – Austin (1984); < *Ipomoea trichocarpa* Elliott – GW2, RAB; > *Ipomoea trichocarpa* Elliott – S; > *Ipomoea trifida* – S, misapplied.

* *Ipomoea hederacea* Jacquin. IVYLEAF MORNING-GLORY. **Hab:** Fields, disturbed areas. **Dist:** ME, MN, ND, NM, AZ, and CA south to s. FL, s. TX, and Mexico; Cuba. Native to the southeastern United States (the core of its distribution), but the more precise limits of its native distribution are obscure (populations in New England, Ontario, and the n. Midwestern US may be only adventive). Its current distribution is centered in southeastern North America and it was encountered there by "early botanists" Michaux and Pursh in the first decades of the 1800s, but its current genetic structure suggests that it may have been introduced (Campitelli & Stinchcombe 2014), but if so, from where? Austin (in Davidse et al. 2012) considered its area of nativity to be the southeastern United States. Austin (1986) also described it as "a temperate plant that grows poorly, if at all, in tropical climes" (in contrast to *Ipomoea nil*). **Phen:** Jul-Dec (-Jun). **Syn:** = Ar, Bah, C, Fl6, GrPl, GW2, Il, K1, K3, K4, Meso4.2, Mi, NcTx, NE, NY, Pa, Tn, Tx, Va, W, WH3, WV, Austin & Huáman (1996), Austin (1984), Wood et al (2020a); > *Ipomoea hederacea* var. *hederacea* – F, G, RAB; > *Ipomoea hederacea* var. *integriuscula* A. Gray – F, G, RAB; > *Ipomoea nil* (Linnaeus) Roth, misapplied; > *Pharbitis barbigera* (Sweet) G. Don – S; > *Pharbitis hederacea* (Linnaeus) Choisy – S.

359. CONVULVULACEAE

627

* *Ipomoea heptaphylla* Sweet. WRIGHT'S MORNING-GLORY. **Hab:** Disturbed areas. **Dist:** Native of India. Reported as likely naturalized in central TN, "spreading northward from the Gulf Coastal Plain" (Kral 1981). It also is known from GA (Kartesz 1999). **Phen:** Jun-Oct. **Syn:** = S, Wood et al (2020a); = *Ipomoea wrightii* A. Gray – Ar, Fl6, K1, K3, K4, Meso4.2, NcTx, Tx, WH3. NatureServe GNR (Not Yet Ranked).

Ipomoea imperati (Vahl) Grisebach. BEACH MORNING-GLORY. **Hab:** Beaches, dune blowouts, fore-dunes. **Dist:** Se. NC south to s. FL, west to TX; south through Mexico, Central America to South America; West Indies; Old World tropics. **Phen:** Aug-Oct. **Syn:** = Fl6, K1, K3, K4, Meso4.2, WH3, Austin & Huáman (1996); = *Ipomoea stolonifera* (Cirillo) J.F. Gmelin – Bah, GW2, RAB, S, Tx, Austin (1984).

Ipomoea indica (Burman) Merrill var. *acuminata* (Vahl) Fosberg. OCEAN-BLUE MORNING-GLORY. **Hab:** Hammocks, coastal areas, disturbed areas. **Dist:** FL west to TX; West Indies, Mexico; Central and South America. **Phen:** Jan-Dec. **Tax:** Wood et al. (2020) stated "Molecular studies suggest it is not monophyletic so more than one species may eventually be recognised." **ID Notes:** "This species might be confused with *Ipomoea purpurea* and *I. magnifolia* but it is usually easily distinguished by the leaves grey-pubescent or tomentose beneath and the clustered flowers with very persistent bracteoles. However, it is extremely variable so leaves are sometimes glabrous, lobed or entire, bracteoles may be reduced and flowers are occasionally solitary varying in colour from blue to deep violet with prominent darker midpetaline bands." (Wood et al. 2020). **Syn:** = K3, K4, WI; = *Ipomoea acuminata* (Vahl) Roemer & J.A. Schultes – Tx; < *Ipomoea indica* – Bah, Fl6, Meso4.2, WH3, Austin (1986); > *Pharbitis cathartica* (Poiret) Choisy – S. NatureServe GNR (Not Yet Ranked).

Ipomoea lacunosa Linnaeus. SMALL WHITE MORNING-GLORY, WHITESTAR. **Hab:** Riverbanks, marshes, swamps, fields, roadsides, disturbed areas. **Dist:** NJ west to OH, IL, and KS, south to FL and e. TX. **Phen:** Jul-Dec. **Syn:** = Ar, C, F, Fl6, G, GrPl, GW2, IL, K1, K3, K4, NcTx, NE, NY, Pa, RAB, S, Tn, Tx, Va, W, WH3, WV, Austin & Huáman (1996), Austin (1984). NatureServe G5? (Secure).

Ipomoea leucantha Jacquin. **Hab:** Disturbed areas, roadsides. **Tax:** This species had been thought to originate from a cross between *I. cordatotriloba* and *I. lacunosa*. However, Duncan & Rausher (2013) found that *I. leucantha* was not interfertile with *I. lacunosa*. It is widespread and fecund (Felger et al. 2012) necessitating its recognition as a species (Duncan & Rausher 2013). Another genetically similar entity was given the provisional name *Ipomoea austinii* (non *I. austinii* Infante-Bet.), but was not formally described (Duncan & Rausher 2013). **ID Notes:** This species seems best identified by its glabrous sepals (Felger et al. 2012), in comparison to the similar species *I. cordatotriloba*, *I. lacunosa*, and *I. triloba*. **Syn:** = Fl6, WH3; = *Ipomoea* \times *leucantha* Jacquin (pro sp.) – K3, K4, Meso4.2.

Ipomoea macrorhiza Michaux. INDIAN-MIDDEN MORNING-GLORY, MANROOT, PINK MOONVINE. **Hab:** Hammocks, shell middens, dunes, dry sands, disturbed maritime areas. **Dist:** Se. NC south to s. FL, west to s. AL. **Phen:** Jun-Jul. **Comm:** Sometimes, as by WH3 and K2, considered an alien, native of South America, but this is nonsense (D. Austin, pers. comm., 2011; Wood et al. 2020). **Syn:** = Fl6, K1, K3, K4, RAB, S, WH3, Austin & Huáman (1996), Austin (1984). NatureServe G3G5 (Apparently Secure).

* *Ipomoea muricata* (Linnaeus) Jacquin. LILACBELL, PURPLE MOONFLOWER. **Hab:** Fields, disturbed areas; native (apparently) of Mexico. **Dist:** Austin & Jansson (1988) discussed the species' spread in se. United States, apparently as a contaminant in soybean seeds. **Phen:** Jun-Nov. **Tax:** Staples et al. (2005) reinstated the name *I. muricata*. **Syn:** = Fl6, K3, K4, Meso4.2, Tx, WH3; = *Ipomoea turbinata* Lagasca y Segura – K1, Austin & Huáman (1996), Austin (1984); ~ *Ipomoea capillacea* (HBK.) G. Don.

* *Ipomoea nil* (Linnaeus) Roth. **Hab:** Disturbed areas. **Dist:** Occurs in scattered states, such as MD and MS, as a rare introduction from tropical America (Kartesz 1999). **Phen:** Jul-Nov. **Syn:** = Bah, K1, K3, K4, Meso4.2, Tx, WI, Austin & Huáman (1996), Austin (1984), Austin (1986); = *Pharbitis nil* (Linnaeus) Choisy – S.

Ipomoea pandurata (Linnaeus) G.F.W. Meyer. WILD SWEET POTATO, MANROOT, MAN-OF-THE-EARTH, BIGROOT MORNING-GLORY. **Hab:** Longleaf pine sandhills, dry forests and woodlands, prairies, disturbed areas. **Dist:** CT, NY, and s. ON west to OH, s. MI, and KS, south to c. peninsular FL and e. TX. **Phen:** May-Sep; Jul-Oct. **Syn:** = Ar, C, F, Fl6, G, GrPl, GW2, IL, K1, K3, K4, Mi, NcTx, NE, NY, Pa, RAB, S, Tn, Tx, Va, W, WH3, WV, Austin & Huáman (1996), Austin (1984); > *Ipomoea pandurata* var. *pandurata* – G; > *Ipomoea pandurata* var. *rubescens* Choisy – G. NatureServe G5 (Secure).

* *Ipomoea purpurea* (Linnaeus) Roth. COMMON MORNING-GLORY. **Hab:** Fields, disturbed areas. **Dist:** Native of tropical America. **Phen:** Jun-Sep. **Syn:** = Ar, C, F, Fl6, G, GrPl, GW2, IL, K1, K3, K4, Meso4.2, Mi, NcTx, NE, NY, Pa, RAB, Tn, Va, W, WH3, WI, WV, Austin & Huáman (1996), Austin (1984), Austin (1986); = *Pharbitis purpurea* (Linnaeus) Voigt – S; > *Ipomoea purpurea* var. *purpurea* – Tx. * ***Ipomoea quamoclit*** Linnaeus. CYPRESS-VINE. **Hab:** Fields, hedgerows, disturbed areas. **Dist:** Native of tropical America. **Phen:** Sep-Dec. **Tax:** The 'Cardinal Climber' is cultivated and will key here. It is *Ipomoea* \times *sloteri* (House) van Ooststroom, an allotetraploid derivative of *Ipomoea coccinea* \times *quamoclit*. It has 11-19 lobes, the lobes narrowly triangular in shape rather than parallel-sided. **Syn:** = Ar, Bah, C, F, Fl6, GrPl, GW2, Il, K1, K3, K4, Meso4.2, NcTx, NE, Pa, RAB, Tn, Tx, WH3, WI, Austin & Huáman (1996), Austin (1984); = *Quamoclit quamoclit* (Linnaeus) Britton - S; = *Quamoclit vulgaris* Choisy - G. **NatureServe GNR** (Not Yet Ranked).

Ipomoea sagittata Poir. SALT MARSH MORNING-GLORY. **Hab:** Edges of brackish marshes, moist thickets on barrier islands, hammocks. **Dist:** E. NC south to s. FL, west to TX; eastern Mexico and Central America; West Indies. **Phen:** Apr-Oct. **Syn:** = Bah, Fl6, GW2, K1, K3, K4, RAB, S, Tx, WH3, WI, Austin & Huáman (1996), Austin (1984). **NatureServe G5?** (Secure).

* ***Ipomoea setosa*** Ker Gawler. BRAZILIAN MORNING-GLORY. **Hab:** Disturbed areas. **Dist:** Native of Brazil. **Comm:** {not yet keyed}. **Syn:** = Fl6, K3, K4, Meso4.2, WH3. **NatureServe GNR** (Not Yet Ranked).

Jacquemontia Choisy 1834 (JACQUEMONTIA)

A genus of about 90 species, tropical, subtropical, and warm temperate areas, especially America. References: Wilson (1960b).

{add key}

* ***Jacquemontia tamnifolia*** (Linnaeus) Grisebach. COMMON JACQUEMONTIA. **Hab:** Fields, roadsides, other disturbed areas. **Dist:** Se. VA south to FL, west to AR and TX; also widespread in West Indies, Central America, and South America, its original range difficult to determine. **Phen:** Aug-Sep. **Comm:** It is probably adventive in much of our area. Fox, Godfrey, & Blomquist (1952) report the first collections of the species in NC, in 1938 and 1950, from obviously disturbed situations. **Syn:** = Ar, Bah, C, F, Fl6, G, GW2, Il, K1, K3, K4, Meso4.2, NcTx, RAB, Tn, Tx, WH3, WI, Wilson (1960b); = *Thyella tamnifolia* (Linnaeus) Rafinesque - S. **NatureServe GNR** (Not Yet Ranked).

Stylisma Rafinesque 1825 (DAWNFLOWER)

A genus of about 7 species (and about 8 taxa), vining to trailing herbs, endemic to se. North America. References: Myint (1966); Shinnars (1962d); Wilson (1960b).

- 2 Corolla pink or purple; filaments glabrous, or nearly so; leaves densely and conspicuously silvery-sericeous; [of seasonally wet habitats] *Stylisma aquatica*
- 2 Corolla white; filaments villous, at least near the base; leaves puberulent or pubescent, but not conspicuously silky-sericeous; [of dry habitats].
- 3 Larger leaves (7-) 12-30 mm wide; peduncles with (1-) 3-7 (-12) flowers; stems with a tendency to twine, at least near growing tip.
 - 4 Sepals glabrous; [widespread in the Coastal Plain and Piedmont of our area] *Stylisma humistrata*
 - 4 Sepals densely villous; [of s. GA southward and westward] *Stylisma villosa*
- 3 Larger leaves 2-10 mm wide; peduncles with 1 (-5) flowers; stems without a tendency to twine.
 - 5 Bracteoles (2-) 10-20 mm long; styler branches usually fused more than 5/6 of the total length (occasionally fused less than 1/2 of length), the free portion of the styler branches usually less than 3 mm long; sepals villous, 4-6 (-7) mm long, ovate-elliptic with obtuse to acute apices; leaves 1-3 mm wide.
 - 6 Styler branches 1-1.5 mm long, usually unequal in length, the longer nearly 2 \times as long as the shorter; sepals mostly acute; [of MS westward] *Stylisma pickeringii* var. *pattersonii*
 - 6 Styler branches 2-3 mm long, nearly equal, the longer 1.0-1.3 \times as long as the shorter; sepals mostly obtuse; [of NC south and west to AL; disjunct in NJ]... *Stylisma pickeringii* var. *pickeringii*
 - 5 Bracteoles 1-3 (-5) mm long; styler branches free nearly to base, the free portion more than 5 mm long; sepals villous or glabrous, 6-9 mm long, ovate-lanceolate with acuminate apices; leaves 2-10 mm wide.
 - *Stylisma patens*

Stylisma aquatica (Walter) Rafinesque. WATER DAWNFLOWER. **Hab:** Clay-based Carolina bays, wet pine savannas, margins of pineland ponds. **Dist:** Se. and sc. NC south to c. FL and Panhandle FL, west to se. AR and e. TX. **Phen:** (May-) Jun-Jul. **ID Notes:** *Stylisma aquatica*, as the epithet

359. CONVULVULACEAE

implies, occurs in wetter (or at least moister) habitats than our other species. The bright pink flowers and densely silvery-hairy leaves are distinctive.

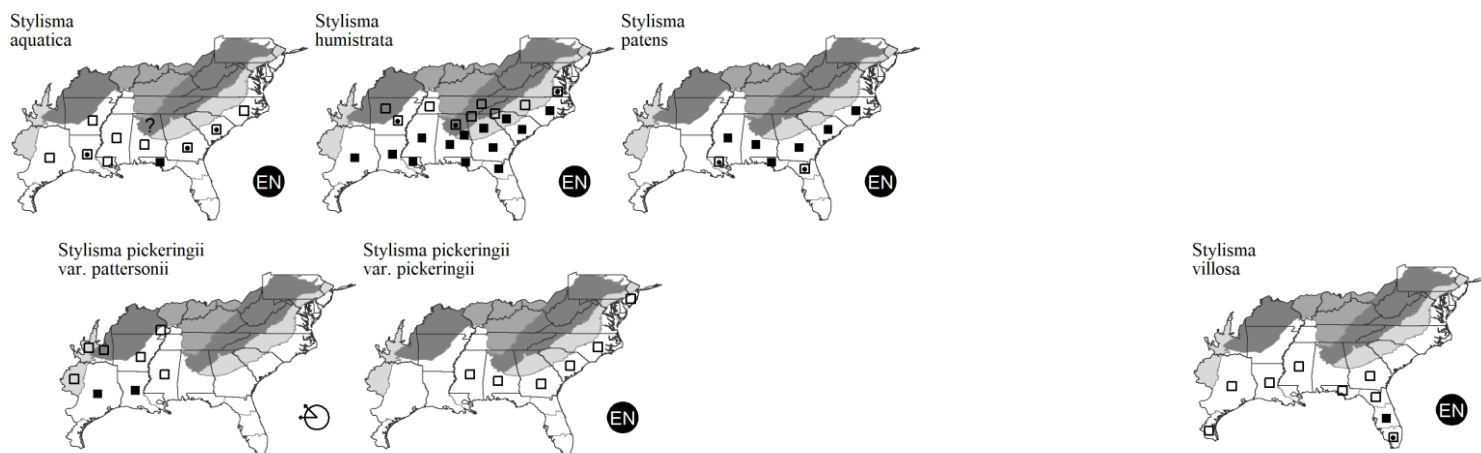

Syn: = Fl6, GW2, K1, K3, K4, S, Tx, WH3, Myint (1966); = *Bonamia aquatica* (Walter) A. Gray – RAB, Shinnars (1962d); = *Bonamia michauxii* (Fernald & Schubert) K.A. Wilson – Wilson (1960b); = *Breweria michauxii* Fernald & Schubert – F. [NatureServe G4](#) (Apparently Secure).

Stylisma humistrata (Walter) Chapman. SOUTHERN DAWNFLOWER. **Hab:** Sandhills, dry hammocks, and other dry woodlands, especially on dryish stream terraces. **Dist:** Se. VA south to Panhandle FL, west to AR and e. TX, north in the interior to n. AL and w. TN. **Phen:** Jun-Aug. **Syn:** = Ar, C, Fl6, K1, K3, K4, S, Tn, Tx, Va, WH3, Myint (1966); = *Bonamia humistrata* (Walter) A. Gray – RAB, Shinnars (1962d), Wilson (1960b); = *Breweria humistrata* (Walter) A. Gray – F, G. [NatureServe G4G5](#) (Apparently Secure).

Stylisma patens (Desrousseaux) Myint. COMMON DAWNFLOWER. **Hab:** Longleaf pine sandhills and other relatively dry sandy areas. **Dist:** E. NC south to n. FL, and west to s. MS; reports from west of the Mississippi River are misidentifications. **Phen:** Jun-Aug. **ID Notes:** Overall, the most common and widespread taxon of the genus in our area, regularly encountered in its habitat. **Syn:** = *Bonamia aquatica* (Walter) A. Gray – Wilson (1960b), misapplied; = *Bonamia patens* (Desrousseaux) Shinnars; = *Bonamia patens* (Desrousseaux) Shinnars var. *patens* – RAB, Shinnars (1962d); = *Breweria patens* Desrousseaux; = *Breweria trichosanthes* (Michaux) Small; = *Stylisma patens* (Desrousseaux) Myint ssp. *patens* – K1, K3, K4, Myint (1966); = *Stylisma patens* (Desrousseaux) Myint var. *patens* – Fl6; = *Stylisma trichosanthes* (Michaux) House – S, misapplied; < *Stylisma patens* (Desrousseaux) Myint – WH3. [NatureServe G5T3T5](#) (Apparently Secure).

Stylisma pickeringii (Torrey ex M.A. Curtis) A. Gray var. *pattersonii* (Fernald & Schubert) Myint. PATTERSON'S DAWNFLOWER. **Hab:** Longleaf pine sandhills, dry sandy prairies, open sandy woodlands, other dry sandy habitats. **Dist:** IL and IA south through KS and OK to w. LA and e. TX; disjunct in w. MS (the material somewhat ambiguous as to varietal affinity). **Phen:** May-Sep. **Syn:** = Ar, GrPl, IL, K1, K3, K4, NcTx, Tx, Myint (1966); < *Bonamia pickeringii* (Torrey ex M.A. Curtis) A. Gray – Shinnars (1962d), Wilson (1960b); < *Stylisma pickeringii* (Torrey ex M.A. Curtis) A. Gray – S. [NatureServe G4T4](#) (Apparently Secure).

Stylisma pickeringii (Torrey ex M.A. Curtis) A. Gray var. *pickeringii*. PICKERING'S DAWNFLOWER. **Hab:** Longleaf pine sandhills, usually in the driest, most barren, deep-sand areas, occasionally colonizing dry, disturbed areas in sandhills, such as sandy roadbanks, known from the Fall-line Sandhills, aeolian rims of Carolina bays, and sandhills on relict riverine dunes along Coastal Plain rivers. **Dist:** Var. *pickeringii* ranges from s. NC south through SC, GA, AL, and e. MS, with a disjunct area in the Pine Barrens of s. NJ, sometimes treated as a separate variety "*caesariensis*" (see synonymy). **Phen:** Jun-Aug (-Sep); Jul-Sep. **Comm:** Fernald and Schubert (1949) named four varieties in this widely but disjunctly distributed species; Myint (1966) reduced this to two varieties, one eastern and one western. **ID Notes:** This rare species is easily recognizable by its growth form, with numerous stems arching from a central point, then trailing radially away, forming a mound 1-2 meters in diameter. The narrowly linear leaves are borne vertically. **Syn:** = C, K1, K3, K4, Myint (1966); < *Bonamia pickeringii* (Torrey ex M.A. Curtis) A. Gray – RAB, Shinnars (1962d), Wilson (1960b); < *Breweria pickeringii* – G; > *Breweria pickeringii* var. *caesariensis* Fernald & Schubert – F; > *Breweria pickeringii* (Torrey ex M.A. Curtis) A. Stylisma villosa (Nash) House. HAIRY DAWNFLOWER. **Hab:** Longleaf pine sandhills, Florida scrub. **Dist:** S. GA south to s. FL, west to e. TX. **Phen:** Late Apr-Jul. **Syn:** = Fl6, K1, K3, K4, S, Tx, WH3, Myint (1966); = *Bonamia villosa* (Nash) K.A. Wilson – Shinnars (1962d), Wilson (1960b); = *Breweria villosa* Nash. [NatureServe G4](#) (Apparently Secure).

360. SOLANACEAE A.L. de Jussieu 1789 (NIGHTSHADE FAMILY) [in SOLANALES]

A family of about 94-96 genera and 2400-3000 species, herbs, shrubs, trees, and lianas, nearly cosmopolitan but especially diverse in South America. References: Barboza et al. in Kadereit & Bittrich (2016); Hunziker (2001).

- 3 Plant distinctly woody, an upright shrub or scrambling vine.
 - 6 Leaves 0.5-7 cm long, 0.2-3.5 cm wide; [tribe *Lycieae*]..... *Lycium*
 - 6 Leaves 10-30 cm long, 4-14 cm wide; [tribe *Solaneae*]..... *Solanum*
- 3 Plant herbaceous (some taxa keyed here can be robust and tough-stemmed, but are herbaceous, lacking overwintering buds on aerial stems).
 - 7 Corolla salverform or narrowly funnel-shaped, with a well-developed tubular portion, this > 1 cm long (except in *Calibrachoa*) and either flared or essentially isodiametric and > 4× as long as its midpoint diameter, the limb expanding more or less abruptly from the tubular portion; fruit a capsule opening by longitudinal valves or by apical pores.
 - 8 Corolla 7-25 cm long, white, pale blue or pale pink; capsule spiny, 3-5 cm long, subtended by a collar formed by the reflexed corolla base; [subfamily *Solanoideae*; tribe *Datureae*]..... *Datura*
 - 8 Corolla 0.6-7 cm long, white, blue, pink, or other colors; capsule smooth, not collared.
 - 9 Flowers solitary, axillary; [subfamily *Petunioideae*].

- 10 Leaves linear to narrowly spatulate *Calibrachoa parviflora*
 10 Leaves oblong, ovate or elliptic..... *Petunia ×atkinsiana*
 9 Flowers in (2-) 3-many flowered racemes or panicles. *Nicotiana*
 7 Corolla either urceolate, campanulate, or rotate, lacking a narrow tubular portion that is both > 1 cm long and > 4× as long as its midpoint diameter; fruit a berry (or circumscissile capsule in *Hyoscyamus*); [subfamily *Solanoideae*].
 14 Calyx not accrescent, subtending the mature berry.
 17 Locules air-filled; berries usually elongate and irregularly shaped (sometimes ovoidal or spherical; [peppers, chilis]; [tribe *Capsiceae*]..... *Capsicum*
 17 Locules fleshy; berries spherical or ellipsoidal; [nightshades, tomato, potato, eggplant]; [tribe *Solaneae*]..... *Solanum*
 14 Calyx accrescent, wholly or partly surrounding the mature berry.
 18 Mature calyx spiny; [tribe *Solaneae*]..... *Solanum*
 18 Mature calyx glabrous or with hairs.
 21 Flowers 2 or more per leaf axil; berries with spherical seed-like bodies intermixed with the flattened, reniform seeds; [of the Gulf Coastal Plain] *Calliphysalis carperteri*
 21 Flowers 1 per leaf axil; berries with flattened, reniform seeds only; [collectively widespread]..... *Physalis*

***Bouchetia* A.P. de Candolle ex Dunal 1852 (BOUCHETIA)**

A genus of 3 species, perennial herbs, of sc. North America and South America. References: Barboza et al. in Kadereit & Bittrich (2016).

***Bouchetia erecta* A.P. de Candolle. PAINTED-TONGUE. **Hab:** Prairies, rocky slopes. **Dist:** Endemic to TX. The reported record for MS is based on a misidentification of *Jacquemontia tamnifolia* (Krings, pers. comm., 2012).**

Phen: May-Oct. **Syn:** = K1, K3, K4, NcTx, Tx; = *Salpiglossis erecta* (A.P. de Candolle) D'Arcy. NatureServe G4 (Apparently Secure).

***Calibrachoa* La Llave & Lexarza 1825 (SEASIDE PETUNIA)**

A genus of 26-30 species, annual or perennial herbs and shrubs, of tropical America. References: Barboza et al. in Kadereit & Bittrich (2016); Hunziker (2001); Jenkins in FNA () (in prep).

* ***Calibrachoa parviflora* (A.L. de Jussieu) D'Arcy. WILD PETUNIA, SEASIDE PETUNIA. **Hab:** Upper edges of salt marshes, drawdown shores, waste areas, garbage dumps. **Dist:** Presumably native of tropical America, though perhaps native in parts of our area (especially along the Gulf Coast and south to s. TX). Tatnall (1946) documents its occurrence in Virginia: "upper edge of salt marsh, Wachapreague", Accomack County (Fernald & Long 4169, 26 Jul 1934). **Phen:** Apr-Sep. **Syn:** = Fl6, FNA, K1, K3, K4, NcTx, NY, WH3; = *Petunia parviflora* A.L. de Jussieu – C, F, G, Il, RAB, S, Tx, Hunziker (2001). NatureServe G5 (Secure).**

***Calliphysalis* M. Whitson 2012**

A monotypic genus, a perennial herb, endemic to se. United States Coastal Plain. References: Barboza et al. in Kadereit & Bittrich (2016); Sullivan (2004); Ward (2008a); Whitson (2010); Whitson (2012).

***Calliphysalis carperteri* (Riddell) M. Whitson. CARPENTER'S GROUND-CHERRY. **Hab:** Longleaf pine sandhills, dry hammocks, dry sandy soils. **Dist:** N. peninsular FL, sw. GA, and Panhandle FL west to e. LA. **Phen:** (Late Apr-) Jun-Aug (-Sep). **Syn:** = Fl6, K3, K4, Whitson (2012), Zhang, Zhang, & Endress (2003); = *Physalis carperteri* Riddell – K1, S, WH3, Sullivan (2004), Ward (2008a). NatureServe G3 (Vulnerable).**

***Capsicum* Linnaeus 1753 (RED PEPPER, CHILE)**

A genus of 25-35 species, herbs, shrubs, and rarely small trees, of tropical America. References: Andrews (1995); Barboza et al. in Kadereit & Bittrich (2016); Barchenger & Bosland (2019); Bosland & Votova (2000); D'Arcy & Eshbaugh (1974); De (2003); Eshbaugh in FNA () (in prep); Heiser & Pickersgill (1975).

* ***Capsicum annum* Linnaeus var. *annuum*. BELL PEPPER, CHILE, PIMIENTO, PAPRIKA, ANCHO, JALAPEÑO, CAYENNE, PEPPERONCINI, SERRANO, AND MANY OTHERS. **Hab:** Naturalized or persistent from gardens; commonly cultivated, rare as a naturalized species. **Dist:** Native of Mexico (but early spread through Central America by native Americans, and since nearly worldwide in distribution at least in cultivation). A very influential food crop introduced from the New World to the Old World, now important in various (especially tropical or subtropical) cuisines, including Hunan, Szechuan, Indian, Thai, various African, Mexican, and others. **Phen:** Jun-Dec (-May). **Comm:** The great majority of our cultivated forms of peppers and chilis are of this species. **Syn:** = K1, K3, K4, Andrews (1995), Bosland & Votova (2000), D'Arcy & Eshbaugh (1974), De (2003); = *Capsicum annum* Linnaeus – S; < *Capsicum annum* Linnaeus – NY, RAB. Datura Linnaeus 1753 (JIMSONWEED, THORN-APPLE)

A genus of 10-11 species, annual herbs, of sw. United States and Mexico. Several species of *Datura* are known to have been in our area at the time of first settlement by Europeans. They may have been weeds in native American fields, or grown for their hallucinogenic properties; the common name 'Jimsonweed' is a corruption of 'Jamestown Weed'. References: Avery, Satina, & Rietsema (1959); Barboza et al. in Kadereit & Bittrich (2016); Bye in FNA [(in prep)].

- 1 Corollas 4-11 cm long, the limb with 5 shallow sinuses alternating with acuminate lobes; fruits erect; [section *Datura*].*Datura stramonium*
- 1 Corollas usually greater than 10 cm long, limb with 5 lobules alternating with acuminate lobes; fruits pendent; [section *Dutra*].*Datura wrightii*

* *Datura stramonium* Linnaeus. JIMSONWEED, THORNAPPLE. **Hab:** Fields, pastures, disturbed areas, especially common in severely over-grazed pastures; presumably introduced from farther south and west (Mexico or Central America) prior to 1492. **Phen:** Jul-Sep; Aug-Oct. **Comm:** The plant is dangerously poisonous. **Syn:** = Ar, Bah, C, Fl6, GrPl, K1, K3, K4, Mi, NcTx, NE, NY, Pa, RAB, S, Tn, Tx, Va, W, WH3, WV, Z; > *Datura stramonium* var. *stramonium* – F, Il; > *Datura stramonium* var. *tatula* (Linnaeus) Torrey – F, Il; > *Datura tatula* Linnaeus.

Datura wrightii Regel. INDIAN-APPLE. **Hab:** Disturbed areas. **Dist:** Native of Mexico. **Phen:** Jul-Sep; Sep-Oct. **Syn:** = Fl6, Il, K1, NcTx, NE, Tx; ? *Datura innoxia* P. Miller – WV, misapplied; ? *Datura metel* Linnaeus – G, misapplied; ? *Datura meteloides* Dunal – RAB, S, Avery, Satina, & Rietsema (1959), misapplied; < *Datura wrightii* Regel – K3.

*Lycium* Linnaeus 1753 (MATRIMONY-VINE, WOLFERRY, GOJI BERRY)

A genus of 90-100 species, shrubs, of warm temperate and tropical areas of the Old World and New World (especially America). References: Barboza et al. in Kadereit & Bittrich (2016); Hitchcock (1932); Levin & Miller in FNA () (in prep).

Lycium carolinianum Walter. CHRISTMAS-BERRY, CAROLINA MATRIMONY-VINE. **Hab:** Shell middens, shell mounds, shelly sand dunes, brackish marshes, maritime sand spits. **Dist:** Se. SC (where not recently seen; its occurrence is based on being named by Walter (1788) and Elliott's (1816) statement "found by Mr. Wm. Bartram, in the saline rushy marshes of Carolina") and e. GA south to FL, west to e. TX; also in the West Indies. **Phen:** Sep-Oct. **Syn:** = Fl6, FNA, GW2, RAB, S, WH3; > *Lycium carolinianum* var. *carolinianum* – K1, K3, K4, Hitchcock (1932); > *Lycium carolinianum* var. *quadrididum* (Dunal) C.L. Hitchcock – K1, K3, K4, Tx, Hitchcock (1932).

Nicotiana Linnaeus 1753 (TOBACCO)

A genus of about 65-80 species, herbs, shrubs, and small trees, of America, Australia, and s. Pacific areas. Fernald (1950) describes the genus as "rank, acrid-narcotic American herbs". Sectional classification follows Knapp, Chase, & Clarkson (2004). References: Barboza et al. in Kadereit & Bittrich (2016); Goodspeed (1954); Knapp in FNA () (in prep); Knapp, Chase, & Clarkson (2004).

- 6 Corolla throat constricted; filaments unequal, stamens didynamous (2 different lengths); cauline leaf blades lanceolate or linear, leaves sessile, auriculate; [section *Alatae*].*Nicotiana longiflora*
- 6 Corolla throat gaping; filaments equal, fused to corolla along their entire length, anthers appearing sessile; cauline leaf blades pandurate and clasping; [section *Repandae*].*Nicotiana repanda*

* *Nicotiana longiflora* Cavanilles. LONG-FLOWER TOBACCO. **Hab:** Disturbed areas. Cultivated and may be found as a waif or persistent. **Dist:** Native of South America. **Phen:** Apr-Sep. **Syn:** = Fl6, Il, K1, K3, K4, NE, S, Tx, WH3, Goodspeed (1954), Knapp in FNA () (in prep). NatureServe GNR (Not Yet Ranked).

Nicotiana repanda Willdenow ex Lehmann. FIDDLELEAF TOBACCO. **Hab:** Disturbed areas, moist areas along streams. **Dist:** Native to TX, Mexico, and West Indies. **Phen:** Feb-Sep. **Syn:** = K3, K4, NcTx, Tx, Knapp in FNA () (in prep). NatureServe G4G5 (Apparently Secure).

Physalis Linnaeus 1753 (GROUND-CHERRY)

Contributed by Milo Pyne

A genus of about 90 species, herbs (rarely shrubs), of the Americas. Many of the species of *Physalis* in our area occur primarily in disturbed habitats; their pre-Columbian ranges are unclear and they may have been introduced to e. North America by native Americans. Of the species treated here, only a few are definitely introduced. References: Barboza et al. in Kadereit & Bittrich (2016); Martínez (1998); Mione et al (1994); Pyne (2018); Pyne et al (2019); Pyne, Orzell, & Bridges (2019); Sullivan (1985); Sullivan (2004); Sullivan (2013); Sullivan in FNA () (in prep); Turner & Martínez (2011); Ward (2008a); Waterfall (1958); Waterfall (1967); Whitson & Manos (2005); Whitson (2011).

- 1 Flowers 2 or more per leaf axil; berries with spherical seed-like bodies intermixed with the flattened, reniform seeds; [of the Gulf Coastal Plain].....*Calliphysalis*
 1 Flowers 1 per leaf axil; berries with flattened, reniform seeds only; [collectively widespread].
 2 Berry 20-40 mm in diameter, green or yellow-green when ripe (tomatillo); anthers strongly coiled after dehiscence, blue; corolla throat with bluish tinge; [cultivated and weakly naturalized near gardens].....*Physalis philadelphica*
 2 Berry to 20 mm in diameter, orange, yellow, or green when ripe; anthers not coiled after dehiscence, yellow, blue, or purple; corolla throat purple, brown, green, or ochre; [collectively widespread].
 3 Plants pubescent with 2-3 branched or dendroid-stelliform hairs (in some species with simple hairs as well), these in some taxa abundantly covering the leaves, or if leaves glabrous, the stellate hairs visible on the tips and margins of the sepals; plants perennial, from deeply buried rhizomes; [section *Stellatae*]
 5 Leaves linear, 10-20× as long as wide, glabrous (except for leaf margins and calyx); plants erect; [of s. FL and FL Panhandle westward to s. LA]
*Physalis angustifolia*
 5 Leaves ovate, elliptic, obovate or spatulate (varying in width but not narrowly linear-lanceolate), 2-10× as long as wide, stellate pubescent, especially on the young growth, flowering calyces, and pedicels (or glabrous); [of se. VA south to s. FL, west to s. MS].
*Physalis walteri*
 3 Plants glabrous, or pubescent with simple hairs only (stellate or branched hairs absent or very rare); plants annual or perennial.
 12 Leaves glabrous or essentially so.
 13 Perennials from rhizomes, frequently with remnant of last year's stem attached to crown; corolla with 5 dark maculations in the throat.
 14 Hairs on the pedicels and young stems retrorse or retrorse-spreading; fruiting calyx 5-angled, indented at base.....*Physalis virginiana*
 14 Hairs on the pedicels and young stems antrorse; fruiting calyx subterete, with 10 ribs, not indented at base
 15 Leaves lanceolate to lance-linear, narrower than the following, many ca. 3.5× as long as wide.....*Physalis longifolia* var. *longifolia*
 15 Leaves lanceolate to broadly lanceolate to ovate, generally broader than above, about 2.5× as long as wide, or broader.
*Physalis longifolia* var. *subglabrata*

- 13 Annuals from taproots; corolla with or without 5 dark maculations in the throat.
- 17 Upper part of the stem with long, spreading hairs; corolla with 5 dark maculations in the throat; [section *Epeteiorhiza*].
- 18 Leaf margins strongly dentate with 7-10 (or more) teeth per side; fruiting pedicels 12 mm or more long; mature fruiting calyx 2.5-4 cm (or more) long, the lobes long-acuminate to attenuate; corolla pubescent internally *Physalis cordata*
- 18 Leaf margins entire, or dentate with 1-8 teeth per side; fruiting pedicels < 10 mm long; mature fruiting calyx 2.5 cm or less long, the lobes triangular-acuminate; corolla glabrous internally *Physalis pubescens*
- 17 Upper part of the stem glabrous or glabrate (when young, sometimes with minute, deflexed hairs in lines); corolla with or without 5 dark maculations in the throat.
- 19 Corolla 7-15 mm long, yellow and with 5 dark maculations in the throat; anthers 2.5-4 mm long; berry to 40 mm in diameter *Physalis philadelphica*
- 19 Corolla 4-10 mm long entirely yellow, without 5 dark maculations in the throat; anthers 1-2.3 mm long; berry 8-11 mm in diameter.
- 20 Corollas white to cream, widely flaring and very flat, with greenish-tinged, densely hairy region in 5 spots towards the base of the inner surface; anthers 2.5-3.0 mm long; fruiting pedicels 2.5-6.0 cm long *Physalis acutifolia*
- 20 Corollas yellow, bell-, or saucer-shaped, sometimes suffused with purple within, but lacking densely hairy spots; anthers 1.5-2.5 mm long; fruiting pedicels 1.5-4.0 cm long *Physalis angulata*
- 12 Leaves variously pubescent, the hairs copious and villous to sparse and appressed.
- 21 Flowering calyces < 6 mm long; annuals from taproots; [section *Epeteiorhiza*].
- 23 Stems, young growth, and major veins of the leaves covered with villous pubescence intermixed with sessile glands; leaves gray-green, prominently and coarsely dentate to the base, with well-defined reticulate venation, especially visible on the lower surface, frequently drying orange or with orange spots; anthers yellow, perhaps with a bluish tinge; body of mature calyx about as long as broad, abruptly acuminate at apex; berry tawny orange when mature *Physalis grisea*
- 23 Stems, young growth, and major veins of leaves with fine, non-villous pubescence; leaves green, obscurely dentate, often in the upper half only, or entire, without well-defined reticulate venation, drying green or brownish; anthers blue or violet; body of mature calyx longer than broad, long-acuminate at the apex; berry green when mature *Physalis pubescens*
- 21 Flowering calyces > 6 mm long; perennials from rhizomes.
- 25 Plants glabrous or villous, hairs antrorse and to 1 mm, sometimes also with hairs 1-2 mm long, often with slender, shallow rhizomes *Physalis arenicola*
- 25 Plants densely villous and/or viscid, hairs divergent and 1-2 mm, often also with shorter hairs; upper leaf surfaces punctate to densely viscid-pubescent; rhizomes stout and deeply buried (but these sometimes not collected).
- 26 Pubescence viscid, generally composed of glandular trichomes mixed with fine, short hairs and long, multicellular ones; leaf blades broadly ovate to suborbicular, the base rounded, truncate, or cordate (occasionally widely cuneate). *Physalis heterophylla*
- 26 Pubescence seldom if at all glandular-viscid, composed of simple trichomes of varying lengths, from dense, spreading, and long-villous to sparse, strigose and appressed; leaf blades narrowly ovate to broadly lanceolate, the base cuneate (rarely truncate).
- 28 Pedicels and flowering calyces pubescent with minute, appressed, antrorse hairs; hairs on the calyx primarily confined to 10 narrow longitudinal strips consisting of simple, appressed hairs < 0.5 mm long.
- 29 Leaves lanceolate to lance-linear, narrower than the following, many ca. 3.5× as long as wide *Physalis longifolia* var. *longifolia*
- 29 Leaves lanceolate to broadly lanceolate to ovate, generally broader than above, about 2.5× as long as wide, or broader. *Physalis longifolia* var. *subglabrata*
- 28 Plants moderately to densely pubescent with divergent hairs 1-1.5 mm long, and antrorse or retrorse hairs to 0.5 mm long; pedicels and flowering calyces densely pubescent with divergent and appressed hairs mixed (or only with appressed retrorse hairs); hairs on the calyx scattered more or less evenly over the surface, not confined to 10 longitudinal strips *Physalis virginiana*

Physalis acutifolia (Miers) Sandwith. **Hab:** Disturbed areas. **Dist:** Native of sw. United States south into Mexico. Collected once in NC (in 1936), from a nursery in Mecklenburg County, NC, in MS (Sullivan 2004), and in nw. GA (the basis of the report of *P. missouriensis* in Jones & Coile 1988). It may not be established. **ID Notes:** *Physalis acutifolia* is most similar to *P. angulata*, but differs in its white to cream-colored corollas, with yellow basal spots, and the presence of 5 hairy pads, alternating with the stamens near the base of the corolla limb. **Syn:** = FNA, K1, K3, K4, Tx, Sullivan (2004). **NatureServe G5?** (Secure).

Physalis angulata Linnaeus. SMOOTH GROUND-CHERRY. **Hab:** Longleaf pine sandhills, disturbed areas, open woodlands, agricultural fields. **Dist:** Widely distributed in tropical America, north to se. VA and MO, and scattered as an adventive farther north. **Phen:** Aug-Oct. **Syn:** = Ar, Bah, C, Fl6, FNA, K1, K3, K4, NeTx, NE, RAB, S, Va, WH3, Sullivan (2004); > *Physalis angulata* Linnaeus – F, G, Il; > *Physalis angulata* var. *angulata* – GrPl, Tn, Tx; > *Physalis angulata* var. *pendula* – GrPl, Tn, Tx; > *Physalis pendula* Rydberg – F, G, Il.

Physalis angustifolia Nuttall. COASTAL GROUND-CHERRY. **Hab:** Maritime dunes and coastal sands, longleaf pine sandhills. **Dist:** Gulf Coast shorelines from S. FL west to s. LA. Reports of *P. viscosa* from the Southeast are based on either *P. angustifolia* or *P. walteri*. **Phen:** Jan-Dec. **Syn:** = Fl6, FNA, K1, K3, K4, WH3, Sullivan (1985), Sullivan (2004), Turner & Martínez (2011), Ward (2008a). **NatureServe G3G4** (Vulnerable).

Physalis arenicola Kearney. SANDHILL GROUND-CHERRY. **Hab:** Longleaf pine sandhills, pine flatwoods. **Dist:** GA, AL, and s. MS south to s. FL. Reported from nc. GA by Jones & Coile (1988) and for "cypress-heads and scrub thickets" by GANHP. **Phen:** Jan-Dec. **Syn:** = Fl6, FNA, K1, K3, K4, WH3, Sullivan (2004); > *Physalis arenicola* var. *arenicola* – Ward (2008a); > *Physalis arenicola* var. *ciliosa* (Rydberg) Waterfall – Ward (2008a); ~ *Physalis ciliosa* Rydb.. **NatureServe G3?** (Vulnerable).

* ***Physalis cordata*** P. Miller. TOOTHLEAF GROUND-CHERRY. **Hab:** Disturbed areas. **Dist:** Native distribution is uncertain; this species is scattered in the Southeastern United States, south to s. FL, and is more widespread in Mexico, Central America, and West Indies. **Phen:** Jul-Oct. **Syn:** = Ar, Bah, Fl6, FNA, K1, K3, K4, Tn, Tx, WH3, Martínez (1998), Sullivan (2004), Ward (2008a); = *Physalis barbadensis* var. *glabra* (Michaux) Fernald – F; = *Physalis pubescens* var. *glabra* (Michaux) Waterfall – GrPl, RAB. **NatureServe G5** (Secure).

Physalis grisea (Waterfall) M. Martínez. GRAY GROUND-CHERRY, STRAWBERRY-TOMATO, DWARF CAPE-GOOSEBERRY. **Hab:** Wooded slopes, disturbed areas. **Dist:** The species is mainly distributed in ne. United States, south (mainly) to NC, TN, and MO, and scattered farther south. **Phen:** May-Nov; Aug-Oct. **Tax:** Martínez (1993) discusses the nomenclature of this species, showing that *P. pruinosa* Linnaeus is properly applied to a Mexican and Central American species. **Comm:** The fruits are edible, sweet, and tasty. **Syn:** = FNA, II, K1, K3, K4, Mi, NE, NY, Tn, Va, Martínez (1998), Sullivan (2004), Ward (2008a); = *Physalis pubescens* var. *grisea* Waterfall – C, GrPl, RAB; < *Physalis pruinosa* Linnaeus – F, G, S, W, misapplied. **NatureServe G5?** (Secure).

Physalis heterophylla Nees. CLAMMY GROUND-CHERRY. **Hab:** Disturbed areas, prairies, stream valleys, dry rocky woodlands, hammocks. **Dist:** Widespread in e. and c. United States and adjacent Canada, south to ne. FL and Panhandle FL. **Phen:** May-Sep; Jul-Sep. **Syn:** = Ar, C, Fl6, FNA, GrPl, GrPl, K3, K4, Mi, NcTx, NY, Pa, RAB, S, Tn, Va, W, WH3, Sullivan (2004); > *Physalis ambigua* (A. Gray) Britton – S; > *Physalis heterophylla* Nees – S; > *Physalis heterophylla* var. *ambigua* (A. Gray) Rydberg – F, G, II; > *Physalis heterophylla* var. *clavipes* Fernald – F; > *Physalis heterophylla* var. *heterophylla* – F, G, II, K1, NE, Tx; > *Physalis heterophylla* var. *nyctaginea* (Dunal) Rydberg – F, II; > *Physalis heterophylla* var. *villosa* Waterfall – Tx; > *Physalis nyctaginea* Dunal – S.

Physalis longifolia Nuttall var. *longifolia*. LONGLEAF GROUND-CHERRY. **Hab:** Bottomlands, other forests, prairies, woodlands, disturbed areas. **Dist:** IL, IA, ND, MT, and ID south to MS, LA, TX, NM, AZ, and Mexico. **Phen:** May-Sep. **Comm:** {not yet keyed}. **Syn:** = Ar, FNA, GrPl, K1, K3, K4, NcTx, Sullivan (2004); > *Physalis virginiana* var. *sonorae* (Torrey) Waterfall – Tx. **NatureServe G5T5** (Secure).

Physalis longifolia Nuttall var. *subglabrata* (Mackenzie & Bush) Cronquist. LONGLEAF GROUND-CHERRY. **Hab:** Open woodlands, gardens and disturbed areas. **Dist:** The species is widespread in e. and c. United States; var. *subglabrata* is more eastern, south to Panhandle FL, var. *longifolia* more western. **Phen:** Jun-Aug; Aug-Oct. **Syn:** = Ar, C, FNA, G, GrPl, K1, K3, K4, NcTx, NE, NY, Tn, Va, W, Sullivan (2004); = *Physalis macrophysa* Rydberg; = *Physalis subglabrata* Mackenzie & Bush – F, Pa, S, WV; = *Physalis virginiana* P. Miller var. *subglabrata* (Mackenzie & Bush) Waterfall – RAB; < *Physalis longifolia* – Fl6, Mi, WH3; > *Physalis longifolia* – II; > *Physalis subglabrata* Mackenzie & Bush – II; > *Physalis virginiana* var. *virginiana* – Tx.

Physalis philadelphica Lamarck. TOMATILLO. **Hab:** Naturalized after cultivation. **Dist:** Native of Mexico and Central America. **Phen:** Jun-Sep; Jul-Oct. **Comm:** See Kartesz & Gandhi (1994) for a discussion of this group. It is the large-flowered plant (and therefore *P. philadelphica* in the narrow sense) that is weakly naturalized after cultivation in our area. **Syn:** = Ar, C, FNA, Mi, NY, Pa, Tx, Sullivan (2004); < *Physalis ixocarpa* Brotero ex Hornemann – F, G, misapplied; > *Physalis philadelphica* var. *immaculata* Waterfall – K1, K3, K4, NE. **NatureServe GNRTNR** (Not Yet Ranked).

Physalis pubescens Linnaeus. DOWNY GROUND-CHERRY, HUSK-TOMATO. **Hab:** Disturbed areas. **Dist:** Widespread in the American tropics, north to PA and IA. **Phen:** Jul-Sep; Aug-Oct. **Tax:** Varieties are sometimes recognized. Var. *integrifolia* has leaves entire or with few teeth, usually 1-4 teeth per side; leaf blade thin in texture, flaccid and translucent; fruiting calyces 1.2-2.5 cm long, 1-1.5 cm wide, the lobes ovate to deltoid, the apex acute, 3-3.5 mm long. Var. *pubescens* has leaves mostly toothed nearly to the base with 5-8 teeth per side; leaf blade thick in texture, not translucent; fruiting calyces 2-3.5 cm long, 1.2-3 cm wide, the lobes triangular to narrowly lanceolate, the apex narrowly acute to acuminate, (3.5-) 4.5-6.5 mm long. **Syn:** = Bah, Fl6, FNA, K4, Va, W, WH3, Martínez (1998), Sullivan (2004); = *Physalis pubescens* var. *pubescens* – RAB; > *Physalis barbadensis* Jacquin – G, S, S; > *Physalis barbadensis* Jacquin var. *barbadensis* – F; > *Physalis integrifolia* (Dunal) D.B. Ward – Ward (2008a); > *Physalis pruinosa* Linnaeus, misapplied; > *Physalis pubescens* Linnaeus – F, G, S, S; > *Physalis pubescens* var. *integrifolia* – C, GrPl, K1, NcTx, NE, Pa, Tn, Tx; > *Physalis pubescens* var. *pubescens* – C, GrPl, K1, NcTx, Pa, Tn, Tx; > *Physalis turbinata* Medikus – G, NcTx, S, Tx.

Physalis virginiana P. Miller. VIRGINIA GROUND-CHERRY. **Hab:** Woodlands, glades, barrens, and disturbed areas. **Dist:** This complex species is widespread in e. and c. North America. **Phen:** Apr-Oct; Jun-Nov. **Tax:** Varieties are sometimes recognized; if so, only var. *virginiana* is represented in the eastern part of our area. **Syn:** = C, F, Fl6, FNA, G, GrPl, II, Mi, NcTx, Pa, Tn, W, WH3, Sullivan (2004), Ward (2008a); > *Physalis intermedia* Rydberg – S; > *Physalis monticola* C. Mohr – S; > *Physalis virginiana* P. Miller – S; > *Physalis virginiana* P. Miller var. *virginiana* – K1, K3, K4, NE, NY, RAB, Tx, Va. **NatureServe G5T5** (Secure).

Physalis walteri Nuttall. DUNE GROUND-CHERRY, TOMATILLA DE SUELO, WALTER'S GROUND-CHERRY, DUNE GROUND-CHERRY. **Hab:** Dunes of sea-beaches, openings in maritime forests, longleaf pine sandhills (southward), and rarely inland as a waif in disturbed areas. **Dist:** Se. VA south to s. FL and west to s. MS. **Phen:** May-Sep. **Tax:** See Sullivan (1985) for further information on this species and its relatives. It is largely replaced on the Gulf Coast by the related *P. angustifolia*, with which it locally intergrades in peninsular FL. *P. viscosa* Linnaeus (in the narrow sense) is South American. **Syn:** = C, Fl6, FNA, K1, K3, Va, WH3, Sullivan (1985), Sullivan (2004), Turner & Martínez (2011); = *Physalis walteri* var. *walteri* – Ward (2008a); < *Physalis maritima* M.A. Curtis – F; < *Physalis viscosa* Linnaeus – G, S; < *Physalis viscosa* Linnaeus ssp. *maritima* (M.A. Curtis) Waterfall – RAB; < *Physalis viscosa* L. var. *maritima* (M.A. Curtis) Rydberg.

360. SOLANACEAE

Solanum Linnaeus 1753 (NIGHTSHADE, TOMATO, POTATO, HORSE-NETTLE)

Contributed by Milo Pyne and Alan S. Weakley

A genus of 1400-1700 species, trees, shrubs, vines, and herbs, of tropical and temperate regions of the Old and New World. References: Barboza et al. in Kadereit & Bittrich (2016); Bohs & Olmstead (1997); Harper & Diamond (2021); Knapp et al (2019); Olmstead & Palmer (1997); Schilling (1981); Wahlert, Chiarini, & Bohs (2015).

Unkeyed waifs: *Solanum melongena*

- 1 Stems, and often leaves, prickly and/or spiny.
 - 3 Shrubs, small trees, or scrambling, vine-like shrubs to 5 m tall or long; stems with strongly recurved prickles. *Solanum torvum*
 - 3 Herbs to 2 (-3) m tall; stems with straight prickles; stems with prickles, but these not strongly recurved.
 - 6 Berry enveloped at least until near maturity by prickly calyx; leaves regularly and strongly pinnately parted or very deeply divided (sinus depth greater than 1/2 distance from leaf margin to midvein).
 - 7 Corolla yellow; inflorescence stellate-pubescent only; calyx tightly enveloping the fruit; seeds coarsely undulate-rugose..... *Solanum rostratum*
 - 7 Corolla violet to (rarely) white, anthers all similar; inflorescence glandular-villous and stellate-pubescent; calyx loosely or tightly enveloping the fruit; seeds minutely reticulate-pitted. *Solanum sisymbriifolium*
 - 6 Berry not enveloped by prickly calyx; the leaves not pinnately parted or divided (except in *S. sisymbriifolium*), or only weakly so (sinus depth < 1/2 the distance from leaf margin to midvein).
 - 9 Berry (1.5-) 2-5 cm long; lower leaf surface pubescent with simple hairs, these viscid (gland-tipped) or not.
 - 10 Ripe berry orange-red to reddish, leaves deeply lobed (sinus depth up to 1/2 distance from leaf margin to midvein); plants with eglandular, villous pubescence; seeds winged *Solanum capsicoides*
 - 10 Ripe berry yellow, immature berry green with white mottles, leaves shallowly lobed (sinus depth typically < 1/3 distance from leaf margin to midvein); plants glandular-viscid; seeds not winged..... *Solanum viarum*
 - 9 Berry < 2 cm in diameter; lower leaf-surface stellate-pubescent.
 - 11 Leaves linear-lanceolate, 1-3 cm wide, trichome clusters 0.5 mm broad, with 12 or more rays *Solanum elaeagnifolium*
 - 11 Leaves ovate to elliptic, 2-8 cm wide, often lobed or cleft, trichome clusters 1 mm broad, with 5-10 rays.
 - 12 Leaves pinnately parted or divided, the segments often pinnately lobed; calyx enveloping fruit when ripe, berry red; plant annual *Solanum sisymbriifolium*
 - 12 Leaves irregularly lobed or cleft, the lobes or segments entire; calyx not enveloping fruit when ripe; berry yellowish orange, never red; plant perennial.
 - 15 Stems sparsely to moderately armed with prickles up to 12 mm long; inflorescences 2- to several-branched; corollas 2.0-4.4 cm in diameter; [mainly AL, FL, and GA, rarely MS]..... *Solanum perplexum*
 - 15 Stems unarmed or sparsely armed with prickles up to 6 mm long; inflorescences unbranched or once branched; corollas 2.2-3.0 cm in diameter; [collectively widespread]. *Solanum carolinense* var. *carolinense*
 - 1 Stems and leaves not prickly or spiny.
 - 17 Leaves compound (at least well-developed leaves), pinnatifid, or basally auriculate-lobed. *Solanum lycopersicum*
 - 17 Leaves not compound or auriculate-lobed.
 - 22 Shrubs and small trees; [mainly FL and s. TX southwards, rarely northwards].
 - 26 Plants glabrous or if sparsely pubescent, the hairs simple. *Solanum diphyllum*
 - 26 Plants stellate-pubescent. *Solanum pseudocapsicum*
 - 22 Herbs; [collectively widespread].
 - 31 Corolla 10-16 mm long, lavender; fruits 10-15 mm in diameter, yellow when ripe (blackening with age); trichomes of stems and leaves stellate, with 9-13 branches..... *Solanum elaeagnifolium*
 - 31 Corolla 5-8 mm long, white to cream; fruits 5-10 mm in diameter, black, purple, green, orange, red, or dark yellow when ripe; trichomes of stems and leaves simple (when present).
 - 32 Foliage with glandular trichomes; fresh plants sticky to the touch. *Solanum sarrachoides*
 - 32 Foliage lacking glandular trichomes, sometimes with a few scattered trichomes with glandular tips, but not markedly glandular (fresh plants not sticky to the touch).
 - 38 Anthers less than or equal to 2 mm long.
 - 39 Mature berries dropping without the pedicel; calyx lobes strongly reflexed in fruit; stone cells 0-2 (-4)..... *Solanum americanum*
 - 39 Mature berries dropping with the pedicel; calyx lobes appressed to spreading in fruit; stone cells more than 4, usually 8 per berry *Solanum emulans*

Key to Map
Symbology:

* : waif
EN : endemic
H : historic

N : no
P : planted
? : questionable

38 Anthers more than 2 mm long

41 Stone cells present in mature berries, always more than 2; corolla (10-) 15-20 mm in diameter

42 Anthers (2.7-) 3-4.5 mm long, slightly tapering to the tip; buds ovoid, tapering to the apex; free portion of the filaments minute, ca. 1/4 the length of the anther; corolla to 20 mm in diameter *Solanum douglasii*

42 Anthers less than 3 mm long, ellipsoid with straight sides; buds ellipsoid; free portion of the filaments half the length of the anthers; corolla < 15 mm in diameter. *Solanum nigrescens*

41 Stone cells in mature berries absent (occasionally 2); corolla < 15 mm in diameter.

..... *Solanum pseudogracile*

Solanum americanum P. Miller. AMERICAN BLACK NIGHTSHADE. **Hab:** Hammocks, marsh edges, shell middens, disturbed areas. **Dist:** E. GA (and SC?) south to s. FL, west to e. TX; western North America, Central America, South America; Old World tropics and subtropics; the original area of nativity obscure. **Phen:** May-Nov (-Apr). **Syn:** = Fl6, K1, K3, WH3, Knapp et al (2019); < *Solanum americanum* P. Miller – F, RAB; > *Solanum americanum* P. Miller – Tx; > *Solanum americanum* var. *americanum* – Bah; > *Solanum americanum* P. Miller var. *nodiflorum* (Jacquin) Edmonds – Bah; < *Solanum nigrum* Linnaeus – C, G, S; > *Solanum nodiflorum* Jacquin – Tx.

Solanum capsicoides Allioni. SODA APPLE, COCKROACHBERRY. **Hab:** Disturbed areas, open woodlands. **Dist:** Native of tropical America. The nativity of this species in the Southeast is uncertain. **Phen:** Jan-Dec. **Syn:** = K1, K3, K4, WH3; = *Solanum aculeatissimum* – RAB, S, Tx, misapplied; = *Solanum ciliatum* Lamarck – Bah. **NatureServe** G4? (Apparently Secure).

Solanum carolinense Linnaeus var. *carolinense*. CAROLINA HORSE-NETTLE, BALL-NETTLE. **Hab:** Fields, gardens, disturbed areas. **Dist:** ME and MN, south to s. FL and TX; naturalized well beyond this area, and the original native distribution unclear. **Phen:** May-Oct. **Syn:** = Fl6, K1, K3, K4, NE, NY, Va, WH3, Wählert, Chiarini, & Bohs (2015); = *Solanum carolinense* – S; < *Solanum carolinense* – Ar, C, F, G, GrPl, Il, Mi, NcTx, Pa, RAB, Tx, W, WV. **NatureServe** G5T5 (Secure).

* ***Solanum diphyllum*** Linnaeus. PAIRED-LEAF NIGHTSHADE. **Hab:** Suburban woodlands, disturbed areas, hammocks. **Dist:** Native of Mexico and Central America. **Phen:** Mar-Aug. **Syn:** = Bah, Fl3, K3, K4, WH3, WI. **NatureServe** GNR (Not Yet Ranked).

Solanum douglasii Dunal. GREEN-SPOT NIGHTSHADE. **Hab:** Disturbed areas. **Dist:** S. MS, LA, TX, NM, AZ, and CA south into Mexico. **Comm:** {not yet keyed}. **Syn:** = K2. **NatureServe** G5 (Secure).

Solanum elaeagnifolium Cavanilles. SILVERLEAF NIGHTSHADE, WHITE HORSE-NETTLE. **Hab:** Glades, prairies, thickets, fencerows, pastures, disturbed areas. **Dist:** W. MO west to CA, south to w. LA and Mexico; the native distribution highly conjectural. **Phen:** Jun-Oct. **Syn:** = Ar, Bah, C, F, Fl6, G, GrPl, Il, K1, K3, K4, Tn, Tx, WH3; = *Solanum elaeagnifolium* – RAB, S, orthographic error. **NatureServe** G4G5 (Apparently Secure).

Solanum emulans Rafinesque. EASTERN BLACK NIGHTSHADE. **Hab:** Forests, roadsides, gardens, river banks, shores, disturbed areas. **Dist:** NL west to SK, south to s. FL and e. TX; reports from s. TX and Mexico are apparently based on other taxa. **Phen:** May-Dec. **Syn:** = K4, Knapp et al (2019); = *Solanum ptychanthum* Dunal – Ar, GrPl, Il, K1, K3, Mi, NcTx, NE, NY, Tn, Va, W, Schilling (1981); < *Solanum americanum* P. Miller – F, Pa, RAB, WH3, WV, misapplied; < *Solanum nigrum* Linnaeus – C, G, Pa, S.

* ***Solanum lycopersicum*** Linnaeus. TOMATO. **Hab:** Persistent and weakly naturalized around gardens, especially where compost or sewage sludge is spread, commonly cultivated, rare as a naturalized species. **Dist:** Native of Andean South America. **Phen:** May-Nov. **Tax:** There appears to be little reason to separate *Lycopersicon* from *Solanum*. **Comm:** *S. lycopersicum* is one of the most important and influential of edible species native of the New World introduced to the Old World, along with two other Solanaceae, the potato (*Solanum tuberosum*) and the chili (*Capsicum annuum*). **Syn:** = Ar, Fl6, K3, K4, Mi, NcTx, NY, Va, WH3; = *Lycopersicon esculentum* – C, F, G, Il, RAB; = *Lycopersicon lycopersicon* (Linnaeus) Karsten – S; > *Lycopersicon esculentum* var. *cerasiforme* (Dunal) Alefani; > *Lycopersicon esculentum* var. *esculentum* – Bah; > *Lycopersicon esculentum* P. Miller var. *leptophyllum* (Dunal) D'Arcy – Bah; > *Solanum cerasiforme* Dunal; > *Solanum lycopersicum* var. *lycopersicon* – NE; > *Solanum lycopersicum* Linnaeus var. *cerasiforme* (Dunal) Spooner, J. Anderson, & R.K. Jansen – K1; > *Solanum lycopersicum* var. *lycopersicon* – K1.

* ***Solanum melongena*** Linnaeus. EGGPLANT, AUBERGINE. **Hab:** Planted in gardens, rarely persistent (only southwards). **Phen:** May-Sep. **Syn:** = F, Fl6, G, K1, K3, K4, NE, S, WH3. **NatureServe** GNR (Not Yet Ranked).

Solanum nigrescens M. Martens & Galeotti. BLACK NIGHTSHADE. **Hab:** Disturbed areas. **Dist:** FL, AL, MS, LA, and TX south through Mexico and Central America to n. South America; West Indies. **Syn:** = Knapp et al (2019); ? *Solanum nigrescens* M. Martens & Galeotti – K3, K4. **NatureServe** G4?Q (Apparently Secure).

Solanum perplexum Small. OCHLOCKONEE GROUND-CHERRY. **Hab:** Forest edges, fields, pastures, disturbed areas. **Dist:** Sw. GA, AL, nc. Peninsular FL; disjunct in w. MS. **Phen:** May-Aug; Sep-Nov. **Syn:** = S, Wahlert, Chiarini, & Bohs (2015); < *Solanum dimidiatum* Rafinesque – K1, K3, K4, WH3.

* ***Solanum pseudocapsicum*** Linnaeus. JERUSALEM-CHERRY. **Hab:** Disturbed areas, sandbars, bottomland hardwood forests. **Dist:** Native of Mediterranean Europe. See Harper & Diamond (2021) for discussion of occurrences and habitats in Alabama. **Phen:** Jul-Oct. **Syn:** = Fl6, K3, K4, NE, NY, WH3; = *Solanum pseudo-capsicum* – F, orthographic variant; ? *Solanum capsicastrum* – K1; > *Solanum capsicastrum* – Tx; > *Solanum pseudocapsicum* Linnaeus – Tx.

Solanum pseudogracile Heiser. DUNE NIGHTSHADE. **Hab:** Ocean dunes, usually with *Uniola paniculata*, maritime forests. **Dist:** E. NC south to s. FL, west to s. MS (or w. LA?). **Phen:** May-Oct (–Apr). **Tax:** Closely related to *S. chenopodioides* and sometimes combined with it (see synonymy). **Syn:** = K1, K3, K4, Knapp et al (2019), Schilling (1981); = *Solanum gracile* – RAB, S, misapplied; < *Solanum chenopodioides* Lamarck – Fl6, WH3.

Solanum rostratum Dunal. BUFFALO-BUR, KANSAS-THISTLE, BUFFALO-BUR NIGHTSHADE. **Hab:** Disturbed areas, especially overgrazed pastures and feedlots. **Dist:** The native distribution obscure, at least in c. and w. United States. **Phen:** May-Oct. **Syn:** = C, F, G, GrPl, IL, K1, K3, K4, Mi, NcTx, NE, NY, Pa, RAB, Tn, Tx, Va, W; = *Androcera rostrata* (Dunal) Rydberg – S; ? *Solanum cornutum* Lamarck, misapplied.

* ***Solanum sarrachoides*** Sendtner. HAIRY NIGHTSHADE, VISCID NIGHTSHADE. **Hab:** Disturbed areas. **Dist:** Native of South America. Works by Edmonds and associates have established that *S. sarrachoides* and *S. physalifolium* Rusby are two distinct species, but both are presently known from North America. **Phen:** Jul-Oct. **Tax:** Mistaken interpretations of Cronquist's 1991 treatment of *Solanum* (e.g. by Kartesz 1999) have given rise to the incorrect belief that only *S. physalifolium* is found in North America. True *S. physalifolium* is present in the western United States, *S. sarrachoides* in the Southeast. **Syn:** = Ar, C, K4, NY, RAB, Va, Knapp et al (2019); = *Solanum sarachoides* – F, Tn, orthographic error; < *Solanum physalifolium* Rusby – IL, K1; > *Solanum physalifolium* var. *nitidibaccum* (Bitter) Edmonds – K3, NE; < *Solanum sarrachoides* Sendtner – GrPl, Schilling (1981).

* ***Solanum sisymbriifolium*** Lamarck. STICKY NIGHTSHADE. **Hab:** Disturbed areas. **Dist:** Native of South America. **Phen:** May-Sep; Sep-Oct. **Comm:** "It is planted widely as a trap plant where potatoes are grown to attract the pale potato cyst nematode" (Virginia Botanical Associates 2019). **Syn:** = C, F, Fl6, G, K1, K3, K4, NE, NY, RAB, S, Tx. NatureServe GNR (Not Yet Ranked).

* ***Solanum torvum*** Swartz. TURKEY-BERRY. **Hab:** Disturbed areas. **Dist:** Native of West Indies. Introduced in AL. **Phen:** Jan-Dec. **Syn:** = Bah, Fl6, K1, K3, K4, WH3. NatureServe GNR (Not Yet Ranked).

* ***Solanum viarum*** Dunal. TROPICAL SODA APPLE. **Hab:** Pastures. **Dist:** Native of South America (s. Brazil, Paraguay, and n. Argentina). This species has only recently appeared in our area, but has been publicized as a severe, extremely aggressive, and rapidly spreading weed (Wunderlin et al. 1993; Mullahey et al. 1993; Mullahey 1996). **Phen:** Apr-Sep. **Syn:** = Fl6, K1, K3, K4, WH3. NatureServe GNR (Not Yet Ranked).

360. SPHENOCLEACEAE Baskerville 1839 (CHICKENSPIKE FAMILY) [in SOLANALES]

A monotypic family of 1 genus and 1 species, an annual herb, of tropical regions, native of the Old World. References: Lammers in Kadereit & Bittrich (2016); Rosatti (1986).

Sphenoclea Gaertner 1788 (CHICKENSPIKE)

A genus of 1 species, an annual herb, native of the Old World. References: Lammers in Kadereit & Bittrich (2016).

* ***Sphenoclea zeylanica*** Gaertner. CHICKENSPIKE, GOOSEWEED. **Hab:** Rice plantations, reservoirs, other disturbed wetlands. **Dist:** Native of Old World tropics. **Phen:** Jul-Nov. **Syn:** = Ar, Fl6, K1, K3, K4, NcTx, S, Tx, WH3, Rosatti (1986); = *Sphenoclea zeylandica* – GW2, RAB, orthographic error (presumably from a mistaken notion that the epithet refers to New Zealand rather than Ceylon). NatureServe G4G5 (Apparently Secure).

361. *HYDROLEACEAE* R. Brown 1821 (HYDROLEA FAMILY) [in SOLANALES]

A family of one genus and 11-12 species, herbs and shrubs of water bodies and wetlands, primarily tropical. The Hydroleaceae is not closely related to Hydrophyllaceae; recent molecular data confirm the view prevailing through most of the 19th century that *Hydrolea* should be placed in its own family. References: APG (2016); Bittrich & Amaral in Kadereit & Bittrich (2016); Ferguson (1998); Hilger & Diane (2003).

Hydrolea Linnaeus 1762

A genus of about 11 species, aquatic and wetland herbs, of tropical and subtropical regions.

- 1 Flowers in axillary cymes; leaves 3-14 cm long, 1.5-4 cm wide; axillary spines present in the axils of some leaves; corolla 7-8 mm long.
 - 2 Calyx and stem sparsely pubescent with spreading hairs 2-3 mm long *Hydrolea quadrivalvis*
 - 2 Calyx and stem glabrous, or minutely puberulent or with sessile glands *Hydrolea uniflora*
- 1 Flowers in terminal cymes or corymbs; leaves 2-6 cm long, 0.6-2.5 cm wide; axillary spines present or absent; corolla 10-15 mm long. *Hydrolea ovata*

Hydrolea ovata Nuttall ex Choisy. OVATE FIDDLELEAF. **Hab:** Swamps, ponds, ditches. **Dist:** C. GA and Panhandle FL west to TX, north in the interior to sc. TN and MO. **Phen:** Jun-Sep. **Syn:** = *Ar*, C, F, Fl6, G, GW2, K1, K3, K4, NcTx, Tn, Tx, WH3; = *Nama ovatum* (Nuttall ex Choisy) Britton – S. NatureServe G5 (Secure).

Hydrolea quadrivalvis Walter. WATERPOD. **Hab:** Swamp forests, backwater sloughs, especially in cypress-gum forests, marshes, ditches. **Dist:** Se. VA south to c. peninsular FL, west to LA. **Phen:** Jun-Sep. **Syn:** = C, F, Fl6, G, GW2, K1, K3, K4, RAB, Tn, Va, WH3; = *Nama quadrivalve* (Walter) Kuntze – S. NatureServe G5 (Secure).

Hydrolea uniflora Rafinesque. **Hab:** Swamp forests, sloughs, marshes. **Dist:** Mainly in the Mississippi River Alluvial Plain, west to e. TX and east to AL, TN, and KY. **Phen:** Jun-Sep. **Syn:** = *Ar*, C, F, G, GW2, Il, K1, K3, K4, Tn, Tx; = *Hydrolea affinis* A. Gray; = *Nama affine* (A. Gray) Kuntze – S. NatureServe G5 (Secure).

366. *OLEACEAE* Hoffmannsegg & Link 1809 (OLIVE FAMILY) [in LAMIALES]

A family of about 25 genera and 600-615 species, trees and shrubs, nearly cosmopolitan, but centered in Asia. References: Green in Kadereit (2004); Hardin (1974); Li et al (2020).

- 1 Leaves compound. *Fraxinus*
- 1 Leaves simple.
 - 4 Leaves cordate or truncate at the base; fruit a 4-seeded capsule; corolla lobes shorter than the tube; flowers lilac or white, in terminal panicles; [tribe *Oleeae*, subtribe *Ligustrinae*] *Syringa*
 - 4 Leaves cuneate to rounded at the base; fruit a drupe; corolla lobes either shorter or longer than the tube; flowers white or greenish-white, in terminal or lateral panicles or fascicles.
 - 5 Corolla absent; calyx minute or lacking; flowers in axillary fascicles; [tribe *Oleeae*, subtribe *Oleinae*] *Forestiera*
 - 5 Corolla present (often conspicuous and showy); calyx present; flowers in lateral or terminal panicles or in terminal subumbellate clusters.
 - 7 Corolla lobes elongate, much longer than the corolla tube; [tribe *Oleeae*, subtribe *Oleinae*] *Chionanthus*
 - 7 Corolla lobes short, no longer than the corolla tube.
 - 8 Inflorescence a many-flowered terminal panicle; leaves generally ovate, elliptic or lanceolate (widest below or at the middle); [tribe *Oleeae*, subtribe *Ligustrinae*] *Ligustrum*
 - 8 Inflorescence a few-flowered axillary panicle or fascicle; leaves generally oblanceolate or obovate (widest above the middle); [tribe *Oleeae*, subtribe *Oleinae*] *Cartrema*

Cartrema Rafinesque 1838 (WILD OLIVE, DEVILWOOD)

A genus of 2 species, trees, of e. North America. Several Asian species that have sometimes been included in *Cartrema* are not closely related to *Cartrema* and are better placed in *Chengiodendron* (Li et al. 2020). References: Guo et al (2011); Hardin (1974); Li et al (2020); Nesom (2012d); Nesom in FNA () (in prep); Weakley et al (2011).

N : no
P : plar....
? : questionable

Cartrema americanum (Linnaeus) Nesom. WILD OLIVE, DEVILWOOD. **Hab:** Maritime forests and (in FL, GA, SC, and extreme s. NC) hammocks and other dry, sandy forests well inland, and reported southwards for wet habitats as well. **Dist:** Se. VA south to c. peninsular FL, west to e. LA (Florida parishes); also in Mexico (CHP). **Phen:** Apr-May; Aug-Oct. **Comm:** The very hard, tough, and "unsplittable" wood is the inspiration for the common name "Devilwood". *C. americanum* is a conspicuous element of maritime forests in most of our coastal area, readily recognizable by the flattened twigs characteristic of the family, and the opposite (or typically, actually subopposite), glossy, oblanceolate to obovate, evergreen leaves. **Syn:** = Fl6, Zhang, Zhang, & Endress (2003); = *Amarolea americana* (Linnaeus) Small – S; = *Cartrema americana* – K4, Nesom (2012d), Weakley et al (2011), orthographic variant; = *Osmanthus americana* – GW2, orthographic variant; = *Osmanthus americanus* (Linnaeus) Benth & Hooker f. – F, G, Meso4.1, RAB, Va, WH3; = *Osmanthus americanus* var. *americanus* – C, K1, K2, Hardin (1974).

Chionanthus Linnaeus 1753 (FRINGE-TREE, OLD MAN'S BEARD)

A genus of controversial circumscription, of only 2 species, limited to se. North America. The genus has often in the past been circumscribed much more broadly, to include 55-60 additional and primarily tropical species. Hong-Wa & Besnard (2013) excluded the African and Madagascanian species and suggested a much narrower circumscription of *Chionanthus*; Li et al. (2020) deepened the understanding that tropical *Chionanthus* are not closely related to our two species in eastern North America. While the disposition of the tropical clades has not been resolved, it is clear that they are not part of *Chionanthus* (whose type species is *C. virginicus*). References: Hardin (1974); Hong-Wa & Besnard (2013); Li et al (2020); Nesom (in prep).

Chionanthus virginicus Linnaeus. FRINGE-TREE, OLD MAN'S BEARD. **Hab:** Dry, mesic, or wet forests and woodlands, granitic flatrocks and domes, glades and barrens over various rocks (including granite, greenstone, etc.), swamp forests in the Coastal Plain, tidal swamps, rarely pocosins. **Dist:** NJ, s. PA, s. OH, and MO south to c. peninsular FL and e. TX. **Phen:** (Late Feb-) Apr-May; Jul-Sep. **Tax:** *C. virginicus* in our area shows a diversity of morphology and correlated habitat that suggests the possible presence of two taxa. Swamp- and pocosin-inhabiting populations in the outer Coastal Plain have leaves 4-8× as long as wide and seem very different than Piedmont dry woodland populations with leaves 1-2× as long as wide; further and more careful study is needed. **Comm:** *C. virginicus* is a traditional southern yard plant, often used as a 'specimen plant', very showy in spring, particularly when grown to its full size. **Syn:** = Ar, C, F, Fl6, FNA, G, GW2, IL, K1, K3, K4, NE, NY, Pa, RAB, Tn, Va, W, WH3, Hardin (1974); = *Chionanthus virginica* – S, orthographic variant; > *Chionanthus virginica* var. *maritima* Pursh – Tx; > *Chionanthus virginica* var. *virginica* – Tx. NatureServe G5 (Secure).

Forestiera Poiret 1812 (FORESTIERA)

A genus of about 15-20 species, shrubs, of sw. and se. North America, Central America, and the West Indies. References: Anderson (1985); Brooks (1977); Godfrey (1988); Green in Kadereit (2004); Hardin (1974); Johnston (1957); Nesom (2009e).

- 2 Leaves (6-) 7-8 (-9) cm long, long-acuminate or acuminate (rarely acute) at the apex, the tip sharply pointed; [of swamp forests, sloughs, and ponds] ***Forestiera acuminata***
- 2 Leaves 1.5-7 (-8) cm long, obtuse at the apex, or if short-acuminate the ultimate tip blunt; [of uplands, over calcareous rocks or shell] ***Forestiera ligustrina***

Forestiera acuminata (Michaux) Poiret. SWAMP FORESTIERA, SWAMP-PRIVET. **Hab:** Swamp forests, especially over calcareous substrates. **Dist:** SC south to n. FL, west to TX, north in the interior to KY, e. and c. TN, IN, IL, MO, and KS. **Phen:** Feb-May; Apr-Jun. **Syn:** = Ar, C, F, Fl6, G, GrPl, GW2, IL, K1, K3, K4, NcTx, RAB, S, Tn, Tx, WH3, Anderson (1985), Brooks (1977), Godfrey (1988), Hardin (1974), Johnston (1957); = *Adelia acuminata* Michaux. NatureServe G5 (Secure).

Forestiera ligustrina (Michaux) Poiret. GLADE FORESTIERA, SOUTHERN-PRIVET. **Hab:** Upland forests, woodlands, and glades, mostly on calcareous rocks or shell middens. **Dist:** E. SC south to n. peninsular FL, west to sc. KY, c. TN, AL, and MS; disjunct in w. LA and e. TX. **Syn:** = Fl6, K1, K3, K4, S, Tn, Tx, WH3, Brooks (1977), Godfrey (1988), Hardin (1974), Johnston (1957); = *Adelia ligustrina* Michaux. NatureServe G4G5 (Apparently Secure).

Fraxinus Linnaeus 1753 (ASH)

A genus of about 43-65 species, trees, mostly north temperate (Asia, North America, Europe). References: Campbell (2017); Green in Kadereit (2004); Hardin & Beckmann (1982); Miller (1955); Nesom (2010g); Nesom (2010i); Wallander (2008); Ward (2011a); Whittemore et al (2018).

Unkeyed taxa: *Fraxinus berlandierana*

Key to Map
Symbology:

- 1 Leaves minutely honeycombed-reticulate beneath (best seen at magnification of 40-100×), more-or-less strongly whitened (and otherwise variously glabrous or pubescent); [*Fraxinus americana* complex].
- 3 Petiole bases and leaf scars V- to U- or crescent-shaped with a deeply concave or notched upper margin; samaras (19-) 25-32 (-38) mm long, samara wings 3-5 (-6) mm wide, samara bodies (5-) 6-11 mm long, 1.5-2.5 mm wide; twigs, petioles, petiolules, and rachises glabrous.....*Fraxinus americana*
- 3 Petiole bases and leaf scars oblong-obovate to widely obovate with a nearly truncate or very shallowly bowl-shaped upper margin; samaras (32-) 33-54 mm long, samara wings (4.5-) 5-8 mm wide, samara bodies (7-) 10-15 mm long, 2-4 mm wide; twigs, petioles, petiolules, and rachises glabrous or hirtellous to hirtellous-puberulent to tomentulose.
- 4 Twigs, petioles, petiolules, and rachises sparsely to densely hirtellous to hirtellous-puberulent or tomentulose; samaras 33-54 mm long, samara wings 6-8 mm wide, samara bodies (7-) 11-15 mm long, 2-4 mm wide.....*Fraxinus biltmoreana*
- 4 Twigs, petioles, petiolules, and rachises glabrous; samaras (32-) 36-44 mm long, samara wings (4.5-) 5-7 mm wide, samara bodies (9-) 10-13 mm long, 2-3.5 mm wide.....*Fraxinus smallii*
- 1 Leaves not minutely-honeycombed-reticulate beneath (sometimes with papillae and small scales visible at 40×, but these not forming a developed netlike pattern), pale green (and otherwise variously glabrous or pubescent).
- 5 Youngest twigs 4-angled to narrowly 4-winged; petiole bases raised on a distinct pedestal; lateral leaflets sessile to subsessile; [of dry to mesic sites].
-*Fraxinus quadrangulata*
- 5 Youngest twigs terete; petiole bases flush with stem; lateral leaflets sessile to subsessile or petiolulate; [of mesic to wetland sites].
- 8 Samara wings arising abruptly from the upper (distal) 1/5-1/4 (-1/2) of the samara body; samara wings 4-7 mm wide.....*Fraxinus pennsylvanica*
- 8 Samara wings arising from the base or lower (proximal) 1/4 of the samara body; samara wings (5.5-) 6-20 (-22) mm wide.
- 9 Trees, 15--30(-40) m tall; leaflet blades (7-) 9-15 (-25) cm long × (2.5-) 3.5-7 (-11) cm wide, the bases often rounded, sometimes obtuse to acute or acuminate; samaras (35-) 40-70 (-75) mm long, the wings gradually expanded from near the base of the body to the proximal 1/2, (5.5-) 6-10 (-12) mm wide.....*Fraxinus profunda*
- 9 Shrubs, trees, or shrublike trees, 2.5-12 (-15) m tall; leaflet blades 4-12 (-15) cm long × (1-) 2-5 (-6) cm wide, the bases acute to truncate or rounded; samaras (25-) 30-50 (-54) mm long, the wings arising **either** from the base of the body to the proximal 1/4 **or** from the middle/proximal 3/4 of the body, 6-20 (-22) mm wide.
-*Fraxinus caroliniana*

Fraxinus americana Linnaeus. WHITE ASH, AMERICAN ASH. **Hab:** Mesic slopes, rich cove forests. **Dist:** NS west to MN, south to n. peninsular FL and TX. **Phen:** Apr-May; Aug-Oct. **Comm:** A valuable timber tree. **Syn:** = Mi, NY, S, Tn, Campbell (2017), Miller (1955), Nesom (2010i); < *Fraxinus americana* Linnaeus – Ar, C, Fl6, GrPl, Il, K1, K3, K4, NeTx, NE, Tx, Va, W, WH3, Hardin (1974), Hardin, & Beckmann (1982), Ward (2010a); < *Fraxinus americana* Linnaeus var. *americana* – F, G, Pa, RAB, WV; > *Fraxinus americana* Linnaeus var. *curtissii* (Vasey) Sudworth; > *Fraxinus americana* Linnaeus var. *iodocarpa* (Fernald) Fernald ex Rehder; > *Fraxinus americana* var. *microcarpa* A. Gray – F; > *Fraxinus curtissii* Vasey. **NatureServe G4** (Apparently Secure).

Fraxinus berlandierana A.P. de Candolle. MEXICAN ASH. **Hab:** Along streams. **Dist:** Native of sc. OK south to s. TX, has been reported as naturalized in s. MS and e. LA (Kartesz 2010), but these records maybe merely based on cultivated individuals (Nesom 2010h). **Phen:** Mar-Aug. **Syn:** = K1, K3, K4, Nesom (2010i); = *Fraxinus berlandierana* – Tx, orthographic variant. **NatureServe G5** (Secure).

Fraxinus biltmoreana Beadle. BILTMORE ASH, BILTMORE WHITE ASH. **Hab:** Mesic slopes, rich cove forests, dry calcareous or mafic glades and woodlands (with *Juniperus virginiana* var. *virginiana* and *Carya glabra*), calcareous hammocks. **Dist:** NJ, OH, and IL south to n. peninsular FL, c. AL, c. MS, and LA. **Phen:** Apr-May; Aug-Oct. **Tax:** This controversial taxon has been recently clarified by Nesom (2010), though much additional information is needed to fully establish its distribution, ecology, and evolutionary origins. It is hexaploid (and possibly also tetraploid) (Whittemore et al. 2018). Whittemore et al. (2018) were disinclined to accept *F. biltmoreana* and *F. smallii* as taxa because of the lack of correlation of ploidy with morphological characters; additional study is needed. **Syn:** = Il, S, Tn, Miller (1955); = *Fraxinus americana* Linnaeus var. *biltmoreana* (Beadle) J. Wright ex Fernald – F, G, Pa, RAB, WV; = *Fraxinus biltmoreana* var. *biltmoreana* – Campbell (2017); < *Fraxinus americana* Linnaeus – Ar, C, Fl6, K1, K3, K4, NE, Va, W, WH3, Hardin (1974), Hardin, & Beckmann (1982); < *Fraxinus biltmoreana* Beadle – Whittemore et al (2018); > *Fraxinus catawbiensis* Ashe.

Fraxinus caroliniana P. Miller. WATER ASH, POP ASH, CAROLINA ASH. **Hab:** Deeply to shallowly flooded swamps, both alluvial and tidal. **Dist:** Se. MD south to n. FL, west to TX, primarily on the Coastal Plain. **Phen:** May; Jul-Oct. **Tax:** J.J.N. Campbell (pers. comm., 2020) suggests recognizing a varietal entity in the Apalachicola region of Panhandle FL, with smaller leaves and leaflets, proportionally broader samaras, and mature at shrub size. **Comm:** A small tree, sometimes very abundant (and nearly the only subcanopy species) as the understory in *Taxodium-Nyssa* swamps. Reported for se. MD by Longbottom, Naczi, & Knapp (2016). **Syn:** = Ar, C, G, K1, RAB, Tx, Va, Hardin & Beckmann (1982), Hardin (1974), Miller (1955), Nesom (2010i); = *Fraxinus caroliniana* var. *caroliniana* – Ward (2010a); < *Fraxinus caroliniana* P. Miller – GW2, K3, K4, S, WH3; > *Fraxinus caroliniana* var. *caroliniana* – F; > *Fraxinus caroliniana* var. *cubensis* (Grisebach) Lingelsheim – F, misapplied; > *Fraxinus caroliniana* var. *oblanceolata* (M.A. Curtis) Fernald & Schubert – F.

Fraxinus pennsylvanica Marshall. GREEN ASH, RED ASH. **Hab:** Bottomlands and swamps, especially along brownwater rivers and streams, rarely on mesic upland disturbed sites. **Dist:** NS west to AB, south to FL, TX, and CO. **Phen:** Apr-May; Aug-Oct. **Tax:** Variation in this species (see synonymy) needs further study. Campbell (2017) has provided a detailed analysis of variation in *F. pennsylvanica*, choosing to recognize four varieties. **Syn:** = Ar, C, GrPl, GW2, K1, K3, Mi, NE, NY, Pa, Tn, Va, W, Hardin & Beckmann (1982), Hardin (1974), Ward (2010a); > *Fraxinus darlingtonii* Britton – S; > *Fraxinus lanceolata* Borkhausen – Il; < *Fraxinus pennsylvanica* Marshall – Fl6, WH3; > *Fraxinus pennsylvanica* Marshall – Il, S; ? *Fraxinus pennsylvanica* ssp. *pennsylvanica* – Miller (1955); > *Fraxinus pennsylvanica* var. *austini* Fernald – F, Campbell (2017); > *Fraxinus pennsylvanica* var. *campestris* (Britton) F.C. Gates – Campbell (2017); > *Fraxinus pennsylvanica* Marshall var. *lanceolata* (Borkhausen) Sargent; > *Fraxinus pennsylvanica* var. *pennsylvanica* – F, G, RAB, WV, Campbell (2017); > *Fraxinus pennsylvanica* var. *subintegerrima* (Vahl) Fernald – F, G, RAB, WV, Campbell (2017); > *Fraxinus pennsylvanica* var. *integerrima* – Tx, orthographic variant.

(see introduction for more)

Fraxinus profunda (Bush) Bush. PUMPKIN ASH. **Hab:** Swamps, especially along blackwater rivers and streams and in freshwater tidal wetlands (as along the James, Pamunkey, Mattaponi, and Rappahannock rivers in e. VA), also in brownwater bottomlands; common (rare in Piedmont and Mountains). **Dist:** S. NJ south to n. FL, west to LA, mostly on the Coastal Plain, north in the interior to w. NC, sc. TN, e. AR, se. MO, s. IL, IN, OH, sc. MI, ne. PA, and w. NY. **Phen:** Apr-May; Aug-Oct. **Tax:** This species has a peculiar distribution; see McCormac, Bissell, & Stine (1995) and Nesom (2010) for additional discussion. The nomenclature has been controversial, but is now resolved. There is also some question as to its evolutionary history and appropriate taxonomic recognition; it may be an allopolyploid derivative of *F. pennsylvanica*, perhaps from multiple origins. Whittemore et al. (2018) determined it to be an octoploid. **Syn:** = Ar, C, GW2, IL, K1, K3, K4, Mi, NY, Pa, Tn, Va, W, Hardin (1974), Hardin, & Beckmann (1982), Ward (2010a); = *Fraxinus tomentosa* Michaux f. – F, G, RAB, Miller (1955); > *Fraxinus michauxii* Britton – S; < *Fraxinus pennsylvanica* Marshall – Fl6, WH3; > *Fraxinus profunda* (Bush) Bush – S.

Fraxinus quadrangulata Michaux. BLUE ASH. **Hab:** Mesic to dry calcareous woodlands and forests. **Dist:** S. ON west to s. MI and e. KS, south to sw. VA, e. TN, nw. GA, n. AL, and OK. **Phen:** Mar-May; Jul-Oct. **Syn:** = Ar, C, F, G, GrPl, IL, K1, K3, K4, Mi, S, Tn, Va, WV, Hardin (1974), Hardin, & Beckmann (1982), Miller (1955). NatureServe G4 (Apparently Secure).

Fraxinus smallii Britton. SMALL'S WHITE ASH. **Hab:** Bottomland forests, alluvial woods, river bluffs, upland hardwood forests, oak-pine forests. **Dist:** PA, MI, IA, and KS south to Panhandle FL and e. TX. **Phen:** (Feb-) Apr-May. **Tax:** Recent studies by Whittemore et al. (2018) did not find a correlation between ploidy and the morphological characters used by Nesom (2010i) to separate *F. biltmoreana* and *F. smallii*. Whittemore et al. (2018) suggest that *F. smallii* should be merged with *F. biltmoreana*, while Campbell (2017) proposed that it be reduced to varietal rank under *F. biltmoreana* (Campbell 2017). Additional study is needed. **Syn:** = Mi, S, Tn, Miller (1955); = *Fraxinus biltmoreana* var. *subcoriacea* J.J.N. Campbell – Campbell (2017); < *Fraxinus americana* Linnaeus – Ar, C, Fl6, GrPl, IL, K1, K3, K4, NcTx, Tx, Va, W, WH3, Hardin (1974), Hardin, & Beckmann (1982), Ward (2010a); < *Fraxinus americana* Linnaeus var. *americana* – F, G, Pa, RAB, WV; < *Fraxinus biltmoreana* Beadle – Whittemore et al (2018); < *Fraxinus pennsylvanica* Marshall – WH3.

Ligustrum Linnaeus 1753 (PRIVET)

Contributed by Guy L. Nesom and Alan S. Weakley

A genus of about 40 species, shrubs and trees, of the Old World. *Ligustrum* appears to be a monophyletic group phylogenetically embedded within *Syringa* (Li, Alexander, & Zhang 2002; Li et al. 2012); Li et al. (2012) recommend treating *Ligustrum* as series *Ligustreae* of *Syringa*, but species combinations have not been made. References: Green in Kadereit (2004); Hardin (1974); Li et al (2012); Li, Alexander, & Zhang (2002); Nesom (2009a).

- 1 Leaves (3-) 4-13 (-15) cm long.
- 2 Leaves mostly (3-) 4-8 (-9) cm long, with the primary lateral leaf veins in 3-5 pairs; leaf apex acute to abruptly acuminate; abaxial midvein covered by epidermis; flowers short-pedicellate on pedicels 0.5-2 mm; corolla tube hardly exserted from calyx, ca. equal lobe length *Ligustrum japonicum*
- 2 Leaves (4.5-) 6-13 (-15) cm, with the primary lateral veins in (5-) 6-8 pairs; leaf apex usually long-acuminate; abaxial midvein not covered by epidermis; flowers subsessile on pedicels 0-0.5 mm; corolla tube distinctly exserted from calyx, ca. 2× longer than lobes..... *Ligustrum lucidum*
- 1 Leaves 1.5-6 (-6.5) cm long.
- 5 Leaf blades narrowly oblong-elliptic to oblanceolate-elliptic, oblanceolate or narrowly obovate, usually broadest slightly above the middle; inflorescence usually narrowly cylindric, flowers sessile to subsessile in verticil-like clusters *Ligustrum quihoui*
- 5 Leaf blades variously shaped; inflorescence broadly cylindric to pyramidal, flowers sessile to pedicellate in broadly cylindric to pyramidal panicles of cymes.
- 6 Corolla tube 1.5-3× longer than the lobes. *Ligustrum obtusifolium* var. *suave*
- 6 Corolla tube < 1.2× as long as the lobes.
- 8 Leaves ovate-elliptic to oblong-ovate, elliptic-lanceolate, or suborbicular, primary lateral veins (3-) 4-5 pairs, apex obtuse to rounded or retuse, abaxial midvein usually sparsely hirsutulous to puberulent; inflorescence diffuse and open panicles terminal and on essentially leafless, lateral branches interspersed with leafy ones; branchlets hirtellous to loosely substrigose with straight hairs of uneven length; corolla tube slightly shorter than lobes, often barely exserted from the calyx tube; pedicels glabrous..... *Ligustrum sinense*
- 8 Leaves elliptic-lanceolate to elliptic-ovate, primary lateral veins 4-6 pairs, apex obtuse to acute, abaxial midvein usually glabrous or with a few scattered hairs; inflorescence mostly a compact, terminal panicle; branchlets evenly and minutely hirtellous to hirsutulous with relatively even-length hairs; corolla tube equal the lobes or slightly shorter, distinctly exserted from the calyx tube; pedicels hirtellous..... *Ligustrum vulgare*

* ***Ligustrum japonicum*** Thunberg. JAPANESE PRIVET. **Hab:** Disturbed places. **Dist:** Native of Japan and Korea. **Phen:** Apr-Jun. **Syn:** = Ar, Fl6, K1, K3, K4, NcTx, RAB, Va, WH3, Hardin (1974), Nesom (2009a). NatureServe GNR (Not Yet Ranked).

* ***Ligustrum lucidum*** W.T. Aiton. GLOSSY PRIVET, BROADLEAF PRIVET. **Hab:** Disturbed places. **Dist:** Native of China, Japan, and Korea. **Phen:** Jun-Sep. **Comm:** This species is superficially similar to *L. japonicum*; the lateral leaf veins are translucent in this species. **Syn:** = Ar, Fl6, K1, K3, K4, Meso4.1, NcTx, S, WH3, Hardin (1974), Nesom (2009a). NatureServe G5 (Secure).

* ***Ligustrum obtusifolium*** Siebold & Zuccarini var. *suave* (Kitagawa) H. Hara. AMUR PRIVET. **Hab:** Disturbed places. **Dist:** Native of Japan. **Syn:** = K4, NE, NY, Va, Nesom (2009a); = *Ligustrum amurense* Carrière – C, F, G, K1, Pa, RAB, Hardin (1974); = *Ligustrum obtusifolium* ssp. *suave* (Kitagawa) Kitagawa – K3; = *Ligustrum obtusifolium* Siebold & Zuccarini var. *amurense* (Carrière) Mansfeld. NatureServe GNR (Not Yet Ranked).

366. OLEACEAE

642

* **Ligustrum quihoui** Carrière. WAXY-LEAF PRIVET. **Hab:** Glade margins, suburban woodlands, disturbed places. **Dist:** Native of China. Though seemingly established only rarely in parts of our area, this species has the potential to become another noxious "shrub weed" across the region. Reported for AL by Diamond & Keener (2012). **Phen:** May-Jul. **Syn:** = Ar, Fl6, K1, K3, K4, NcTx, Tx, WH3, Hardin (1974), Nesom (2009a); = n/a – RAB. NatureServe GNR (Not Yet Ranked).

* **Ligustrum sinense** Loureiro. CHINESE PRIVET, "PRIVY HEDGE". **Hab:** Moist forests, especially alluvial bottomlands, and also in a wide range of other forests, woodlands, glade edges, etc. **Dist:** Native of China. **Phen:** (Late Apr-) May-Jun. **Comm:** This species is one of the most noxious of all weeds in much of our area, choking out native vegetation. The rapidity with which it has engulfed southern wetlands (and increasingly uplands as well) is hinted at by Small's (1933) mention of it only as "an escape in southern Louisiana". **Syn:** = Ar, C, Fl6, G, GW2, K1, K3, K4, Meso4.1, NcTx, NE, RAB, S, Tn, Tx, Va, W, WH3, Hardin (1974), Nesom (2009a). NatureServe GNR (Not Yet Ranked).

* **Ligustrum vulgare** Linnaeus. COMMON PRIVET. **Hab:** Disturbed places. **Dist:** Native of Europe and n. Africa. **Phen:** May-Jul. **Syn:** = Ar, C, F, G, Il, K1, K3, K4, Mi, NE, NY, Pa, S, Va, WV, Hardin (1974), Nesom (2009a). NatureServe GNR (Not Yet Ranked).

Syringa Linnaeus 1753 (LILAC)

A genus of about 20-23 species, shrubs, from s. Europe to se. Asia. See *Ligustrum* for discussion of generic circumscription. References: Green in Kadereit (2004); Hardin (1974); Li et al (2012); Li, Alexander, & Zhang (2002).

* **Syringa vulgaris** Linnaeus. LILAC. **Hab:** Commonly planted, persistent and naturalizing around old farms. **Dist:** Native of se. Europe. **Phen:** Apr-May. **Syn:** = C, F, G, Il, K1, K3, K4, Mi, NE, NY, Pa, Va, Hardin (1974). NatureServe GNR (Not Yet Ranked).

367. TETRACHONDRAEAE Skottsberg ex Wettstein 1924 (TETRACHONDRA FAMILY) [in LAMIALES]

A family of 2 genera, *Polypremum* and *Tetrachondra* (Oxelman et al. 1999), and 3 species, perennial herbs, of s. North America south to South America, and New Zealand. The assignment of *Polypremum* to family has been controversial, with placement formerly in Loganiaceae or Buddlejaceae. A recent molecular analysis strongly suggests that its closest relationship is with *Tetrachondra* (Oxelman et al. 1999), and the treatment followed here reflects the current general consensus. Some prefer to treat it in the monospecific Polypremaceae (Reveal 2011). References: Oxelman, Backlund, & Bremer (1999); Rabeler & Freeman (2019c) in FNA17 (2019); Wagstaff in Kadereit (2004).

Polypremum Linnaeus 1753 (POLYPREMUM)

The genus is monotypic, an herb, or warm temperate, subtropical and tropical America. References: Rabeler (2019) in FNA17 (2019); Rogers (1986); Wagstaff in Kadereit (2004).

Identification Notes: Plants tend to turn a distinctive orangish color in midsummer to later in the year.

Polypremum procumbens Linnaeus. POLYPREMUM, RUSTWEED, JUNIPERLEAF. **Hab:** Dunes, longleaf pine sandhills, pine flatwoods, pond margins, fields, pastures, roadsides, riverside sand bars, disturbed areas. **Dist:** Se. NY, NJ, and MO south to FL and TX, south into Central America and South America; West Indies. **Phen:** Late May-Nov; Aug-Dec. **Syn:** = Ar, Bah, C, F, Fl6, FNA17, G, GW2, Il, K1, K3, K4, Meso4.1, NcTx, RAB, S, Tn, Tx, Va, W, WH3, Rogers (1986). NatureServe G5 (Secure).

370. PLANTAGINACEAE A.L. de Jussieu 1789 (PLANTAIN FAMILY) [in LAMIALES]

As radically recircumscribed, a family of about 100-120 genera and 1800-1900 species, herbs and shrubs, nearly cosmopolitan. References: Albach, Meudt, & Oxelman (2005); Fischer in Kadereit (2004); Freeman, Rabeler, & Elisens (2019c) in FNA17 (2019); Olmstead et al (2001); Schwarzbach in Kadereit (2004).

1 Leaves alternate, at least those on the upper stem; calyx 5-merous; stamens 4.

3 Corolla with a broad pouch at the base (saccate or gibbose).

3 Corolla with a slender spur at the base.

5 Flowers in terminal racemes *Antirrhinum*

5 Flowers solitary in leaf axils. *Linaria*

5 Flowers solitary in leaf axils. *Kickxia*

370. PLANTAGINACEAE

- 1 Leaves either strictly basal, or opposite or whorled throughout; calyx 0-, 4-, or 5-merous; stamens 1, 2, or 4.
 - 8 Leaves strongly basally disposed, usually all the leaves basal; petals 4, scarious and translucent in texture; inflorescence a spike; [tribe *Plantagineae*] *Plantago*
 - 8 Leaves cauline, either opposite or whorled; petal 0, or 4, or 5; inflorescence various.
 - 9 Leaves whorled. *Veronicastrum*
 - 9 Leaves opposite.
 - 11 Petals 0; sepals 0, stamens 1; leaves both < 2 cm long and entire; [tribe *Callitricheae*]..... *Callitriche*
 - 11 Petals 4 or 5; sepals 4 or 5; stamens 2 or 4; leaves > 2 cm long, or serrate, or both.
 - 12 Calyx and corolla 4-merous.
 - 13 Leaves punctate; stamens 4; [tribe *Gratioleae*]..... *Scoparia*
 - 13 Leaves not punctate; stamens 2; [tribe *Veroniceae*] *Veronica*
 - 12 Calyx and corolla 5-merous.
 - 14 Plants erect, moderately robust, usually > 4 dm tall, larger leaves > 5 cm long; inflorescences terminal (the bracts subtending flowers strongly reduced in size in comparison to main leaves of the stem); [tribe *Cheloneae*].
 - 15 Inflorescence compact, the inflorescence axis generally hidden by the closely packed and overlapping flowers; each flower subtended by large overlapping bracts..... *Chelone*
 - 15 Inflorescence more diffuse, the inflorescence axis readily visible between the flowers; flowers lacking extra subtending bracts *Penstemon*
 - 14 Plants creeping, decumbent or erect, small, usually < 4 dm tall (except *Mecardonia*, to 5 dm tall), larger leaves < 5 cm long; inflorescences axillary (all or most of the flowers axillary to more-or-less normally sized leaves).
 - 16 Stamens 2; [section *Gratioleae*].
 - 18 Flowers and fruits on definite pedicels; annual or perennial; leaves not papillose *Gratiola*
 - 18 Flowers and fruits sessile or subsessile, the pedicels < 1 mm long; perennial; leaves papillose on the surfaces and margins..... *Sophranthe*
 - 16 Stamens 4.
 - 20 Leaves deeply pinnatifid; [tribe *Stemodieae*]..... *Leucospora*
 - 20 Leaves entire or toothed; [tribe *Gratioleae*].
 - 21 Corolla nearly radially symmetrical; corolla lobes about as long as the corolla tube; leaves palmately veined, with parallel veins diverging from the base, margins entire to crenulate; of aquatic to moist habitats, often somewhat succulent..... *Bacopa*
 - 21 Corolla distinctly bilabiate; corolla lobes shorter than the corolla tube; leaves pinnately veined, with a single main-vein and lateral veins diverging along it, margins serrate; of moist habitats, not succulent *Mecardonia*

Antirrhinum Linnaeus 1753 (SNAPDRAGON)

A genus of about 20 species, herbs, of Mediterranean Europe. References: Barringer & Harriman (2019a) in FNA17 (2019); Pennell (1935); Sutton (1988).

* *Antirrhinum majus* Linnaeus. COMMON SNAPDRAGON. **Hab:** Cultivated, rarely persistent or naturalized. **Dist:** Native of Mediterranean Europe. **Phen:** May-Nov. **Syn:** = C, FNA17, G, GrPI, II, K1, K3, K4, Mi, NE, NY, Pa, WV, Pennell (1935), Sutton (1988). NatureServe GNR (Not Yet Ranked).

Bacopa Aublet 1775 (WATER-HYSSOP)

A genus of about 50 species, herbs (mostly aquatic or at least wetland), of tropical, subtropical, and warm temperate regions of the Old and New Worlds. References: Ahedor (2019a) in FNA17 (2019); Fernald (1942a); Pennell (1935); Schuyler (1989).

- 1 Fresh plants strongly aromatic when bruised; corolla blue, 9-13 mm long; stem and leaves pubescent..... *Bacopa caroliniana*
- 1 Fresh plants not aromatic when bruised; corolla predominantly white (in some species slightly pink or marked with yellow), 2-10 mm long; stem and leaves pubescent or glabrous.
 - 2 Leaves glabrous; leaf margins crenate to serrate or entire; flowers radially symmetrical. *Bacopa monnieri*
 - 2 Leaves pubescent, leaf margins entire; flowers bilaterally symmetrical.
 - 4 Corolla 4-10 mm long, white with a yellow throat; capsule ca. 5 mm long..... *Bacopa rotundifolia*
 - 4 Corolla 2-5 mm long, white or pink, without a yellow throat; capsule 2-3 mm long.
 - 5 Leaves strongly clasping, mostly ovate; stamens 2 (or very rarely 4); [native]..... *Bacopa innominata*
 - 5 Leaves only slightly clasping, mostly obovate; stamens 4; [a very rare introduction]..... *Bacopa repens*

Bacopa caroliniana (Walter) B.L. Robinson. BLUE WATER-HYSSOP, SWEET WATER-HYSSOP, CAROLINA WATER-HYSSOP, LEMON BACOPA. **Hab:** Wet shores, tidal muds, marshes, disturbed wetland sites. **Dist:** Se. VA south to s. FL, west to e. TX; disjunct in KY. **Phen:** May-Oct. **ID Notes:** The strongly fragrant stems and leaves are unique. **Syn:** = C, F, Fl6, FNA17, G, GW2, K1, K3, K4, RAB, Tn, Tx, Va, W, WH3; = *Hydrotrida caroliniana* (Walter) Small – S, Pennell (1935). NatureServe G4G5 (Apparently Secure).

Bacopa innominata (M. Gómez) Alain. TROPICAL WATER-HYSSOP. **Hab:** Freshwater tidal muds, marshes, shallow water. **Dist:** MD south to s. FL, and in the West Indies and Central America. **Phen:** Jun-Sep. **Tax:** *B. stragula* Fernald has been considered a rare endemic of tidal areas in VA and MD, differing from *B. innominata* in its glabrous stems (vs. pubescent), smaller flowers (the corolla < 3 mm long vs. > 3 mm long), and shorter, glabrous pedicels 3-6 mm long (vs. pubescent and to 8 mm long). Schuyler (1989) concluded that *B. stragula* is an intertidal form of *B. innominata*, the morphologic differences induced by the flooding regime. Additional work, perhaps involving growth under experimental conditions or chemical

370. PLANTAGINACEAE

or molecular studies, is needed to corroborate Schuyler's conclusion. See Schuyler (1989), F, and Fernald (1942) for further discussion. **Syn:** = C, Fl6, FNA17, GW2, K1, K3, K4, Va, WH3, Schuyler (1989); > *Bacopa cyclophylla* Fernald – RAB; > *Bacopa stragula* Fernald – F, G; ? *Herpestis rotundifolia* Gaertner f. – S, Pennell (1935); ? *Macuillamia obovata* Rafinesque – Pennell (1935). **NatureServe G3G5** (Apparently Secure).

Bacopa monnieri (Linnaeus) Pennell. BRAHMI, INDIAN-PENNYWORT, HERB-OF-GRACE, MONNIER'S WATER-HYSSOP. **Hab:** Freshwater tidal marshes, muddy shores, streams and pools. **Dist:** E. MD and e. VA south to s. FL, west to c. TX, and in the West Indies and the New World subtropics and tropics; also Old World tropics and subtropics. **Phen:** Apr-Sep. **Syn:** = Ar, Bah, C, F, Fl6, FNA17, G, GW2, K1, K3, K4, NcTx, RAB, Tx, Va, WH3; = *Bramia monnieri* (Linnaeus) Drake – S, Pennell (1935). **NatureServe G5?** (Secure).

* ***Bacopa repens*** (Swartz) Wettstein. SOUTH AMERICAN WATER-HYSSOP. **Hab:** Freshwater pools. **Dist:** Presumably native of the New World tropics. **Phen:** Jul-Sep. **Syn:** = Ar, Fl6, FNA17, GW2, K1, K3, K4, RAB, Tn, WH3; = *Macuillamia repens* (Swartz) Pennell – S, Pennell (1935). **NatureServe GNR** (Not Yet Ranked).

Bacopa rotundifolia (Michaux) Wettstein. MIDWESTERN WATER-HYSSOP. **Hab:** Tidal muds, shallow water of large natural lake, river sandbars, other shallow water and shore situations. **Dist:** IN and IA west to ND and MT, south to AL and AZ; disjunct in e. MD, e. VA, ne. NC, and e. SC (Bradley et al. [in prep.]), where apparently native, though Cronquist (1991) considered introduced. Known in NC only from Lake Mattamuskeet, Hyde County, where not seen since 1929. **Phen:** May-Sep (-Nov). **Comm:** *B. simulans* Fernald has been considered a rare endemic of tidal areas in VA and MD. It is alleged to differ from *B. rotundifolia* in its glabrous to glabrescent stems (vs. pubescent), more succulent condition, smaller leaves (the larger 1-2 cm long and 0.6-1.5 cm wide vs. 2-3.5 cm long and 1.5-2.7 cm wide), smaller flowers (corolla 3-4 mm long vs. 6-10 mm long). Schuyler (1989) concluded that *B. simulans* is an intertidal form of *B. rotundifolia*, the morphologic differences the result of differences in inundation. Additional work, perhaps involving growth under experimental conditions or chemical or molecular studies, is needed to corroborate Schuyler's conclusion. See Schuyler (1989), F, and Fernald (1942) for further discussion. **Syn:** = Ar, C, FNA17, GrPl, GW2, Il, K1, K3, K4, Mo1, NcTx, Tn, Tx, Schuyler (1989); = *Macuillamia rotundifolia* (Michaux) Rafinesque – S, Pennell (1935); > *Bacopa rotundifolia* (Michaux) Wettstein – F, G; > *Bacopa simulans* Fernald – F, G.

*Callitriche* Linnaeus 1753 (WATER-STARWORT)

A genus of 20-50 species, annual and perennial herbs of aquatic, wetland, and upland habitats, nearly cosmopolitan. This genus should be included in a greatly expanded Plantaginaceae. References: APG (2016); Crow & Hellquist (2000a); Erbar & Leins in Kadereit (2004); Fassett (1951); Lansdown (2009); Lansdown (2019) in FNA17 (2019); Pránčl et al (2020).

- 2 Flowers and young fruits with 2 inflated bracteoles at the base; leaves dimorphic (with floating rosettes of spatulate leaves and submersed linear leaves) or monomorphic. *Callitriche heterophylla* var. *heterophylla*
- 2 Flowers and young fruits lacking bracts at their base; leaves monomorphic, obovate-spatulate, rounded at the tip. *Callitriche peploides*
- 5 Mericarps bent at an angle and thickened on one side at the base; [of SC southward] *Callitriche peploides*
- 5 Mericarps not bent at an angle nor thickened at the base; [collectively widespread] *Callitriche pedunculosa*
- 6 Fruit on pedicels 0.5-7 mm long; margin of fruit curled over on itself, appearing thickened; fruit developing underground *Callitriche pedunculosa*
- 6 Fruit on pedicels 0.1-0.6 mm long; margin of fruit narrow, thin; fruit developing aboveground *Callitriche terrestris*

Callitriche heterophylla Pursh var. *heterophylla*. COMMON WATER-STARWORT. **Hab:** Pools, slow-moving streams, ditches. **Dist:** Greenland west to AK, south to c. peninsular FL, TX, CA, and Mexico. **Phen:** Mar-Nov. **Tax:** The other variety, var. *bolanderi* (Hegelmann) Fassett, with larger fruits, co-occurs with var. *heterophylla* in nw. North America and is of uncertain taxonomic status, having been treated as species, subspecies, variety, and lumped. **Syn:** = NE, Va, Lansdown (2009); = *Callitriche heterophylla* ssp. *heterophylla* – K1, K3, K4, NY; > *Callitriche anceps* Fernald – F, Fassett (1951); < *Callitriche heterophylla* – Ar, C, Fl6, FNA17, G, GrPl, GW2, Il, Mi, NcTx, Pa, RAB, S, Tn, Tx, W, WH3, Crow & Hellquist (2000a); > *Callitriche heterophylla* – F; > *Callitriche heterophylla* Pursh var. *heterophylla* – Fassett (1951). **NatureServe G5T5** (Secure).

Callitriche pedunculosa Nuttall. NUTTALL'S WATER-STARWORT. **Hab:** Low fields, pond shores. **Dist:** NC, c. TN, and OK south to c. peninsular FL, AL, and TX. **Phen:** Late Mar-Apr. **Syn:** = Fl6, FNA17, K1, K3, K4, WH3; = *Callitriche nuttallii* Torrey – Ar, GW2, NcTx, Tn, Tx, Crow & Hellquist (2000a), Fassett (1951), Lansdown (2009). **NatureServe G5** (Secure).

Callitriche peploides Nuttall. **Hab:** Low fields, ditches. **Dist:** SC south to s. FL, west to TX; disjunct inland in AR (the report for Polk Co., TN erroneous); e. Mexico south to Costa Rica. **Phen:** (Jan-) Feb-Apr (-Jun). **Syn:** = Ar, Fl6, FNA17, GW2, K1, K3, K4, NcTx, RAB, S, Tx, WH3, Lansdown (2009); > *Callitriche peploides* var. *peploides* – Fassett (1951). **NatureServe G4G5** (Apparently Secure).

Callitriche terrestris Rafinesque. TERRESTRIAL WATER-STARWORT. **Hab:** Clay-pan areas, streambanks, ditches, low fields, wet paths. **Dist:** MA to KS, south to GA, TX, and Mexico. **Phen:** Apr-Jun. **Syn:** = Ar, C, FNA17, GrPl, GW2, Il, K1, K3, K4, Mi, NcTx, NE, NY, Pa, S, Tn, Tx, Va, W, Crow & Hellquist (2000a), Lansdown (2009); = *Callitriche deflexa* A. Braun – RAB, Fassett (1951); = *Callitriche terrestris* ssp. *terrestris*; > *Callitriche deflexa* var. *austini* (Engelmann) Hegelmann – F, G.

370. PLANTAGINACEAE

Callitriche heterophylla
var. heterophyllaCallitriche
pedunculosaCallitriche
peploidesCallitriche
terrestris*Chelone* Linnaeus 1753 (TURTLEHEAD)

A genus of about 4 species, perennial herbs, of e. North America. References: Nelson (2019) in FNA17 (2019); Nelson, Elisens, & Benesh (1998); Pennell (1935).

Identification Notes: The four fertile stamens are inserted on either side of the corolla near its base and are flattened and conspicuously pilose. The single staminodium (the color of which is used in the key) is much shorter (often only a few mm long), and is inserted uppermost on the corolla near its base.

- 2 Petioles (2-) 10-40 mm long; leaf blade rounded or truncate at the base; leaf blades averaging ca. 2× as long as wide, 4-8 cm wide; staminodes with white to light pink tips; corolla purple; inflorescence bracts 2-7 mm long *Chelone lyonii*
- 2 Petioles 1-15 mm long; leaf blade cuneate at the base; staminodium white or green; leaf blades averaging 3× (or more) as long as wide, 1-6 cm wide; corolla purple or white; inflorescence bracts 4-23 mm long.
 - 3 Corolla white (or tinged with purple, pink, or green near the mouth); staminodes with green tips; palate white-bearded (rarely greenish-yellow-bearded) *Chelone glabra*
 - 3 Corolla pink or purple throughout; staminodes with white tips (rarely with green or purple tips); palate yellow-bearded (rarely white-bearded) *Chelone obliqua* var. *obliqua*

Chelone glabra Linnaeus. WHITE TURTLEHEAD. **Hab:** Streambanks, seeps, swamp forests. **Dist:** NL (Newfoundland) and MN south to GA and AL. **Phen:** Jul-Oct; Sep-Nov. **Comm:** The named varieties (or subspecies) are intergrading and the characters used to distinguish them do not correlate well. The species is diploid (Nelson, Elisens, & Benish 1998). **Syn:** = C, FNA17, GW2, K1, K3, K4, Mi, NE, NY, Pa, RAB, Tn, Va, W; > *Chelone chlorantha* Pennell & Wherry – S; > *Chelone glabra* ssp. *chlorantha* (Pennell & Wherry) Pennell – Pennell (1935); > *Chelone glabra* ssp. *dilatata* (Fernald & Wiegand) Pennell – Pennell (1935); > *Chelone glabra* ssp. *elatior* (Rafinesque) Pennell – Pennell (1935); > *Chelone glabra* ssp. *elongata* (Pennell & Wherry) Pennell – Pennell (1935); > *Chelone glabra* ssp. *ochroleuca* (Pennell & Wherry) Pennell – Pennell (1935); > *Chelone glabra* ssp. *typica* – Pennell (1935); > *Chelone glabra* var. *dilatata* Fernald & Wiegand – F; > *Chelone glabra* var. *elatior* Rafinesque – F, G, S; > *Chelone glabra* var. *elongata* – F, G, S; > *Chelone glabra* var. *glabra* – F, G, Il, S; > *Chelone glabra* var. *linifolia* Coleman – Il; > *Chelone glabra* var. *ochroleuca* Pennell & Wherry – F, G, S; > *Chelone montana* var. *elatior* (Rafinesque) Small – S; > *Chelone montana* (Rafinesque) Pennell & Wherry var. *montana* – S.

Chelone lyonii Pursh. APPALACHIAN TURTLEHEAD. **Hab:** Cove forests, spruce-fir forests, balds, streambanks. **Dist:** W. NC and e. TN south to nw. SC, nw. GA (Zomlefer et al. 2018), and ne. AL. **Phen:** Jul-Sep; Oct. **Comm:** The species is diploid (Nelson, Elisens, & Benish 1998); scattered localities away from the Southern Appalachians are the result of horticultural use. **Syn:** = C, FNA17, GW2, K1, K3, K4, NE, RAB, Tn, W; = *Chelone lyoni* – F, G, S, Pennell (1935), orthographic variant. **NatureServe G4** (Apparently Secure).

Chelone obliqua Linnaeus var. *obliqua*. PURPLE TURTLEHEAD. **Hab:** Streambanks, swamp forests, ecotones of freshwater tidal marshes. **Dist:** MD and KY south to GA and MS. **Phen:** Jul-Oct; Sep-Nov. **Comm:** Var. *obliqua* is hexaploid (Nelson, Elisens, & Benish 1998). **Syn:** = FNA17, K1, K3, NE; = *Chelone obliqua* ssp. *obliqua* – Pennell (1935); < *Chelone obliqua* – C, F, G, GW2, RAB, S, Tn, Va, W. **NatureServe G4T3T4Q** (Vulnerable).

*Gratiola* Linnaeus 1753 (HEDGE-HYSSOP)

A genus of about 20 species, herbs, of temperate regions (and tropical mountains) of the Old and New Worlds. Circumscription of the genus includes *Amphianthus* (following Estes & Small 2007, 2008). References: Estes & Small (2007); Estes & Small (2008); Freeman (2019b) in FNA17 (2019); Pennell (1935).

Identification Notes: *Gratiola amphiantha* somewhat resembles *Callitriche*, but has floating leaves in single pairs rather than in a whorl.

- 2 Flowers and fruits sessile or subsessile, the pedicels < 1 mm long; perennial.
 - 3 Leaves linear-subulate; corolla 2-3× as long as the calyx *Sophranthe hispida*
 - 3 Leaves ovate; corolla 1-1.5× as long as the calyx *Sophranthe pilosa*
- 2 Flowers and fruits on definite pedicels; annual or perennial.
 - 4 Leaves clasping or subclasping-rounded at the base; perennial; [section *Gratiola*].

370. PLANTAGINACEAE

- 5 Calyx subtended by 0 (-1) bractlet; corolla lobes white; corolla tube greenish yellow, conspicuously veined..... *Gratiola ramosa*
 5 Calyx subtended by 2 bractlets; corolla lobes white or yellow-orange; corolla tube greenish yellow and conspicuously veined, or orange and not conspicuously veined..... *Gratiola brevifolia*
- 4 Leaves cuneate at the base; annual; [section *Nibora*].
 10 Pedicels stout, erect, 1-5 (-12) mm long..... *Gratiola virginiana*
 10 Pedicels slender, spreading, 10-45 mm long.
 11 Corolla 13-25 mm long; leaves oval or oblanceolate *Gratiola floridana*
 11 Corolla 5-14 mm long; leaves elliptic, rhombic-lanceolate, or lanceolate *Gratiola neglecta*

Gratiola brevifolia Rafinesque. STICKY HEDGE-HYSSOP. **Hab:** Floodplain forests, cypress swamps, other wet places. **Dist:** E. GA, south and west to c. peninsular FL, e. Panhandle FL, and se. AL; c. AR and se. OK; se. LA and e. TX; c. TN; s. DE (Knapp & Estes 2006). **Phen:** Apr-Jun (-Sep). **Comm:** Previous reports from SC are based on misidentifications (Knapp & Estes 2006). **Syn:** < *Gratiola brevifolia* Rafinesque – Ar, Fl6, FNA17, GW2, K1, K3, K4, S, Tn, Tx, WH3, Pennell (1935).

Gratiola floridana Nuttall. FLORIDA HEDGE-HYSSOP. **Hab:** Stream banks, spring runs, blackwater swamps. **Dist:** Ne. GA, se. TN (in counties adjacent to NC) (Chester, Wofford, & Kral 1997), and e. KY, south to e. GA (in counties adjacent to SC) (Jones & Coile 1988), ne. FL, Panhandle FL, AL, and MS. **Phen:** Mar-May. **Syn:** = Fl6, FNA17, GW2, K1, K3, K4, S, Tn, WH3, Pennell (1935). *NatureServe* G4 (Apparently Secure).

Gratiola neglecta Torrey. MUD-HYSSOP, CLAMMY HEDGE-HYSSOP. **Hab:** Ditches, wet areas, bottomlands, wet cropped fields, brackish marshes. **Dist:** QC and ME west to BC, south to c. GA, e. TX, AZ, and CA. **Phen:** Mar-Oct. **Syn:** = FNA17, GrPl, Il, K3, K4, Mi, NE, NY, Tn, Va, Estes & Small (2007); < *Gratiola neglecta* Torrey – C, G, GW2, K1, NcTx, Pa, RAB, S, Tx, W, WV, Pennell (1935); < *Gratiola neglecta* var. *neglecta* – F.

Gratiola ramosa Walter. BRANCHED HEDGE-HYSSOP. **Hab:** Wet pine savannas, pineland ponds and Carolina bays, marshes, pond margins; ditches. **Dist:** Se. NC south to s. FL, west to sw. LA; disjunct in se. VA (Greensville County) and (at least historically) in e. MD. **Phen:** May-Jun. **Syn:** = C, F, Fl6, FNA17, G, GW2, K1, K3, K4, RAB, S, Va, WH3, Pennell (1935). *NatureServe* G4G5 (Apparently Secure).

Gratiola virginiana Linnaeus. VIRGINIA HEDGE-HYSSOP, ROUND-FRUIT HEDGE-HYSSOP. **Hab:** Sluggish streams, bogs, wet areas. **Dist:** NJ west to OH and IA and KS, south to c. peninsular FL and e. TX. **Phen:** Mar-Oct. **Tax:** Var. *aestuariorum* Pennell, of s. NJ south to e. VA, is alleged to differ in being shorter, with more rounded leaves, short pedicels (< 2 mm long), a shorter calyx and corolla, and a smaller capsule; it is likely merely a stunted aquatic form, but needs additional study – see Fernald (1950) and Pennell (1935) for additional details. **Syn:** = Ar, C, Fl6, FNA17, G, GrPl, GW2, Il, Mi, NcTx, NY, RAB, S, Tn, Va, W, WH3, WV; > *Gratiola virginiana* var. *aestuariorum* Pennell – F, K1, K3, K4, Pennell (1935); > *Gratiola virginiana* var. *virginiana* – F, K1, K3, K4, NE, Pennell (1935).

***Kickxia* Dumortier 1827 (FLUELLEN, CANCERWORT)**

A genus of about 9 species (following the removal of *Nanorrhinum* Betsche), annual herbs, of Mediterranean Europe west to c. Asia. Generic circumscription follows Yousefi, Zarre, & Heubl (2016). References: Elisens (2019b) in FNA17 (2019); Ghebrehwet (2000); Pennell (1935); Sutton (1988); Yousefi, Zarre, & Heubl (2016).

* ***Kickxia elatine*** (Linnaeus) Dumortier. SHARP-LEAVED FLUELLEN, MALE FLUELLEN. **Hab:** Gravel bars, road shoulders, railroad embankments, other disturbed areas. **Dist:** Native of Mediterranean Europe, n. Africa, and w. Asia. **Phen:** May-Nov. **Tax:** Two infraspecific taxa are sometimes recognized (as by Sutton 1988), especially in the European literature. Ssp. *crinita* (Mabille) W. Greuter is considered to differ from the typic subspecies in having stems densely villous (vs. sparsely villous), the stems robust, usually 1.5-3.5 mm thick, often much-branched (vs. slender, to 1.5 mm thick, sparingly if at all branched, and pedicels 5-12 (-20) mm long, 0.25-0.35 mm in diameter, often villous their entire lengths (vs. pedicels mostly (8-) 15-25 (-30) mm long, 0.1-0.2 mm in diameter, glabrous except for immediately below the calyx). It is unclear the degree to which these characters are well-correlated and describe useful taxa, and whether distinctions made in its native range apply well in North America. **Syn:** = Ar, C, F, FNA17, G, GrPl, Il, K1, K3, K4, Mi, NE, NY, Pa, RAB, S, Tn, Va, Ghebrehwet (2000), Pennell (1935); = *Antirrhinum elatine* Linnaeus; > *Kickxia elatine* ssp. *crinita* – Sutton (1988); > *Kickxia elatine* ssp. *elatine* – Sutton (1988). *NatureServe* GNR (Not Yet Ranked).

***Leucospora* Nuttall 1834 (LEUCOSPORA)**

A genus of 2 species, herbs, of e. North America and Coahuila, Mexico. *Leucospora* may not be distinct from *Stemodia*. References: Freeman (2019c) in FNA17 (2019); Pennell (1935); Turner & Cowan (1993).

Leucospora multifida (Michaux) Nuttall. LEUCOSPORA, NARROWLEAF PALESEED. **Hab:** Moist to wet, sandy margins of artificial ponds, drawdown areas on riverbanks, streambanks, drawdown depressional wetlands, other seasonally ponded disturbed areas, probably introduced in some

of our area from c. United States. **Dist:** S. ON west to IA and KS, south to nw. GA, AL, LA, and e. TX; scattered occurrences farther east (as in e. NC, FL, KY, TN, VA, and se. PA) may be recent introductions. **Phen:** May-Oct. **Syn:** = Ar, C, Fl6, FNA17, G, GrPl, GW2, Il, K1, K3, K4, Mi, NcTx, NY, Pa, S, Tn, Tx, Va, Pennell (1935); = *Conobea multifida* (Michaux) Benth – F, WH3; = *Stemodia multifida* (Michaux) Sprengel – Turner & Cowan (1993). NatureServe G5 (Secure).

Linaria P. Miller 1754 (YELLOW-TOADFLAX)

A genus of about 160 species, of temperate regions of Eurasia and less commonly North and South America.

Following the analyses of Fernández-Mazuecos, Blanco-Pastor, & Vargas (2013), Ogutcen & Varnosi (2016), and Yousefi, Heubl, & Zarre (2017) it seems best to include *Nuttallanthus* in *Linaria* as section *Lectoplectron*. References: Fernández-Mazuecos, Blanco-Pastor, & Vargas (2013); Freeman (2019j) in FNA17 (2019); Ogutcen & Varnosi (2016); Pennell (1935); Sáez Goñalons (2019) in FNA17 (2019); Sutton (1988); Yousefi, Heubl, & Zarre (2017).

3 Corollas yellow; plants perennials; [aliens].

..... *Linaria vulgaris*

3 Corollas blue, violet, pale bluish-white, or white; plants annuals, biennials, or perennials; [natives (often weedy) and aliens].

7 Infructescence axis zigzag; fruiting pedicels densely glandular pubescent, 5-13 mm long, 2× or more as long as the calyx; corolla spur almost obsolete, reduced to a bulge 0.1-0.4 mm long..... *Linaria floridana*

7 Infructescence axis straight or nearly so; fruiting pedicels glabrous or with a few scattered glandular hairs, 2-6 (-9) mm long, < 1× as long as the calyx; corolla spur 2-11 mm long.

8 Corolla 8-11 (-14) mm long (measured from the tip of the spur to the tip of the middle lobe of the lower lip), the lower lip 2-4.5 (-6) mm long; seeds longitudinally ridged, the intervening faces smooth or with sparse low tubercles..... *Linaria canadensis*

8 Corolla (11-) 14-22 mm long (measured from the tip of the spur to the tip of the middle lobe of the lower lip), the lower lip 5-11 mm long; seeds densely tuberculate, not longitudinally ridged..... *Linaria texana*

Linaria canadensis (Linnaeus) Dumont de Courset. COMMON TOADFLAX. **Hab:** In a wide variety of natural and disturbed habitats, especially common and weedy in disturbed sites such as roadsides and fields, also common and apparently native in thin soil of rock outcrops. **Dist:** NS west to ND, south to s. FL and TX; also adventive on the west coast, from WA to CA. **Phen:** Mar-Aug; Apr-Nov. **Tax:** Sutton (1988) comments that there is substantial variation in this species not taxonomically explained. **Syn:** = Fl6, K4, Pa, Tx, WH3, WV, Pennell (1935), Yousefi, Heubl, & Zarre (2017); = *canadensis* var. – C, F, G, GrPl, S; = *Nuttallanthus canadensis* (Linnaeus) D.A. Sutton – Ar, FNA17, Il, K1, K3, Mi, NcTx, NE, NY, Tn, Va, Sutton (1988); < *Linaria canadensis* (Linnaeus) Dumont de Courset – RAB, W. NatureServe G5 (Secure).

Linaria floridana Chapman. FLORIDA TOADFLAX. **Hab:** Sandhills, scrub, dunes, other dry, sandy places. **Dist:** E. GA south to s. FL and west to s. MS. **Syn:** = Fl6, K4, S, WH3, Pennell (1935), Yousefi, Heubl, & Zarre (2017); = *Nuttallanthus floridanus* (Chapman) D.A. Sutton – FNA17, K1, K3, Sutton (1988). NatureServe G3G5 (Apparently Secure).

Linaria texana Scheele. TEXAS TOADFLAX. **Hab:** Granite flatrocks, grassy pinelands, dry sandy soils, disturbed soils of roadsides and fields. **Dist:** Native of sc. United States, the eastern extent of the original range unclear. **Phen:** (Feb-) Mar-Aug; Apr-Nov. **Syn:** = Fl6, K4, Tx, WH3, Pennell (1935), Yousefi, Heubl, & Zarre (2017); = *Linaria canadensis* var. *texana* (Scheele) Pennell – C, F, G, GrPl, S; = *Nuttallanthus texanus* (Scheele) D.A. Sutton – Ar, FNA17, Il, K1, K3, NcTx, Tn, Va, Sutton (1988); < *Linaria canadensis* (Linnaeus) Dumont de Courset – RAB, W. NatureServe G4G5 (Apparently Secure).

* ***Linaria vulgaris*** P. Miller. BUTTER-AND-EGGS, YELLOW TOADFLAX, WILD-SNAPDRAGON. **Hab:** Fields, pastures, roadsides, disturbed areas.

Dist: Native of Europe. Reported for Coastal Plain of GA (Taylor County) by Carter, Baker, & Morris (2009). **Phen:** (Mar-) May-Nov. **Syn:** = Ar, C, F, FNA17, G, GrPl, Il, K1, K3, K4, Mi, NcTx, NE, NY, Pa, RAB, Tn, Tx, Va, W, WV, Pennell (1935), Sutton (1988); = *Linaria linaria* (Linnaeus) Karsten – S. NatureServe GNR (Not Yet Ranked).

Mecardonia Ruiz & Pavón 1794 (MECARDONIA, AXIL-FLOWER)

A genus of about 10 species, of tropical, subtropical, and warm temperate regions of America. References: Ahedor (2019b) in FNA17 (2019); Pennell (1935).

1 Corolla yellow, with reddish veins; outer sepals broadly lanceolate to ovate, overlapping the shorter, much narrower inner sepals..... *Mecardonia procumbens*

1 Corolla white, with purple veins; sepals lanceolate nearly equal in length.

2 Pedicels (in fruit) 10-18 mm long; sepals > 2 mm wide..... *Mecardonia acuminata* var. *microphylla*

2 Pedicels (in fruit) 16-35 mm long; sepals < 2 mm wide.

..... *Mecardonia acuminata* var. *acuminata*

Mecardonia acuminata (Walter) Small var. *acuminata*. MECARDONIA, COMMON AXIL-FLOWER. **Hab:** Marshes, ditches, wet pine savannas, bottomland forests, wet disturbed areas. **Dist:** DE and MD south to n. peninsular FL, west to e. TX, north in the interior to KY, TN, and MO. **Phen:** Jul-Sep; Aug-Oct. **ID Notes:** The long, ascending pedicels are distinctive for the species. The plant blackens on drying. **Syn:** = FNA17, K1, K3, K4, S,

Mecardonia procumbens (Miller) Small. BABY JUMP-UP. **Hab:** Ponds, streams, ditches, moist shores. **Dist:** FL, AL, MS, AR, TX, NM, and AZ south. Reported for MS (Phillely 2020). **Phen:** (Mar-) Jun-Sep (-Feb). **ID Notes:** Often mistaken for a yellow-flowered *Gratiola*. **Syn:** = Fl6, K1, K3, K4, NcTx, WH3; = *Pagesia procumbens* (Miller) Pennell – Pennell (1935); > *Mecardonia procumbens* (Miller) Small – S; > *Mecardonia tenuis* Small – S; ? *Mecardonia vandellioides* (Kunth) Pennell – GW2, misspelled; ? *Mecardonia vandellioides* (Kunth) Pennell – Tx.

Penstemon Schmidel 1763 (BEARDTONGUE, PENSTEMON)

Contributed by Alan S. Weakley and Dwayne Estes

A genus of about 280 species, perennial herbs and shrubs, of w. North America, e. North America, and (a single species) ne. Asia. References: Bennett (1963); Clements, Baskin, & Baskin (1998); Estes (2012); Freeman (2019d) in FNA17 (2019); Pennell (1935).

- 6 Corolla weakly bilabiate, white, unlined, glandular-puberulent within; stem leaves abruptly reduced upwards.....*Penstemon tubaeiflorus*
- 6 Corolla strongly bilabiate, white or variously pinkish to purplish, lined (except *P. hirsutus* and *P. tenuiflorus*), glabrous or pubescent with non-glandular hairs within; stem leaves gradually reduced upwards.
- 7 Mid and upper stem (but below the inflorescence) glabrous or with short eglandular hairs distributed in patches or lines; lower lobes of the corolla essentially equaling the upper lobes; corolla throat not strongly 2-ridged within, the tube conspicuously dilated into the throat; [*Penstemon digitalis* complex].
- 8 Corolla 20-35 mm long. *Penstemon digitalis*
- 8 Corollas 15-23 mm long.
 - 11 Leaves mostly 2.5-4 cm wide; anthers bearded with long papillae *Penstemon alluviorum*
 - 11 Leaves mostly 1.5-2.5 cm wide; anthers glabrous or papillose *Penstemon laevigatus*
- 7 Mid and upper stem (but below the inflorescence) pubescent throughout, consisting of short eglandular hairs and sometimes also with an overstory of longer glandular hairs; lower lobes of the corolla projecting beyond the upper lobes; corolla throat strongly 2-ridged on its floor, the tube also slightly to moderately dilated into the throat.
- 12 Stem vestiture (mid and upper stem, but below the inflorescence) of short eglandular hairs only (or rarely also with a few glandular hairs in *P. smallii*).
- 13 Leaves 4-28 mm wide, 4-5× as long as wide *Penstemon laxiflorus*
- 13 Leaves 15-60 mm wide, 2.5-4× as long as wide; [*Penstemon smallii* complex]. *Penstemon tenuis*
- 12 Stem vestiture (mid and upper stem, but below the inflorescence) of a mixture of long glandular hairs and short eglandular hairs.
- 16 Corolla throats closed or nearly so (the lower lip arching upwards and pressing against the upper lip); corollas unlined or very obscurely lined (except strongly lined in *P. australis*).
- 17 Corollas lined; inflorescence branches erect-ascending, nearly paralleling the inflorescence axes..... *Penstemon australis*
- 17 Corollas unlined; inflorescence branches spreading-ascending, obviously diverging from the vertical inflorescence axis; [*Penstemon hirsutus* complex]. *Penstemon tenuiflorus*
- 16 Corolla throats open, not as described above (except sometimes nearly closed in *P. australis*); corollas lined, at least internally; [*Penstemon canescens* complex].
- 20 Corollas 14-23 mm long. *Penstemon pallidus*
- 20 Corollas 20-32 mm long.
- 22 Inflorescence branches erect-ascending, nearly paralleling the inflorescence axes; sepals 4-5.2 mm long; corollas 20-25 mm long; corolla:calyx length ratio 4-5 *Penstemon australis*
- 22 Inflorescence branches spreading-ascending, obviously diverging from the vertical inflorescence axis; sepals 3.2-4.5 mm long; corollas 20-30 mm long; corolla:calyx length ratio 7-9 *Penstemon canescens*

Penstemon alluviorum Pennell. LOWLAND BEARDTONGUE. **Hab:** Bottomland forests and fields. **Dist:** S. OH, s. IN, s. IL, and e. MO south to TN, AL, MS, and ne. AR. **Phen:** May-Jun. **Syn:** = C, F, G, Il, K1, K3, K4, S, Tn, Clements, Baskin, & Baskin (1998), Estes (2012), Pennell (1935); < *Penstemon digitalis* Nuttall ex Sims; < *Penstemon laevigatus* ssp. *alluviorum* (Pennell) R.W. Bennett var. *alluviorum* – Bennett (1963).

Penstemon australis Small. SOUTHERN BEARDTONGUE, SANDHILL BEARDTONGUE. **Hab:** Longleaf pine sandhills, pine flatwoods, dry hammocks, dry sandy roadsides, woodland margins. **Dist:** Se. VA south to c. peninsular FL, west to s. and wc. AL, primarily on the Coastal Plain, but not uncommon westward into the Piedmont and lower Mountains, and extending in the interior into c. TN. **Phen:** May-Jul; Jul-Aug. **Syn:** = Fl6, FNA17, K1, K3, K4, S, Clements, Baskin, & Baskin (1998), Estes (2012), Pennell (1935); = *Penstemon australis* ssp. *australis* – Bennett (1963); < *Penstemon australis* Small – C, F, G, RAB, Va, W, WH3. Penstemon laevigatus Aiton. EASTERN SMOOTH BEARDTONGUE. **Hab:** Low meadows, bottomlands, forest edges, hammocks. **Dist:** ME west to MI, south to s. GA, Panhandle FL, MS, and AR. **Phen:** May-Jul; Jul-Aug. **Syn:** = F, Fl6, FNA17, G, GW2, K1, K3, K4, NE, Pa, RAB, Tn, Va, W, WH3, WV, Clements, Baskin, & Baskin (1998), Estes (2012), Pennell (1935); = *Penstemon laevigatus* ssp. *laevigatus* – Bennett (1963); = *Penstemon pentstemon* (Linnaeus) MacMillan – S; < *Penstemon laevigatus* Aiton – C, (also see *P. calycosus*).

Penstemon laxiflorus Pennell. NODDING BEARDTONGUE. **Hab:** Dry sandy areas in woodlands and openings. **Dist:** C. GA, FL Panhandle, and n. AL west to c. OK and c. TX. **Phen:** Apr-May. **Syn:** = Ar, FNA17, GrPl, K1, K3, K4, NcTx, S, Tx, Clements, Baskin, & Baskin (1998), Pennell (1935); = *Penstemon australis* Small ssp. *laxiflorus* (Pennell) Bennett – Bennett (1963); < *Penstemon australis* Small – WH3. NatureServe G5T4 (Apparently Secure).

Penstemon pallidus Small. EASTERN WHITE BEARDTONGUE. **Hab:** Limestone and shale barrens, other dry, disturbed areas. **Dist:** ME west to MN, south to NC, GA, and AR. **Phen:** May-Jun. **Syn:** = Ar, C, F, FNA17, G, GrPl, II, K1, K4, Mi, NE, NY, Pa, RAB, S, Va, W, Clements, Baskin, & Baskin (1998), Estes (2012), Pennell (1935); = *Penstemon pallidus* ssp. *pallidus* – Bennett (1963); < *Penstemon pallidus* Small – K3.

Penstemon tenuiflorus Pennell. PLATEAU BEARDTONGUE, LIMESTONE BEARDTONGUE, KENTUCKY BEARDTONGUE. **Hab:** Dry woodlands, glades, prairies, barrens, cliffs, especially over limestone or other calcareous rocks. **Dist:** Endemic to the Interior Low Plateau of w. KY, c. TN, n. AL, extending slightly into the Coastal Plain to the west, and disjunct in the Black Belt of AL and MS. **Phen:** Apr-Jun. **Syn:** = C, F, FNA17, G, K1, K3, K4, S, Tn, Clements, Baskin, & Baskin (1998), Estes (2012), Pennell (1935). NatureServe G4? (Apparently Secure).

Penstemon tenuis Small. GULF COAST BEARDTONGUE. **Hab:** Bottomlands. **Dist:** MS and AR south to LA and e. TX. **Phen:** Apr-May. **Syn:** = Ar, K3, K4, S, Tx, Estes (2012). NatureServe G4 (Apparently Secure).

Penstemon tubaeiflorus Nuttall. TRUMPET BEARDTONGUE. **Hab:** Prairies, glades, forest openings, fens, disturbed areas. **Dist:** Sw. OH, IN, WI, IA, and NE south to w. KY, w. TN, MS, LA, and e. TX; also known from adventive sites farther east, as in e. PA (Rhoads & Klein 1993). **Phen:** May-Jun. **Syn:** = C, FNA17, G, II, K4, NcTx, NY, Tn, Tx, Clements, Baskin, & Baskin (1998), Estes (2012), Pennell (1935); = *Penstemon tubiflorus* Nuttall – Ar, K3, NE, S, orthographic variant; > *Penstemon tubaeiflorus* var. *achoreus* Fernald – F, GrPl; > *Penstemon tubaeiflorus* var. *tubaeiflorus* – F, GrPl; > *Penstemon tubiflorus* var. *achoreus* Fernald – K1, orthographic variant; > *Penstemon tubiflorus* var. *tubiflorus* – K1, orthographic variant.

Plantago Linnaeus 1753 (PLANTAIN)

A genus of about 270 species, herbs and rarely shrubs, of cosmopolitan distribution. Harper (1944) discusses at length the interesting issue of the native distributions of the many weedy species of *Plantago*. The native or introduced status of many of our species is uncertain or controversial. References: Bassett (1966); Bassett (1967); Hassemer et al (2019); Rosatti (1984); Schwarzbach in Kadereit (2004); Shipunov (2019b) in FNA17 (2019).

- 3 Leaf venation pinnate, some major veins departing from the midvein well above the leaf base; summer and winter leaves dimorphic, the winter leaves lanceolate (typically submersed), the summer leaves ovate or cordate (emersed except in floods); plants perennial from a thick, fleshy rootstock that is typically 3-8 cm wide near its summit, with a cavity below (like an inverted bowl), and with 3-10 fleshy roots 3-15 mm thick descending or spreading from the bowl rim; capsule 2-4-seeded; scapes hollow and terete; [aquatic or semi-aquatic]; [subgenus *Plantago*, section *Heptaneuron*]..... ***Plantago cordata***
- 3 Leaf venation parallel, with all of the major veins separating at the base of the leaf blade; leaves not dimorphic; plants either perennial from thin, fibrous roots or an erect caudex, or annual from a small taproot; capsule 2-30-seeded; scapes solid, terete or 5-angled; [terrestrial or wetland].
 - 4 Leaves ovate to broadly lanceolate or broadly oblanceolate, 1-10× as long as wide, distinctly broadened upward from a petiolar base, the larger leaves > 1 cm wide.
 - 5 Leaves broadly ovate-elliptic, the blades 1-3× as long as wide, distinctly petiolate; scapes solid and terete.

? : questionable

- 7 Fruit (3-) 4-6 mm long, dehiscent below the middle (the terminal portion about 2× as long as the basal); sepals narrowly elliptic, 2-4× as long as wide, mostly acute; petioles usually purple and glabrous at the base; well-developed leaves with 5-7 major veins; seeds 4-10 per capsule, each 1.5-2.0 (-2.5) mm long; [subgenus *Plantago*, section *Pacifica*]..... *Plantago rugelii*
- 7 Fruit (2-) 2.5-4 mm long, dehiscent near the middle (the terminal portion about as long as the basal); sepals broadly ovate, ca. 1.5× as long as wide, mostly obtuse; petioles usually green and pubescent at the base; well-developed leaves with 3-5 major veins; seeds (4-) 6-22 (-34) per capsule, each 0.7-1.7 mm long; [subgenus *Plantago*, section *Plantago*].
- 5 Leaves mostly broadly oblanceolate, broadly lanceolate, or spatulate, (3-) 4-10× as long as wide, attenuate to the only somewhat petiolar base; scapes solid and 5-angled, or hollow (to solid) and terete.
- 9 Bracts and calyx glabrous; perennial, flowering Apr-Nov. *Plantago major*
- 9 Bracts and calyx pubescent, at least on the keels; annual or perennial; flowering late Mar-Aug; [subgenus *Plantago*, section *Virginica*].
- 4 Leaves linear or narrowly lanceolate, (8-) 10-25× as long as wide, only slightly (if at all) broadened upward, the base not petiolar, the leaves typically < 1 cm wide.
- 14 Seeds (3-) 4-25 (-30) per capsule; corollas radially symmetrical, the lobes 0.5-1 mm long; stamens 2; [subgenus *Plantago*, section *Micropsyllium*]
- 15 Seeds 0.5-0.8 mm long; capsules with 10-25 (-30) seeds..... *Plantago heterophylla*
- 15 Seeds 0.8-2.5 mm long; capsules with (3-) 4-9 (-12) seeds.
- 14 Seeds 2 per capsule; corollas bilaterally or radially symmetrical, the lobes 1.3-3.6 mm long; stamens 4; [subgenus *Psyllium*, section *Gnaphaloides*].
- 18 Stems (below the lowermost flowers) 20-40 cm long; bracts subtending the flowers either 2-3 mm long or 10-30 mm long.
- 19 Bracts subtending the flowers 10-30 mm long; uppermost corolla lobe 1.4-2.3 mm long *Plantago aristata*
- 19 Bracts subtending the flowers 2-3 mm long; uppermost corolla lobe 2.4-3.0 mm long *Plantago wrightiana*
- 18 Stems 0-15 mm long; bracts 1.5-10 mm long; [mainly OK and TX westwards, rarely adventives eastwards].
- 20 Leaves 4-10 mm wide, the margins toothed, the teeth to 4 mm long (rarely entire); corolla lobes 2.2-2.5 mm long..... *Plantago hookeriana*
- 20 Leaves 1-4 mm wide, the margins entire (rarely toothed); corolla lobes 1.6-2.1 mm long *Plantago patagonica*

Plantago aristata Michaux. BUCKHORN PLANTAIN, LARGE-BRACTED PLANTAIN. **Hab:** Sandy and other barren soils, disturbed areas, especially dry, barren, exposed soil, such as clay soils denuded by bulldozing. **Dist:** The original distribution obscure; perhaps from OH west to NE, south to Panhandle FL and TX. **Phen:** Late Apr-Nov. **Syn:** = Ar, C, F, Fl6, FNA17, G, GrPl, Il, K1, K3, K4, Mi, NcTx, NE, NY, Pa, RAB, S, Tn, Tx, Va, W, WH3, WV, Rosatti (1984). **NatureServe G5** (Secure).

Plantago cordata Lamarck. KING-ROOT, HEARTLEAF PLANTAIN. **Hab:** Aquatic or semi-aquatic in streambeds with outcrops of slate, limestone, or calcareous clay, and aquatic in tidal estuaries. **Dist:** NY and s. ON west to WI, south to w. VA, c. NC, nw. GA, AL, sc. TN, and MO, very scattered and rare in every state in which it occurs, except MO. *P. cordata* is not known to be extant in VA, where it formerly occurred in the estuary of the Potomac River and in Smyth County in sw. VA. In NC, *P. cordata* is apparently limited to two slate-bottomed streams in s. Davidson County. **Phen:** Mar-May; May-Jul. **Tax:** A study of morphological and genetic variability in the species found the two NC populations to "represent sites of primary [conservation] concern with unique genetic composition" (Mymudes & Les 1993). **ID Notes:** Characteristically, *P. cordata* is a very robust plant, the inflorescences up to 1 meter in height, and the glabrous leaves with ovate blades to 30 cm long and 20 cm wide, on ascending petioles up to 40 cm long and 2 cm wide. Winter leaves are 3-10 cm long, ca. 1 cm wide, and remotely toothed. Spring leaves show a gradual transition from the winter form to the summer form. **Syn:** = Ar, C, F, FNA17, G, GW2, Il, K1, K3, K4, Mi, NY, RAB, S, Tn, Va, W, Bassett (1967), Rosatti (1984). **NatureServe G4** (Apparently Secure).

Plantago heterophylla Nuttall. SLENDER PLANTAIN, MANY-SEEDED PLANTAIN, SMALL PLANTAIN. **Hab:** Fields, roadsides, disturbed areas. **Dist:** Se. VA and MO south to Panhandle FL and TX; adventive at scattered sites farther north (at least as far north as NY). **Phen:** Mar-May. **ID Notes:** Superficially similar to *P. pusilla*. **Syn:** = Ar, C, F, Fl6, FNA17, G, Il, K1, K3, K4, NcTx, NY, RAB, S, Tn, Va, W, WH3, Bassett (1966), Rosatti (1984); = *Plantago hybrida* W. Barton – GW2, Tx, (an older name but of uncertain application). **NatureServe G5** (Secure).

Plantago hookeriana Fischer & C.A. Meyer. TALLOW-WEED. **Hab:** Sandy, gravelly, or rocky areas, dunes, clay flats; eastwards adventive in disturbed areas. **Dist:** Native of sc. North America: e., c. and w. TX south to n. Mexico (CHI, COA, TAM, NLE), scattered eastwards as a waif. **Phen:** Mar-Jul. **Syn:** = FNA17, K3, K4, NcTx, Tx.

* ***Plantago lanceolata*** Linnaeus. ENGLISH PLANTAIN, RIB-GRASS, NARROWLEAF PLANTAIN. **Hab:** Lawns, roadsides, disturbed areas. **Dist:** Native of Europe. **Phen:** Apr-Nov. **Syn:** = Ar, Bah, C, Fl6, FNA17, GrPl, Il, K1, K3, K4, Mi, NE, NY, Pa, RAB, S, Tn, Tx, Va, W, WH3, WV, Rosatti (1984); > *Plantago lanceolata* var. *angustifolia* Poir – G; > *Plantago lanceolata* var. *lanceolata* – F, G; > *Plantago lanceolata* var. *sphaerostachya* Mertens & Koch – F, G. **NatureServe G5** (Secure).

* ***Plantago major*** Linnaeus. COMMON PLANTAIN, WHITE-MAN'S-FOOT. **Hab:** Lawns, roadsides, disturbed areas. **Dist:** Native of Europe, possibly also native in ne. North America, possibly as far south as the northern part of our area. **Phen:** May-Nov. **Tax:** Very variable, and possibly worthy of some of the infraspecific subdivisions suggested by various authors. The Coastal Plain populations associated with the Chesapeake Bay in VA may represent a native, estuarine genotype. **Syn:** = Fl6, GrPl, GW2, Il, K4, Mi, NcTx, NY, RAB, S, Tn, Tx, Va, W, WH3, WV, Rosatti (1984); = *Plantago major* ssp. *major* – G; < *Plantago major* Linnaeus – C, FNA17, K1, K3, Pa; > *Plantago major* var. *major* – F; > *Plantago major* Linnaeus – F.

Plantago patagonica Jacquin. WOOLLY PLANTAIN. **Hab:** Sandy, gravelly, and rocky soils, prairies; eastwards on roadsides and in disturbed areas. **Dist:** ON and BC south to w. AR, TX, NM, AZ, CA, Mexico. **Phen:** Mar-Aug. **Syn:** = Ar, FNA17, IL, K1, K3, K4, Mi, NcTx, NE, NY, Rosatti (1984); > *Plantago patagonica* var. *breviscapa* (Shinners) Shinners – GrPl, Tx; > *Plantago patagonica* var. *gnaphaloides* (Nuttall) A. Gray – C, G, Tx; > *Plantago patagonica* var. *patagonica* – C, G, GrPl, Tx; > *Plantago patagonica* var. *spinulosa* (Decaisne) A. Gray – GrPl, Tx; > *Plantago purshii* Roemer & J.A. Schultes – F, RAB.

Plantago pusilla Nuttall. LITTLE PLANTAIN. **Hab:** Roadsides, disturbed areas. **Dist:** IN, IL, MN, MB, SK, AB, BC south to Panhandle FL, TX, CA, and Mexico. **Phen:** Mar-Jun. **Comm:** Belden et al. (2004) discuss the Virginia occurrence, on Fort Pickett Military Reservation, Nottoway County. **Syn:** = Ar, C, Fl6, FNA17, K1, K4, NE, NY, Pa, S, Tn, Va, WH3, Bassett (1966), Rosatti (1984); < *Plantago elongata* Pursh – GrPl, GW2, K3; > *Plantago pusilla* var. *major* Engelm. – F, G, Il; > *Plantago pusilla* var. *pusilla* – F, G, Il.

Plantago rugelii Decaisne. AMERICAN PLANTAIN, BROAD-LEAVED PLANTAIN, BLACKSEED PLANTAIN, RUGEL'S PLANTAIN. **Hab:** Roadsides, lawns, disturbed areas. **Dist:** NB to ND, south to Panhandle FL and e. TX. **Phen:** May-Nov. **Syn:** = Ar, C, F, Fl6, FNA17, G, GrPl, GW2, IL, K3, K4, Mi, NcTx, NE, NY, Pa, RAB, S, Tn, Va, W, WH3, WV, Rosatti (1984); > *Plantago rugelii* var. *asperula* Farwell – K1; > *Plantago rugelii* var. *rugelii* – K1.

Plantago virginica Linnaeus. VIRGINIA PLANTAIN, HOARY PLANTAIN. **Hab:** Saline marshes, thin soils over rock, roadsides, lawns, disturbed areas. **Dist:** MA and NY west to SD, south to s. FL and TX. **Phen:** Mar-Jul. **Syn:** = Ar, Bah, C, Fl6, FNA17, G, GrPl, IL, K1, K3, K4, Mi, NcTx, NE, NY, Pa, RAB, S, Tn, Tx, Va, W, WH3, WV, Rosatti (1984); > *Plantago virginica* var. *virginica* – F; > *Plantago virginica* var. *viridescens* Fernald – F. NatureServe G5 (Secure).

Plantago wrightiana Decaisne. WRIGHT'S PLANTAIN. **Hab:** Sandy, rocky, or gravelly prairies and open woodlands; eastwards in on roadsides, lawns, disturbed areas. **Dist:** Apparently native of sc. and sw. United States and n. Mexico, but the original distribution somewhat obscure. Now extending east to VA, NC, SC, GA, and FL. **Phen:** Apr-Jul. **Syn:** = Ar, Fl6, FNA17, GrPl, K1, K3, K4, NcTx, Tn, Tx, Va, WH3, Rosatti (1984); = *Plantago hookeriana* Fischer & C.A. Meyer var. *nuda* (A. Gray) Poe – RAB, W; < *Plantago hookeriana* Fischer & C.A. Meyer.

Scoparia Linnaeus 1753 (GOAT-WEED, SWEET-BROOM)

A genus of about 10-20 species, herbs, of tropical and subtropical America. References: Freeman (2019f) in FNA17 (2019); Pennell (1935).

Scoparia dulcis Linnaeus. GOAT-WEED, SWEET-BROOM, LICORICE-WEED. **Hab:** Marshes, wet hammocks, flatwoods, river sandbars, roadsides, disturbed places, rather weedy and the original distribution unclear. **Dist:** S. SC south to s. FL, west to e. and s. TX, south to South America. **Phen:** (Jan-) Apr-Nov (-Dec). **Syn:** = Ar, Bah, Fl6, FNA17, GW2, K1, K3, K4, RAB, S, Tx, WH3, Pennell (1935). NatureServe G4G5 (Apparently Secure).

Sophronanthe Benth 1836

A genus of 2 species, herbs, of southeastern North America. The two taxa included here are not part of *Gratiola*. References: Freeman (2019g) in FNA17 (2019); Pennell (1935).

- 1 Leaves linear-subulate; corolla 2-3× as long as the calyx *Sophronanthe hispida*
 1 Leaves ovate; corolla 1-1.5× as long as the calyx *Sophronanthe pilosa*

Sophronanthe hispida Benth. PINELAND HEDGE-HYSSOP. **Hab:** Dry-mesic pine savannas, scrubby pine savannas, longleaf pine sandhills, Florida scrub, grasslands, dunes. **Dist:** E. GA (within a few counties of SC) south to s. FL, and west to MS. **Phen:** May-Oct. **Syn:** = Fl6, FNA17, K3, K4, S, Pennell (1935); = *Gratiola hispida* (Benth) Pollard – GW2, K1, WH3. NatureServe G3G5 (Apparently Secure).

Sophronanthe pilosa (Michaux) Small. SHAGGY HEDGE-HYSSOP. **Hab:** Marshes, wet areas, wet pine savannas. **Dist:** NJ south to s. FL, west to e. TX, northward in the interior to KY, TN, AR, and e. OK. **Phen:** May-Oct. **Syn:** = Fl6, FNA17, K3, K4, Tn, Va; = *Gratiola pilosa* Michaux = C, F, G, GW, K1, RAB, W, WH3 – Ar, C, F, G, GW2, K1, NcTx, RAB, Tx, WH3; = *Tragiola pilosa* (Michaux) Small & Pennell – S; > *Tragiola pilosa* (Michaux) Small & Pennell var. *typica* – Pennell (1935). 370. PLANTAGINACEAE

Sophronanthe
hispidulaSophronanthe
pilosa*Veronica* Linnaeus 1753 (SPEEDWELL)

A genus of about 180 species, herbs, nearly cosmopolitan (at least now), most diverse in Europe. The genus appears to be paraphyletic as currently circumscribed (Albach & Chase 2001). Subgeneric classification (shown in the key) follows Albach in FNA (2019). References: Albach (2019) in FNA17 (2019); Atha et al (2021b); Barty et al (2010); Crow & Hellquist (2000a); Pennell (1935); Stace (2010); Walters & Webb (1972).

- 9 Bracts abruptly smaller than the foliage leaves, the flowers thus in well-developed terminal racemes or spikes; perennials from rhizomes. *Veronica serpyllifolia* var. *serpyllifolia*
- 9 Bracts gradually reduced in size upward, all of the flowers or at least those lower on the stem axillary in the axils of well-developed foliage leaves; annuals (except *V. filiformis*).
- 12 Pedicels 0-2 mm long; flowers in the axils of bracts, all or at least the upper of which are very different than foliage leaves.
- 13 Larger leaves 3-10× as long as wide, entire or dentate towards the apex; flowers white or very pale, ca. 2 mm across; stems usually glabrous (except *V. peregrina* var. *xalapensis*); [subgenus *Beccabunga*]. *Veronica peregrina* var. *peregrina*
- 13 Larger leaves 1-2.5× as long as wide, palmately lobed or toothed; flowers blue, 2-6 mm across; stems pubescent. *Veronica arvensis*
- 12 Pedicels 5-40 mm long; flowers in the axils of leaves similar in shape and size to foliage leaves (though the upper are sometimes somewhat smaller).
- 19 Leaves with usually > 7 small teeth or crenations; capsules either obviously compressed in ×-section, or nearly round (*V. polita*); [subgenus *Pocilla*].
- 20 Lobes of the capsule with apices diverging at ca. 90 degrees, the apical notch of the capsule > 90°; corolla > 8 mm wide *Veronica persica*
- 20 Lobes of the capsule with apices parallel or diverging at an acute angle, the apical notch of the capsule < 90°; corolla < 8 mm wide.
- 21 Capsule with all hairs straight and gland-tipped; corolla white to pale blue or violet *Veronica agrestis*
- 21 Capsule with a mixture of short, arching, non-glandular hairs and longer, straight, gland-tipped hairs; corolla bright blue *Veronica polita*
- 19 Leaves with 3-7 shallow lobes or large teeth; capsules nearly round in ×-section; [subgenus *Cochlidiosperma*]. *Veronica hederifolia*

* *Veronica agrestis* Linnaeus. FIELD SPEEDWELL. **Hab:** Lawns and disturbed areas. **Dist:** Native of Eurasia. **Phen:** Feb-Jul. **Syn:** = C, F, Fl6, FNA17, G, K1, K3, K4, NcTx, NE, NY, Pa, WH3, Pennell (1935), Stace (2010), Walters & Webb (1972); < *Veronica agrestis* Linnaeus – G, GrPl, RAB, Va; ? *Veronica biloba* Linnaeus – Il; < *Veronica polita* Fries – WV.

* *Veronica arvensis* Linnaeus. CORN SPEEDWELL, WALL SPEEDWELL. **Hab:** Fields, roadsides, disturbed areas. **Dist:** Native of Eurasia. **Phen:** Feb-Sep (-Oct). **Syn:** = Ar, C, F, Fl6, FNA17, G, GrPl, Il, K1, K3, K4, Mi, NcTx, NE, NY, Pa, RAB, S, Tn, Tx, Va, W, WH3, WV, Pennell (1935), Stace (2010), Walters & Webb (1972). NatureServe GNR (Not Yet Ranked).

* *Veronica hederifolia* Linnaeus. IVYLEAF SPEEDWELL. **Hab:** Lawns, fields, disturbed areas. **Dist:** Native of Europe. **Phen:** Feb-Jun. **Syn:** = Ar, Fl6, FNA17, K1, K3, K4, Mi, NY, Pa, Tn, Va, W, WH3; = *Veronica hederifolia* – C, F, G, GrPl, Il, NE, RAB, S, WV, Pennell (1935), orthographic variant; = *Veronica hederifolia* ssp. *hederifolia* – Stace (2010), Walters & Webb (1972). NatureServe GNR (Not Yet Ranked).

Veronica peregrina Linnaeus var. *peregrina*. COMMON PURSLANE SPEEDWELL, NECKLACE-WEED. **Hab:** Fields, roadsides, disturbed areas. **Dist:** NS and ND south to FL and TX; AK south to OR (perhaps only as an introduction?); South America. **Phen:** (Feb-) Apr-Aug. **Syn:** = C, F, G, GrPl, Il, Mi, S, Tx, Va, WV; = *Veronica peregrina* ssp. *peregrina* – K1, K3, K4, NcTx, NE, NY, Pa, Tn; = *Veronica peregrina* var. *typica* – Pennell (1935); < *Veronica peregrina* – Ar, Bah, Fl6, FNA17, RAB, W, WH3, Stace (2010), Walters & Webb (1972). NatureServe G5T5 (Secure).

* *Veronica persica* Poir. BIRD'S-EYE SPEEDWELL. **Hab:** Lawns, fields, roadsides, disturbed areas. **Dist:** Native of Eurasia. **Phen:** Feb-Oct. **Syn:** = Ar, C, F, Fl6, FNA17, G, GrPl, Il, K1, K3, K4, Mi, NcTx, NE, NY, Pa, RAB, S, Tn, Tx, Va, W, WH3, WV, Pennell (1935), Stace (2010), Walters & Webb (1972). NatureServe GNR (Not Yet Ranked).

* *Veronica polita* Fries. WAYSIDE SPEEDWELL. **Hab:** Lawns, waste areas. **Dist:** Native of Eurasia. This species is introduced in c. TN (Chester, Wofford, & Kral 1997), WV, and s. PA (Rhoads & Klein 1993), FL (Pennell 1935; Kunzer et al. 2009), NC (Kartesz 1999), VA (Kartesz 1999), and AL (H. Horne, pers. comm., 2013), and w. NC (D. Mercier, pers. comm., specimen at BOON, 2008). **Phen:** Feb-Aug. **ID Notes:** *Veronica polita* is similar to *V. agrestis* and has been much confused with it. **Syn:** = Ar, C, F, Fl6, FNA17, Il, K1, K3, K4, Mi, NcTx, NE, NY, Pa, S, Tn, Tx, WH3, Stace (2010), Walters & Webb (1972); < *Veronica agrestis* Linnaeus – G, GrPl, RAB, Va; ? *Veronica didyma* Tenore – Pennell (1935), misapplied; < *Veronica polita* Fries – WV.

370. **PLANTAGINACEAE**

* **Veronica serpyllifolia** Linnaeus var. *serpyllifolia*. THYMELEAF SPEEDWELL. **Hab:** Meadows, lawns, roadsides, other disturbed areas. **Dist:** Native of Eurasia. **Phen:** Apr-Aug. **Syn:** = Ar, C, G, GrPl, Mi, Va; = *Veronica serpyllifolia* – Pennell (1935); = *Veronica serpyllifolia* ssp. *serpyllifolia* – K1, K3, K4, NE, NY, Stace (2010), Walters & Webb (1972); < *Veronica serpyllifolia* – F, FNA17, Il, Pa, RAB, S, Tn, W, WV. NatureServe G5TNR (Not Yet Ranked).

**Veronicastrum** Heister ex Fabricius 1759 (CULVER'S-ROOT)

A genus of ca. 20 species, herbs, of e. North America and e. Asia. References: Freeman (2019k) in FNA17 (2019); Pennell (1935).

Veronicastrum virginicum (Linnaeus) Farwell. CULVER'S-ROOT, CULVER'S-PHYSIC. **Hab:** Streambanks, bogs, wet meadows, moist prairies, dryish soils in areas with prairie affinities, woodlands on high pH soils. **Dist:** VT west to MB, south to nc. and nw. GA, w. FL Panhandle (Escambia County), and LA. **Phen:** Jun-Sep. **Comm:** Populations seem to be of somewhat sporadic or irregular appearance from year to year. **Syn:** = Ar, C, F, Fl6, FNA17, G, GrPl, GW2, Il, K1, K3, K4, Mi, NcTx, NE, NY, Pa, RAB, S, Tx, Va, W, WH3, WV, Pennell (1935). NatureServe G4 (Apparently Secure).

371. **SCROPHULARIACEAE** A.L. de Jussieu 1789 (FIGWORT FAMILY) [in LAMIALES]

There is now overwhelming evidence that the Scrophulariaceae as traditionally constituted includes disparate components and requires dismantling (Olmstead & Reeves 1995; Young, Steiner, & dePamphilis 1999; Albach, Meudt, & Oxelman 2005; Schäferhoff et al. 2010, and others). Based on molecular analysis, Young, Steiner, & dePamphilis (1999) suggest that Scrophulariaceae, Antirrhinanthaceae, and Orobanchaceae be restructured to include the current members of Orobanchaceae, Scrophulariaceae, and Callitrichaceae. Beardsley & Olmstead (2002) suggest that *Mimulus* and *Mazus* be included with *Phryma* in a redefined Phrymaceae. Additional changes have been suggested, as summarized below and reviewed and discussed by Schäferhoff et al. (2010). References: Beardsley & Olmstead (2002); Olmstead & Reeves (1995); Olmstead et al (2001); Pennell (1935); Rabeler, Freeman, & Elisens (2019c) in FNA17 (2019); Schäferhoff et al (2010); Young, Steiner, & dePamphilis (1999).

Disposition of the traditional Scrophulariaceae (including Antirrhinanthaceae), and related families:

Linderniaceae: *Lindernia*, *Hemianthus*, *Micranthemum*, *Torenia*

Orobanchaceae: *Agalinis*, *Aphyllon*, *Aureolaria*, *Buchnera*, *Castilleja*, *Conopholis*, *Dasistoma*, *Epifagus*, *Macranthera*, *Melampyrum*, *Myzorrhiza*, *Orobanche*, *Pedicularis*, *Phelipanche*, *Schwalbea*, *Seymeria*, *Striga*.

Paulowniaceae: *Paulownia*.

Plantaginaceae (Veronicaceae) *Mazus*.

Phrymaceae: *Glossostigma*, *Mimulus*, *Phryma*, *Erythranthe*.

{add to key: *Capraria*}

- 1 Plant a shrub; inflorescence a terminal thyse..... **Buddleja**
 1 Plant an herb; inflorescence either a raceme, a spike, or a diffuse panicle (*Scrophularia* and *Verbascum*), or the flowers solitary from basal axils (*Limosella*).
 3 Corolla cylindric, purplish; fertile stamens 4..... **Scrophularia**
 3 Corolla rotate, yellowish; fertile stamens 5..... **Verbascum**

Buddleja Linnaeus 1753 (BUTTERFLY-BUSH)

A genus of about 90-100 species, trees and shrubs, of subtropical and tropical America, Asia, and Africa. Members of the genus are grown for ornament and for their attractiveness as nectaring sites for butterflies. References: Norman (2019) in FNA17 (2019); Oxelman, Kornhall, & Norman in Kadereit (2004); Rogers (1986).

* **Buddleja lindleyana** Fortune ex Lindley. LINDLEY'S BUTTERFLY-BUSH. **Hab:** Rarely escaped to disturbed areas. **Dist:** Native of China. **Phen:** Jun-Oct; Aug-Nov. **Syn:** = Fl6, FNA17, K1, K3, K4, RAB, Tx, WH3, Rogers (1986); = *Adenopsea lindleyana* (Fortune ex Lindley) Small – S. NatureServe GNR (Not Yet Ranked).

Scrophularia Linnaeus 1753 (FIGWORT)

A genus of about 200 species, of temperate and tropical regions of the Old and New Worlds. Though our two species are only subtly distinct morphologically, they are clearly distinct. References: Fischer in Kadereit (2004); Kersh (2019) in FNA17 (2019); Pennell (1935).

Scrophularia marilandica Linnaeus. EASTERN FIGWORT. **Hab:** Moist to dry, nutrient-rich woodlands and forests, especially over mafic or calcareous rocks. **Dist:** QC west to MN, south to SC, ne. GA, Panhandle FL, LA, and ne. TX. **Phen:** Mid Jul-Oct. **Syn:** = Ar, C, F, Fl6, G, GrPl, Il, K1, K3, K4, Mi, NcTx, NE, NY, Pa, RAB, S, Tn, Tx, Va, W, WH3, WV, Pennell (1935); < *Scrophularia marilandica* Linnaeus – FNA17.

Verbascum Linnaeus 1753 (MULLEIN)

A genus of about 360 species, herbs (annual, biennial, and perennial), of Eurasia and ne. Africa. References: Fischer in Kadereit (2004); Nesom (2019c) in FNA17 (2019); Pennell (1935).

- 1 Flowers usually 1 per node throughout the inflorescence or with lowermost nodes with > 1 flower; inflorescences usually unbranched; leaves green and glabrous on both sides, or sparsely or densely pubescent with glandular hairs; hairs of the calyx and upper stem simple and glandular. *Verbascum blattaria*
- 1 Flowers mostly in axillary clusters of 2-10; inflorescences either branched or unbranched; leaves densely tomentose at least on the lower surface, and often the upper as well; hairs of the calyx and upper stem branched (dendritic), not glandular (except in *V. sinuatum*). *Verbascum thapsus* ssp. *thapsus*

* *Verbascum blattaria* Linnaeus. MOTH MULLEIN. **Hab:** Fields, roadsides, disturbed areas. **Dist:** Native of Eurasia. **Phen:** May-Jun (-Nov); Jun-Jul (-Dec). **Syn:** = C, F, Fl6, FNA17, G, GrPl, Il, K1, K3, K4, Mi, NcTx, NE, NY, Pa, RAB, S, Tn, Tx, Va, W, WH3, WV, Pennell (1935). NatureServe GNR (Not Yet Ranked).

* *Verbascum thapsus* Linnaeus ssp. *thapsus*. WOOLLY MULLEIN, COMMON MULLEIN, FLANNEL-PLANT, VELVET-PLANT. **Hab:** Fields, roadsides, disturbed areas, sometimes weedy on rock outcrops. **Dist:** Native of Europe. **Phen:** May-Sep; Jul-Oct. **Syn:** = FNA17; < *Verbascum thapsus* – Ar, C, F, Fl6, G, GrPl, Il, K1, K3, K4, Mi, NcTx, NE, NY, Pa, RAB, S, Tn, Tx, Va, W, WH3, WV, Pennell (1935). NatureServe GNRTNR (Not Yet Ranked).

373. LINDERNIACEAE Borsch, Kai Müller, & Eb. Fischer 2005 (FALSE-PIMPERNEL FAMILY) [in LAMIALES]

A family of about 13 genera and 195 species, herbs, pantropical and warm temperate. References: Fischer in Kadereit (2004); Fischer, Schäferhoff, & Müller (2013); Lewis et al (2019) in FNA17 (2019); Pennell (1935); Tank et al (2006).

- 1 Calyx conspicuously 5-winged (each calyx segment strongly keel-winged) *Torenia*
- 1 Calyx not winged.
 - 2 Flowers < 2 mm long. *Micranthemum*
 - 2 Flowers > 4 mm long.
 - 4 Fertile stamens 4; calyx lobes connate at anthesis for > ½ their length, later separating *Torenia*
 - 4 Fertile stamens 2 (with 2 staminodia without anthers, or with rudimentary anthers); calyx lobes separate, or connate at base for < ¼ the length of the calyx. *Lindernia*

Lindernia Allioni 1755 (FALSE-PIMPERNEL)

A genus of about 30 species, of warm temperate and subtropical regions of the Old and New Worlds. The narrower circumscription follows Fischer, Schäferhoff, & Müller (2013). References: Cooperrider & McCready (1975); Fischer in Kadereit (2004); Fischer, Schäferhoff, & Müller (2013); Lewis (2000); Lewis (2019a) in FNA17 (2019); Pennell (1935); Qualls (1984).

- 1 Fertile stamens 4; calyx lobes connate at anthesis for > ½ their length, later separating..... *Torenia crustacea*
- 1 Fertile stamens 2 (with 2 staminodia without anthers, or with rudimentary anthers); calyx lobes separate, or connate at base for < ¼ the length of the calyx.
 - 6 Leaf blades 5-15 mm long; lower leaves (and upper as well) widest at base and rounded or clasping; bracteal leaves subtending flowers much smaller (< 1/2 x as long) than the lower stem leaves; pedicels much longer than the reduced bracteal leaves subtending them; flowers all chasmogamous (opening)..... *Lindernia anagallidea*

(see introduction for more)

- 6 Leaf blades 10-30 mm long; lower leaves narrowed towards the base; bracteal leaves subtending flowers only somewhat shorter than lower stem leaves; pedicels shorter than or somewhat longer than the slightly reduced bracteal leaves subtending them; flowers all or in part cleistogamous (remaining closed).

Lindernia dubia var. *dubia*

Lindernia anagallidea (Michaux) Pennell. **Hab:** Wet sandy or muddy areas. **Dist:** Nearly throughout North America, Central America, and South America. **Phen:** Jun-Sep. **Syn:** = F, G, GW2, IL, RAB, Tx, WV, Pennell (1935); = *Ilysanthes inequalis* – S; = *Lindernia dubia* var. *anagallidea* – C, K1, K3, Mi, NcTx, NE, NY, Pa, Tn, Va, WH3, Lewis (2000), Qualls (1984); < *Lindernia dubia* (Linnaeus) Pennell – Ar, FNA17, GrPl, K4, W, Cooperrider & McCready (1975), Fischer, Schäferhoff, & Müller (2013). **NatureServe** G5T4 (Apparently Secure).

Lindernia dubia (Linnaeus) Pennell var. *dubia*. **YELLOWSEED FALSE-PIMPERNEL.** **Hab:** Wet sandy or muddy areas. **Dist:** Nearly throughout North America, Central America, and South America. **Phen:** (Apr-) Jun-Sep (-Oct). **Tax:** The extensive and essentially coincident ranges of the taxa "*dubia*" and "*anagallidea*" has suggested that they are merely forms (Voss 1996, Cooperrider & McCready 1975, and others). **Syn:** = K1, Pa; > *Ilysanthes attenuata* (Muhlenberg) Small; < *Ilysanthes dubia* (Linnaeus) Barnhart – S; < *Lindernia dubia* (Linnaeus) Pennell – Ar, FNA17, GrPl, GW2, K4, RAB, Tx, W, WV, Cooperrider & McCready (1975), Fischer, Schäferhoff, & Müller (2013); > *Lindernia dubia* ssp. *major* (Pursh) Pennell var. *major* – Pennell (1935); > *Lindernia dubia* ssp. *typica* – Pennell (1935); < *Lindernia dubia* (Linnaeus) Pennell var. *dubia* – C, K3, Mi, NE, NY, Tn, Va, WH3, Lewis (2000), Qualls (1984); > *Lindernia dubia* (Linnaeus) Pennell var. *dubia* – F, G, IL; > *Lindernia dubia* (Linnaeus) Pennell var. *inundata* (Pennell) Pennell – Pa; > *Lindernia dubia* (Linnaeus) Pennell var. *major* (Pursh) Pennell; > *Lindernia dubia* var. *riparia* (Rafinesque) Fernald – F, G, IL; > *Lindernia dubia* (Linnaeus) Pennell var. *typica* Pennell; > *Lindernia pyxidaria* Linnaeus – Pennell (1935), misapplied.

Micranthemum Michaux 1803

A genus of 14-17 species, annual herbs, of s. North America, Central America, and South America. The recognition of *Hemianthus* as separate from *Micranthemum* is uncertain and needs additional study; Fischer, Schäferhoff, & Müller (2013) show that *Micranthemum* is very close to *Lindernia* s.s., but leave it separate for now (based on inadequate sampling). References: Fischer in Kadereit (2004); Keener (2019b) in FNA17 (2019); Pennell (1935).

Micranthemum umbrosum (J.F. Gmelin) Blake. **SHADE MUDFLOWER.** **Hab:** Shallow pools, stagnant streams, wet depressions in swamp forests. **Dist:** Se. VA south to FL, west to TX, and south into tropical America (Mexico, Central America, West Indies, e. South America). **Phen:** May-Oct. **Syn:** = C, F, FNA17, G, GW2, K1, K3, K4, RAB, Va, WH3, Pennell (1935); = *Globifera umbrosa* J.F. Gmelin – S; = *Micranthemum umbros* – Fl6, orthographic variant. **NatureServe** G5 (Secure).

Torenia Linnaeus 1753 (BLUE-WINGS)

A genus of about 51 species, annual and perennial herbs, of the Old World tropics. References: Fischer in Kadereit (2004); Fischer, Schäferhoff, & Müller (2013); Lewis (2000); Lewis (2019b) in FNA17 (2019); Qualls (1984).

* ***Torenia crustacea*** (Linnaeus) Chamisso & Schlechtendal. **MALAYSIAN FALSE-PIMPERNEL.** **Hab:** Lawns, roadsides, sand and mudbars. **Dist:** Native of Malaysia. **Phen:** May-Sep (-Apr). **Syn:** = Fl6, K4, Fischer, Schäferhoff, & Müller (2013); = *Lindernia crustacea* (Linnaeus) F. Mueller – Ar, FNA17, GW2, K1, K3, RAB, WH3, Lewis (2000), Pennell (1935), Qualls (1984). **NatureServe** GNR (Not Yet Ranked).

375. MARTYNIACEAE Horaninow 1847 (MARTYNIA FAMILY) [in LAMIALES]

A family of 5 genera and about 16 species, herbs, tropical and subtropical. Bretting & Nilsson (1988) present evidence for maintaining the Martyniaceae as distinct from the Pedaliaceae. References: Ihlenfeldt in Kadereit (2004).

- 1 Sepals separate; corolla yellow; fertile stamens 2; fruit echinate with numerous broad-based spines.....*Ibicella*
 1 Sepals connate for >1/2 their length; fertile stamens 4; corolla purplish; fruit sculptured with elongate ridges.....*Proboscidea*

Ibicella Van Eseltine 1929 (YELLOW UNICORN-PLANT)

A genus of 3 species, annual herbs, of South America. References: Ihlenfeldt in Kadereit (2004).

Key to Map
 Symbology:

375. MARTYNIACEAE

* ***Ibicella lutea*** (Lindley) Van Eseltine. YELLOW UNICORN-PLANT. **Hab:** Disturbed areas, persistent or weakly spreading after cultivation. **Dist:** Native of South America. Reported for SC (J.B. Nelson, pers. comm., 2015). **Phen:** Jun-Aug. **Syn:** = Fl6, K3, K4, WH3. **NatureServe GNR** (Not Yet Ranked).

Proboscidea Schmidel 1763 (UNICORN-PLANT)

A genus of about 9 species, herbs, of warm temperate to subtropical America. References: Bretting & Nilsson (1988); Thieret (1977).

Proboscidea louisiana (Miller) Thellung *ssp. louisiana*. UNICORN-PLANT, DEVIL'S-CLAW, COW CATCHER.

Hab: Disturbed areas, pastures. **Dist:** Native of the Great Plains; populations eastwards are adventive. **Phen:** Jun-Sep. **Comm:** The curious fruits are unmistakable. **Syn:** = K3; = *Proboscidea louisianica* *ssp. louisianica* – K1, NE, NY, Bretting & Nilsson (1988), orthographic variant; < *Martynia louisiana* Miller – S; < *Proboscidea louisiana* – C, G, Mi; < *Proboscidea louisianica* (Miller) Thellung – Ar, F, Fl6, GrPl, GW2, Il, K4, NcTx, Pa, RAB, Tn, Tx, WH3, WV, Thieret (1977), orthographic variant. **NatureServe GUTU** (Unrankable).

376e. VISCACEAE Batsch 1802 (CHRISTMAS MISTLETOE FAMILY) [in SANTALALES]

A family of 7 genera and about 575 species, epiphytic herbs and shrubs, nearly cosmopolitan. References: Nickrent (2016d) in FNA12 (2016).

Phoradendron Nuttall 1848 (MISTLETOE)

A genus of 235-250 species, epiphytic hemiparasites, of tropical and rarely temperate America. *Phoradendron* is placed in the segregate family Viscaceae by Nickrent et al. (2010) and Nickrent in FNA (2016). References: Abbott & Thompson (2011); Hawkins (2010); Kuijt (1982); Kuijt (2003); Nickrent (2016d) in FNA12 (2016).

Phoradendron leucarpum (Rafinesque) Reveal & M.C. Johnston *ssp. leucarpum*. AMERICAN MISTLETOE, CHRISTMAS MISTLETOE. **Hab:** Parasitic on various species of trees, especially abundant in swamp forests (perhaps because they are less frequently cut and have older, more mature hardwoods). **Dist:** NJ west to s. OH, s. IN, and s. MO, south to s. FL and s. TX. **Phen:** Oct-Nov (-Mar); Nov-Jan (-May). **Tax:** Kuijt (2003) interprets this as a species with four subspecies; *ssp. serotinum* is the eastern component, ranging from NJ west to s. OH, s. IN, and s. MO, south to s. FL and s. TX. Hawkins (2010) studied the subspecies and population structure in *P. leucarpum* and found complex patterns of molecular and morphological variation that do not readily correspond to the subspecies. While the best taxonomic resolution is unclear, I here retain *ssp. leucarpum* for the easternmost element in this complex (the only element in our area). The other three subspecies of Kuijt (2003) are distributed in sw. United States and n. Mexico. The same four subspecies are recognized by Abbott & Thompson, under what has now been ruled to be the correct species name: *P. leucarpum* (Applequist 2012). The lengthy and arcane debates about the correct nomenclature are summarized by Abbott & Thompson (2011), and references cited therein. **Comm:** *Phoradendron* is, of course, the mistletoe familiar (at least traditionally) in e. United States as a Christmas decoration. Kuijt (1982) comments that "the superficial likeness of *Phoradendron serotinum* to the European *Viscum album* has made the transfer of the latter's folklore to North America easy;" *Viscum album* was a sacred plant of Celtic and druidical pre-Christian European societies. The white berries of *P. leucarpum* are extremely poisonous. Their sticky flesh promotes the dispersal of the seeds by birds from tree to tree. **Syn:** = K3, Va, Abbott & Thompson (2011); = *Phoradendron leucarpum* (Rafinesque) Reveal & M.C. Johnston – K4; = *Phoradendron serotinum* (Rafinesque) M.C. Johnston *ssp. serotinum* – Kuijt (2003); = *Phoradendron tomentosum* *ssp. tomentosum* – Tx; > *Phoradendron eatonii* Trelease – S; < *Phoradendron flavescens* (Pursh) Nuttall – F, G, WV; > *Phoradendron flavescens* (Pursh) Nuttall – S; < *Phoradendron leucarpum* (Rafinesque) Reveal & M.C. Johnston – Ar, Fl4, FNA12, Il, K1, NY, Pa, Tn, WH3; > *Phoradendron macrotomum* Trelease – S; < *Phoradendron serotinum* (Rafinesque) M.C. Johnston – C, RAB, W, Kuijt (1982); > *Phoradendron serotinum* (Rafinesque) M.C. Johnston – GrPl; > *Phoradendron tomentosum* (A.P. de Candolle) Engelman ex A. Gray – GrPl, NcTx.

377. ACANTHACEAE A.L. de Jussieu 1789 (ACANTHUS FAMILY) [in LAMIALES]

A family of about 230 genera and about 3450 species, herbs, shrubs, vines, and trees, largely tropical. References: Long (1970); McDade & Moody (1999); Wasshausen (1998).

- 1 Plant a tree, with opposite leathery leaves; [of FL, s. MS, s. LA southward]..... *Avicennia germinans*
- 1 Plant an herb, with various leaf arrangements.
 - 2 Leaves in a basal rosette (sometimes with smaller leaves on a scape)..... *Ruellia ciliosa*
 - 2 Leaves cauline.
 - 5 Fertile stamens 2; corolla distinctly 2-lipped (except salverform in *Pseuderanthemum* and with 4 nearly equal lobes in *Yeatesia*).
 - 8 Bracts and bractlets inconspicuous, 2-5 mm long, linear or triangular; stem subterete or obscurely 4-angled..... *Justicia*
 - 8 Bracts and/or bractlets subtending the flowers conspicuous, 5-15 mm long, obovate; stem terete or 6-angled.
 - 9 Stem six-angled in cross-section; corolla conspicuously 2-lipped..... *Dicliptera*
 - 9 Stem terete in cross-section; corolla 4-lobed, the lobes nearly equal..... *Yeatesia*
 - 5 Fertile stamens 4; corolla not distinctly 2-lipped, the corolla lobes of nearly equal size (except distinctly 2-lipped in *Hygrophila*).
 - 10 Corolla distinctly 2-lipped..... *Hygrophila*
 - 10 Corolla not distinctly 2-lipped, the corolla lobes of nearly equal size.
 - *Ruellia*

Avicennia Linnaeus 1753 (BLACK MANGROVE)

A genus of 4-7 species, tropical. Of variable family placement, having been variously placed in the Acanthaceae, Verbenaceae, or Avicenniaceae.

Avicennia germinans (Linnaeus) Linnaeus. BLACK MANGROVE. **Hab:** Brackish and salt marshes and swamps. **Dist:** Scattered on the Gulf Coast in FL peninsula (Dixie county southward on the west coast, St. Johns County southward on the east coast), Panhandle FL (Franklin and Taylor counties), s. MS, s. AL, s. LA, and se. TX, southward into the West Indies and Tropical America. **Phen:** Jan-Dec. **Syn:** = Bah, Fl6, GW2, K1, K3, K4, Tx, WH3; = *Avicennia nitida* Jacquin – S.

*Dicliptera* A.L. de Jussieu 1807 (DICLIPTERA, FOLDWING)

A genus of about 150 species, largely tropical, but extending into warm temperate regions. References: Long (1970); Wasshausen (1998).

Dicliptera brachiata (Pursh) Sprengel. DICLIPTERA, BRANCHED FOLDWING. **Hab:** Bottomland forests. **Dist:** Se. VA south to c. peninsular FL, west to c. TX, and north in the interior to c. TN, s. IN, s. IL, MO, and se. KS. **Phen:** Aug-Oct. **Syn:** = Ar, C, F, Fl6, GrPl, GW2, Il, K1, K3, K4, Mo2, NcTx, RAB, Tn, Tx, Va, WH3, Wasshausen (1998); = *Diapedium brachiatum* (Pursh) Kuntze – S; > *Dicliptera brachiata* var. *brachiata* – Long (1970). NatureServe G5 (Secure).

*Hygrophila* R. Brown 1810 (SWAMPWEED)

A genus of about 25 species, of tropical regions. References: Daniel (2013); Les & Wunderlin (1981); Wasshausen (1998).

- 3 Leaf blades 1-3.5 cm long; calyx segments ca. 2 mm long, pubescent; flowers borne in terminal and axillary spikes ***Hygrophila polysperma***
 3 Leaf blades 5-12 cm long; calyx segments ca. 5 mm long, glabrous; flowers borne in axillary clusters. ***Hygrophila lacustris***

Hygrophila lacustris (Schlechtendal & Chamisso) Nees. GULF SWAMPWEED. **Hab:** Shallow water of swamps and shores. **Dist:** Sw. GA south to c. FL Peninsula, west to e. TX; West Indies. **Phen:** Jun-Sep. **Tax:** *H. lacustris* has recently been interpreted as a component within *H. costata*, widespread in the Neotropics (Daniel 2013). **Syn:** = GW2, K1, K3, K4, S, Tx, Les & Wunderlin (1981), Wasshausen (1998); = *Ruellia lacustris* Schlechtendahl & Chamisso; < *Hygrophila costata* Nees et al. – Fl6, WH3, Daniel (2013).

* ***Hygrophila polysperma*** (Roxburgh) T. Anderson. EAST INDIAN SWAMPWEED, HYGRO, MIRAMAR-WEED, EAST INDIAN HYGROPHILA. **Hab:** Lakes, rivers, canals; established in AL, FL, and SC (Hook & Nelson 2011), doubtfully established in VA. **Dist:** Native of the East Indies. Grown for the aquarium trade, and sporadically introduced to bodies of water, apparently well-established in FL (Les & Wunderlin 1981). **Syn:** = Fl6, GW2, K1, K3, WH3, Les & Wunderlin (1981), Wasshausen (1998); = n/a – RAB. NatureServe GNR (Not Yet Ranked).

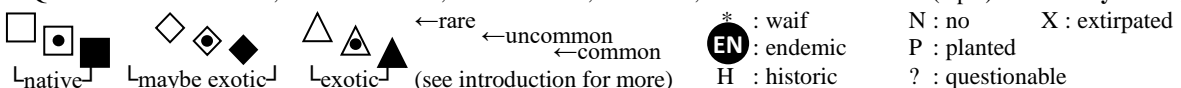

*Justicia* Linnaeus 1753 (WATER-WILLOW)

A genus of 600 or more species, herbs and shrubs of the tropics and warm temperate North America. *Justicia* as circumscribed is highly polyphyletic and will need to be expanded further or split into smaller, monophyletic units. Any splitting will remove *Justicia* from our native flora, as the type of *Justicia* is Old World, and all the New World taxa form a separate clade. References: Daniel (2013); Long (1970); Wasshausen (1998).

- 5 Spike densely flowered; seeds verrucose; primary leaves averaging 6-8× as long as wide; [of the Piedmont, Mountains, and Coastal Plain] ***Justicia americana***
 5 Spike loosely flowered; seeds smooth or minutely muricate (with very fine, sharp projections); primary leaves either ca. 2-6× as long as wide or > 8× as long as wide; [of the Coastal Plain].
 8 Spikes lax, the flowers usually borne singly, secund; seeds smooth; leaves averaging ca. 5× as long as wide ***Justicia lanceolata***
 8 Spikes somewhat congested, the flowers borne in opposite pairs; seeds minutely muricate (with very fine, sharp projections); leaves averaging ca. 3× as long as wide ***Justicia ovata***

Justicia americana (Linnaeus) Vahl. AMERICAN WATER-WILLOW. **Hab:** River and stream beds, in shallow water, often rooted in rocky shallows. **Dist:** W. QC west to s. MI and NE, south to sw. GA, Panhandle FL, and s. TX; COA and CHH. **Phen:** (Apr-) Jun-Oct. **Syn:** = Ar, C, Fl6,

IL. **Phen:** May-Jul. **Syn:** = K3, K4, S, Daniel (2013); = *Justicia ovata* (Walter) Lindau var. *ovata* – C, Fl6, IL, K1, Va, WH3, Long (1970), Wasshausen (1998); ? *Justicia humilis* Michaux var. *humilis* – G; > *Justicia mortuifluminis* Fernald – F; < *Justicia ovata* (Walter) Lindau – GW2, RAB; >> *Justicia ovata* (Walter) Lindau – F.

***Ruellia* Linnaeus 1753 (WILD-PETUNIA)**

A genus of about ca. 300 species, of the tropics and temperate North America (E. Tripp, pers. comm., 2009). References: Daniel (2013); Ezcurra & Daniel (2007); Fernald (1945); Long (1970); Tripp et al (2009); Turner (1991); Ward (2007c); Wasshausen (1998).

- 1 Flowers borne in terminal cymose panicles (the flower not directly subtended by a leaf). ***Ruellia nudiflora* var. *nudiflora***
- 1 Flowers borne in leaf axils (including at upper and terminal nodes), solitary or in either sessile or pedunculate clusters.
 - 5 Principal leaf blades linear-lanceolate, > 10× as long as wide (8-27 cm long, 0.7-2 cm wide); [alien, cultivated and naturalized] ***Ruellia simplex***
 - 5 Principal leaf blades elliptic, ovate or broadly lanceolate, 2-5 × as long as wide (2-16 cm long, 0.5-7 cm broad); [native or alien].
 - 6 Plant with a rosette of basal leaves, flat on the ground, and 0 (-2) pairs of leaves on the stem; [restricted to dry pinelands in the Coastal Plain] ***Ruellia ciliosa***
 - 6 Plant with all leaves on the stem; leaves ovate, lanceolate, elliptic, or oblong; [collectively widespread in our area].
 - 7 Calyx lobes narrowly linear-lanceolate, flattened to the tip, 1-4 mm wide; larger leaf blades 7-18 cm long, 3-9 cm wide ***Ruellia strepens***
 - 7 Calyx lobes linear, filiform or setaceous at least apically, < 1.2 mm wide at their widest point (usually the base), hairlike at the tip; larger leaf blades 2-11 cm long, 0.8-5 cm wide.
 - 8 Flowers borne on peduncles 0.2-7 cm long, from the axils of lower and median nodes, not from the terminal node or terminal cluster; capsules glabrous (*R. pinetorum*) or variously hairy (*R. purshiana*, *R. pedunculata*). ***Ruellia pinetorum***
 - 8 Flowers sessile or subsessile, in the axils of median and upper nodes, and usually also from the terminal node or cluster; capsules glabrous (or at most with a few scattered hairs).
 - 11 Corolla 6-10 cm long, opening at night and withering by mid-morning, white to pale lavender; calyx lobes 2.5-4.5 cm long; [of Coastal Plain seepage bogs and wet pine flatwoods] ***Ruellia noctiflora***
 - 11 Corolla 3-7 cm long, opening during the day, lavender to lavender-blue (rarely white in *R. humilis*); calyx lobes 1-2.5 (-3) cm long; [of various habitats].
 - 13 Leaves sessile or subsessile; flower-bearing nodes usually 4-8; stem typically branched at base ***Ruellia humilis***
 - 13 Leaves short-petioled; flower-bearing nodes usually 1-3; stem typically simple below (unless damaged), sometimes branched upward ***Ruellia caroliniensis***

Ruellia caroliniensis (J.F. Gmelin) Steudel. CAROLINA WILD-PETUNIA, COMMON WILD-PETUNIA. **Hab:** Dry to moist forests and woodlands. **Dist:** NJ, s. OH, s. IN, s. IL, and OK, south to s. FL and e. TX. **Phen:** (May-) Jun-Sep. **Syn:** = Ar, C, Fl6, G, NcTx, Pa, RAB, Va, WH3, Turner (1991), Ward (2007c); = *Ruellia caroliniensis* ssp. *caroliniensis* var. *caroliniensis* – K1, K3, K4, Long (1970), Wasshausen (1998); < *Ruellia caroliniensis* (J.F. Gmelin) Steudel – Tn, W; > *Ruellia caroliniensis* var. *caroliniensis* – F, Tx; > *Ruellia caroliniensis* var. *cheloniformis* Fernald – F, Fernald (1945); > *Ruellia caroliniensis* var. *dentata* (Nees) Fernald – F, IL, WV, Fernald (1945); > *Ruellia caroliniensis* var. *membranacea* Fernald – F, WV, Fernald (1945); > *Ruellia caroliniensis* var. *nanella* Fernald – F, Fernald (1945); > *Ruellia caroliniensis* var. *salicina* Fernald – F, Tx, Fernald (1945); > *Ruellia caroliniensis* var. *semicalva* Fernald – F, Tx, Fernald (1945); > *Ruellia caroliniensis* var. *serrulata* Tharp & Barkley – Tx; > *Ruellia caroliniensis* var. *typica* – Fernald (1945); ? *Ruellia parviflora* (Nees) Britton – S.

Ruellia ciliosa Pursh. SANDHILL WILD-PETUNIA, DWARF WILD-PETUNIA. **Hab:** Sandhills, particularly in loamy, submesic swales. **Dist:** Sc. NC south to c. peninsular FL, west to se. LA. **Phen:** May-Sep. **Tax:** Although treated as only subspecifically distinct from *R. caroliniensis* by many recent authors, there seem ample differences in morphology, distribution, and habitat to warrant specific distinction. Var. *cinerascens* Fernald of the FL Panhandle needs additional assessment, but is here tentatively submerged in *R. ciliosa*. **Syn:** = Fl6, RAB, S, WH3, Ward (2007c); = *Ruellia caroliniensis* ssp. *ciliosa* var. *ciliosa* – Long (1970), Wasshausen (1998); = *Ruellia caroliniensis* (J.F. Gmelin) Steudel ssp. *ciliosa* (Pursh) R.W. Long var. *cinerascens* (Fernald) Kartesz & Gandhi – K1, K3, K4; < *Ruellia caroliniensis* (J.F. Gmelin) Steudel – W; > *Ruellia ciliosa* var. *cinerascens* Fernald – Fernald (1945); > *Ruellia ciliosa* var. *typica* – Fernald (1945).

Ruellia humilis Nuttall. LOW WILD-PETUNIA, HAIRY WILD-PETUNIA, FRINGELEAF RUELLIA. **Hab:** Calcareous or mafic glades and woodlands, prairies, dry woodlands and fields. **Dist:** S. PA west to se. MN and e. NE, south to c. NC, nc. SC (York County; Schmidt & Barnwell 2002), c. AL, s. MS, s. LA, and c. and s. TX. **Phen:** May-Oct. **Tax:** This species badly needs taxonomic re-evaluation, looking at variation (some previously recognized -- see synonymy) across its wide and fragmented distribution. **Comm:** Piedmont plants of NC and SC are uniformly white-flowered. **Syn:** = Ar, GrPl, K1, K3, K4, Mi, Mo2, NcTx, NY, Pa, RAB, Tn, Va, W, WV, Long (1970), Wasshausen (1998); > *Ruellia humilis* var. *calvescens* Fernald – C, F, G, Fernald (1945); > *Ruellia humilis* var. *depauperata* Tharp & Barkley – Tx, Turner (1991); > *Ruellia humilis* var. *expansa* Fernald – F, Tx; > *Ruellia humilis* var.

377. ACANTHACEAE

frondosa Fernald – F, G, Tx, Fernald (1945), Fernald (1945); > *Ruellia humilis* var. *humilis* – C, F, G, Il, Turner (1991); > *Ruellia humilis* var. *longiflora* A. Gray – Il, Tx, Fernald (1945); > *Ruellia humilis* var. *typica* – Fernald (1945).

Ruellia noctiflora (Nees) A. Gray. NIGHT-FLOWERING WILD-PETUNIA. **Hab:** Wet pinelands and savannas. **Dist:** E. GA (in counties immediately adjacent to SC) south to ne. FL; Panhandle FL west to se. LA. **Phen:** (May-) Jun-Jul (-Aug). **Syn:** = Fl6, GW2, K1, K3, K4, S, WH3, Long (1970), Turner (1991), Ward (2007c), Wasshausen (1998). NatureServe G3? (Vulnerable).

Ruellia nudiflora (Engelmann & A. Gray) Urban var. *nudiflora*. VIOLET WILD-PETUNIA. **Hab:** Moist to dry woodlands and forests. **Dist:** AL west to TX, south into Mexico. **Phen:** Jan-Dec. **Syn:** = K2, K3, NcTx, Turner (1991); < *Ruellia ciliatiflora* Hooker – K4, Daniel (2013); > *Ruellia nudiflora* var. *hispidula* Shinnery – Tx; > *Ruellia nudiflora* (Engelmann & A. Gray) Urban var. *nudiflora* – Tx.

Ruellia pinetorum Fernald. PINELAND WILD-PETUNIA. **Hab:** Dry to wet pinelands and prairies. **Dist:** SC south to Panhandle FL, west to e. TX. **Phen:** May-Sep. **Tax:** Although treated as only subspecifically distinct from *R. pedunculata* by many recent authors, there seem ample differences in morphology, distribution, and habitat to warrant specific distinction. First reported for GA by Sorrie (1998b). **Syn:** = F, RAB, Tx, Turner (1991), Ward (2007c); = *Ruellia pedunculata* Torrey ex A. Gray ssp. *pinetorum* (Fernald) R.W. Long – Fl6, K1, K3, K4, WH3, Long (1970), Wasshausen (1998). NatureServe G5T3T4 (Vulnerable).

* ***Ruellia simplex*** C. Wright. MEXICAN BLUEBELL, MEXICAN PETUNIA. **Hab:** Disturbed areas, commonly cultivated, especially in maritime situations along the south Atlantic and Gulf coasts, persistent and spreading (including by seed) to adjacent areas. **Dist:** Native of e. Mexico. **Phen:** May-Sep. **Syn:** = Fl6, K3, WH3, Ezcurra & Daniel (2007); = *Ruellia brittoniana* Leonard – GW2, RAB, Turner (1991), Ward (2007c), Wasshausen (1998); = *Ruellia caerulea* – K1; = *Ruellia malacosperma* – S; > *Ruellia brittoniana* Leonard – NcTx, Tx; > *Ruellia malacosperma* – NcTx, Tx.

Ruellia strepens Linnaeus. LIMESTONE WILD-PETUNIA, LIMESTONE RUELLIA. **Hab:** Calcareous forests, woodlands, and fields. **Dist:** NJ west to OH and IA, south to se., sc., and ne. NC, e. SC, AL, and TX. **Phen:** May-Oct. **Syn:** = Ar, C, F, G, GrPl, Il, K1, K3, K4, Mi, Mo2, NcTx, Pa, RAB, S, Tn, Va, W, WV, Long (1970), Turner (1991), Wasshausen (1998); > *Ruellia strepens* Linnaeus var. *cleistantha* A. Gray – Tx; > *Ruellia strepens* var. *strepens* – Tx.

Neotropics

***Yeatesia* Small 1896 (BRACTSPIKE)**

A genus of 3-4 species, of warm temperate to tropical areas, se. United States to ne. Mexico. References: Long (1970); Wasshausen (1998).

Yeatesia viridiflora (Nees) Small. YELLOW BRAC-T-SPIKE. **Hab:** Rich bottomlands, calcareous river bluffs and hammocks, prairies, marshes. **Dist:** Sw. GA and Panhandle FL west to TX (Kartesz 1999). See Sorrie & LeBlond (2008) for additional distributional information. **Phen:** Apr-Oct. **Syn:** = Fl6, K1, K3, K4, S, Tx, WH3, Wasshausen (1998); = *Dicliptera halei* Riddell; = *Dicliptera viridiflora* (Nees) R.W. Long – Long (1970); > *Yeatesia laetivirens* (Buckley) Small. NatureServe G3G5 (Apparently Secure).

378. BIGNONIACEAE A.L. de Jussieu 1789 (BIGNONIA FAMILY) [in LAMIALES]

A family of about 110 genera and 800 species, trees, shrubs, and lianas, mainly tropical and especially of South America. The monophyly of the Bignoniaceae (excluding *Paulownia*) has now been confirmed many times (Spangler & Olmstead 1999; Olmstead et al. 2009; etc.). References: Fischer, Theisen, & Lohmann in Kubitzki et al (2004); Gentry (1992); Krings & Braham (2004); Lohmann & Taylor (2014); Manning (2000); Olmstead et al (2009); Spangler & Olmstead (1999).

- 1 Leaves simple; plant a tree or shrub. *Catalpa*
- 1 Leaves compound; plant a liana, tree, or shrub.
 - 5 Leaves either all 2-foliolate, with a tendril in the terminal position (this often withered and absent on older leaves), or a mixture of 2-foliolate and 3-foliolate, with at least some leaves on a branch 2-foliolate; plant a liana; [tribe *Bignonieae*]. *Bignonia capreolata*
 - 5 Leaves 3-many-foliolate; plant a tree, shrub, or liana. *Campsis radicans*

Bignonia Linnaeus 1753 (CROSS-VINE)

A genus of ca. 28 species, lianas and shrubs, of se. North America, Central America, and n. South America, as recircumscribed by Lohmann & Taylor (2014). References: Fischer, Theisen, & Lohmann in Kubitzki et al (2004); Lohmann & Taylor (2014); Manning (2000).

Bignonia capreolata Linnaeus. CROSS-VINE. **Hab:** Swamp forests, bottomlands, forests, woodlands. **Dist:** MD west to s. OH and s. MO, south to c. peninsular FL and e. TX. **Phen:** (Mar-) Apr-May (-Jul); Jul-Aug. **Comm:** This species is absent from most of the Mountains in our area (also scarce in the Piedmont of Virginia and upper Piedmont of NC), reappearing at lower elevations on the west side of the Blue Ridge. Though primarily a species of swamp and bottomland forests, *Bignonia* often occurs as well in mesic or even dry forests, where it generally remains stunted (most individuals with only a few leaves) and does not flower or fruit. **Syn:** = Ar, C, F, Fl6, GW2, Il, K1, K3, K4, NcTx, Tn, Tx, Va, W, WH3, Lohmann & Taylor (2014), Manning (2000); = *Anisostichus capreolata* (Linnaeus) Bureau – G, RAB; = *Anisostichus crucigera* (Linnaeus) Bureau – S; = *Bignonia crucigera* Linnaeus. NatureServe G5 (Secure).

Campsis Loureiro 1790 (TRUMPET-CREEPER)

The only other species in the genus is the e. Asian *C. grandiflora* (Thunberg) K. Schumann. Wen & Jansen (1995) estimated the age since divergence to be 24.4 million years, based on molecular divergence. References: Fischer, Theisen, & Lohmann in Kubitzki et al (2004); Gentry (1992); Manning (2000); Wen & Jansen (1995).

Campsis radicans (Linnaeus) Seemann ex Bureau. TRUMPET-CREEPER. **Hab:** Bottomland forests, swamp forests, fencerows, old fields, forests, thickets, disturbed areas. **Dist:** NJ west to IA, south to s. FL and c. TX. **Phen:** (May-) Jun-Jul (-Aug); Sep-Oct. **Comm:** In the pre-Columbian landscape this plant was primarily limited to swamps and bottomlands; it has done well as a weedy colonizer of abandoned farmland, fencerows, and thickets (where particularly conspicuous on fenceposts and old tobacco barns). In swamps of the Coastal Plain it is a common liana, often with its foliage in the canopy 30-40 m above the ground, and with stems to 15 cm in diameter. **ID Notes:** Even when the foliage cannot be seen, *Campsis* is immediately recognizable by its shreddy tannish bark (unlike any of our other high-climbing vines). **Syn:** = Ar, C, F, Fl6, G, GrPl, GW2, Il, K1, K3, K4, Mi, NcTx, NE, NY, Pa, RAB, Tn, Tx, Va, W, WH3, Gentry (1992), Manning (2000); = *Bignonia radicans* Linnaeus – S. NatureServe G5 (Secure).

Catalpa Scopoli 1777 (CATALPA, CATAWBA-TREE)

A genus of about 10 species, trees, of e. North America (2 species), e. Asia (4 species), and the West Indies (4 species). References: Fischer, Theisen, & Lohmann in Kubitzki et al (2004); Gentry (1992); Li (2008); Manning (2000); Olsen & Kirkbride (2017); Paclt (1952).

- 2 Corolla 2-4 cm wide, the lower corolla lobe densely spotted with purple, entire; capsule 6-10 mm in diameter, each valve 9-15 mm wide when flattened; seeds with 2 elongated wings, each wing narrowing to an acutish end, the hairs at the end appressed to one another in 2 planes, thus forming a pointed tail (like a sharply pointed paintbrush); fresh foliage with a fetid odor; leaves abruptly acuminate *Catalpa bignonioides*
- 2 Corolla 4-6 cm wide, the lower corolla lobe sparsely spotted with purple, notched; capsule 10-15 mm in diameter, each valve 13-18 mm wide when flattened; seeds with 2 elongated wings, each wing narrowing only slightly to a rounded or oblique end, the hairs at the end appressed to one another only in one plane, thus forming a flattish fringe (like a flat paintbrush); fresh foliage essentially odorless; leaves long-acuminate *Catalpa speciosa*

Catalpa bignonioides Walter. SOUTHERN CATALPA. **Hab:** Bottomlands and streambanks (as a native), escaped or persistent after cultivation. **Dist:** S. SC, s. GA, ne. FL, n. peninsular FL, and Panhandle FL west to s. MS (or LA?), on the Coastal Plain, early naturalized in a more widespread area, and now extending north to CT and MI. **Phen:** May-early Jul; Oct. **Syn:** = Ar, C, F, Fl6, G, GrPl, GW2, Il, K1, K3, K4, NE, NeUS, NY, Pa, RAB, Tn, Tx, Va, W, WH3, Manning (2000), Olsen & Kirkbride (2017); = *Catalpa catalpa* (Linnaeus) Karsten – S. NatureServe G4 (Apparently Secure).

Catalpa speciosa (Warder) Warder ex Engelm. NORTHERN CATALPA. **Hab:** Bottomland forests, stream banks, and mesic upland forests (as a native), also old fields, roadsides, moist disturbed areas, suburban woodlands, eastwards of its native range escaped or persistent after cultivation, and sometimes thoroughly naturalized. **Dist:** Apparently native in the upper Mississippi River Embayment of s. IN and s. IL, south to w. TN and e. AR; early naturalized in a more widespread area. **Phen:** May-Jul; Jul-Aug. **Syn:** = Ar, C, F, G, GrPl, Il, K1, K3, K4, Mi, NE, NeUS, NY, Pa, RAB, S, Tn, Tx, Va, W, Manning (2000), Olsen & Kirkbride (2017). NatureServe G4? (Apparently Secure).

379. LENTIBULARIACEAE Richard 1808 (BLADDERWORT FAMILY) [in LAMIALES]

A family of 3 genera and about 270-320 species, insectivorous herbs, cosmopolitan. References: Fischer et al. in Kadereit (2004).

Key to Map
Symbology:

* : waif
EN : endemic
H : historic

N : no
P : planted
? : questionable
X : extirpated

- 1 Leaves ovate or elliptic, in a basal rosette; carnivory via the viscid-slimy upper leaf surfaces; flowers solitary on bractless peduncles..... *Pinguicula*
- 1 Leaves or leaf segments linear, borne along a subterranean or submersed stem; carnivory via specialized bladder-like traps; flowers in (1-) many-flowered racemes, each flower pedicel subtended by a bract..... *Utricularia*

Pinguicula Linnaeus 1753 (BUTTERWORT)

A genus of about 46-80 species, herbs, of America, Mediterranean Europe, and circumboreal America and Eurasia. References: Fischer et al. in Kadereit (2004); Godfrey & Stripling (1961); Schnell (1980a); Schnell (2002b); Wood & Godfrey (1957).

- 1 Expanded corolla < 1.5 cm across; palate not exerted from the throat of the corolla; rosettes usually 2-4 cm in diameter; flowers usually white to pale violet (rarely medium violet or yellow); seeds 0.4 mm long..... *Pinguicula pumila*
- 1 Expanded corolla > 1.8 cm across; palate markedly exerted from the throat of the corolla; rosettes usually 5-10 (-15) cm across; corolla yellow, violet, or white; seeds (0.4-) 0.5-0.8 mm long.
- 2 Corolla yellow..... *Pinguicula lutea*
- 2 Corolla lavender-blue or white.
- 4 Fresh leaves dull red or reddish green; corolla lobes ca. 2× as long than broad, the lobes notched about 1/2 their length..... *Pinguicula planifolia*
- 4 Fresh leaves bright yellow-green; corolla lobes ca. 1× as long than broad, the lobes notched about 1/4 their length..... *Pinguicula primuliflora*

Pinguicula lutea Walter. YELLOW BUTTERWORT. **Hab:** Pine savannas and wet pine flatwoods, mostly in the outer Coastal Plain, rarely extending inland to seepages and sandhill-pocosin ecotones in the fall-line Sandhills of SC. **Dist:** Se. NC (Pender and New Hanover counties) south to s. FL, west to e. LA. **Phen:** (Late Dec-) Feb-May. **Syn:** = Fl6, GW2, K1, K3, K4, RAB, S, WH3, Schnell (2002b). [NatureServe G4G5](#) (Apparently Secure).

Pinguicula planifolia Chapman. CHAPMAN'S BUTTERWORT. **Hab:** Pond margins, bogs, flatwoods, margins of cypress stringers. **Dist:** S. AL, Panhandle of FL, and s. MS. **Phen:** (Early Dec-) Feb-Mar. **Syn:** = Fl6, GW2, K1, K3, K4, S, WH3, Schnell (2002b). [NatureServe G3?](#) (Vulnerable).

Pinguicula primuliflora C.E. Wood & Godfrey. CLEARWATER BUTTERWORT. **Hab:** Mucky margins of clearwater streams, seeps. **Dist:** Sw. GA, s. AL, Panhandle FL, and s. MS. **Phen:** Mar-Apr. **Syn:** = Fl6, GW2, K1, K3, K4, WH3, Schnell (2002b). [NatureServe G3G4](#) (Vulnerable).

Pinguicula pumila Michaux. SMALL BUTTERWORT. **Hab:** Pine savannas and wet pine flatwoods. **Dist:** Se. NC (Carteret and Pender counties) south to s. FL, west to se. TX; Bahamas. **Phen:** (Oct-) Feb-May. **Syn:** = Bah, Fl6, GW2, K1, K3, K4, RAB, S, Tx, WH3, Schnell (2002b). [NatureServe G4](#) (Apparently Secure).

*Utricularia* Linnaeus 1753 (BLADDERWORT)

As monographed by Taylor (1989), *Utricularia* consists of 214 species in 35 sections, with a nearly cosmopolitan distribution. References: Fischer et al. in Kadereit (2004); Müller & Borsch (2005); Schnell (2002b); Silva et al (2018); Taylor (1989).

- 1 Flowers white or cream-white, 1-3 mm long; inflorescence peduncles very reduced, the pedicels appearing to arise directly from the stolons; traps 0.3-0.8 mm long; plants floating unattached in water (sometimes deposited on land by dropping water, but then the principal branch systems stranded on the soil surface); capsules ca. 1 mm long, fusiform, indehiscent, with 1 seed; seeds essentially smooth, unornamented; leaves absent; [subgenus *Utricularia*, section *Utricularia*]..... *Utricularia olivacea*
- 1 Flowers yellow, pink, or purple (sometimes fading whitish), (2-) 5-20 mm long; inflorescence peduncles well-developed, the inflorescence clearly a raceme; traps 0.2-5.0 mm long; plants either attached (with principal branch systems within the soil), or floating unattached in water (sometimes deposited on land by dropping water, but then the principal branch systems stranded on the soil surface); capsules 1-8 mm long, globose, subglobose, or ovoid, with many seeds; seeds reticulate, papillose, echinate, multi-angled, or winged (rarely more-or-less smooth); leaves present (sometimes absent in the terrestrial species).
- 2 Plants attached (with principal branch systems within the soil); leaves aerial, from near the rooted base of the plant (rosulate or from nodes of stolons), simple, linear or spatulate (sometimes absent); traps 0.2-1.1 mm long, most or all on a plant usually < 1.0 mm long; seeds reticulate-alveolate (also angled in *U. resupinata*), 0.2-0.4 mm long.
- 6 Bracts subtending the pedicels peltate (attached near their middles), unattached at either end; pair of bracteoles absent; spur of the corolla oriented forward, more-or-less appressed to the lower lip; leaves with subacute to obtuse apex; [subgenus *Utricularia*, section *Setiscapella*]..... *Utricularia subulata*
- 6 Bracts subtending the pedicels ovate (attached at their bases), free only at their upper end; pair of bracteoles associated with each bract present, linear to lanceolate; spur of the corolla oriented downward or backward, at approximately a right angle to the lower lip; leaves with acute apex; [subgenus *Bivalvaria*, section *Stomostia*].
- 7 Corolla 1.5-2.0 cm long; spur 8-12 mm long; raceme usually short, the (1-) 2-6 flowers crowded together, all of them chasmogamous..... *Utricularia cornuta*
- 7 Corolla 0.25-1.5 cm long; spur 5-7 (-9) mm long; raceme usually elongate, the (1-) 2-15 flowers well-spaced, often the lower (sometimes all) cleistogamous and much smaller than the chasmogamous flowers..... *Utricularia juncea*
- 2 Plants floating unattached in water (sometimes deposited on land by dropping water, but then the principal branch systems stranded on the soil surface); leaves present and dissected into linear segments, normally submersed; traps 0.7-5.0 mm long, most or all on a plant > 1.0 mm long; seeds papillose, reticulate, ridged, angled, or winged, 0.5-2.0 mm long.

- 8 Flowers purple; leaves divided into verticillate segments with terminal traps; [subgenus *Utricularia*, section *Vesiculina*]..... *Utricularia purpurea*
- 8 Flowers yellow; leaves divided into alternate segments with lateral traps; [subgenus *Utricularia*, section *Utricularia*].
- 9 Peduncle with whorl of inflated leaf-like organs (floats).
- 10 Floats 4-7, not fused basally to one another, fusiform, tapering gradually to base and apex from a widest point near the middle; leaves with the 2 primary divisions unequal; bracts of the scape longer than broad, entire; flowers (6-) 9-14 (-17) per scape; apex of corolla spur bifid..... *Utricularia inflata*
- 10 Floats (5-) 6-8 (-10), fused basally to one another, cylindrical, more-or-less parallel-sided through most of their length, tapering abruptly to base and apex; leaves with the 2 primary divisions equal; bracts of the scape broader than long, the apex slightly to strongly 3-lobed; flowers (1-) 3-4 (-7) per scape; apex of corolla spur usually entire (rarely bifid)..... *Utricularia radiata*
- 9 Peduncle without whorl of inflated leaf-like organs (floats).
- 11 Main axes distinctly flattened in cross-section, up to 10 mm wide..... *Utricularia foliosa*
- 11 Main axes round in cross-section.
- 16 Vegetative shoots uniform, all bearing rather sparsely divided leaf segments bearing traps, seeds 0.8-1.1 mm long, with a continuous, circumferential wing, slightly to irregularly lobed.
- 17 Lower corolla lip 8-10 mm long, about equaling or slightly shorter than the conical, 5-9 mm long spur; leaves usually forked twice..... *Utricularia biflora*
- 17 Lower corolla lip 5-6 mm long, exceeding the blunt, 3.5-4.5 mm long spur; leaves usually forked once..... *Utricularia gibba*
- 16 Vegetative shoots of 2 kinds, some bearing leafy segments and few or no traps, others bearing reduced segments and more-or-less numerous traps; seeds 1.0-2.5 mm long, with an irregularly deeply lobed or partial wing.
- *Utricularia striata*

Utricularia biflora Lamarck. LONGSPUR CREEPING BLADDERWORT. **Hab:** Ponds, lakes, and ditches. **Dist:** E. MA south to FL, west to TX and OK, primarily on the Coastal Plain; also apparently widespread in the New World and Old World tropics. **Phen:** Jun-Oct. **Comm:** This species may not be distinct from *U. gibba* (which see for discussion). **Syn:** = C, F, G, GrPl, GW2, RAB, Tx, Va, W; = *Utricularia pumila* Walter – Bah, S, misapplied; < *Utricularia gibba* Linnaeus – Fl6, FNA, K1, K3, K4, NE, WH3, Schnell (2002b), Taylor (1989).

Utricularia cornuta Michaux. HORNED BLADDERWORT. **Hab:** Saturated peaty soils of shores of limesink ponds (dolines), bogs, fens, wet barrens. **Dist:** NL (Newfoundland) and QC west to n. ON, AB, and MN, south to s. FL and e. TX; Bahamas and Cuba. **Phen:** May-Sep. **Comm:** Taylor (1989) states that where sympatric with *U. juncea*, *U. cornuta* flowers much earlier. **Syn:** = Bah, C, F, Fl6, FNA, G, GW2, IL, K1, K3, K4, Mi, NeTx, NE, NY, Pa, RAB, Tn, Tx, W, WH3, WI, WV, Schnell (2002b), Taylor (1989); = *Stomoisia cornuta* (Michaux) Rafinesque – S. NatureServe G5 (Secure).

Utricularia foliosa Linnaeus. FLATSTEM BLADDERWORT. **Hab:** In deep water of natural lakes and ponds. **Dist:** Se. NC south to s. FL, west to TX (Brown & Marcus 1998); West Indies, South America, Africa. This species was reported for NC by Taylor (1989). **Phen:** Aug. **Tax:** See Godfrey & Wooten (1981) for a detailed description of this species. **Syn:** = Bah, Fl6, FNA, GW2, K1, K3, K4, S, WH3, WI, Schnell (2002b), Taylor (1989). NatureServe G5 (Secure).

Utricularia gibba Linnaeus. SHORTSPUR CREEPING BLADDERWORT. **Hab:** Ponds, lakes, and ditches. **Dist:** QC west to WI, south to FL and LA; also apparently widespread in the West Indies and Central America and apparently the Old World tropics. **Phen:** May-Sep. **Tax:** Taylor (1989) includes *U. biflora* in *U. gibba*. Other authors have expressed doubts about the distinction, including RAB ('doubtfully distinct'). Taylor suggests that "further research is clearly indicated, but to be at all meaningful, it must be conducted on a worldwide basis". I have here, for the moment, retained the two traditionally recognized species, though intermediates will be encountered. **Syn:** = Bah, C, F, G, GrPl, NeTx, RAB, S, Va, W, WV; > *Utricularia fibrosa* Walter – Tx; < *Utricularia gibba* Linnaeus – Ar, Fl6, FNA, K1, K3, K4, Mi, NE, NY, Pa, Tn, WH3, Schnell (2002b), Taylor (1989); > *Utricularia gibba* Linnaeus – Tx.

Utricularia inflata Walter. SWOLLEN BLADDERWORT, INFLATED BLADDERWORT. **Hab:** Ponds, lakes, ditches. **Dist:** NJ south to s. FL, west to e. TX; disjunct in WA (probably introduced). **Phen:** May-Nov. **Comm:** Also disjunct in an artificial pond in Henderson County, NC (Carl Sandburg Home National Historic Site). **Syn:** = C, Fl6, FNA, G, GW2, K1, K3, K4, NE, NY, Pa, S, Tn, Tx, Va, WH3, Schnell (2002b), Taylor (1989); = *Utricularia inflata* var. *inflata* – F, RAB. NatureServe G5 (Secure).

Utricularia juncea M. Vahl. SOUTHERN BLADDERWORT. **Hab:** Shores of limesink ponds (dolines), borrow pits, wet sands. **Dist:** NY (Long Island) and NJ south to s. FL, west to e. TX and se. AR; also in the West Indies, Central America and South America. **Phen:** Jul-Sep. **Syn:** = C, F, Fl2, FNA, G, GW2, K1, K3, K4, NY, RAB, Tx, Va, WH3, WI, Schnell (2002b), Taylor (1989); > *Stomoisia juncea* (M. Vahl) Barnhart – S; > *Stomoisia virgatula* Barnhart – S. NatureServe G5 (Secure).

Utricularia olivacea Wright ex Grisebach. DWARF BLADDERWORT, MINUTE BLADDERWORT. **Hab:** In floating mats (often algal) in water of limesink ponds (dolines), artificial lakes or beaver ponds. **Dist:** NJ south to FL, west to s. AL and s. MS (Sorrie & Leonard 1999), in the Coastal Plain; also in the West Indies (Cuba), Central America, and South America. **Phen:** Sep-Oct. **Syn:** = Fl6, FNA, GW2, K1, K3, K4, RAB, Va, WH3, WI, Schnell (2002b), Taylor (1989); = *Biovularia olivacea* (Wright ex Grisebach) Kam. – S. NatureServe G4 (Apparently Secure).

Utricularia purpurea Walter. PURPLE BLADDERWORT. **Hab:** In water of ponds, ditches, other slow-moving water. **Dist:** NS and QC west to MN, south to NY, n. IN, s. MI, and WI, and on the Coastal Plain south to s. FL, west to se. TX; also in Mexico, the West Indies, and Central America. **Phen:** May-Sep (-Apr). **Syn:** = Bah, C, F, Fl6, FNA, G, GW2, IL, K1, K3, K4, Mi, NE, NY, Pa, RAB, Tx, Va, WH3, WI, Schnell (2002b), Taylor (1989); = *Vesiculina purpurea* (Walter) Rafinesque – S. NatureServe G5 (Secure).

Utricularia radiata Small. FLOATING BLADDERWORT, SMALL SWOLLEN BLADDERWORT. **Hab:** Ponds, depression ponds, lakes, and ditches. **Dist:** NS south to s. FL, west to TX; disjunct in w. VA, w. TN, nw. IN; reports of this species in Cuba and South America are apparently in error. **Phen:**

379. LENTIBULARIACEAE

May–Nov. **Syn:** = Ar, C, Fl6, FNA, G, GW2, K1, K3, K4, Mi, NE, NY, Pa, S, Tx, Va, W, WH3, Schnell (2002b), Taylor (1989); = *Utricularia inflata* var. *minor* Chapman – F, RAB. **NatureServe G4** (Apparently Secure).

Utricularia striata Le Conte ex Torrey. FIBROUS BLADDERWORT. **Hab:** Ponds, lakes, and ditches. **Dist:** Se. MA south to n. FL, west to e. TX and e. OK. **Phen:** May–Nov. **Syn:** = Ar, Fl6, FNA, K1, K3, K4, NE, NY, Va, WH3, Schnell (2002b), Taylor (1989); = *Utricularia fibrosa* Walter – C, F, G, GW2, RAB, S, misapplied.

Utricularia subulata Linnaeus. SLENDER BLADDERWORT, ZIGZAG BLADDERWORT. **Hab:** Moist sands or peats of various kinds of acidic wetlands, including wet pine savannas and flatwoods, shores of limesink ponds (dolines), borrow pits, ditches. **Dist:** In North America primarily in the Coastal Plain, from NS and e. MA south to s. FL, west to TX, north in the interior to TN and AR; also in the West Indies, Central America, South America, Africa, and Asia. **Phen:** Jan–Dec. **Comm:** Taylor (1989) termed this "the most widespread of *Utricularia* species". **Syn:** = Ar, Bah, C, F, Fl6, FNA, G, GW2, Il, K1, K3, K4, Mi, NE, NY, Pa, RAB, Tn, Tx, Va, W, WH3, WI, Schnell (2002b), Taylor (1989); > *Setiscapella cleistogama* (A. Gray) Barnhart – S; > *Setiscapella subulata* (Linnaeus) Barnhart – S. **NatureServe G5** (Secure).

382. VERBENACEAE J. Saint-Hilaire 1805 (VERBENA FAMILY) [in LAMIALES]

As recently reworked, a family of about 34–41 genera and 950–1200 species, trees, shrubs, vines, and herbs, widespread in tropical, subtropical, and warm temperate regions of the Old World and New World. Tribal classification follows Marx et al. (2010). References: Atkins in Kadereit (2004); Marx et al (2010); Yuan & Olmstead (2008).

{add *Citharexylum*, *Lippia*, *Priva*}

- 1 Shrubs; fruits fleshy *Lantana*
- 1 Herbs; fruits dry.
 - 4 Mericarps 2; corolla 4-lobed, evidently zygomorphic (bilabiate); [tribe *Lantaneae*] *Phyla*
 - 4 Mericarps 4; corolla 5-lobed, actinomorphic or only weakly irregular; [tribe *Verbeneae*].
 - 5 Styles > 6 mm long; calyx 8–10 mm long, longer than the fruit; corolla salverform *Glandularia*
 - 5 Styles < 3 mm long; calyx 2–4 mm long, often shorter than the fruit; corolla funnelform *Verbena*

Glandularia J.F. Gmelin 1796 (VERVAIN)

A genus of about 100 species, herbs, of s. North America, Central America, and South America. Christenhusz, Fay, & Byng (2018) propose including *Glandularia* in *Verbena*, a course not followed here. References: Atkins in Kadereit (2004); Christenhusz, Fay, & Byng (2018); Nesom (2010); O'Leary & Thode (2016); Umber (1979).

- 1 Leaves finely dissected, the divisions 1 mm or less wide, the margins strongly revolute.
 - 2 Bracts as long as or longer than the calyx; leaf segments 1–4 mm wide *Glandularia bipinnatifida* var. *bipinnatifida*
 - 2 Bracts much shorter than the calyx; leaf segments 0.5–1.5 mm wide *Glandularia aristigera*
- 1 Leaves coarsely dissected or lobed, the divisions > 1 mm wide, the margins slightly or not at all revolute.
 - 5 Calyx lobes > 3 mm long *Glandularia canadensis*
 - 5 Calyx lobes < 3 mm long *Glandularia ×hybrida*

* ***Glandularia aristigera*** (S. Moore) Troncoso. MOSS VERVAIN, SOUTH AMERICAN VERVAIN. **Hab:** Pastures, roadsides, other disturbed areas. **Dist:** Native of South America. **Phen:** Mar–Nov. **Syn:** = Fl6, K3, K4, O'Leary & Thode (2016); = *Glandularia pulchella* (Sweet) Troncoso – Ar, K1, WH3, Umber (1979), misapplied; = *Glandularia tenuisecta* (Briquet) Small – S; = *Verbena pulchella* Sweet; = *Verbena tenuisecta* Briquet – C, Meso4.2, RAB, Tx. **NatureServe G5?** (Secure).

Glandularia bipinnatifida (Nuttall) Nuttall var. *bipinnatifida*. DAKOTA VERVAIN. **Hab:** Dry prairies on clay soils. **Dist:** KY, MO, SD, and CO south to c. GA, AL, AZ and s. Mexico; elsewhere in e. North America as waifs. **Comm:** {synonymy incomplete}. **Syn:** = Ar, K1, K4, Umber (1979); = *Glandularia bipinnatifida* (Nuttall) Nuttall – K3, NcTx, Nesom (2010); < *Verbena bipinnatifida* Nuttall – C, GrPl, Meso4.2. **NatureServe G5T5** (Secure).

Glandularia canadensis (Linnaeus) Nuttall. ROSE VERVAIN, ROSE VERBENA, CREEPING VERVAIN. **Hab:** Roadsides, longleaf pine sandhills, calcareous glades, rocky prairies, other dry sandy or rocky soils. **Dist:** IL and CO, south to FL, TX, and NM; introduced elsewhere. **Phen:** Mar–May. **Syn:** = Ar, Fl6, GrPl, Il, K1, K3, K4, Mi, NcTx, NE, S, Tn, Va, WH3, Umber (1979); = *Verbena canadensis* Linnaeus – C, F, G, Pa, RAB; > *Verbena canadensis* var.

* ***Glandularia ×hybrida*** (Groenland & Rümpler) Nesom & Pruski. GARDEN VERVAIN. **Hab:** Cultivated in gardens, uncommonly cultivated, rarely escaped or persistent; of garden origin. **Phen:** Mar-Jul. **Tax:** Nesom & Pruski (1992) provided the transfer to *Glandularia* of this common garden plant. **Syn:** = Fl6, K3, K4, NcTx, WH3; = *Glandularia peruviana* × *phlogiflora*; = *Verbena ×hybrida* Grönland & Rümpler – G, K1, Meso4.2, RAB; = *Verbena hybrida* – C, Tx.

Lantana Linnaeus 1753 (LANTANA)

A genus of about 150 species, shrubs and subshrubs, of tropical and subtropical America and Africa. References: Atkins in Kadereit (2004); Sanders (1987); Sanders (2006); Sanders (2012); Sanders in FNA () (in prep).

- 1 Inflorescence axes not thickened or spongy; inflorescence bracts broadly elliptic, broadly ovate, or reniform; corollas either pink or white to pale lavender and often with a pale yellow 'eye'; drupes white, tan, brown, pink, or purplish black, succulent to nearly dry when ripe; stems trailing, ascending, or erect. *Lantana montevidensis*
- 1 Inflorescence axes clavate-thickened, spongy; inflorescence bracts lanceolate-triangular or oblanceolate; corollas at least in part orange, variously entirely orange or varicolored in the inflorescence with oranges, pinks, and/or purples; drupes bluish-black and juicy when ripe; stems ascending to erect. *Lantana strigocamara*
- 4 Inflorescence bracts (excluding lowermost one or two that sometimes develop leaflike structure) widest at or just above base, deciduous after flowering; twigs with curled or appressed hairs usually < 0.5 mm long. *Lantana strigocamara*
- 4 Inflorescence bracts widest near or above the middle, persistent in fruit; twigs with spreading hairs 0.5-2 mm long. *Lantana urticoides*

* ***Lantana montevidensis*** (Sprengel) Briquet. TRAILING SHRUB-VERBENA, TRAILING LANTANA, POLECAT-GERANIUM. **Hab:** Landscaped areas, disturbed areas. **Dist:** Native of South America. Scattered locations in s. and e. GA (Jones & Coile 1988). **Phen:** Mar-Nov. **Syn:** = Fl6, FNA, K1, K3, K4, Tx, WH3, Sanders (2012); = *Lantana sellowiana* Link & Otto – S. **NatureServe GNR** (Not Yet Ranked).

* ***Lantana strigocamara*** R.W. Sanders. COMMON LANTANA, HEDGEFLOWER. **Hab:** Disturbed areas, especially near the coast. **Dist:** Of garden hybrid origin. **Phen:** Jan-Dec. **Tax:** Sanders (2006) described in careful detail the history and nomenclature of this species. **Syn:** = Fl6, FNA, Meso4.2, Sanders (2006), Sanders (2012); = *Lantana camara* Linnaeus – Ar, Bah, K1, K2, NcTx, RAB, S, Tx, Sanders (1987), misapplied; < *Lantana camara* Linnaeus – WH3; > *Lantana camara* ssp. *camara* – K4; ~ *Lantana camara* L. var. *mista* (L.) Bailey; > *Lantana strigocamara* R.W. Sanders – K4. **NatureServe G5TNRQ** (Not Yet Ranked).

Lantana urticoides Hayek. TEXAS LANTANA, HIERBA DE CRISTO. **Hab:** Disturbed and brackish areas. **Dist:** S. OK, TX, s. NM, and s. AZ southwards into tropical America (West Indies and sw. and sc. United States southwards). **Phen:** May-Dec. **Syn:** = FNA, K1, K3, K4, NcTx, Sanders (1987), Sanders (2006), Sanders (2012); < *Lantana horrida* Kunth – RAB, misapplied; > *Lantana horrida* Kunth – Tx; > *Lantana scorta* Moldenke – Tx. **NatureServe G5** (Secure).

Phyla Loureiro 1790 (FROGFRUIT)

A genus of 5 species, herbs, of tropical, subtropical, and warm temperate regions of the Old and New Worlds. References: Atkins in Kadereit (2004); O'Leary & Múlgura (2012).

- 1 Leaves 2-7.5 cm long, lanceolate, widest at or below the middle, acute at the tip; leaf teeth (5-) 7-11 per leaf side. *Phyla lanceolata*
- 1 Leaves 1-4 cm long, obovate, widest above the middle, obtuse to rounded at the tip; leaf teeth (0-) 1-5 (-7) per leaf side. *Phyla nodiflora*

Phyla lanceolata (Michaux) Greene. MARSH FROGFRUIT, NORTHERN FROGFRUIT. **Hab:** Oligohaline tidal marshes, tidal swamps, maritime swamps, dune swales and ponds, other marshes, seasonally exposed shores of rivers, ditches. **Dist:** ON west to SD, south to Panhandle FL, AL, MS,

Phyla nodiflora (Linnaeus) Greene. CREEPING FROGFRUIT, CAPEWEED, TURKEY-TANGLE, MATGRASS. **Hab:** Interdune swales, shell middens, sandy soils of roadsides, lawns, ditches, impoundments, disturbed areas. **Dist:** Pantropical, in North America from se. VA south to s. FL and west to CA, north in the interior to AR, se. MO, and southward into the tropics. **Phen:** May-Nov. **Comm:** This species is very weedy, and is a familiar component of road margins and lawns in the southeastern Coastal Plain. **Syn:** = K4; = *Phyla nodiflora* (Linnaeus) Greene var. *nodiflora* – Bah, GrPl, O'Leary & Múlgara (2012); < *Lippia nodiflora* (Linnaeus) Michaux – F, RAB; > *Phyla incisa* Small – Tx; < *Phyla nodiflora* (Linnaeus) Greene – Ar, C, Fl6, G, GW2, K1, Meso4.2, NcTx, S, Va, WH3; > *Phyla nodiflora* (Linnaeus) Greene – Tx; < *Phyla nodiflora* (Linnaeus) Greene var. *nodiflora* – K3.

**Verbena** Linnaeus 1753 (VERBENA, Vervain)

A genus of about 70 species, herbs, of tropical, subtropical, and warm temperate regions of the New World and (rarely) Old World. Infrageneric taxonomy follows Nesom (2010b). References: Atkins in Kadereit (2004); Barber (1982); Jiménez-Mejías & Naczi (2019); Nesom (2010b); Nesom (2010c); Nesom (2010d); O'Leary, Múlgara, & Morrone (2007); Verloove (2011); Yuan & Olmstead (2008).

- 1 Spikes short and stout, the flowers or fruits overlapping and completely obscuring all of the rachis (except in *V. montevidensis*, the fruits spaced toward the base of the spike); [weedy aliens usually of disturbed areas]
 - 2 Plant procumbent or decumbent; leaves pinnately lobed or dissected; [section *Verbena*, series *Bracteatae*]..... **Verbena bracteata**
 - 2 Plant erect; leaves coarsely serrate.
 - 3 Leaves basally attenuate to short-petiolate; corolla tubes 2.5-5 mm long.
 - 4 Central spikes sessile to subsessile, spikes compact, 3-5 mm wide, fruits remaining densely overlapping at maturity; [section *Verbenaca*, series *Pachystachyae*]..... **Verbena brasiliensis**
 - 4 Central spikes pedunculate, spikes loose, 2-3 mm wide, with fruits becoming remote at least in the proximal portion at maturity; [section *Verbenaca*, series *Litorales*]..... **Verbena montevidensis**
 - 3 Leaves basally clasping to subclasping; corolla tubes 2.5-9 (-11) mm long; [section *Verbenaca*, series *Pachystachyae*].
 - 5 Corolla tube (5-) 6.5-9 (-11) mm long..... **Verbena rigida**
 - 5 Corolla tube 2.5-6 (-7) mm long..... **Verbena incompta**
- 1 Spikes elongate, the flowers or fruits well-spaced and not obscuring the rachis; [aliens and natives, collectively of a range of habitats].
 - 7 Leaves mostly lobed or dissected.
 - 9 Bractlets about as long as the calyx; [AL. westward]; [section *Verbena*, series *Candelabrae*]..... **Verbena xutha**
 - 9 Bractlets about ½ as long as the calyx; [collectively widespread].
 - 10 Basal and lower cauline leaves persistent, relatively thick, large and spatulate, margins revolute, cauline leaves quickly reduced in size distally and becoming linear-entire; rachis and calyces eglandular; [section *Verbena*, series *Haleae*]..... **Verbena halei**
 - 10 Basal leaves usually deciduous, relatively thin, margins not revolute, cauline leaves relatively even-sized upward or largest near midstem; rachis and calyces stipitate-glandular, sometimes sparsely so; [section *Verbena*, series *Verbena*]..... **Verbena officinalis**
 - 7 Leaves not lobed or dissected, or some of the leaves lower on the stem 3-lobed.
 - 11 Stem leaves sessile or subsessile, cuneate to base.
 - 12 Leaves linear to narrowly oblanceolate, < 1.5 cm wide, > 6× as long as wide; [section *Verbena*, series *Simplices*]..... **Verbena simplex**
 - 12 Leaves ovate, 2-4 cm wide, < 4× as long as wide
 - 13 Mericarps tightly adhering in fruit, appearing as one; calyx lobes curved inward in fruit; corolla pink to pinkish lavender; [section *Verbena*, series *Connaticarpae*]..... **Verbena carnea**
 - 13 Mericarps separate in fruit; calyx lobes erect to divergent in fruit; corolla blue to violet; [section *Verbena*, series *Candelabrae*]..... **Verbena stricta**
 - 11 Stem leaves with well-developed petioles.
 - 14 Flowers and fruits distinctly overlapping in the upper part of the spikes; [section *Verbena*, series *Candelabrae*]..... **Verbena hastata**
 - 14 Flowers and fruits well-spaced throughout the inflorescence; [section *Verbena*, series *Leptostachyae*].
 - 15 Upper leaf surfaces densely scabrous or hispidulous to hispid or hispid-hirsute; calyx lobes triangular, connivent; corollas mostly pinkish to bluish, lavender, or purple; nutlet outer surfaces deeply ridged and grooved, often with prominent cross-ridges, commissural faces consistently densely silver-white minutely papillate-bullate; fibrous-rooted..... **Verbena scabra**
 - 15 Upper leaf surfaces hirsutulous to hirsute or strigose-hirsute; calyx lobes deltate-subulate, not connivent or subconnivent; corollas white, rarely pinkish; nutlet outer surfaces smooth to longitudinally ridged, sometimes with cross-ridges distally, commissural faces smooth or rarely with slight development of minutely bullate ornamentation; taprooted..... **Verbena urticifolia**

Verbena bracteata Lagasca y Segura & Rodriguez. PROSTRATE Vervain, BIG-BRACTED Vervain. **Hab:** Glades, riverbanks, sandy fields, other disturbed areas, waste areas near wool-combing mills. **Dist:** The original distribution uncertain, now distributed from ME west to BC, south to FL and Mexico, but apparently native of mw. and w. North America. **Phen:** Late Apr-Oct. **Syn:** = Ar, C, F, Fl6, G, GrPl, Il, K1, K3, K4, Mi, NE, NY, Pa, RAB, Tn, Tx, WH3, WV, Barber (1982), Nesom (2010b); = *Verbena bracteosa* Michaux – S. [NatureServe G5](#) (Secure).

* ***Verbena brasiliensis*** Vellozo. BRAZILIAN VERVAIN. **Hab:** Roadsides, disturbed areas, old fields, clearings. **Dist:** Native of South America.

Phen: May-Oct. **Syn:** = Ar, C, F, Fl6, G, GW2, K1, K3, K4, RAB, S, Tn, Va, WH3, Nesom (2010b), Nesom (2010c), Verloove (2011); = *Verbena litoralis* Kunth var. *brevibracteata* (Kuntze) N. O'Leary – O'Leary, Múlgara, & Morrone (2007); > *Verbena brasiliensis* Vellozo – Tx; > *Verbena litoralis* – Il, Tx.

Verbena carnea Medikus. CAROLINA VERVAIN. **Hab:** Sandy woodlands, longleaf pine sandhills. **Dist:** E. NC (se. VA?) south to c. peninsular FL, west to e. TX. **Phen:** Apr-Jul. **Comm:** *Verbena carnea* is sometimes placed in a monotypic genus, *Stylodon* Rafinesque, but apparently evolved from within *Verbena*. See discussion in Nesom (2010b, 2010e). **Syn:** = F, Fl6, K3, K4, RAB; = *Stylodon carneum* – WH3, orthographic variant; = *Stylodon carneus* (Medikus) Moldenke – K1, Tx; = *Stylodon carolinensis* (Walter) Small – S; = *Verbena caroliniana* Michaux. **NatureServe G4?** (Apparently Secure).

Verbena halei Small. TEXAS VERVAIN. **Hab:** Dry hammocks, prairies, open woodlands, roadsides, pastures. **Dist:** C. GA south to c. peninsular FL, TX, AZ, and Mexico; scattered as an introduction farther north, as in NC and SC. **Phen:** (Feb-) Apr-Jun (-Nov). **Syn:** = Ar, Fl6, GrPl, K1, K3, K4, NcTx, RAB, S, Tx, Nesom (2010b); = *Verbena officinalis* ssp. *halei* (Small) S.C. Barber – WH3, Barber (1982). **NatureServe G5** (Secure).

Verbena hastata Linnaeus. COMMON VERVAIN, BLUE VERVAIN, SIMPLER'S-JOY. **Hab:** Fens, marshes, bogs, meadows, calcareous spring marshes, riverbanks, low fields. **Dist:** NS west to BC, south to NC, n. AL, AR, OK, n. TX, NM, AZ, CA; scattered occurrences farther south appear to be introductions. **Phen:** Jun-Oct. **Tax:** The hybrid with *V. urticifolia*, *Verbena × engelmannii* Moldenke, is known from our area. **Syn:** = Ar, C, F, G, GrPl, GW2, Il, K3, K4, Mi, NE, NY, Pa, RAB, S, Tn, Tx, Va, W, WV, Barber (1982), Nesom (2010b); > *Verbena hastata* var. *hastata* – K1; > *Verbena hastata* var. *scabra* Moldenke – K1.

* ***Verbena incompta*** P.W. Michael. PURPLETOP VERVAIN. **Hab:** Roadsides, disturbed areas, old fields. **Dist:** Native of South America. **Phen:**

May-Oct. **Syn:** = Ar, Fl6, K4, Nesom (2010b), Nesom (2010c), Verloove (2011); = *Verbena litoralis* Kunth var. *brevibracteata* (Kuntze) N. O'Leary – Y = V. – O'Leary, Múlgara, & Morrone (2007); < *Verbena bonariensis* Linnaeus – C, F, G, GW2, RAB, S, Tx; > *Verbena bonariensis* Linnaeus – K1; < *Verbena incompta* P.W. Michael – WH3; > *Verbena litoralis* Kunth var. *brevibracteata* (Kuntze) N. O'Leary – Y = V. – K1.

* ***Verbena montevidensis*** Sprengel. URUGUAYAN VERVAIN. **Hab:** Disturbed areas. **Dist:** Native of South America. **Phen:** Jun-Jul (-Sep). **Syn:** = Ar, Fl6, K1, K3, K4, WH3, Nesom (2010b), Nesom (2010c). **NatureServe GNR** (Not Yet Ranked).

* ***Verbena officinalis*** Linnaeus. EUROPEAN VERVAIN, JUNO'S TEARS, HERB-OF-THE-CROSS. **Hab:** Disturbed areas, riverbanks. **Dist:** Native of Europe. **Phen:** Jun-Oct. **Comm:** The enigmatic *V. riparia* is represented by a few collections, and the taxonomic status of the taxon is unclear; it probably represents an unusual form of *V. officinalis*. Jiménez-Mejías & Naczi (2019) clarify its typification and mention that if what Small and Heller believed to be a separate and native species proves to be so, it will need a new name. **Syn:** = Fl6, K3, K4, Mi, NE, NY, Tn, Va, Nesom (2010b); = *Verbena officinalis* ssp. *officinalis* – WH3, Barber (1982); > *Verbena officinalis* Linnaeus – C, F, G, Pa, RAB, S; > *Verbena officinalis* var. *officinalis* – K1; > *Verbena officinalis* var. *prostrata* Grenier & Godron – K1; > *Verbena riparia* Rafinesque ex Small & Heller – C, F, G, K1, RAB, S, W.

* ***Verbena rigida*** Sprengel. VEINY VERVAIN. **Hab:** Prairies, pastures, roadsides, disturbed areas. **Dist:** Native of South America, distributed as an introduction from OK, CO, and AZ south to c. and s. TX and Mexico. **Phen:** Late Mar-Jul (-Oct). **Syn:** = Ar, Fl6, K1, K3, K4, Meso4.2, NcTx, S, Tx, WH3, Nesom (2010b), O'Leary, Múlgara, & Morrone (2007). **NatureServe GNR** (Not Yet Ranked).

Verbena scabra Vahl. ROUGH VERVAIN, HARSH VERVAIN. **Hab:** Oligohaline tidal marshes, shell deposits, river shores, other wet habitats. **Dist:** VA and WV south to s. FL, west to TX and CA, south into tropical America; mainly coastal in our area but with scattered inland records (probably adventive). **Phen:** (Mar-) May-Oct (-Dec). **Syn:** = Bah, C, F, Fl6, G, GW2, K1, K3, K4, NcTx, RAB, S, Tx, Va, WH3, WV, Nesom (2010b), Nesom (2010d). **NatureServe G5** (Secure).

Verbena simplex Lehmann. NARROWLEAF VERVAIN. **Hab:** Glades, prairies, woodlands, forests, rock outcrops, and roadsides, over limestone or mafic rocks. **Dist:** NH west to MN and NE, south to Panhandle FL (Jackson County) and TX. **Phen:** May-Sep. **Syn:** = Ar, C, F, Fl6, G, GrPl, Il, K1, K3, K4, Mi, NE, NY, Pa, RAB, Tn, Va, W, WH3, Barber (1982), Nesom (2010b); = *Verbena angustifolia* Michaux – S, illegitimate name. **NatureServe G5** (Secure).

Verbena stricta Ventenat. HOARY VERVAIN. **Hab:** Prairies, glades, barrens, pastures, and roadsides. **Dist:** W. NY ON, MI, MN, ND, and MT south to KY, TN, MS, AR, TX, and NM; the eastern extent of nativity is uncertain. **Phen:** Jun-Sep. **Syn:** = Ar, C, F, G, GrPl, Il, K1, K3, K4, Mi, NcTx, NE, NY, Pa, RAB, S, Tn, Tx, W, WV, Barber (1982), Nesom (2010b). **NatureServe G5** (Secure).

Verbena urticifolia Linnaeus. WHITE VERVAIN, NETTLELEAF VERVAIN. **Hab:** Floodplain forests, mesic and dry upland forests, disturbed habitats. **Dist:** NB west to SK, south to Panhandle FL and TX. **Phen:** May-Nov. **Tax:** Two varieties have been distinguished by many authors (see synonymy), but the characters used are poorly correlated and the distributional ranges largely overlapping. The hybrid with *V. hastata*, *Verbena × engelmannii* Moldenke, is known from our area. **Syn:** = Ar, Fl6, GW2, K3, K4, Mi, NcTx, NY, RAB, Va, W, WH3, Barber (1982), Nesom (2010b), Nesom (2010d); = *Verbena urticaefolia* – S, orthographic variant; > *Verbena urticifolia* var. *leiocarpa* Perry & Fernald – C, F, G, GrPl, Il, K1, NE, Pa, Tx, WV; > *Verbena urticifolia* var. *urticifolia* – C, F, G, GrPl, Il, K1, NE, Pa, Tx, WV.

382. VERBENACEAE

Verbena xutha Lehmann. GULF Vervain, COARSE Vervain. **Hab:** Beaches, blackland prairies, bottomlands along streams, fields, roadsides.

Dist: AL west to TX. **Phen:** Jun-Oct. **Syn:** = Ar, K1, K3, K4, NcTx, S, Tx, Nesom (2010b). NatureServe G5 (Secure).

383. LAMIACEAE Martinov 1820 (MINT FAMILY) [in LAMIALES]

A family of about 230-250 genera and 6700-7170 species, herbs, shrubs, vines, and trees, cosmopolitan. The placement in the Lamiaceae of several genera traditionally placed in Verbenaceae (e.g. *Clerodendrum*) is strongly supported by several lines of evidence. References: Harley et al. in Kadereit (2004); Li et al (2016a); Pastore et al (2021).

incertae sedis: *Callicarpa*.

subfamily Viticoideae: *Vitex*.

subfamily Ajugoideae: *Ajuga*, *Teucrium*, *Clerodendrum*, *Trichostema*.

subfamily Scutellarioideae: *Scutellaria*.

subfamily Lamioideae:

tribe Synandreae: *Synandra*, *Macbridea*, *Physostegia*

tribe Stachydeae: *Ballota*, *Galeopsis*, *Stachys*, *Sideritis*

tribe Leonuridae: *Leonurus*, *Chaiturus*

tribe Marrubieae: *Marrubium*

tribe Lamieae: *Lamium*

subfamily Nepetoideae:

tribe Elsholtzieae: *Collinsonia*, *Elsholtzia*, *Mosla*, *Perilla*.

tribe Mentheae:

subtribe Salviinae: *Rosmarinus*, *Salvia*.

subtribe Menthinae: *Blephilia*, *Clinopodium*, *Conradina*, *Cunila*, *Dicerandra*, *Hedeoma*, *Stachydeoma*, *Hyssopus*, *Lycopus*, *Mentha*, *Monarda*, *Origanum*, *Piloblephis*, *Prunella*, *Pycnanthemum*, *Thymus*.

subtribe Nepetinae: *Agastache*, *Dracocephalum*, *Glechoma*, *Meehania*, *Nepeta*.

incertae sedis: *Melissa*.

tribe Ocimeae:

subtribe Hyptidinae: *Hyptis*, *Cantinoa*, *Condea*.

subtribe Ociminae: *Ocimum*.

- 1 Fruit a fleshy drupe; plant a small tree, shrub, or sprawling vine; mature stems terete or obscurely 4-sided (by secondary growth).
 - 2 Flowers zygomorphic; leaves simple or palmately (3-) 5-7 (-9) foliolate; [subfamily Viticoideae]..... *Vitex*
 - 2 Flowers essentially actinomorphic; leaves simple.
 - 3 Stems pubescent with dendritic hairs; inflorescence axillary; calyx 0.5-2 mm, lobes diminutive to nearly obsolete; [genus incertae sedis] *Callicarpa*
 - 3 Stems glabrous or pubescent with simple hairs; inflorescence terminal (rarely only axillary); calyx 5-18 mm, lobes conspicuous; [subfamily Ajugoideae]..... *Clerodendrum*
- 1 Fruit a schizocarp of 4 dry mericarps; plant either an herb or a shrub to 5 (-20) dm tall; mature stems usually distinctly 4-sided (sometimes terete or obscurely 4-sided).
 - 4 Calyx with either a distinctly enlarged protuberance on the upper surface, or the upper lobe expanded and "cap-like". *Scutellaria*
 - 4 Calyx without an enlarged protuberance or "cap-like" upper lobe.
 - 6 Upper lip of corolla greatly reduced or lobes laterally disposed, thus the corolla appearing to consist of one large lower lip; [subfamily Ajugoideae].
 - 7 Lower lip with 2-4 lobes; flowers yellow or deep blue-purple; plants stoloniferous..... *Ajuga*
 - 7 Lower lip appearing 5-lobed (proximal 2 lateral, erect lobes represent the cryptic upper lip); flowers white to pink; plants caespitose *Teucrium*
 - 6 Upper lip of corolla conspicuous, flaring or galeate.
 - 8 Plants distinctly repent and rooting at the nodes, or producing elongate stolons.
 - 9 Plants repent.
 - 10 Herbs; leaves cordate-reniform, coarsely crenate, the blade > 1 cm long; inflorescence of axillary cymes; corollas 10-20 mm..... *Glechoma*
 - 10 Subshrubs; leaves ovate to elliptic, entire, the blade < 1 cm long; inflorescence a terminal thyrse; corollas 4-5 mm *Thymus*
 - 9 Plants stoloniferous. *Lycopus*

- 8 Plants not distinctly repent or stoloniferous.
- 12 Calyx with 6-10 lobes or teeth.
- 13 Calyx zygomorphic, canescent with simple trichomes, spinose lobe tips straight *Leonotis*
- 13 Calyx actinomorphic or essentially so, densely pubescent with stellate hairs, spinose lobe tips uncinat *Marrubium*
- 12 Calyx with 5 or fewer lobes or teeth.
- 14 Calyx with 3-4 prominent lobes (rarely 5, if one includes small teeth).
- 15 Calyx and corolla essentially actinomorphic *Lycopus*
- 15 Calyx and corolla zygomorphic. *Salvia*
- 14 Calyx usually with 5 prominent lobes (except for *Clinopodium* with rarely fused upper lobes).
- 19 Fertile stamens 0-2.
- 20 Calyx actinomorphic or essentially so; corollas actinomorphic or zygomorphic.
- 21 Corolla actinomorphic, lobes spreading and nearly equal (one lobe slightly emarginate and/or enlarged).
- 22 Inflorescences axillary; foliage not or faintly aromatic *Lycopus*
- 22 Inflorescences terminal; foliage strongly aromatic *Mentha*
- 21 Corolla zygomorphic (bilabiate).
- 23 Inflorescence in loose terminal and axillary cymes; corollas not galeate or arching *Cunila*
- 23 Inflorescence densely capitate (often also axillary); corollas strongly galeate, arching *Monarda*
- 20 Calyx and corollas clearly zygomorphic.
- 24 Corolla 7-20 mm; inflorescence a densely clustered terminal or axillary cyme, or a well developed panicle.
- 25 Inflorescence a dense cluster of one or more terminal cymes (occasionally just axillary); lower lip of corolla not fringed *Blephilia*
- 25 Inflorescence a panicle; lower lip of corolla conspicuously fringed *Collinsonia*
- 24 Corolla ca. 3-10 mm long; inflorescence a loose axillary cyme or slender terminal spike or spike-like panicle. *Hedeoma*
- 19 Fertile stamens 4.
- 28 Stamens ascending under the upper corolla lip, either included within the tube (or at least not clearly exerted beyond it).
- 29 Calyx actinomorphic.
- 30 Flowers borne in terminal verticils or thyrses, with reduced bracteal leaves.
- 31 Calyx 15-nerved; verticils tightly aggregated *Nepeta*
- 31 Calyx 5-10-nerved; verticils well spaced *Stachys*
- 30 Flowers borne in axils of well-developed leaves, or a terminal raceme with 1 flower per node.
- 32 Calyx lobes with thickened spinescent apices. *Leonurus*
- 32 Calyx lobes without spinescent apices (although lobes may be pointed or acute).
- 35 Flowers in terminal racemes, corolla tube broadly inflated *Physostegia*
- 35 Flowers borne in axils of well developed leaves, corolla tube not broadly inflated. *Lamium*
- 29 Calyx zygomorphic.
- 38 Shrubs, diffusely branched; [restricted to se. Coastal Plain and Cumberland Plateau] *Conradina*
- 38 Herbs, branched or unbranched; [collectively widespread].
- 40 Flowers 1 per bracteal axil.
- 41 Corolla nearly regular, 4-6 mm long *Perilla*
- 41 Corolla bilabiate, >10 mm long *Physostegia*
- 40 Flowers 2-many per bract or leaf axil.
- 42 Plants lemon-scented, flowers in the axils of well-developed leaves *Melissa*
- 42 Plants mint-scented or non-aromatic, flowers terminal and/or axillary.
- 43 Upper median calyx lobe longer and wider than the other 4; flowers terminal *Dracocephalum*
- 43 Upper lobes differing in sinus depth and/or size from the lower lobes; flowers borne variously.
- 44 Bracts broadly rounded, apiculate or absent. *Prunella*
- 44 Bracts setaceous or elliptic, but not broadly rounded or apiculate, present. *Clinopodium*
- 28 Stamens (at least some) well exerted beyond the upper corolla lobe.
- 47 Lower lip of corolla distinctly fringed *Collinsonia*
- 47 Lower lip of corolla not fringed.
- 48 Calyx zygomorphic.
- 49 Flowers in dense terminal capitate clusters, subtended by large bracteal leaves (these often whitened on the upper surface and especially towards the base) *Pycnanthemum*
- 49 Flowers borne otherwise. *Trichostema*
- 48 Calyx actinomorphic.
- 52 Flowers borne in a dense terminal spike, 2-3-verticilled globose head, or spiciform thyrse.
- 55 Bracts broadly rounded; corolla distinctly bilabiate; plants 1-3 m tall *Agastache*
- 55 Bracts linear-lanceolate; corolla nearly regular; plants < 1 m tall *Mentha*
- 52 Flowers borne in axillary verticils or terminal (capitate to loosely flowered) clusters.
- 56 Flowers in axillary clusters, corolla nearly regular.
- 57 Axillary clusters loose, 1-3-flowered; [subfamily *Ajugoideae*] *Trichostema*
- 57 Axillary clusters dense, many-flowered; corolla white-pink
- 58 Stems scabrous; corolla mostly blue-violet *Cantinoa mutabilis*
- 58 Stems glabrous to pubescent; corolla mostly white-pink *Mentha*
- 56 Flowers in densely capitate or loosely flowered terminal clusters, corolla distinctly bilabiate.

Callicarpa Linnaeus 1753 (BEAUTYBERRY)

A genus of about 140 species, small trees, shrubs, and lianas, mainly tropical and subtropical. References: Atha et al (2019b); Harley et al. in Kadereit (2004); Moldenke (1980).

- 1 Leaves 7-23 cm long, stellate-scurfy pubescent beneath; peduncles 1-5 mm long..... *Callicarpa americana*
 1 Leaves 2-13 cm long, glabrous or nearly so beneath (except on the midrib); peduncles 10-20 mm long..... *Callicarpa japonica*

Callicarpa americana Linnaeus. BEAUTYBERRY, AMERICAN BEAUTYBERRY, FRENCH-MULBERRY. **Hab:** Hammocks, other forests (especially with sandy or rocky soils), maritime forests (the main habitat northward), pine flatwoods, disturbed areas. **Dist:** MD and AR south to s. FL, TX, Mexico; West Indies. Reported as native for Lyon County, KY (Brock 2020). **Phen:** Jun-Aug; Aug-Oct (persisting into the winter). **Syn:** = Ar, Bah, C, F, Fl6, G, GrPl, K1, K3, K4, NcTx, RAB, S, Tn, Tx, Va, W, WH3, Atha et al (2019b). NatureServe G5 (Secure).

* ***Callicarpa japonica*** Thunberg. JAPANESE BEAUTYBERRY. **Hab:** Suburban woodlands. **Dist:** Native of e. Asia. Reported for Durham County, NC by Moldenke (1980); corroborated by specimens from Orange County, NC (Giencke, pers. comm., 2005). See Atha et al. (2019b) for a report from n. NJ. **Syn:** = K1, K3, K4, Atha et al (2019b), Moldenke (1980); = n/a – RAB.

*Cantinoa* Harley & J.F.B. Pastore 2012 (CANTINOA)

A genus of about 25 species, herbs and shrubs, of warm temperate, subtropical, and tropical America. References: Harley & Pastore (2012); Harley et al. in Kadereit (2004); Pastore et al (2021).

* ***Cantinoa mutabilis*** (A. Richard) Harley & J.F.B. Pastore. TROPICAL BUSHMINT. **Hab:** Moist disturbed areas. **Dist:** Native of South America. **Phen:** Jan-Dec. **Syn:** = Fl6, FNA, K3, K4, Meso4.2, Harley & Pastore (2012); = *Hyptis mutabilis* (A. Richard) Briquet – GW2, K1, S, WH3. NatureServe GNR (Not Yet Ranked).

*Clerodendrum* Linnaeus 1753 (GLORY-BOWER)

A genus of about 150 species, trees and shrubs (rarely perennial or annual herbs), mostly tropical and warm temperate, African and Asian (after removal of the “Pantropical Coastal” clade into *Volkameria*) (Yuan et al. 2010). References: Harley et al. in Kadereit (2004); Hsiao & Lin (1995); Steane et al (1999); Steane, de Kok, & Olmstead (2004); Yuan et al (2010).

- 1 Corolla tube 5-12 cm long..... *Clerodendrum indicum*
 1 Corolla tube < 3 cm long..... *Clerodendrum bungei*

* ***Clerodendrum bungei*** Steudel. ROSE GLORYBOWER, KASHMIR-BOUQUET, BROCAEMELIA. **Hab:** Roadsides and suburban woodlands, spread from horticultural use. **Dist:** Native of e. Asia. First reported from South Carolina by Hill & Horn (1997); also reported for our area by W. Duncan (pers. comm.). **Phen:** Aug-Sep. **Syn:** = Fl6, K1, K3, K4, Meso4.2, Tx, WH3. NatureServe GNR (Not Yet Ranked).

* ***Clerodendrum indicum*** (Linnaeus) Kuntze. TUBEFLOWER, TURK’S-TURBAN. **Hab:** Disturbed areas, roadsides, spread from horticultural use. **Dist:** Native of the Malaysian Archipelago. **Phen:** Aug-Oct; Nov-Dec. **Syn:** = Fl6, K1, K3, K4, Tx, WH3; = *Clerodendron indicum* – RAB, orthographic variant; = *Siphonanthus indicus* Linnaeus. NatureServe GNR (Not Yet Ranked).

(see introduction for more)

Clinopodium Linnaeus 1753 (CALAMINT)

A genus of uncertain circumscription and size, herbs and shrubs, of temperate and subtropical areas of the w. and e. hemispheres. The circumscription will certainly change in the future, with the native species here placed in *Clinopodium* rearranged into several genera, based on the clear polyphyly of a broad *Clinopodium* and its clear interdigitation with other genera (such as *Conradina*, *Piloblephis*, and *Stachydeoma*), as shown by Bräuchler, Meimberg, & Heubl (2010), Drew & Sytsma (2012), and Edwards, Soltis, & Soltis (2006). References: Bräuchler et al. (2012); Cantino & Wagstaff (1998); Drew & Sytsma (2012); Edwards, Soltis, & Soltis (2006); Floden et al (2020); Shinnars (1962a); Shinnars (1962f).

- 1 Flowers 1 per leaf axil *Clinopodium brownei*
 1 Flowers > 1 per leaf axil.
 2 Plant a shrub, not flowering the first year; [of sandy or rocky habitats of the Coastal Plain and Piedmont, from s. NC southward].
 3 Corolla bright scarlet, 27-50 mm long; calyx 8-18 mm long. *Clinopodium coccineum*
 3 Corolla light lavender or pink with darker spots, 10-20 mm long; calyx 5.0-7.5 mm long. *Clinopodium georgianum*
 2 Plant an herbaceous to suffrutescent perennial, often flowering the first year; [of various habitats, collectively widely distributed in our area].
 10 Axillary flower clusters in peduncled, contracted cymes. *Clinopodium calamintha*
 10 Axillary flower clusters sessile, dense. *Clinopodium gracile*

Clinopodium brownei (Swartz) Kuntze. BROWNE'S SAVORY. **Hab:** Floodplain forests, pondshores. **Dist:** Sw. GA and s. FL west to e. and s. TX; Mexico, Central America, and South America. In sw. GA (Jones & Coile 1988) and reported for SC (Beaufort County, SC) (Daniel Payne, pers. comm. 2006, specimen at CLEMS). **Phen:** Apr-Jul. **Tax:** Needing rangewide study for variation, and also (of course) appropriate generic placement. **Syn:** = Fl6, K1, K3, K4, Meso4.2, WI; = *Satureja brownei* (Swartz) Briquet – Bah; > *Micromeria brownei* (Swartz) Benth var. *pilosuscula* A. Gray – GW2, Tx, WH3, Shinnars (1962f); > *Micromeria pilosuscula* (A. Gray) Small – S. **NatureServe G5** (Secure).

* ***Clinopodium calamintha*** (Linnaeus) Stace. LESSER CALAMINT, BASIL-THYME. **Hab:** Disturbed areas. **Dist:** Native of Europe. **Phen:** Jun-Oct. **Syn:** = K3, NY, Va; = *Calamintha nepeta* (Linnaeus) Savi – Il, Tn, Shinnars (1962a); = *Clinopodium nepeta* (Linnaeus) Kuntze – Ar, K4, S; = *Satureja calamintha* (Linnaeus) Scheele – C; > *Calamintha nepeta* ssp. *glandulosa* (Riquien) P.W. Ball – K1, Pa; > *Calamintha nepeta* (Linnaeus) Savi ssp. *nepeta* – K1; > *Calamintha officinalis* Moench – Shinnars (1962a); > *Satureja calamintha* var. *calamintha* – F; > *Satureja calamintha* var. *glandulosa* (Riquien) Briquet – F; > *Satureja calamintha* (Linnaeus) Scheele var. *nepeta* (Linnaeus) Briquet – F, G, RAB, W; > *Satureja calamintha* var. *nepetoides* (Jordan) Briquet – F, G.

Clinopodium coccineum (Nuttall ex Hooker) Kuntze. SCARLET CALAMINT, SCARLET WILD BASIL, RED MINT SHRUB. **Hab:** Longleaf pine sandhills and pine flatwoods. **Dist:** E. GA south to c. peninsular FL, west to s. MS. **Phen:** Apr-May. **Syn:** = S; < *Calamintha coccinea* (Nuttall ex Hooker) Benth – Fl6, WH3, Shinnars (1962a); < *Clinopodium coccineum* (Nuttall ex Hooker) Kuntze – K1, K3, K4, Cantino & Wagstaff (1998); < *Satureja coccinea* (Nuttall ex Hooker) Bertolini.

Clinopodium georgianum R.M. Harper. GEORGIA CALAMINT. **Hab:** Longleaf pine sandhills, dry rocky or sandy woodlands. **Dist:** S. NC south to Panhandle FL and west to LA. **Phen:** Jul-Sep. **Syn:** = K1, K3, K4, S, Cantino & Wagstaff (1998); = *Calamintha georgiana* (R.M. Harper) Shinnars – Fl6, WH3, Shinnars (1962a); = *Satureja georgiana* (R.M. Harper) H.E. Ahles – RAB; > *Satureja caroliniana* (Michaux) Briquet, misapplied. **NatureServe G5** (Secure).

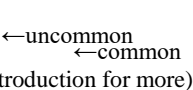

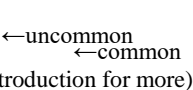

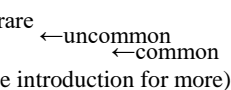

* ***Clinopodium gracile*** (Benth) Kuntze. SLENDER WILD BASIL. **Hab:** Disturbed areas, roadsides, bottomland forests. **Dist:** Native of Asia. Introduced in s. AL, FL, LA (Kartesz 1999; Woods, Diamond, & Searcy 2003), MS (S.W. Leonard, pers. comm. 2005), GA (Zomlefer et al. 2011, 2012), and SC (Bradley et al. [in prep.]). **Phen:** Jun-Aug; Aug-Oct. **Tax:** This taxon is part of *Clinopodium* s.s. **Syn:** = Ar, Fl6, K1, K3, K4, WH3. **NatureServe GNR** (Not Yet Ranked).

*Collinsonia* Linnaeus 1753 (HORSEBALM, RICHWEED, STONEROOT)

A genus of about 4 species, perennial herbs, of e. North America. References: Harley et al. in Kadereit (2004); Peirson, Cantino, & Ballard (2006); Shinnars (1962b).

- 2 Fertile stamens 4; fresh plants with anise scent; [GA southward and westward] *Collinsonia anisata*
 2 Fertile stamens 2; fresh plants with lemon scent; [collectively widespread in our area].
 3 Blades of the larger stem leaves 4.0-10.5 cm long, with 5-15 teeth on each margin, glabrous or hispidulous on the main veins beneath; plant from a small, rounded tuber-like crown, to 6 cm long and 5 cm in diameter. *Collinsonia tuberosa*
 3 Blades of the larger stem leaves 8-25 cm long, with 11-42 teeth on each margin, glabrous or variously pubescent beneath; plant from an elongate, woody, rhizome-like crown, to 15 cm long.
 4 Calyx 2-5 mm long; calyx teeth lance-subulate to narrowly lanceolate; flowers 8-13 mm long. *Collinsonia canadensis*
 4 Calyx 4.5-7 mm long; calyx teeth broadly lanceolate; flowers 12-17 mm long *Collinsonia punctata*

Collinsonia anisata Sims. SOUTHERN HORSEBALM, ANISE HORSEBALM. **Hab:** Rich forests. **Dist:** C. GA south and west to Panhandle FL and west to s. MS, on the Piedmont and Coastal Plain. **Phen:** Late Jul-Sep; Sep-Oct. **Tax:** This species is apparently distinct, but Shinnery's concept of it included hybrids with *C. canadensis* and aberrant *C. canadensis* (Peirson, Cantino, & Ballard 2006). **Syn:** = K3, Peirson, Cantino, & Ballard (2006); < *Collinsonia canadensis* var. *punctata* (Elliott) A. Gray – F, misapplied; < *Collinsonia punctata* Elliott – S; < *Collinsonia serotina* Walter – Fl6, K1, K4, W, WH3, Shinnery (1962b); ? *Micheliella anisata* (Sims) Briquet – S.

Collinsonia canadensis Linnaeus. RICHWEED, NORTHERN HORSEBALM. **Hab:** Cove forests, rich forests, especially over calcareous or mafic substrates. **Dist:** QC, MI, and WI, south to Panhandle FL and LA. **Phen:** Late Jul-Sep; Sep-Oct. **Syn:** = C, F, Fl6, G, II, K1, K3, K4, Mi, Mo1, NE, NY, Pa, RAB, S, Tn, Va, W, WH3, WV, Shinnery (1962b); < *Collinsonia canadensis* Linnaeus – Peirson, Cantino, & Ballard (2006).

Collinsonia punctata Elliott. FLORIDA HORSEBALM. **Hab:** Rich woods. **Dist:** S. SC (Barnwell County) to e. LA, on the Coastal Plain. **Phen:** Late Aug-mid Oct; Sep-Oct. **Syn:** = K3, K4, Peirson, Cantino, & Ballard (2006); ~ *Collinsonia canadensis* var. *punctata* (Elliott) A. Gray; < *Collinsonia serotina* Walter – Fl6, K1, WH3, Shinnery (1962b); ~ *Collinsonia species 1*, of Weakley (2015) is referable here. It has been found to be variation within *C. punctata* (Steve Bowling pers. comm.).

Collinsonia tuberosa Michaux. STONEROOT. **Hab:** Rich forests, over calcareous or mafic substrates. **Dist:** C. NC west to c. TN, south to n. GA and MS (or LA?). **Phen:** Late Jul-Sep; Sep-Oct. **Comm:** Peirson, Cantino, & Ballard (2006) conclude that *C. tuberosa* should be merged into *C. canadensis*, a conclusion not followed here. **Syn:** = K1, K3, K4, RAB, S, Tn, W, Shinnery (1962b); = *Collinsonia canadensis* Linnaeus var. *tuberosa* (Michaux) Alph. Wood; < *Collinsonia canadensis* Linnaeus – Peirson, Cantino, & Ballard (2006).

***Conradina* A. Gray 1870 (CONRADINA, ROSEMARY)**

A genus of 6 species, shrubs and suffrutescent herbs, of temperate se. North America. References: Edwards et al (2008); Edwards et al (2009); Edwards, Soltis, & Soltis (2006); Harley et al. in Kadereit (2004); Shinnery (1962g); Ward (2012a).

Conradina canescens A. Gray. GRAY ROSEMARY. **Hab:** Longleaf pine sandhills, Florida scrub, pine flatwoods, riverine sandbars. **Dist:** Panhandle FL and s. AL west to s. MS. **Phen:** Jan-May. **Tax:** Less densely hairy populations on riverine sandbars in Santa Rosa County, FL and adjacent AL may warrant taxonomic recognition; additional study is needed. Additionally, *C. puberula* Small, usually included here, appears to be genetically and morphologically differentiable and may warrant "re-recognition". **Syn:** = Fl6, K1, K3, K4, Edwards et al (2009), Shinnery (1962g); < *Conradina canescens* A. Gray – WH3; > *Conradina canescens* A. Gray – S; > *Conradina puberula* Small – S.

***Cunila* D. Royen ex Linnaeus 1759 (STONE-MINT, AMERICAN-DITTANY, WILD-OREGANO)**

A genus of 1 or 9 species, of e. North America (1 species) and (depending on circumscription) Mexico (8 species). Agostini, Echeverrigaray, & Souza-Chies (2012) and Drew & Sytsma (2012) show that the South American species previously included in *Cunila* definitely do not belong there, and that *Cunila* may best be treated as monophyletic, including only our species (the 8 Mexican species removed to a new genus). References: Agostini, Echeverrigaray, & Souza-Chies (2012); Drew & Sytsma (2012); Harley et al. in Kadereit (2004).

Cunila organoides (Linnaeus) Britton. STONE-MINT, AMERICAN-DITTANY, WILD-OREGANO. **Hab:** Dry rocky slopes, shale barrens, other dry (usually sloping) woodlands and barrens. **Dist:** S. NY and PA west to MO, south to c. SC, n. GA, n. AL, nw. MS, c. and s. LA (allegedly), and ne. TX (Singhurst & Holmes 2004). **Phen:** Aug-Oct; Oct-Dec. **Syn:** = Ar, C, F, G, GrPl, II, K1, K3, K4, NcTx, NY, Pa, RAB, Tn, Tx, Va, W, WV; = *Mappia organoides* (Linnaeus) House – S. NatureServe G5 (Secure).

***Dracocephalum* Linnaeus 1753 (DRAGON'S-HEAD)**

A genus of about 45-70 species, herbs, of Eurasia and North America. References: Harley et al. in Kadereit (2004).

* ***Dracocephalum parviflorum*** Nuttall. AMERICAN DRAGON'S-HEAD. **Hab:** Cultivated ground;. **Dist:** Native in w. North America. **Phen:** May-Jul; Jul-Sep. **Syn:** = C, F, G, GrPl, II, K1, K3, K4, Mi, NE, NY, Pa, WV; = *Moldavica parviflora* (Nuttall) Britton – RAB. NatureServe G5 (Secure).

***Glechoma* Linnaeus 1753 (GILL-OVER-THE-GROUND)**

A genus of about 4-10 species, herbs, of temperate Eurasia. References: Harley et al. in Kadereit (2004).

Key to Map
Symbology:

* : waif
EN : endemic
H : historic

N : no
P : plarEurasia
? : questionable

* ***Glechoma hederacea*** Linnaeus. GILL-OVER-THE-GROUND, GROUND-IVY, CREEPING CHARLIE. **Hab:** Lawns, gardens, disturbed areas. **Dist:** Native of Eurasia. **Phen:** Late Mar-Jun; May-Jul. **Syn:** = Ar, C, Fl6, K1, K3, K4, Mi, NcTx, NE, NY, Pa, Tn, Va, WH3; = *Glechoma hederacea* – GrPl, RAB, S, W, misspelling; > *Glechoma hederacea* var. *hederacea* – F, Il, WV; > *Glechoma hederacea* var. *micrantha* Moricand – F, Il, WV; > *Glechoma hederacea* var. *parviflora* (Benthom) House – G.

Hedeoma Persoon 1807 (AMERICAN PENNYROYAL)

A genus of about 38-42 species, herbs, of North America, Central America, and South America. References: Harley et al. in Kadereit (2004); Irving (1980); Turner (2011).

- 2 Calyx teeth convergent, closing the orifice at maturity; bracteoles subtending the individual flower pedicels 1-2 mm long, about ½ as long as the pedicel; leaves (5.0-) avg. 7.7 (-11.0) mm long, (1.2-) avg. 2.2 (-4.0) mm wide, 3-5× as long as wide..... ***Hedeoma drummondii* var. *drummondii***
- 2 Calyx teeth spreading (the upper) to slightly convergent (the lower), not closing the orifice at maturity; bracteoles subtending the individual flower pedicels (1.5-) 2.5-6 mm long, generally as long as or longer than the pedicel; leaves (11.0-) avg. 16.4 (-21.0) mm long, (1.0-) avg. 2.2 (-3.0) mm wide, > 5× as long as wide ***Hedeoma hispida***

Hedeoma drummondii Benthom var. ***drummondii***. DRUMMOND'S HEDEOMA. **Hab:** Blackland prairies. **Dist:** MN and MT south to TX, n. Mexico, and CA; disjunct eastward in MS and AL. **Phen:** Jun-Sep. **Tax:** A second variety, var. *crenulata* Irving, is restricted to sc. Mexico. **Syn:** = Tx, Turner (2011); < *Hedeoma drummondii* – GrPl, K1, K3, K4, NcTx, Irving (1980). [NatureServe G5](#) (Secure).

Hedeoma hispida Pursh. ROUGH PENNYROYAL, MOCK PENNYROYAL. **Hab:** Prairies, Disturbed areas, pastures, barrens, granitic flatrocks, especially in exposed, thin soil; apparently adventive eastwards in the eastern portions of our area from farther west, but the native distribution unclear. **Dist:** BC and NM east to ME, MA, PA, VA, NC, SC, and GA. Irving (1980) shows *H. hispida* east to e. Panhandle FL, c. AL, nc. TN, and s. OH; some of the scattered records further east are adventive. It may be recently arrived farther east or was previously overlooked. First reported for SC by Hill & Horn (1997). **Phen:** May-Aug. **Syn:** = Ar, C, F, Fl6, G, Il, K1, K3, K4, Mi, NcTx, NE, NY, Tn, WV, Irving (1980); = *Hedeoma hispidum* – GrPl, Pa, Tx, WH3, orthographic variant. [NatureServe G5](#) (Secure).

Hyptis Jacquin 1786 (CLUSTER BUSHMINT)

A genus of about 145 species, herbs and shrubs, of warm temperate, subtropical, and tropical America. References: Harley & Pastore (2012); Harley et al. in Kadereit (2004); Shinnars (1962j).

- 1 Flowers borne in irregular verticillate spikes, sessile to pedunculate on peduncles 1-2 mm long; leaves either ovate to deltate, narrowed to a broadly cuneate to truncate base and well-developed petiole (4-6 cm long on larger leaves), or lanceolate and narrowed to a cuneate, subpetiolar base. ***Cantinoa***
- 1 Flowers borne in large, globose heads, 1.5-2.5 cm across, borne on peduncles 2-6 cm long; leaves lanceolate, narrowed to a narrowly cuneate, subpetiolar base. ***Hyptis alata* var. *alata***

Hyptis alata (Rafinesque) Shinnars var. ***alata***. CLUSTER BUSHMINT. **Hab:** Wet pine savannas, margins of swamp forests, wet powerline rights-of-way, ditches. **Dist:** E. NC south to s. FL, west to se. TX. **Phen:** May-Oct. **Syn:** = Shinnars (1962j); < *Hyptis alata* (Rafinesque) Shinnars – Fl6, GW2, K1, K3, K4, RAB, Tx, WH3; < *Hyptis alata* ssp. *alata* – FNA; < *Hyptis radiata* Willdenow – S.

Lamium Linnaeus 1753 (DEAD-NETTLE, HENBIT, ARCHANGEL)

A genus of about 17-40 species, herbs, of n. Africa and Eurasia. References: Harley et al. in Kadereit (2004); McMullen & Lowry (2019); Mennema (1989).

- 2 Perennial, with rhizomes or stolons; corolla 18-35 mm long, the tube curved; leaves all petioled; [section *Lamiotypus*]. ***Lamium album* ssp. *album***
- 2 Annual, lacking rhizomes or stolons; corolla 10-18 (-20) mm long, the tube straight; leaves all petioled or upper leaves sessile and clasping.
- 4 Leaves subtending flower clusters sessile; [section *Amplexicaule*] ***Lamium amplexicaule* var. *amplexicaule***
- 4 Leaves all petiolate; [section *Lamium*]. ***Lamium purpureum***

* ***Lamium album*** Linnaeus ssp. ***album***. WHITE ARCHANGEL, WHITE DEAD-NETTLE, SNOWFLAKE. **Hab:** Disturbed areas. **Dist:** Native of Eurasia. **Phen:** Apr-Sep. **Syn:** = NE, NY, Mennema (1989); < *Lamium album* – C, F, G, K1, K3, K4, Mi, Pa. [NatureServe G5](#) (Secure).

Lamium album
ssp. albumLamium amplexicaule
var. amplexicauleLamium
purpureum**Leonotis** (Persoon) R. Brown 1810 (LION'S-EARS)

A genus of about 9 species, herbs, shrubs, and small trees, of sub-Saharan Africa. References: Iwarsson & Harvey (2003).

* **Leonotis nepetifolia** (Linnaeus) W.T. Aiton var. **nepetifolia**. LION'S-EARS, LIGHTNING-ROD-PLANT. **Hab:** Pastures, field edges, roadsides, other disturbed areas. **Dist:** Native of s. Africa. **Phen:** Late Aug-Oct. **Syn:** = Iwarsson & Harvey (2003); < *Leonotis nepetaefolia* – RAB, S, Tx, orthographic variant; < *Leonotis nepetifolia* – Ar, Bah, Fl6, K1, K3, K4, Meso4.2, NcTx, WH3. NatureServe GNR (Not Yet Ranked).

Leonotis nepetifolia
var. nepetifolia**Leonurus** Linnaeus 1753 (MOTHERWORT)

A genus of 25 species, herbs, of temperate Eurasia. References: Harley & Paton (2001).

- 1 Calyx strongly 5-angled, the lower 2 lobes deflexed; upper corolla lip white-villous; leaves lacerately toothed and the larger shallowly lobed **Leonurus cardiaca**
- 1 Calyx slightly 5-angled, no lobes notably deflexed; upper corolla lip with densely and finely puberulent; leaves either entire to few-toothed (but not lobed) or deeply 3-parted, the 3 divisions further lacerately toothed or lobed. **Leonurus japonicus**

* **Leonurus cardiaca** Linnaeus. MOTHERWORT, LION'S-TAIL. **Hab:** Roadsides, pastures, disturbed areas. **Dist:** Native of c. Asia. Nelson (1993) reports the occurrence of this species in SC. **Phen:** May-Aug; Jul-Oct. **Syn:** = Ar, C, F, G, GrPl, Il, Mi, NcTx, NE, NY, Pa, RAB, S, Tn, Va, W, WV; > *Leonurus cardiaca* ssp. *cardiaca* – K1, K3. NatureServe GNRTNR (Not Yet Ranked).

* **Leonurus japonicus** Houttuyn. HONEYWEED, SIBERIAN MOTHERWORT, PIPE-SHANK. **Hab:** Disturbed areas. **Dist:** Native of Asia. **Phen:** (Apr-) May-Sep. **Syn:** = Fl6, K3, Meso4.2, NY, WH3, Harley & Paton (2001); = *Leonurus heterophyllus* Sweet; = *Leonurus sibiricus* Linnaeus – Ar, Bah, C, F, G, Il, K1, K4, NcTx, Pa, S, Tx, misapplied to our plants; > *Leonurus japonicus* Houttuyn – K2; > *Leonurus sibiricus* Linnaeus – K2. NatureServe GNR (Not Yet Ranked).

Leonurus
cardiacaLeonurus
japonicus**Lycopus** Linnaeus 1753 (BUGLEWEED, WATER-HOREHOUND)

A genus of about 10-14 species, herbs, of temperate Eurasia, North America, and Australia. References: Harley et al. in Kadereit (2004); Henderson (1962); Sorrie (1997).

- 1 Calyx lobes acute at the apex, shorter than or equaling the nutlets. **Lycopus virginicus**
- 1 Calyx lobes acuminate to subulate-tipped, much exceeding the nutlets.
- 4 Nutlet tubercles not developed or only weakly so.
- 5 Calyx 2.0-3.3 mm long; stems and branches glabrous to sparsely pubescent with hairs < 0.5 mm long; leaf teeth sharply acute to short-acuminate. **Lycopus americanus**

Symbology:

* : waif
 EN : endemic
 H : historic

N : no
 P : planted
 ? : questionable
 X : extirpated

- 5 Calyx 3.0-4.5 mm long; stems and branches densely to sparsely pubescent with hairs 0.5-1.6 mm long; leaf teeth blunt to acute.....*Lycopus europaeus*
 4 Nutlet tubercles well developed.
 6 Leaves evidently petiolate, the petioles narrowly winged.....*Lycopus rubellus*
 6 Leaves sessile or subsessile.
 7 Leaves ovate to lanceolate, usually rounded at the base, scarcely reduced upward on the stem.....*Lycopus amplexens*
 7 Leaves lanceolate to linear, cuneate at the base, upper leaves conspicuously narrower (and often also shorter) than the lower leaves*Lycopus angustifolius*

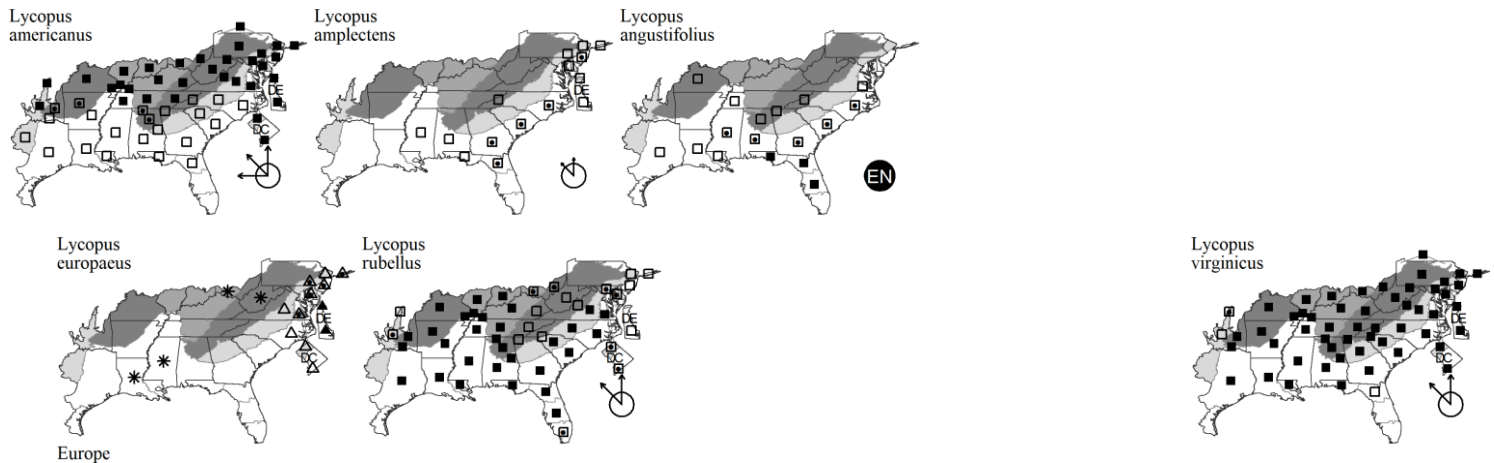

Lycopus americanus Muhlenberg ex W.P.C. Barton. AMERICAN BUGLEWEED. **Hab:** Marshes, bottomlands. **Dist:** NL (Newfoundland) west to BC, south to FL Panhandle and CA. **Phen:** Jun-Nov. **Tax:** See comment under *L. europaeus* about hybridization between *L. americanus* and *L. europaeus*. **Syn:** = Ar, C, Fl6, GrPl, GW2, Il, K1, K3, K4, Mi, NcTx, NE, NY, Pa, RAB, S, Tn, Va, W, WH3, WV, Henderson (1962), Sorrie (1997); > *Lycopus americanus* var. *americanus* – F, G, Tx; > *Lycopus americanus* var. *longii* Benner – F, G; > *Lycopus americanus* var. *scabrifolius* Fernald – F, Tx.

Lycopus amplexens Rafinesque. CLASPING WATER-HOREHOUND. **Hab:** Clay-based Carolina bays, other moist habitats. **Dist:** MA south to ne. FL; disjunct inland around the Great Lakes and (allegedly) in w. NC. **Phen:** Jun-Nov. **Syn:** = C, Fl6, GW2, Il, K1, K3, K4, NE, NY, RAB, W, WH3, Henderson (1962), Sorrie (1997); > *Lycopus amplexens* var. *amplexens* – F, G; > *Lycopus amplexens* var. *pubens* (Britton) Fernald – F, G; > *Lycopus pubens* Britton – S; > *Lycopus sessilifolius* A. Gray – S. **NatureServe G5** (Secure).

Lycopus angustifolius Elliott. NARROWLEAF BUGLEWEED, SOUTHERN BOG WATER-HOREHOUND. **Hab:** Bogs, marshes. **Dist:** Se. VA south to FL, west to e. TX, north in the interior to s. TN and s. MO. **Phen:** Jun-Nov. **Syn:** = C, Va, Henderson (1962), Sorrie (1997); = *Lycopus rubellus* Moench var. *angustifolius* (Elliott) H.E. Ahles – GW2, RAB; = *Lycopus rubellus* Moench var. *lanceolatus* Benner – F; < *Lycopus rubellus* Moench – Fl6, G, K1, K3, K4, W, WH3; < *Lycopus rubellus* var. *rubellus* – Tx.

* *Lycopus europaeus* Linnaeus. GYPSYWORD, EUROPEAN BUGLEWEED. **Hab:** Tidal marshes and shores, other marshes, ditches. **Dist:** Native of Europe. In the Great Lakes and St. Lawrence River regions, hybrid swarms involving *L. americanus* and *L. europaeus* are numerous (Webber & Ball 1980). **Phen:** Jun-Nov. **Comm:** However, to date there is no evidence that these species have hybridized within the Flora region. **Syn:** = C, G, Il, K1, K3, K4, Mi, NE, NY, Pa, RAB, S, Va, Henderson (1962), Sorrie (1997); > *Lycopus europaeus* var. *europaeus* – F; > *Lycopus europaeus* var. *mollis* (A. Kerner) Briquet – F. **NatureServe GNR** (Not Yet Ranked).

Lycopus rubellus Moench. STALKED BUGLEWEED. **Hab:** Marshes, swamp forests, bottomlands. **Dist:** ME west to MI, south to FL and TX. **Phen:** Jun-Nov. **Syn:** = Ar, C, GrPl, Il, Mi, NE, NY, Pa, S, Va, Henderson (1962), Sorrie (1997); = *Lycopus rubellus* var. *rubellus* – GW2, RAB; < *Lycopus rubellus* Moench – Fl6, G, K1, K3, K4, NcTx, W, WH3; > *Lycopus rubellus* Moench – S; > *Lycopus rubellus* var. *arkansanus* (Fresenius) Brenner – Tx; > *Lycopus rubellus* var. *rubellus* – Tx; > *Lycopus velutinus* Rydberg – S.

Lycopus virginicus Linnaeus. VIRGINIA BUGLEWEED. **Hab:** Swamps, bottomlands, tidal marshes, other wet habitats. **Dist:** MA west to PA, s. IN, MO, and OK, south to n. peninsular FL, Panhandle FL, and e. TX. **Phen:** Jul-Nov. **Syn:** = Ar, C, F, Fl6, G, GrPl, GW2, Il, K1, K3, K4, Mi, NcTx, NE, NY, Pa, RAB, S, Tn, Tx, Va, W, WH3, WV, Henderson (1962), Sorrie (1997). **NatureServe G5** (Secure).

Marrubium Linnaeus 1753 (HOREHOUND)

A genus of about 30-40 species, herbs, of Mediterranean Europe and Asia. References: Harley et al. in Kadereit (2004).

* *Marrubium vulgare* Linnaeus. WHITE HOREHOUND. **Hab:** Fencerows, disturbed places, formerly widely planted and escaped, now declining in abundance. **Dist:** Native of Eurasia. **Phen:** Jun-Aug. **Comm:** Used for cough-syrups in folk medicine. **Syn:** = Ar, C, F, G, GrPl, Il, K1, K3, K4, Meso4.2, Mi, NcTx, NE, NY, Pa, RAB, S, Tn, Tx, Va, W, WV. **NatureServe GNR** (Not Yet Ranked).

Melissa Linnaeus 1753 (BALM)

A genus of 3-4 species, herbs, from Europe to Iran and c. Asia. References: Harley et al. in Kadereit (2004).

Key to Map
Symbology:

* : waif
EN : endemic
H : historic

N : no X : extirpated
P : planted
? : questionable

* **Melissa officinalis** Linnaeus. LEMON BALM, COMMON BALM. **Hab:** Disturbed areas. **Dist:** Native of w. Asia. **Phen:** Jun-Aug. **Syn:** = Ar, C, F, G, Il, K1, K3, K4, Mi, NE, NY, Pa, RAB, S, Tn, Va, W; < *Melissa officinalis* ssp. *officinalis* – Mo1.

Mentha Linnaeus 1753 (MINT)

A genus of about 20-25 species, herbs, of temperate Eurasia and n. North America. References: Denslow & Poindexter (2009); Harley et al. . Key largely adapted from C, Y, and Z in Kadereit (2004); Stace (2010); Tucker & Naczi (2007).

Identification Notes: The distribution, habitats, phenology, and abundance of all *Mentha* species need substantial additional herbarium investigation.

- 7 Calyx tube glabrous; leaves glabrous, or with scattered hairs on the lower surface.
 8 Petioles of the main leaves 4-15 mm long; spikes stout; plants sterile; fresh plant with peppermint odor or flavor *Mentha x piperita* var. *piperita*
 8 Petioles of the main leaves 0-3 mm long; spikes slender; plants fertile; fresh plant with spearmint odor or flavor *Mentha spicata* var. *spicata*
 7 Calyx tube pubescent; leaves moderately to densely hairy on the lower surface.
 9 Leaves lanceolate to oblong-lanceolate, > 3× as long as wide.
 10 Hairs of the leaf undersurface unbranched; leaves widest near the middle, slightly rugose; fertile anthers 0.28-0.38 mm long; fresh plant with musty flavor or odor..... *Mentha longifolia* ssp. *longifolia*
 10 Hairs of the leaf undersurface dendritic; leaves oblong lanceolate, widest toward the base, conspicuously rugose; fertile anthers 0.38-0.52 mm long; fresh plant with spearmint odor or flavor..... *Mentha spicata* var. *spicata*
 9 Leaves oblong to ovate, 1-3× as long as wide.
 11 Leaves generally 1-2× as long as wide, ovate-orbicular, broadly rounded to subcordate at the base, obtuse at the apex; leaf serrations rounded and often turned downward (thus appearing crenate); leaf surface strongly rugose, with scattered dendritic hairs below; fresh plant with sickly or sweet flavor or odor *Mentha suaveolens* ssp. *suaveolens*
 11 Leaves generally 1-3× as long as wide, ovate to oblong, broadly cuneate to rounded at the base, acute at the apex; leaf serrations sharp; leaf surface moderately rugose; fresh plant with spearmint odor.
 *Mentha x rotundifolia*

* **Mentha longifolia** (Linnaeus) Linnaeus ssp. *longifolia*. HORSE MINT. **Hab:** {VA}. **Comm:** Native of Europe. **Syn:** = Mo1, Tucker & Naczi (2007); < *Mentha longifolia* – C, G, Il, NE, NY, Pa, RAB, WV; > *Mentha longifolia* (Linnaeus) Hudson var. *longifolia* – F; > *Mentha longifolia* var. *undulata* (Willdenow) Fiori & Paoletti – F; < *Mentha spicata* – K4.

* **Mentha x piperita** Linnaeus (pro sp.) var. *piperita* [*Mentha aquatica* × *spicata*]. PEPPERMINT. **Hab:** Disturbed areas. **Dist:** Native of Europe. **Syn:** = C, K1, Stace (2010), Tucker & Naczi (2007); = *Mentha x piperata* – Pa, misspelling; = *Mentha x piperita* – K4; = *Mentha aquatica* × *spicata* – NY; = *Mentha piperita* – G, RAB, S, Tx, Va, WV; < *Mentha x piperita* – Ar, Fl6, GrPl, Il, K3, Mi, NcTx, NE, Tn, WH3; > *Mentha crispa* Linnaeus – F; > *Mentha piperita* – F.

* **Mentha x rotundifolia** (Linnaeus) Hudson. **Hab:** Disturbed areas. **Dist:** Native of Europe. **Phen:** Jun-Sep. **Syn:** = C, Il, K1, K3, K4, NcTx, Pa, Tn, Tucker & Naczi (2007); = *Mentha longifolia* × *suaveolens* – NY; = *Mentha rotundifolia* – G, S, Tx, Va, WV.

* **Mentha spicata** Linnaeus var. *spicata*. SPEARMINT. **Hab:** Disturbed areas. **Dist:** Native of Europe. **Phen:** Jun-Sep. **Syn:** = Tucker & Naczi (2007); = *Mentha spicata* ssp. *spicata* – NE, NY; < *Mentha spicata* – Ar, C, F, Fl6, G, GrPl, Il, K1, K3, K4, Mi, NcTx, Pa, RAB, S, Tn, Tx, Va, WH3, WV, Stace (2010).

* **Mentha suaveolens** Ehrhart ssp. *suaveolens*. APPLE MINT, PINEAPPLE MINT, ROUND-LEAVED MINT. **Hab:** Disturbed areas. **Dist:** Native of Europe. **Phen:** Jun-Sep. **Comm:** See Denslow & Poindexter (2009) for helpful information on distinguishing *M. suaveolens* from *M. x rotundifolia*. **Syn:** = Tucker & Naczi (2007); < *Mentha suaveolens* – Ar, C, Fl6, Il, K1, K3, K4, Mi, WH3, Stace (2010). NatureServe GNRTNR (Not Yet Ranked).

Monarda Linnaeus 1753 (BERGAMOT, BEEBALM)

A genus of about 12-20 species, herbs, of North America. Many of our species are cultivated, especially *M. didyma* in various selected forms. Additional studies are needed on a number of taxonomic problems in *Monarda*. Most of the varieties recognized have been considered valid by a succession of workers; they do seem to describe morphologically distinguishable (if not entirely discrete) entities which make phytogeographic sense. References: Floden (2015); Floden (2017a) in Weakley et al (2017); Fosberg & Artz (1953); Gill (1977); Harley et al. in Kadereit (2004); McClintock & Epling (1942); Prather & Keith (2003); Sammons (2011); Scora (1967); Singhurst & Holmes (2011); Turner (1994); Waterfall (1970).

- 1 Flowers in a single, terminal glomerule (rarely also 1 at the next node down the stem); stamens exserted; leaves ovate to ovate-lanceolate, broadest near the rounded, truncate, or subcordate base, 1.5-3 (-4)× as long as wide.
 *Monarda fistulosa* var. *mollis*
 1 Flowers in 2-6 glomerules, terminal and at 2-5 successive nodes down the stem; stamens included; leaves linear, lanceolate, to narrowly elliptic, usually broadest near the middle and tapered to a cuneate base, (2.5-) 3-8× (or more) as long as wide.
 12 Calyx lobes (3-) 5-10× as long as wide, the length including a spinose awn 2-7 mm long; corolla white to pink or lavender; inner bracts subtending the flowers 4-9 mm wide, abruptly acuminate into a spinose bristle

- 12 Calyx lobes 1-3× as long as wide, narrowly to broadly triangular, acute or long-acuminate but not awned; corolla yellow, spotted with purple; inner bracts 8-14 mm wide, acuminate.

..... *Monarda punctata* var. *punctata*

Monarda citriodora Cervantes ex Lagasca y Segura var. *citriodora*. LEMON BERGAMOT. **Hab:** Prairies, oak savannas, roadsides, other disturbed places. **Dist:** IL, MO, KS south to AL, MS, LA, TX, NM, and Mexico; also naturalized outside that range (the native distribution unclear). **Phen:** Apr-Sep; Jul-Nov. **Syn:** = Ar, Il, Tx, Scora (1967), Turner (1994); = *Monarda citriodora* ssp. *citriodora* – McClintock & Epling (1942); = *Monarda citriodora* ssp. *citriodora* var. *citriodora* – K1, K3, K4; < *Monarda citriodora* – F, Fl6, G, GrPl, NcTx, RAB, Tn, WH3, Sammons (2011); ? *Monarda dispersa* – S.

Monarda fistulosa Linnaeus var. *mollis* (Linnaeus) Benth. EASTERN BERGAMOT, PALE WILD BERGAMOT. **Hab:** Moist wooded slopes. **Dist:** ME west to MN, south to GA, AL, and se. TX. **Phen:** Jun-Sep; Aug-Oct. **Tax:** See comments under var. *fistulosa*. **Syn:** = Ar, F, Il, Mi, NcTx, NY, WV, Fosberg & Artz (1953), Scora (1967), Turner (1994), Waterfall (1970); = *Monarda fistulosa* ssp. *fistulosa* var. *mollis* (Linnaeus) Benth. – K1, K3, K4, NE; < *Monarda fistulosa* – Pa, RAB, Tn, Tx, W; < *Monarda fistulosa* ssp. *fistulosa*; < *Monarda fistulosa* Linnaeus var. *fistulosa* – C, G, GrPl, Va, McClintock & Epling (1942); > *Monarda mollis* Linnaeus – S; > *Monarda scabra* Beck – S.

Monarda punctata Linnaeus var. *punctata*. EASTERN HORSEMINT. **Hab:** Maritime forests, dunes, roadsides, rocky or sandy woodlands. **Dist:** NJ to s. FL, west to TX, mainly on the Coastal Plain, but extending inland. **Phen:** Late Jul-Sep; Sep-Oct. **Syn:** = C, F, NY, Va, Scora (1967), Turner (1994); = *Monarda punctata* ssp. *punctata* – G, McClintock & Epling (1942); = *Monarda punctata* ssp. *punctata* var. *punctata* – K1, K3, K4; < *Monarda punctata* – Ar, Fl6, Pa, RAB, S, Tn, W, WH3, Sammons (2011).

Nepeta Linnaeus 1753 (CATNIP, CATMINT)

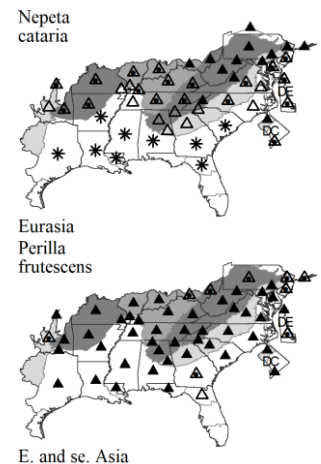

A genus of about 250 species, herbs, of Eurasia and n. Africa. References: Harley et al. in Kadereit (2004).

* ***Nepeta cataria*** Linnaeus. CATNIP, CATMINT. **Hab:** Fencerows, barnyards, disturbed areas. **Dist:** Native of Eurasia. **Phen:** Jul-Oct. **Syn:** = Ar, C, F, G, GrPl, Il, K1, K3, K4, Mi, NcTx, NE, NY, Pa, RAB, S, Tn, Tx, Va, W, WV. NatureServe GNR (Not Yet Ranked).

Perilla Linnaeus 1764 (PERILLA, BEEFSTEAK-PLANT, SHISO)

A genus of about 1-6 species, herbs, of s. and e. Asia. References: Harley et al. in Kadereit (2004).

* ***Perilla frutescens*** (Linnaeus) Britton. PERILLA, BEEFSTEAK-PLANT, SHISO. **Hab:** Moist disturbed areas. **Dist:** Native of India. **Phen:** Aug-Oct; Oct-Dec. **Tax:** Var. *crispa* (Benth.) Deane (leaves purple above and below; leaf margins lacinate-dentate and also crisped) and var. *frutescens* (leaves purple below; leaf margins dentate, not crisped) are sometimes recognized; these appear to be recently-derived cultivars rather than taxonomically distinct entities. **Syn:** = Ar, C, Fl6, G, GrPl, K4, Mi, Pa, RAB, S, Tn, Tx, W, WH3; = *Perilla frutescens* – NcTx, orthographic variant; > *Perilla frutescens* (Linnaeus) Britton var. *crispa* (Benth.) Deane – F, Il, K1, K3, NE, NY, WV; > *Perilla frutescens* var. *frutescens* – F, Il, K1, K3, NE, NY, WV.

Physostegia Benth. 1829 (OBEDIENT-PLANT)

A genus of about 12 species, perennial herbs, of North America. References: Cantino (1982); Harley et al. in Kadereit (2004).

- 1 Leaves petiolate or sessile, none of them clasping the stem.
 3 Axis of raceme with at least some of the hairs 0.13-0.25 mm long; nutlets 2-3 mm long; flowering Apr to early Jul (or later if burned)..... *Physostegia angustifolia*
 3 Axis of raceme with hairs < 0.1 mm long; nutlets usually 3-4 mm long; flowering Jul-Oct.
 *Physostegia virginiana* ssp. *praemorsa*
 1 Leaves, 1 or more of them, conspicuously or inconspicuously clasping the stem.
 8 Perennating buds borne directly on the primary rhizome or at the ends of short, vertical secondary rhizomes (horizontal secondary rhizomes lacking), the plant thus forming clumps
 *Physostegia angustifolia*
 8 Perennating buds borne at the ends of elongate, horizontal, secondary rhizomes, the plant thus forming clonal patches.
 *Physostegia angustifolia*

(see introduction for more)

Physostegia angustifolia Fernald. NARROWLEAF DRAGONHEAD, NARROWLEAF OBEDIENT-PLANT. **Hab:** Calcareous openings, glades, prairies, bottomlands. **Dist:** Sw. GA and AL west to KS and TX. **Phen:** May-Sep. **Syn:** = Ar, GrPl, GW2, Il, K1, K3, K4, NcTx, Tx, Cantino (1982). NatureServe G4G5 (Apparently Secure).

Physostegia virginiana (Linnaeus) Benth. *ssp. praemorsa* (Shinners) Cantino. SOUTHERN OBEDIENT-PLANT. **Hab:** Woodlands, glades, seepages, especially over calcareous or mafic rock. **Dist:** OH west to n. IL, south to c. NC, n. FL, TX, NM, and Mexico. **Phen:** Jul-Nov. **Syn:** = GrPl, K1, K3, K4, NcTx, Tn, W, Cantino (1982); = *Physostegia praemorsa* Shinners – Tx; = *Physostegia virginiana* var. *arenaria* Shimek – C; < *Dracocephalum virginianum* Linnaeus – G, RAB, S; >> *Physostegia speciosa* (Sweet) Sweet – Il; < *Physostegia virginiana* – Fl6, GW2, WH3; >> *Physostegia virginiana* – Il; >> *Physostegia virginiana* var. *speciosa* (Sweet) A. Gray – F; >> *Physostegia virginiana* var. *virginiana* – F.

Prunella Linnaeus 1753 (SELF-HEAL, HEAL-ALL)

A genus of about 4-7 species, herbs, of n. temperate areas. References: Harley et al. in Kadereit (2004).

Prunella vulgaris Linnaeus var. *lanceolata* (W.P.C. Barton) Fernald. AMERICAN SELF-HEAL. **Hab:** Disturbed areas, pastures, roadsides, bottomland forests; other forests and woodlands. **Dist:** NL (Newfoundland) west to AK, south to NC, SC?, TN, MO, KS, NM, AZ, and CA. **Phen:** Apr-Dec. **Tax:** Additional herbarium work is needed to determine the relative ranges, distributions, habitats, and abundances of the two varieties. **Syn:** = C, F, G, GrPl, Pa, Tx; = *Prunella vulgaris* ssp. *lanceolata* (W. Barton) Hultén – Ar, K1, K3, K4, NcTx, NE, NY; = *Prunella vulgaris* var. *elongata* Benth. – Il; < *Prunella vulgaris* – Fl6, Mi, RAB, S, Tn, Va, W. NatureServe G5T5 (Secure).

Pycnanthemum Michaux 1803 (MOUNTAIN-MINT, WILD-BASIL)

A genus of 20-25 species, herbs, of temperate North America. *Pycnanthemum* remains a complicated and difficult group, with speciation apparently having proceeded by allopolyploidy, autopolyploidy, and aneuploidy. Numerous aberrant forms and (probably) sterile hybrids complicate identification and understanding. References: Chambers & Hamer (1992); Chambers (1993); Grant & Epling (1943); Harley et al. in Kadereit (2004).

- 1 Leaves 1-15 mm wide (to 30 mm wide in *P. setosum*), mostly > 3× as long as wide (except in *P. nudum*); calyx lobes not tipped with a tuft of long, jointed bristles (except *P. clinopodioides*).
- 2 Longer calyx lobes 1.5-5 mm long, attenuate-aristate, stiff, whitened; [Coastal Plain pinelands, rarely in Mountain bogs with Coastal Plain affinities].
..... *Pycnanthemum flexuosum*
- 2 Longer calyx lobes 0.5-1.6 mm long, deltoid to narrowly triangular, not notably stiff (except in *P. tenuifolium*) or whitened; [widespread in our area, but mainly of the Piedmont and Mountains].
- 4 Leaves 10-15 mm wide (or more often even wider, to 25 mm wide, in *P. clinopodioides*); longer calyx lobes 0.7-1.6 mm long, tipped with a few long (1-3 mm) jointed bristles (*P. clinopodioides*) or not tipped (*P. nudum*).
..... *Pycnanthemum pilosum*
- 4 Leaves 1-12 (-15) mm wide; longer calyx lobes 0.5-1.5 mm long, variously pubescent but not tipped with a tuft of long jointed bristles.
- 7 Leaves glabrous on the lower and upper surface, with 2-3 pairs of lateral veins; stems glabrous on the faces and angles (rarely with a few small upwardly-curved hairs on the angles).
..... *Pycnanthemum tenuifolium*
- 7 Leaves pubescent at least on the lower surface along the midrib and main veins; leaves with 4-5 pairs of lateral veins; stems glabrous or pubescent on the faces, pubescent on the angles.
..... *Pycnanthemum virginianum*
- 1 Leaves broad, 15-40 mm wide, mostly 1.5-3× as long as wide; calyx lobes usually tipped with a tuft of long, jointed bristles (except *P. curvipes*, *P. muticum*, *P. setosum*).
- 12 Calyx lobes not tipped with a tuft of long, jointed bristles.
- 14 Calyx distinctly bilabiate, the lower 2 lobes 1.5-2.5× longer than the upper 3 lobes, and separated from each other and the upper 3 lobes by deeper sinuses
..... *Pycnanthemum albescentum*
- 14 Calyx not distinctly bilabiate, all of the calyx lobes about the same length, the sinuses about the same depth.
..... *Pycnanthemum muticum* var. *muticum*
- 12 Calyx lobes usually tipped with a tuft of long, jointed bristles.
..... *Pycnanthemum incanum* var. *puberulum*

Pycnanthemum albescentum Torrey & A. Gray. WHITE MOUNTAIN-MINT, WHITE-LEAVED MOUNTAIN-MINT. **Hab:** Bluff forests, hammocks, other open, mesic forests. **Dist:** S. IL, MO, and se. KS south to GA, AL, MS, LA, and TX. Reported for NC by Small (as *Koellia albescentum*), the basis of the report unknown to me. It is known from nc. GA (Jones & Coile 1988). **Phen:** Aug-Sep. **Syn:** = Ar, C, F, G, GrPl, Il, K1, K3, K4, NcTx, Tx, WH3; = *Koellia albescentum* (Torrey & A. Gray) Kuntze – S; ~ *Koellia pauciflora* Small. NatureServe G5 (Secure).

Pycnanthemum flexuosum (Walter) Britton, Sterns, & Poggenburg. SAVANNA MINT, SAVANNA MOUNTAIN-MINT. **Hab:** Moist to wet pine savannas, pine flatwoods, pocosin margins, mountain bogs, seepage areas on low elevation granite domes. **Dist:** Se. VA south to ne. FL, west to

383. LAMIACEAE

679

Panhandle FL and s. MS (Sorrie & LeBlond 2008) on the Coastal Plain; disjunct inland in bogs and rock outcrops of sw. NC with Coastal Plain affinities, and in sc. TN. **Phen:** Jun-Sep; Sep-Oct. **Tax:** A diploid species ($n = 18$). *Koellia hugeri* Small, alleged to differ details of the calyx, was established for the plants of bogs of the Blue Ridge; it apparently is not morphologically segregated from other variation within the species (Grant & Epling 1943). **ID Notes:** Sometimes mistaken in vegetative condition for *Eupatorium leucolepis*, *P. flexuosum* can be distinguished by its square stem and aromatic odor. **Syn:** = C, F, Fl6, K1, K3, K4, RAB, Va, W, WH3, Chambers & Hamer (1992); = *Pycnanthemum hyssopifolium* Benth – G, GW2, Grant & Epling (1943); > *Koellia hugeri* Small – S; > *Koellia hyssopifolia* (Benth) Britton – S.

Pycnanthemum incanum (Linnaeus) Michaux var. ***puberulum*** (E. Grant & Epling) Fernald. **Hab:** Forests and woodland borders. **Dist:** WV and NC south to FL and AL. **Phen:** Late Jun-Aug; Sep-Oct. **Comm:** A tetraploid species ($n = 38$). **Syn:** = F, K1, K3, K4; = *Pycnanthemum puberulum* E. Grant & Epling – WV, Grant & Epling (1943); < *Koellia incana* (Linnaeus) Kuntze – S; < *Pycnanthemum incanum* – C, G, Pa, RAB, Tn, W, Chambers & Hamer (1992). NatureServe G5T4? (Apparently Secure).

Pycnanthemum muticum (Michaux) Persoon var. ***muticum***. **Hab:** Bogs, wet meadows, moist to wet forests. **Dist:** NJ and MO south to FL and LA. **Phen:** Jun-Aug; Sep-Oct. **Tax:** A diploid, tetraploid, and hexaploid (?) species ($n = 20, 40$, ca. 54), under study by D.B. Poindexter. **Syn:** < *Koellia mutica* (Michaux) Kuntze – S; < *Pycnanthemum muticum* – Ar, C, F, G, GW2, Il, K1, K3, K4, Mi, NcTx, NY, Pa, RAB, Tn, Tx, Va, Chambers & Hamer (1992).

Pycnanthemum pilosum Nuttall. HAIRY MOUNTAIN-MINT. **Hab:** Upland woodlands. **Dist:** S. ON west to MI and IA, south to TN, AR, and OK. In c. TN, and reported from a single county in e. TN (Chester, Wofford, & Kral 1997), in se. PA (Rhoads & Klein 1993), and WV (Kartesz 1999). **Phen:** Jul-Sep. **ID Notes:** *P. pilosum* differs from *P. verticillatum* in having the stems thickly (vs. thinly pubescent), the lower surface of the leaves evenly pubescent (vs. pubescence chiefly restricted to the midrib). **Syn:** = Ar, F, G, GrPl, K4, Mi, Tn; = *Koellia pilosa* (Nuttall) Britton – S; = *Pycnanthemum verticillatum* (Michaux) Persoon var. *pilosum* (Nuttall) Cooperrider – C, K1, K3, NE, NY, Pa; < *Pycnanthemum verticillatum* (Michaux) Persoon – Il. NatureServe G5T5 (Secure).

Pycnanthemum tenuifolium Schrader. SLENDER MOUNTAIN-MINT. **Hab:** Bogs, wet meadows, moist to wet forests. **Dist:** ME west to MN, KS, and OK, south to FL and TX. **Phen:** Jun-Aug; Sep-Oct. **Tax:** A diploid and tetraploid species ($n = 20$ and 40). **Syn:** = Ar, C, F, Fl6, GrPl, GW2, Il, K1, K3, K4, Mi, NcTx, NE, NY, Pa, RAB, Tn, Tx, Va, W, WH3, Chambers & Hamer (1992); = *Koellia flexuosa* – S, misapplied; = *Pycnanthemum flexuosum* (Walter) Britton, Sterns, & Poggenburg – G, Grant & Epling (1943), misapplied.

Pycnanthemum virginianum (Linnaeus) T. Durand & B.D. Jackson ex B.L. Robinson & Fernald. VIRGINIA MOUNTAIN-MINT. **Hab:** Wet meadows, marshes, prairie sloughs, over calcareous or mafic rocks or sediments. **Dist:** ME west to ND, south to NC, nw. GA, n. AL, and OK. **Phen:** Jun-Sep; Sep-Oct. **Tax:** A tetraploid species ($n = 40$). **Syn:** = Ar, C, F, G, GrPl, GW2, K1, K3, K4, Mi, NY, Pa, RAB, Tn, Va, W, Chambers & Hamer (1992), Grant & Epling (1943); = *Koellia virginiana* (Linnaeus) MacMillan – S. NatureServe G5 (Secure).

Salvia Linnaeus 1753 (SAGE, CLARY)

A genus of about 900 species, shrubs and herbs, almost cosmopolitan. Walker et al. (2004) and Walker & Sytsma (2007) have determined that *Salvia* as traditionally circumscribed is polyphyletic. Will & Claßen-Bockhoff (2017) proposed splitting *Salvia* into multiple genera (and retaining *Rosmarinus* as a genus), while Drew et al. (2017) proposed treating *Salvia* broadly and including *Rosmarinus* in it. At least until a coherent system of splitting *Salvia* is presented, it seems best to include *Rosmarinus*. References: Drew et al (2017); Epling (1938); Keener & Diamond (2018) in Weakley et al (2018a); Stace (2010); Walker & Sytsma (2007); Walker et al (2004); Will & Claßen-Bockhoff (2017).

- 1 Leaves predominantly basal. *Salvia lyrata*
- 1 Leaves predominantly cauline, not lobed.
- 4 Leaves rhombic-ovate, the base cordate, subcordate, truncate, or broadly cuneate.
- 5 Petiole not clearly differentiated from the leaf blade (leaf tissue decurrent on the petiole for most or all its length); corolla blue
- 6 Leaves with cuneate bases extending into a winged petiole; plants typically with both terminal and axillary inflorescences; corolla 7-12 mm long; flowering Aug-Oct. *Salvia chapmanii*
- 6 Leaves with abruptly truncate bases into a winged petiole; plants typically with a single terminal inflorescence; corolla 10-17 mm long; flowering Apr-May. *Salvia urticifolia*
- 5 Petiole clearly differentiated from the leaf blade; corolla blue, white, or scarlet. *Salvia coccinea*

Key to Map
Symbology:

- 4 Leaves lanceolate, linear, or narrowly elliptic, the base cuneate to attenuate.

- 12 Stem usually with sparse, antrorse or somewhat spreading pubescence; calyx with antrorse hairs limited to major veins; flowers of mature inflorescences spaced out, most internodes elongate and ranging up to 25 (-34) mm; [Atlantic and Gulf Coastal Plain and adjacent piedmont, from south-central NC to central FL to southeast LA]..... *Salvia azurea* var. *azurea*
- 12 Stem usually with dense, retrorse pubescence; calyx with dense antrorse pubescence; flowers of mature inflorescences densely arranged, internodes between flowers very short, only the lowermost 1-3 internodes elongate and ranging up to 12 (-17) mm; [inland and prairie sites, ranging from IL, IA, NE, and e. CO south to nw. GA, n. AL, ne. MS, LA, and se. and c. TX]..... *Salvia azurea* var. *grandiflora*

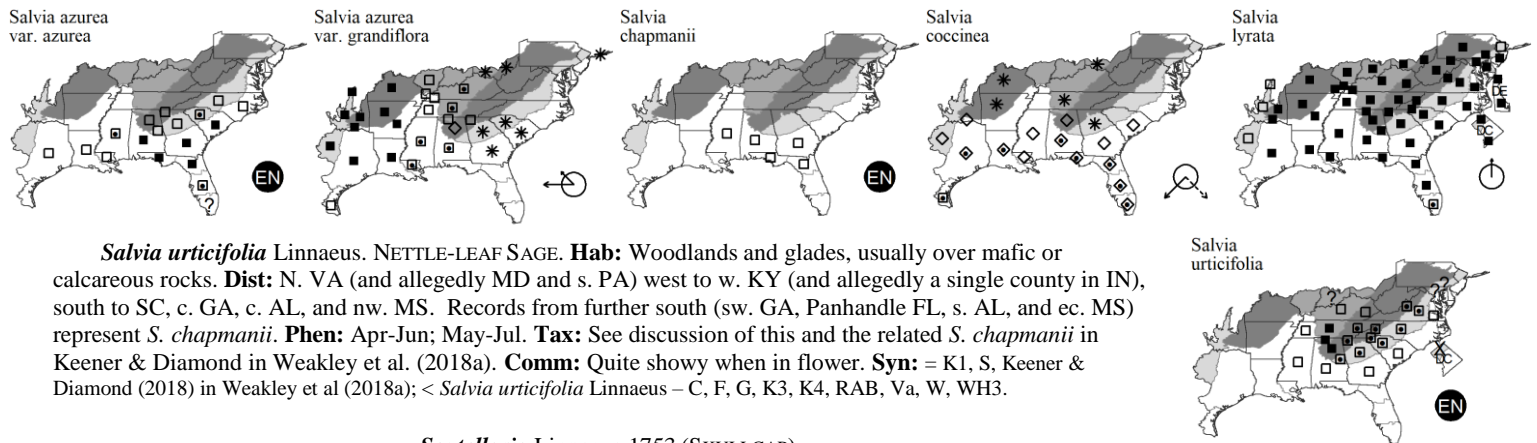

Salvia azurea Michaux ex Lamarck var. *azurea*. AZURE SAGE. **Hab:** Longleaf pine sandhills, pine flatwoods, hammocks, other sandy or rocky woodlands. **Dist:** S. NC south to Panhandle FL, west to TX. **Phen:** (May-) Aug-Nov; Oct-Dec. **Syn:** = K1, K3, K4, Tx; < *Salvia azurea* – Fl6, RAB, S, WH3. **NatureServe** G4G5T4?Q (Apparently Secure).

Salvia azurea Michaux ex Lamarck var. *grandiflora* Benth. BLUE SAGE, PRAIRIE AZURE SAGE. **Hab:** Prairies, woodlands over calcareous or mafic rocks. **Dist:** IL, IA, NE, and e. CO south to nw. GA, n. AL, ne. MS, LA, se. TX, and c. TX. **Phen:** (May-) Aug-Oct; Oct-Nov. **Syn:** = Ar, F, GrPl, K1, K3, K4, Mi, NcTx, NE, NY, Tn, Tx; = *Salvia azurea* ssp. *pitcheri* (Torrey ex Benth) Epling; = *Salvia pitcheri* Torrey ex Benth – C, G; < *Salvia azurea* – Il, S.

Salvia chapmanii A. Gray. CHAPMAN'S SAGE. **Hab:** Calcareous glades, calcareous woodlands. **Dist:** N. FL, sw. GA, s. AL, and ec. MS. **Phen:** Sep. **Tax:** This species has usually been included in *S. urticifolia*, but warrants specific status (Keener & Diamond in Weakley et al. 2018a). **Comm:** {synonymy incomplete, add Z}. **Syn:** = K1, K4, S, Keener & Diamond (2018) in Weakley et al (2018a); < *Salvia urticifolia* Linnaeus – Fl6, K3, WH3.

Salvia coccinea P.J. Buch'hoz ex Etlinger. SCARLET SAGE, BLOOD SAGE, COUNTRY BELLE, BANDERILLA COLORADO, MIRTO. **Hab:** Hammocks, longleaf pine sandhills, disturbed areas. **Dist:** The species is certainly only an introduction in the more northern parts of its distribution in our region. Whether it is native in the more southern parts of the region is uncertain and disputed. **Phen:** (Feb-) May-Nov. **Syn:** = Ar, Bah, Fl6, G, K1, K3, K4, Meso4.2, NcTx, RAB, S, Tx, WH3. **NatureServe** G5? (Secure).

Salvia lyrata Linnaeus. LYRELEAF SAGE, CANCER-WEED. **Hab:** Hammocks, lawns, roadsides, dry to mesic woodlands and forests, floodplains, calcareous barrens. **Dist:** CT west to MO, south to FL and TX. **Phen:** (Dec-) Apr-May; (Feb-) May-Jul. **Comm:** A common and familiar "native weed". **Syn:** = Ar, C, F, Fl6, G, GrPl, Il, K1, K3, K4, NcTx, NE, NY, Pa, RAB, S, Tn, Tx, Va, W, WH3, WV. **NatureServe** G5 (Secure).

Salvia urticifolia Linnaeus. NETTLE-LEAF SAGE. **Hab:** Woodlands and glades, usually over mafic or calcareous rocks. **Dist:** N. VA (and allegedly MD and s. PA) west to w. KY (and allegedly a single county in IN), south to SC, c. GA, c. AL, and nw. MS. Records from further south (sw. GA, Panhandle FL, s. AL, and ec. MS) represent *S. chapmanii*. **Phen:** Apr-Jun; May-Jul. **Tax:** See discussion of this and the related *S. chapmanii* in Keener & Diamond in Weakley et al. (2018a). **Comm:** Quite showy when in flower. **Syn:** = K1, S, Keener & Diamond (2018) in Weakley et al (2018a); < *Salvia urticifolia* Linnaeus – C, F, G, K3, K4, RAB, Va, W, WH3.

Scutellaria Linnaeus 1753 (SKULLCAP)

Contributed by Bruce A. Sorrie, Derick B. Poindexter, and Keith A. Bradley

A genus of about 350-360 species, herbs and shrubs, almost cosmopolitan. References: Bradley (2020) in Weakley et al (2020); Collins (1976); Epling (1942); Harley et al. in Kadereit (2004); Leonard (1927); Pittman (1988); Poindexter & Weakley (2018a) in Weakley et al (2018a).

Identification Notes: Recognizable by the "tractor seat"-shaped protuberance (scutellum) on the upper calyx. To discern annulate vs. non-annulate species, the corolla must be dissected to determine if a sharply defined ring of hairs (annulus) exists inside the corolla tube at the base of the calyx. *Note: in key break 26b, corollas of *S. alabamensis* may reach 22 mm long; its calyces are both stipitate glandular and punctate glandular, thus differing from *S. arenicola* and *S. mellichampii*. In key break 26a, corollas of *S. mellichampii* may be as short as 21 mm; its calyces are punctate glandular only, unlike *S. incana* var. *australis* which has both punctate glands and stipitate glands on calyces.

- 1 Flowers axillary (the bracts subtending flowers resembling stem leaves in size and shape); stem leaves sessile or petioles < 4 mm.
- 4 Lower leaves hastate; plants glabrous..... *Scutellaria racemosa*
- 4 Lower leaves ovate or deltoid-ovate; plants puberulent or pubescent.
- 5 Stems glabrate, the pubescence ascending, curled or appressed, eglandular..... *Scutellaria leonardii*
- 5 Stems obviously hairy, the pubescence spreading, glandular, eglandular, or a mixture of both.
- 8 Upper stems antrorse eglandular and spreading stipitate-glandular; leaf veins tending to anastomose along margins, lower surfaces with only stipitate-glandular hairs, or nearly so; fresh plants inodorous..... *Scutellaria australis*
- 8 Upper stems retrorse or spreading eglandular and/or stipitate-glandular; leaf veins usually unbranched along margins, lower surfaces clothed like stem with glandular and/or eglandular hairs; fresh plants with strong turpentine odor..... *Scutellaria parvula*
- 1 Flowers in racemes (bracts subtending flowers much reduced, not leaf-like); stem leaf petioles > 4 mm.
- 10 Corolla tube interior lacking a sharply defined ring of hairs (annulus) at the bend of the tube near the mouth of the calyx (= non-annulate).
- 11 Racemes secund.

- 11 Racemes not secund, flowers on more than one side of the axis.
 15 Margins of lower lip cleft and erose; lower lip with large lateral auricles (flabelliform) *Scutellaria ovata* var. *bracteata*
 15 Margins of lip entire; lip undulate or weakly auriculate. *Scutellaria ovata* var. *ovata*
- 10 Corolla tube interior with a sharply defined ring of hairs (annulus) at the bend of the tube near the mouth of the calyx (= annulate).
 17 At least some upper leaves entire.
 20 Corolla glabrous, lower lip with an immaculate the white central band; leaf bases long-attenuate *Scutellaria glabriuscula*
 20 Corolla short pilose, lower lip with blue spots or lines on the white central band; leaf bases cuneate to deltoid. *Scutellaria integrifolia*
- 17 All leaves serrate or crenate.
 22 Second internode below the base of the inflorescence stipitate glandular. *Scutellaria elliptica* var. *hirsuta*
 22 Second internode below the base of the inflorescence eglandular.
 30 Leaves softly villous beneath; calyces and bracts eglandular *Scutellaria incana* var. *incana*
 30 Leaves glabrate, with appressed hairs on veins. *Scutellaria incana* var. *australis*

Scutellaria australis (Fassett) Epling. SOUTHERN SKULLCAP. **Hab:** Bottomland forests, rocky woodlands, glades, barrens, prairies. **Dist:** NC, s. WV, KY, IN, IL, MO, and KS, south to Panhandle FL, LA, and e. TX. **Phen:** May-July. **Syn:** = G, II, WV, Epling (1942); = *Scutellaria parvula* Michaux var. *australis* Fassett – Ar, F, GrPl, K1, NcTx, NE, Tn, Tx; < *Scutellaria parvula* Michaux – Fl6, K3, K4, RAB, S, WH3. **NatureServe** G4T4? (Apparently Secure).

Scutellaria elliptica Muhlenberg ex Sprengel var. *hirsuta* (Short & Peter) Fernald. KENTUCKY SKULLCAP. **Hab:** Mesic to dry forests. **Dist:** PA and MI south to w. VA, w. NC, nw. GA, s. AL, and e. TX. **Phen:** Late May-Jun; Jun-Jul. **Tax:** See discussion in Poindexter & Weakley (2018a). **Syn:** = C, F, G, K1, Mi, Pa, Tn, Tx, Va, W, WV, Collins (1976); = *Scutellaria ovalifolia* ssp. *hirsuta* (Short & Peter) Epling – Epling (1942); < *Scutellaria elliptica* – II, K3, RAB, Tx; < *Scutellaria elliptica* Muhlenberg ex Sprengel var. *elliptica* – K4; ~ *Scutellaria hirsuta* Short & Peter; < *Scutellaria ovalifolia* – S.

Scutellaria glabriuscula Fernald. GEORGIA SKULLCAP, GULF SKULLCAP. **Hab:** Longleaf pine sandhills. **Dist:** Sw. GA and w. FL Panhandle west through s. AL to s. MS, an East Gulf Coastal Plain endemic. **Phen:** Late Sep-early Nov. **Syn:** = Fl6, K1, K3, K4, S, WH3, Collins (1976). **NatureServe** G2 (Imperiled).

Scutellaria incana Biehler var. *australis* (Epling) J.L. Collins ex D.B. Poindexter & Weakley. **Hab:** Longleaf pine sandhills, other dry sandy open woods or woodland margins. **Dist:** Gulf Coastal Plain of sw. GA, nw. FL, s. AL, and c. MS; disjunct to Brunswick County, NC. **Phen:** Jul-Aug. **Tax:** See Weakley et al. (2018a) for detailed discussion. **Syn:** = Weakley et al (2018a); = *Scutellaria altamaha* Small ssp. *australis* Epling; = *Scutellaria altamaha* var. *australis* (Epling) D.B. Ward; < *Scutellaria incana* – Fl6, K3, K4, WH3; ~ *Scutellaria incana* Beihl. var. 1 of Weakley (2015).

Scutellaria incana Biehler var. *incana*. **Hab:** Dry to mesic forests and woodlands. **Dist:** NY, OH, IN, IL, and s. MI, south to e. VA, c. NC, KY, w. TN, MS, AR, se. KS, and e. OK. **Phen:** Late Jun-early Sep. **Tax:** See Weakley et al. (2018a) for detailed discussion. **Syn:** = Ar, C, F, G, K1, NY, Tn, WV, Collins (1976), Weakley et al (2018a); = *Scutellaria incana* – Epling (1942); < *Scutellaria incana* – GrPl, II, K3, K4, Mi, Pa, RAB, S, Va. **NatureServe** G5T5 (Secure).

Scutellaria integrifolia Linnaeus. NARROWLEAF SKULLCAP. **Hab:** Wet pine savannas, pine flatwoods, seeps in forests, bottomlands, other moist sites, ditches. **Dist:** MA south to c. peninsular FL, west to e. TX, northward in the interior to OH, KY, and TN. **Phen:** May-Jul; Jul-Aug. **Syn:** = Ar, C, Fl6, G, GW2, K1, K3, K4, NE, NY, Pa, S, Tn, Va, W, WH3, Collins (1976); > *Scutellaria integrifolia* var. *hispida* Benth – F, RAB, Tx; > *Scutellaria integrifolia* var. *integrifolia* – F, RAB, Tx. **NatureServe** G5 (Secure).

Scutellaria lateriflora Linnaeus. MAD-DOG SKULLCAP, TALL BLUE SKULLCAP. **Hab:** Alluvial forests, bogs, seeps, marshes, shores. **Dist:** NL (Newfoundland) west to BC, south to GA, Panhandle FL, and CA. **Phen:** Jul-Nov. **Syn:** = Ar, C, F, Fl6, G, GrPl, GW2, II, Mi, NcTx, NE, NY, Pa, RAB, S, Tn, Tx, Va, W, WH3, WV; > *Scutellaria lateriflora* var. *lateriflora* – K1, K3, K4. **NatureServe** G5T5 (Secure).

Scutellaria leonardii Epling. SHALE-BARREN SKULLCAP, GLADE SKULLCAP. **Hab:** Limestone glades, diabase barrens, shale barrens and woodlands, dry sandy soils. **Dist:** MA west to MI and ND, south to se. VA, nc. NC, AR, and OK. **Phen:** Apr-Jun; May-Jul. **Syn:** = C, G, II, Pa, Va, W, WV, Epling (1942); = *Scutellaria ambigua* Nuttall – S; = *Scutellaria parvula* Michaux var. *leonardii* (Epling) Fernald – Mi, Tx; = *Scutellaria parvula* Michaux var. *missouriensis* (Torrey) Goodman & C.A. *Thymus* Linnaeus 1753 (THYME)

A genus of about 220-350 species, herbs and shrubs, of temperate Eurasia. References: Harley et al. in Kadereit (2004).

- * ***Thymus pulegioides* Linnaeus.** LEMON THYME. **Hab:** Disturbed areas. **Dist:** Native of Eurasia. **Phen:** Jun-Sep. **Syn:** = K1, K3, K4, Mi, NE, NY, Pa.

*Trichostema* Linnaeus 1753 (BLUE CURLS)

A genus of about 18 species, shrubs, annual and perennial herbs, of temperate North America (especially diverse in w. North America, with a second center of diversity in se. North America). References: Harley et al. in Kadereit (2004); Lewis (1945); McClelland & Weakley (2019) in Weakley et al (2019a).

- 1 Calyx lobes essentially equal; stamens straight, < 10 mm long; leaves acute to slightly acuminate, the two main lateral veins reconnecting to the midvein near the leaf tip; [section *Orthopodium*]..... *Trichostema brachiatum*
- 1 Calyx strongly bilabiate; stamens strongly arched, 12-20 mm long; leaves obtuse, the two main lateral veins not reconnecting to the midvein; [section *Trichostema*].
- 2 Plants annual; larger leaves 3-7 cm long (including the petiole); plants with long internodes near the base, near-basal branches absent, the best-developed branches from the mid or upper stem; hairs on the upper stem long (0.5-2.0 mm long) or short (0.1-0.4 mm long); [collectively widespread, in a wide variety of habitats, primarily inland, though occasionally occurring as a weed in coastal areas].
- 3 Leaves 2.5-4× as long as wide; longer hairs of the upper stem (0.3-) 0.5-2.0 mm long..... *Trichostema dichotomum*
- 3 Leaves 5-15× as long as wide; longer hairs of the upper stem 0.1-0.3 (-0.4) mm long..... *Trichostema setaceum*
- 2 Plants perennial; larger leaves 1-4 cm long (including the petiole); plants with short internodes near the base, near-basal branches well-developed, these often branching again (except in *T. suffrutescens*); hairs on the upper stem short (0.1-0.4 mm long); [of the Coastal Plain].
- *Trichostema species 2*

***Trichostema brachiatum* Linnaeus.** GLADE BLUE CURLS, FALSE PENNYROYAL. **Hab:** Shale barrens, outcrops of calcareous or mafic rock, diabase barrens, calcareous dry prairies, disturbed rocky areas. **Dist:** VT and s. ON west to MN and NE, south to c. and w. NC, nc. SC, nw. GA, AL, TX, and AZ. **Phen:** (Jul-) Aug-Sep (-Oct). **Syn:** = Ar, GrPl, K3, K4, Mi, NcTx, NE, NY, Pa, Tx, Va, W, Lewis (1945); = *Isanthus brachiatus* (Linnaeus) Britton, Sterns, & Poggenburg – C, F, Il, K1, S, Tn, WV; = n/a – RAB; > *Isanthus brachiatus* var. *brachiatus* – G; > *Isanthus brachiatus* var. *linearis* Fassett – G. Trichostema dichotomum Linnaeus. COMMON BLUE CURLS. **Hab:** Dry woodlands, disturbed areas, thin soils around rock outcrops. **Dist:** ME, ON, QC, MI, and IA, south to FL and TX. **Phen:** Aug-Nov. **Syn:** = Ar, C, Il, Mi, NcTx, NE, NY, Pa, RAB, S, Tn, Tx, Va, W, WV, McClelland & Weakley (2019) in Weakley et al (2019a); = *Trichostema dichotomum* var. *dichotomum* – G; < *Trichostema dichotomum* Linnaeus – Fl6, K1, K3, K4, WH3; > *Trichostema dichotomum* var. *dichotomum* – F; >> *Trichostema dichotomum* var. *puberulum* Fernald & Griscom – F.

Trichostema setaceum Houttuyn. NARROWLEAF BLUE CURLS. **Hab:** Thin soils around rock outcrops, especially granite flatrocks, dry sandy soils of the Coastal Plain. **Dist:** CT west to OH, south to FL and TX, primarily on the Coastal Plain. **Phen:** Aug-Nov. **Syn:** = C, F, Fl6, Il, K1, K3, K4, NE, NY, Pa, RAB, Tn, Tx, Va, W, WH3, Lewis (1945), McClelland & Weakley (2019) in Weakley et al (2019a); = *Trichostema dichotomum* var. *lineare* (Walter) Pursh – G; = *Trichostema lineare* Walter – S. NatureServe G5 (Secure).

Trichostema species 2. FLORIDA BLUE CURLS. **Hab:** Maritime hammocks, maritime dunes, grasslands, and coastal scrub. **Dist:** E. GA around the FL peninsula west to s. MS; Bahamas. **Phen:** Aug-Nov. **Syn:** = McClelland & Weakley (2019) in Weakley et al (2019a); < *Trichostema dichotomum* Linnaeus – Bah, Fl6, K4, WH3, Lewis (1945), ("pubescence type B"); >> *Trichostema dichotomum* var. *puberulum* Fernald & Griscom – F; < *Trichostema suffrutescens* Kearney – Lewis (1945).

Vitex Linnaeus 1753 (CHASTE-TREE)

A genus of about 250 species, trees and shrubs, tropical to temperate. References: Chen & Gilbert (1994); de Kok (2007); Harley et al. in Kadereit (2004).

- 1 Leaves unifoliolate (or palmately 3-foliolate); leaflets orbicular or obovate; plant a sprawling and spreading shrub/vine *Vitex rotundifolia*
 1 Leaves palmately (3-) 5-7-(-9) foliolate; leaflets lanceolate; plant an upright small tree.

..... *Vitex agnus-castus*

* ***Vitex agnus-castus*** Linnaeus. CHASTE-TREE. **Hab:** Pastures, woodland edges, suburban woodlands. **Dist:** Native of Mediterranean Europe.

Phen: Jun-Aug. **Syn:** = Ar, C, Fl6, G, GrPl, Meso4.2, Pa, RAB, S, WH3; > *Vitex agnus-castus* var. *agnus-castus* – K1, K3, K4, NcTx, Tx; > *Vitex agnus-castus* var. *caerulea* Rehder – K1, K3, K4, NcTx, Tx.

* ***Vitex rotundifolia*** Linnaeus f. BEACH VITEX, ROUNDEAF CHASTE-TREE. **Hab:** Coastal dunes, planted for ornament and stabilization and now spreading aggressively as an invasive species. **Dist:** Native of e. Asia, se. Asia, and nearby islands. **Tax:** See Cousins et al. (2010) and Roecker & Socha (2004) for additional information. **Comm:** The runners are reported to reach 10m in length. **Syn:** = Fl6, K1, K3, K4, Va, Chen & Gilbert (1994); = n/a – RAB; = *Vitex trifolia* Linnaeus ssp. *littoralis* Steenis – de Kok (2007); < *Vitex trifolia* Linnaeus – WH3.

384. MAZACEAE Reveal 2011 (MAZUS FAMILY) [in LAMIALES]

A family of 2 genera and ca. 36 species, herbs, of e. Asia south to Australia. References: Rabaler & Freeman (2019a) in FNA17 (2019).

Mazus Loureiro 1790 (MAZUS)

A genus of ca. 33 species, herbs, of Asia to Australia. References: Keener (2019a) in FNA17 (2019); Pennell (1935); Pringle (2018).

* ***Mazus pumilus*** (Burman f.) Steenis. MAZUS. **Hab:** Lawns, sandy, rocky, or muddy shores and bars along lakes and rivers. **Dist:** Native of e. Asia. **Phen:** Dec-Oct. **Tax:** See Pringle (2018) for additional, detailed discussion of the species. **Syn:** = Ar, Bah, C, Fl6, FNA17, Il, K1, K3, K4, NcTx, NE, NY, Pa, Tn, Va, WH3, Pringle (2018); = *Mazus japonicus* (Thunberg) Kuntze – F, G, RAB, Tx, WV, Pennell (1935). NatureServe GNR (Not Yet Ranked).

385. *PHRYMACEAE* Schauer 1847 (LOPSEED FAMILY) [in LAMIALES]

As radically circumscribed, a family of about 20 genera and 240 species, herbs, cosmopolitan. See Tank et al. (2006) and Barker et al. (2012).
References: Cantino in Kadereit (2004); Fischer in Kadereit (2004); Lee et al (1996); Rabeler, Freeman, & Elisens (2019b) in FNA17 (2019); Tank et al (2006); Thieret (1972); Wagstaff & Olmstead (1997).

- 2 Inflorescence of a solitary, terminal flower; bracteal leaves alternate.....*Mazaceae*
- 2 Inflorescence either of axillary flowers or of terminal and axillary spikes; bracteal leaves or bracts opposite.
 - 3 Inflorescence of terminal and axillary spikes; flowers 6-8 mm long*Phryma*
 - 3 Inflorescence of axillary flowers; flowers 17-30 mm long*Mimulus*

Mimulus Linnaeus 1753 (MONKEYFLOWER)

A genus of about 7-8 species, perennial herbs, of e. North America, Australia, s. and se. Asia, s. Africa, and Madagascar, as narrowed by Barker et al. (2012). References: Barker et al (2012); Grant (1924); Lowry et al (2019); Nesom (2019f) in FNA17 (2019); Nesom et al (2019); Pennell (1935).

- 1 Leaves petiolate (the upper sessile or nearly so); pedicels 2-15 mm long; stem with 4 winged angles..... *Mimulus alatus*
- 1 Leaves sessile; pedicels 20-45 mm long; stem with 4 rounded angles.....*Mimulus ringens* var. *ringens*

Mimulus alatus Aiton. WINGED MONKEYFLOWER. **Hab:** Marshes, bottomlands, ditches. **Dist:** MA and CT west to s. MI and s. IA, south to Panhandle FL and TX. **Phen:** Jul-Nov. **Syn:** = C, F, Fl6, FNA17, G, GrPl, GW2, Il, K1, K3, K4, Mi, NcTx, NE, NY, Pa, RAB, S, Tn, Tx, Va, W, WH3, WV, Grant (1924), Pennell (1935). NatureServe G5 (Secure).

Mimulus ringens Linnaeus var. *ringens*. ALLEGHENY MONKEYFLOWER. **Hab:** Marshes, bogs, wet meadows, bottomlands. **Dist:** NS and QC west to SK, south to c. GA, LA, OK, and CO. **Phen:** Jun-Sep. **Syn:** = G, K1, K3, K4, Va; = *Mimulus ringens* var. *typica* – Pennell (1935); < *Mimulus ringens* – C, GrPl, GW2, Mi, NE, NY, Pa, RAB, S, Tn, Tx, W, WV; > *Mimulus ringens* var. *minthodes* (Greene) A.L. Grant – F, Il, Grant (1924); > *Mimulus ringens* Linnaeus var. *ringens* – F, Il, Grant (1924). NatureServe G5T5 (Secure).

Phryma Linnaeus 1753 (LOPSEED)

A genus of 2 species, herbs, of e. North America and Asia. The disjunct populations in e. North America and e. Asia have been variously treated as species, varieties, or races; following the analysis of Nie et al. (2006), I opt to recognize the continentally disjunct populations as being morphologically and genetically different enough (and with a long enough time since separation) to warrant specific status. References: Barker et al (2012); Cantino in Kadereit (2004); Lee et al (1996); Nie et al (2006); Thieret (1972); Wagstaff & Olmstead (1997); Walker (2019) in FNA17 (2019).

Phryma leptostachya Linnaeus. AMERICAN LOPSEED. **Hab:** Bottomland forests, nutrient-rich slopes, mesic hammocks, in the Coastal Plain primarily in places underlain by coquina limestone ('marl') and essentially absent from the more acidic portions of the Coastal Plain. **Dist:** QC west to MB, south to ne. FL, Panhandle FL, and TX. **Phen:** May-Aug; Jul-Oct. **Tax:** An e. Asian relative has been variously treated as a separate species (as here), subspecies, variety, or merely form; the treatment here of the American and Asian plants as separable at species plant makes the Asian plant *P. asiatica* (H. Hara) O. Degener & I. Degener. **ID Notes:** The fruits "lopped down" against the stem are unmistakable. **Syn:** = *Phryma leptostachya* ssp. *leptostachya* – Fl6; = *Phryma leptostachya* var. *leptostachya* – FNA17, Va, Lee et al (1996); < *Phryma leptostachya* Linnaeus – Ar, C, G, GrPl, Il, K1, K3, K4, Mi, NcTx, NE, NY, Pa, RAB, S, Tn, Tx, W, WH3, WV, Barker et al. (1996); > *Phryma leptostachya* var. *confertifolia* Fernald – F; > *Phryma leptostachya* var. *leptostachya* – F.

386. *PAULOWNIACEAE* Nakai 1949 (PAULOWNIA FAMILY) [in LAMIALES]

A monogeneric family, trees, of e. Asia. There has been disagreement over whether *Paulownia* is best placed in Scrophulariaceae, Bignoniaceae, or its own family, Paulowniaceae; superficially it closely resembles *Catalpa* of the Bignoniaceae. Armstrong (1985) concluded that *Paulownia*'s affinities lie with the Scrophulariaceae, based on floral anatomy, embryo morphology, and seed morphology. A molecular study by Spangler & Olmstead (1999) conclude that *Paulownia* is best retained in its own family. Manning (2000) concurs with its removal from Bignoniaceae. Molecular evidence supports that it is sister to the reconstituted Orobanchaceae. References: Freeman, Rabeler, & Elisens (2019b) in FNA17 (2019); Manning (2000); Spangler & Olmstead (1999).

Paulownia Siebold & Zuccarini 1835 (PRINCESS-TREE)

A genus of 6-7 species, trees, of e. Asia. References: Armstrong (1985); Freeman (2019i) in FNA17 (2019).

* *Paulownia tomentosa* (Thunberg) Siebold & Zuccarini ex Steudel. PRINCESS TREE, EMPRESS TREE, PAULOWNIA. **Hab:** Roadsides, disturbed areas, roadcuts, forests. **Dist:** Native of China. **Phen:** Apr-Jun; Sep-Oct. **Comm:** *Paulownia* is becoming a nuisance, showing an ability to invade pristine woodlands. The very soft wood is highly prized in Asia. The leaves of stump sprouts can reach very large sizes (at least to 80 cm long and wide). The woody capsules are persistent, and the densely tomentose, tan flower buds are conspicuous through the winter. **Syn:** = Ar, C, F, Fl6, FNA17, G, II, K1, K3, NE, NY, Pa, RAB, S, Tn, Tx, Va, W, WH3, WV. NatureServe GNR (Not Yet Ranked).

387. OROBANCHACEAE Ventenat 1799 (BROOMRAPE FAMILY) [in LAMIALES]

A family of about 96 genera and 2060 species, root-parasitic herbs lacking chlorophyll (Orobanchaceae sensu stricto) and chlorophyllose hemiparasites (formerly placed in the Scrophulariaceae), of temperate and subtropical regions of the Northern Hemisphere (Manen et al. 2004). References: Fischer in Kadereit (2004); Freeman, Rabeler, & Elisens (2019d) in FNA17 (2019); Olmstead et al (2001); Schneeweiss (2013); Schneeweiss et al (2004); Schneider (2016); Thieret (1971).

- 1 Plants lacking chlorophyll (parasitic), variously pink, purple, brown, tan, orange, or white.
 - 2 Stem paniculately branched; flowers dimorphic, those low in the inflorescences small, pistillate, and fertile, those high in the inflorescence larger, apparently perfect but functionally staminate; [tribe *Orobancheae*] *Epifagus*
 - 2 Stem simple (rarely few-branched); flowers all alike.
 - 3 Calyx deeply cleft on the lower side; stamens exserted; [tribe *Rhinantheae*] *Conopholis*
 - 3 Calyx either nearly regular, or deeply cleft above and below into 2 lateral halves; stamens included; [tribe *Orobancheae*] *Aphyllon*
- 1 Plants with chlorophyll (hemiparasitic), with foliage and stems normally green.
 - 7 Stem leaves alternate.
 - 8 Leaves pinnately lobed; [tribe *Rhinantheae*] *Pedicularis*
 - 8 Leaves entire or 3-5-lobed at the tip.
 - 9 Bracts subtending flowers orange, red, or yellow; calyx 4-lobed; capsule loculicidal; pedicel lacking bracteoles; seeds broad, wingless; [tribe *Castillejeae*] *Castilleja*
 - 9 Bracts subtending flowers green; calyx 5-lobed; capsule septicidal and tardily also loculicidal; pedicel with 2 bracteoles; seeds narrow, winged; [tribe *Cymbarieae*] *Schwalbea*
 - 7 Stem leaves (at least the lower) opposite.
 - 10 Corolla salverform; [tribe *Buchneraeae*] *Buchnera*
 - 10 Corolla various, but not salverform.
 - 12 Calyx 4-lobed or essentially unlobed; corolla strongly bilabiate, the upper lip consisting of 2 petals almost wholly connate and strongly cucullate (hooded); corolla white or yellow; [tribe *Rhinantheae*] *Pedicularis*
 - 12 Calyx 5-lobed; corolla 5-lobed, the lobes relatively similar in size and shape, spreading; corolla yellow, orange, red, or pink; [tribe *Gerardieae*] *Agalinis*
 - 14 Corolla pink; leaves linear and thread-like (except lanceolate in *A. auriculata*) *Agalinis*
 - 14 Corolla yellow or orange; leaves either lanceolate or broader, at least the basal pinnately or bipinnately lobed or toothed, or pinnately or bipinnately divided into linear segments.
 - 15 Leaves pinnately or bipinnately divided into linear segments up to 2 mm wide; corolla rotate, the tube shorter than the lobes *Seymeria*
 - 15 Leaves not lobed or divided, or the segments broader; corolla tubular, campanulate, or funnelform, the tube much longer than the lobes.
 - 16 Corolla orange, tubular, the tube narrow and straight, > 5× as long as the diameter *Macranthera*
 - 16 Corolla yellow, campanulate or funnelform, the tube conical, < 4× as long as the diameter.
 - 17 Anthers pubescent; lower leaves < 12 cm long *Aureolaria*
 - 17 Anthers glabrous; lower leaves 20-40 cm long *Dasistoma*

Agalinis Rafinesque 1836 (AGALINIS, PURPLE-FOXGLOVE)

A genus of about 60 species, hemiparasitic annual (*A. linifolia* perennial) herbs, of tropical and warm temperate regions of America. References: Canne (1979); Canne-Hilliker & Hays (2019) in FNA17 (2019); Hays (1998a); Hays (1998b); Hays (2010); Pennell (1935); Sorrie (2017b) in Weakley et al (2017).

[Key adapted from FNA]

- 3 Leaves fleshy; upper leaf surfaces with sessile, dome-shaped trichomes; [wetland habitats].
 - 4 Plant perennial, from horizontal rhizomes, 7-16 dm tall; corollas 25-35 mm long; [of saturated, seasonally ponded, and tidal freshwater to brackish wetlands] *Agalinis linifolia*
